Although it appears to be legal to impose on owners and operators of self-propelled pleasure vehicles fees and licenses not exacted of those who pursue pleasure in horse-drawn rigs, Judge Bischoff, in the New York Supreme Court, on Thursday last, 15th inst., ruled that practically similar discrimination of the sort when applied to business vehicles is unconstitutional. He held that because one form of vehicle possesses advantages over another form is not lawful reason why it should be subjected to higher fees or discriminated against.

Judge Bischoff's decision was rendered in a test case instituted by the Universal Taxicab Co. to restrain the City of New York from enforcing the new ordinance subjecting taxicab companies using meters to a higher license rate and lower fare than other public vehicles.

That the Court's research on the question was exhaustive is indicated by his opinion, which begins:

"A 'hack' or 'hackney coach' is a vehicle offered for hire from its stand in the public thoroughfare and intended for the use of passengers. It is of ancient origin. Samuel Repys in his diary, written between the years 1660-1669, mentions the fact that he took a 'hackney coach' over London Bridge (Pepys's Diary II., 320), and it derived its name from Hackney, a metropolitan borough in the northeast of London, between which and London its use is supposed to have been the first instituted. In the sense, therefore, that the motor vehicles operated by the plaintiff are offered for hire from its hack stand in the street they are 'hacks' or 'hackney coaches,' by whatever other name they may be called."

Last August by amendments to the city ordinances all motor vehicles equipped with a taximeter had their license fee increased to give the city money to hire inspectors to examine the taxicabs, and were required to reduce their fare from 50 cents for the first half mile to 40 cents. The Court says:

"These amendments are assailed by the plaintiff as contrary to the Fourteenth Amendment of the Constitution of the United States in that they deny to the plaintiff and others similarly situated the 'equal protection of the laws,' and this motion is made for an interlocutory injunction to restrain the enforcement of such amendments pending this action for permanent injunctive relief. That the complaint is well founded seems an irresistible conclusion.

"Nothing in the ordinances as amended points to any just cause for any differentiation between vehicles equipped with taximeters and those not so equipped. Both classes are employed in identically the same business, and the owners or operators of both are therefore entitled to be treated alike. There is nothing unlawful in the use of the taximeter, and it is beyond the power of the State in the exercise of its police power and of the municipality in the exercise of its delegated power to impose upon the owners or operators of vehicles equipped with a taximeter the necessity of abandoning its use to escape the higher license fee and the lesser maximum rate of fare.

"The discrimination against the use of taximeters seems wholly arbitrary, and indeed the only reason given by counsel for the defendants for it is that since the taximeter as a means of detecting errors and impositions in the charge for hire of vehicles so equipped will draw to the owners and operators the larger share of public patronage they should be content with the payment of a higher license fee and a lesser maximum rate of fare.

"As well might the municipal legislative body have discriminated against clocks or watches carried by the operators of such vehicles, or other devices calculated to measure the time of travel, or between vehicles furnished with cushioned seats, mirrors and haircomb and brush, and others not so furnished.

"This argument plainly is one in favor of penalizing him who because of the better accommodations in his business attracts to himself the greater favor of patronage, and involves a tax purely and simply upon one the volume of whose business may exceed that of his competitor engaged in essentially the same business. That such a tax infringes upon the constitutional provision hereinbefore alluded to was emphatically ruled by the Supreme Court of the United States in *Cotting vs. Kansas City Stock Yards Company* (183 U. S. 111).

"Says Mr. Justice Brewer, writing the opinion of the court in the case last alluded to: '\* \* \* We must \* \* \* always remember that the equal protection of the laws is denied when upon one of two parties engaged in the same kind of business and under the same conditions burdens are cast which are not cast upon the other. \* \* \* If once the door is opened to the affirmance of the proposition that a State may regulate one who does much business while not regulating another who does the same but less business, then all significance in the guarantee of the equal protection of the laws is lost.'"

If Justice Bischoff's decision is sustained by the higher courts the city will have to make some other provision for the maintenance of the special bureau of taximeter inspectors than obtains at present, since no appropriation was made for running the

taximeter bureau except from the increased taxation upon the 2,000 taximeter cabs in the city. The New York Transportation Co., which operates the largest number of taxicabs, has been paying the increased tax under protest, although no point was raised as to lowering the rate.

John H. Naughton, treasurer of the Universal Taximeter Cab Co., said that if the Appellate Court upheld the ordinance in question his company would take out the taximeters and run cabs under the old coach ordinance, under which the company could charge \$1 for the first hour—a move that would serve further to expose the ridiculousness of the ordinance.

#### Liberal Law that is Being Abused.

It was not until the new Motor Car Acts—the automobile law of Victoria and New South Wales—went into effect, that the great number of automobiles at present in use on the Australian continent became generally known. In fact, the totals came as a surprise to even well informed people, for no one imagined that there could be 3,500 automobiles and 2,500 motorcycles on the highways of these two states, as the registration figures prove. As the entire population of the two states does not exceed 2,800,000, in the aggregate, the proportion is a large one.

Reports from Melbourne indicate that there is little friction between motorists and the police, because the regulations for the administration of the new law are cast in reasonable, liberal lines. A speed limit, as a good many American judges, police officers and nearly all motorists assert, is useless in a city, and in Victoria a speed limit has been omitted. Ordinarily, vehicular traffic (which may, if necessary, be construed so as to include automobiles) is limited to ten miles an hour in Melbourne, but this does not give motorists the license to travel at that pace. They are required to move at a "rate which is safe and mindful of the common danger," even if it be only two miles per hour. On the other hand, they may speed along at a 20-mile clip, or even faster, through the principal streets, when the exigencies of the traffic permit it, simply because it is recognized that there is no danger when the streets are free of traffic.

But although little friction is likely to arise over the traffic regulations or the registration requirements, there is one privilege of the new law which is being grossly abused, and that by members of the trade. Dealers and manufacturers of motor vehicles are permitted to register all their cars under a blanket registration number, which carries the letter "A" behind it, similar to the "M" required by the New York law. These plates are numbered in rotation and for the privilege of using them, the dealer pays an annual registration fee of \$15.75. They may be used legitimately only on cars (a) that are on a trial run after being

built, or (b) on a trial run with a prospective purchaser. It now appears that the dealers and agents continually use cars with the trade numbers, to transact their private business, for pleasure trips, and even for public hire. One firm is said to have about twenty cars out on the streets, all running under the same registration number. Such wholesale abuse of a privilege, of course, could have but one effect, and the police authorities are now taking steps to prosecute the offending firms.

Motorists, cyclists, and almost everyone else considers the Victorian Act, as it is called, the most liberal and equitable measure in operation in any country, and they greatly deplore the abuse by the dealers themselves, as it may lead to a revision of the act by Parliament, which may prove of inconvenience to the traders' section. Only a few arrests have been made for violation of the regulation by others than dealers. Two or three arrests for speeding when the condition of the streets did not warrant it, a few fines for being without number or rear tail light, and a small fine for a smoky exhaust make the record for the first month or so of the new act.

#### New Clubs Formed in Many Places.

The Middle Georgia Automobile Association has been launched at Jackson, Ga. Its officers are W. H. Mallet, president; Paul Turner, vice-president; R. A. Franklin, treasurer, and J. D. Jones, secretary.

The Western Illinois Automobile Club is the title of a new organization which has been formed at Monmouth, Ill. The officers of the club are: W. G. Stevenson, president; R. R. Murdock, vice-president; I. F. Dains, secretary; H. B. Smith, treasurer.

The Gardner Automobile Club is the name of a new club organized at Gardner, Mass., with the following officers: Theodore L. Harlow, president; L. H. Greenwood, vice-president; Fred H. Follett, secretary; George T. Greenwood, treasurer.

With E. H. Croninger as president, the Kenton County Automobile Club just has been organized at Cincinnati, Ohio. The other officers elected are as follows: William A. Kaiper, vice-president; Dr. W. Wyman, secretary; B. Adams, treasurer.

Under the style the Georgetown Good Roads & Drainage League, a large number of automobile owners and farmers of Georgetown, S. C., have organized a club and elected the following officers: J. B. Johnson, president; M. S. Bellune, vice-president; H. L. Oliver, secretary and treasurer.

Nearly fifty automobile owners of Norwalk, Ohio, "got together" and organized the Huron County Automobile Club, with the following officers: Dr. S. E. Simmons, president; J. R. Wetmore, vice-president; F. W. Watson, secretary; I. W. Goodell, treasurer. Dr. Simmons, F. W. Watson and F. Burk form the executive committee.

**EVERITT LINE IS ENLARGED**

**Hereafter Will Consist of Six Models, Including Closed Fronts, of Course—Mechanical Features Unaltered.**

By the addition of two new body styles to its list the Metzger Motor Car Co., Detroit, Mich., has increased the range of its product to six different models, all of which are founded on the same chassis. The chassis is similar to that produced hardly a year ago, when the Everitt "30" first was introduced to the public. The bodies, of course, are strictly up-to-date, particularly the two innovations, which are of the closed front pattern.

The entire line as now constituted includes the standard touring car, small tonneau, five passenger closed front touring car, four passenger closed front touring

style. In both these vehicles, all levers are placed inside the body, due care being taken to ensure ample room for the fingers so that there shall be no danger of jamming them when operating the levers. The control devices are placed within easy reach of the driver and are of the standard arrangement.

By all odds the most interesting portion of the machine is the motor, which is a peculiarly clever adaptation of the block principle. The four cylinders, with their water jackets, valve pockets, the upper half of the crank case, the inner half of the two-to-one gear housing and the supporting arms, as well as the cam shaft housing, all are included in a single unit casting, most wonderfully cored and machined. This arrangement has been so contrived that the lower part of the case, which comprises the usual oil pan, may be dropped and the crank shaft, or even the pistons and connecting rods removed, without disturbing the motor in the chassis. As the

pension is semi-elliptical in front and of the full elliptical-scroll end pattern in the rear. The wheel base is 110 inches, and the wheels are 34 inches in diameter, shod with  $3\frac{1}{2}$  inch tires.

**Uneven Running Due to Valve Tappets.**

It is a melancholy fact that certain engines, of the sort such as frequently are installed in automobiles of the cheaper grade, frequently evince a tendency to uneven running after they have been in service for some little time. On careful inspection it may be found that this results from an obscure ailment of the valve mechanism. The use of too soft metal in the valve tappets may result in the "upsetting" of the working surfaces of one or more parts, thus increasing the clearance under the valve stems and so delaying the opening of the valves. A difficulty less easily discovered arises from the presence of a "soft spot" in one of the cam surfaces. This will cause the cam to wear unevenly

EVERITT "30" FIVE PASSENGER TOURING CAR

FOUR PASSENGER CLOSE COUPLED TOURING CAR

car, inside driven coupe and light delivery wagon. The standard touring model is distinguished for its great breadth of rear seat, this portion of the body being no less than 48 inches wide at the cushion and 52 inches across the shoulders. The small tonneau car is arranged with lower seats than the touring car, and with a steering column having a more acute angle than that of the touring car. The tonneau is detachable and may be removed by releasing only two bolts.

For neat condensation of style and comfort, however, attention must be directed to the new closed front models. The accompanying illustrations show how the draughtsman has worked out the straight line effect, very much after the torpedo fashion, without rendering the vehicle trappy in appearance and without sticking too close to the conventional. Both doors are of the same height, but the top moulding does not come above the line of the hood. The fenders in front are curved on the inner side, and in the rear follow the wheel line to the back of the body. The five passenger form is the largest body built on the Everitt "30" chassis.

The closed front close coupled pattern is a reduced form of the car just described, built to accommodate four passengers only, but otherwise much the same in general

water pump and magneto supporting brackets are carried on the upper part of the case, this process is rendered extremely simple. The cylinder dimensions are 4 by  $4\frac{1}{4}$  inches, bore and stroke.

The valves are mounted in pockets on the left side and operated from a single cam shaft mounted on two bearings. Because of the nature of its mounting the shaft is of very rigid construction and of  $1\frac{1}{4}$ -inch diameter, the cams being forged integral.

As has been the case in models produced up to this time, engine lubrication is accomplished by a modified splash system, provision being made for the replenishment of the case by automatic means, somewhat on the order of the system used for supplying drinking fountains from large bottles.

The master clutch is of the leather-faced cone type with relieving springs underneath the leather. The change gear set is embodied in the rear axle construction and is of the selective pattern, affording three forward speeds. The axle bridge is made up of a malleable center casting and steel tubular end sections, forced into place and pinned. It is trussed and very rigid. Double brakes are employed on the wheels, the linkage being laid out for straight line pulls on all the members. The spring sus-

and besides reducing the lift of the valve will upset the timing and cause the explosions to be less powerful than in the other cylinders.

**To Secure Mats to Floor Boards.**

Shellac, dissolved in the form of a thick syrup, is all that is needed to secure rubber or oil-cloth mats to the floor boards of the car in a satisfactory and permanent manner. Two or three coats should be applied to the floor and allowed to become "tacky" before the covering is put in place. After being pressed down firmly at all points, the rubber or fabric should be weighted and permitted to remain undisturbed for five or six hours—longer if possible.

**To Assist Starting of Cold Engine.**

To avoid delay and possible difficulty in starting a cold engine, it is well to open the throttle wide and swing the crank a few times with the spark cut off. The effect of this will be to fill the cylinders and inlet manifold with gas without any loss due to light explosions of insufficient power to start the engine. After the preliminary cranking the throttle may be brought back to the normal starting position and the engine started either on the spark or by a quarter-turn of the crank.

**REVISED REO HAS NEW BODIES**

Otherwise Its Principal Features are Retained and Improved—One and Two Cylinder Models are Unchanged.

There are three different chassis that make up the Reo line as now produced by the Reo Motor Car Co., Lansing, Mich.; and they are much the same as those produced during the past year. The two smaller models, indeed, namely, the single cylinder 10 horsepower runabout and the two cylinder opposed 20 horsepower touring car, are replicas of previous models. The four cylinder 30 horsepower car, however, which is the leader of the line, has undergone some alteration. This is the same car that recently was driven across the continent by L. L. Whitman and his

torsion tube and rear axle groups and the front axle, and given the same treatment.

The alteration in the lubricating system has been designed to render it possible to feed a greater amount of oil at low speeds than formerly, while at the same time preventing the water from flooding at high speeds. The new arrangement also permits the use of a heavier grade of oil. Also in connection with the engine, it may be mentioned that the carburetter now is provided with a hot air intake, which fortifies the operator against carburetter troubles in cold weather and also makes it possible to get along comfortably with low grade fuel, if necessary.

With the clutch construction as now employed, it is possible to remove that important organ without in any way disturbing either the motor or the gearset. But it is even more important to note that the number of discs in the clutch has been increased, so that more pliable springs may

from the end bearings, even when the casing is filled with lubricant.

The front axle spindles have been increased in size, and consequently rendered more reliable. They are mounted with Timken bearings which are provided with a secure locking device to prevent them from loosening accidentally. With the exceptions noted, the construction of this model remains as heretofore.

The accompanying illustrations indicate the neatness and clean-cut appearance of the new bodies. The new model "S" roadster has the same body as the corresponding model of the previous series, while it is mounted on the same chassis as the model "R." The five passenger body is extremely roomy considering the external dimensions, and at the same time so worked out as not to be unduly "chunky" in appearance. The four passenger model gives the effect of the compact close-coupled type of body so much affected by the builders of larger cars,

FOUR CYLINDER REO TOURING CAR MODEL "R"

FOUR PASSENGER ROADSTER MODEL "S"

companions in a little over twelve and a half days, breaking all transcontinental records.

In addition to the distinction of being one of the few light touring cars now produced that are equipped with left hand control mechanism, the Reo four possesses a number of other points of favorable distinction. Its motor is of the type that has the inlet valves of very large diameter and mounted in the cylinder heads, while the exhausts are offset at one side. Its cylinder dimensions are 4 by 4½ inches. It has dual ignition, with low tension magneto, coil and batteries; automatic force feed lubrication, with return overflow; and in general accessibility and mounting is well up in its class. The master clutch is of the multiple disc type; the selective sliding gearset is mounted in the frame just back of the clutch; and the drive to the semi-floating rear axle is through a single-jointed propeller shaft housed in a combined torsion tube and radius member.

In working over the design of this model after a full year's service on the road a number of desirable improvements have been introduced. These affect mainly the oiling system, the clutch, propeller shaft,

be used in separating the discs, while the tendency to slippage caused by the accumulation of oil on the plates is provided against. A minor change in its way is the strengthening of the gear-shifting arm which actuates the gearset in effecting the speed changes. Also in the nature of a small but useful change is the adoption of six spring locks to hold the sod pan in position, the result of the innovation being that the housing can be dropped in a couple of minutes without the necessity of getting under the car.

The rear axle bearing equipment is of the Timken roller variety, saving only the two outer bearings, which are of the plain ball type running on hardened steel sleeves and in hardened steel cages. The propeller shaft, which has been materially increased in diameter, also is mounted on Timken bearings. The torsion tube and bevel gear housing likewise have been increased in strength. Another improvement in the construction of the rear axle is the adoption of an oil-retaining device at the extremities of the housing, which make it possible to employ light oil in the gear casing, ensuring thorough lubrication at all times and also preventing any overflow

and possesses the same advantage of having its rear seat placed over the axle in such a way as to secure immunity from unpleasant rebound in covering rough roads.

**Requirements of the Radiator Fan.**

Radiator fans fulfil an important and at the same time trying function, since by reason of their high speed they are subjected to stresses that are far more severe than would be supposed when the light weight and simplicity of their construction is considered. On this account it is important to see that both the fan and its driving mechanism are kept in good order at all times. The bracket which holds the fan spindle to the forward cylinder must be of ample strength and securely adjusted, the bearing itself must be adjusted in such a way as to prevent undue lost motion, and, above all, the fan blades must be kept in line and, if of the attached variety, firmly secured to the central spider. The penalty of neglecting to keep the fan in condition is almost certain to be a damaged radiator and the amount of injury that can be done when the fan is allowed to get out of condition is out of all proportion to the extent of the fundamental difficulty.

**OWEN'S NEWEST OFFERINGS**

**Sumptuous Six-Passenger Berlin is One of Them—Rumble Roadster with Closed Front is Another.**

After originating what is in many respects a most striking form of automobile it is natural that the Owen Motor Car Co., of Detroit, Mich., should proceed with the construction of other types that are both unusual and progressive. The characterization applies particularly to the new Berlin, which takes the place of the ordinary limousine in the Owen line. If it were not a much older pattern the Berlin well might be termed an outgrowth of the closed front touring car of present popularity. As it is it classes with that form of body

and corner lights, bouquet holder, toilet and card cases and mirror. Drain strips over the doors protect the entrances from dripping water in wet weather, while antirattling devices prevent the vibration of the window sashes, whether open or closed. In respect to left hand driver's position, central arrangement of the gear shifting lever, long-stroke motor, and details of equipment, the specifications are the same as those for the standard touring car.

In addition to the Berlin body, not a little distinction is added to the Owen line by the adoption of the roadster style, a form of body that may be had with either single or double rumble equipment for the rear, flat back, or with just a hamper in addition to the gasoline tank and spare tire carrier. In this machine, the same general form for the front seat is employed as is used with the touring car, even to the

**URUGUAY A GROWING MARKET**

**American Consul Outlines the Types of Car that Are Wanted—Methods that Will Assist Their Sale.**

The steady increase in the number of importations shows that this is becoming a good market for the sale of automobiles, says Consul Frederic W. Goding, of Montevideo, Uruguay. Although the machines usually purchased have been high priced here, there is a growing demand for cheaper grades of strong and simple construction. American manufacturers who desire to enter this market should build their machines along the following lines:

Voiturette for two persons, arranged with two movable seats behind, two cylinders,

NEW OWEN BERLIN SEATING SIX PASSENGERS

NEW ROADSTER MODEL WITH CLOSED FRONT

very nicely, since it fulfils several of the very purposes for which the closed front has been developed.

The new Berlin is more than merely a closed front limousine, just as the true flush sided touring body is more than an ordinary touring body with front door equipment. It is designed as a complete car body from end to end, and it thus marks a diversion from the rigid precedents of the carriage makers more or less in the direction of the Pullman type of railway coach. As the accompanying illustration shows, the great length of body enclosure, the flat roof, the three rectangular windows and the absence of prominent mouldings render the appearance of the vehicle decidedly novel.

In appointment the vehicle is quite as striking as in general appearance. The side windows all are arranged to drop into wall pockets, thus rendering the car practically an open one upon occasion. The wind shield is of the vizor type, its upper section opening outward at an angle, while the entire body can be thrown into a single compartment by lowering the glass partition that separates the front and back sections. The equipment is complete in every respect and includes electric dome

use of side doors. This feature gives the machine a most unusual appearance, and is warranted by the same arguments that led up to the adoption of the closed front touring style. With the double rear rumble, and full equipment, including top and wind shield, the roadster is one of the most radical in appearance yet produced, without at the same time being in the least freakish or extravagant.

**Lost Motion in Flexible Couplings.**

To obviate difficulties arising from lost motion in the flexible couplings which commonly are introduced into the driving gear of magnetos and water pumps on well made cars, it is possible to introduce a simple form of spring drive at slight expense. In some instances, the spring itself may be made to serve the purpose of the flexible connection, but where an Oldham coupling or universal joint is employed, a light spring may be added outside the coupling in such a way that it will take up all slack and prevent the connecting parts from clattering. Besides eliminating a source of noise, this arrangement will do away with certain minute, though occasionally troublesome, uncertainties in the timing when applied to the magneto drive.

12 horsepower, double ignition of any standard system, two or three speeds, two brakes, water cooled, two kerosene and two acetylene lights; height from the ground to the motor protection box about 14 inches, with a forward projecting top. Price f. o. b. New York, \$500 to \$800. Tonneau of 25 horsepower, four cylinders, four seats, double ignition of any standard system, three speeds, two brakes, water cooled, light and top over four seats, glass shield in front, normal height, gage of wheels 1.4 meters (55.1 inches). Price f. o. b. New York, \$800 to \$1,100. Double phaeton (touring car), 25 horsepower, otherwise same as above. Price, \$1,000 to \$1,400. Coupe for two persons with direction within, special type for physicians, 18 to 25 horsepower. Price reasonable.

The principal requirements are strong construction of all parts, especially the springs and axles; interchangeable pieces in double pairs; simple construction; easy access to all parts of the machine so as to dispense with the services of a chauffeur; certain concessions with liberal terms to agents.

Strong construction is demanded, owing to the rough granite block pavements and 15 per cent. grades. For the voiturette a

minimum height of 35 centimeters (13.78 inches) is imperative because the country roads are rough, with conditions which debar a low machine. An apron should protect the parts below from water and mud. Complaint has been made as to the quality of the axles and springs in the few

would be prompted to decide on buying from such a deposit.

The American machines would have the competition of those made in France, Germany, Italy and Great Britain, which are now well established, and as the experiment of introducing a new make is both

of securing a fair percentage of sales for American automobiles in this country in the course of time.

#### To Keep Dust Out of Bearings.

Spring oil cups, of the sort such as frequently are employed on the shackles of

### HENRY FORD AND HIS SALES STAFF GATHERED AT DETROIT

Twenty-four of the branch managers of the Ford Motor Co. were gratified to learn last week, during their annual three days' convention in Detroit, that their business for the last year had reached \$14,000,000, which amount is exclusive of the transac-

tions of direct dealers. Despite the large total, they guaranteed to exceed that amount the coming year. The morning meetings of the convention were devoted to business, leaving plenty of time for pleasure, of which there was no lack. Luncheon

was served the first day at the Hotel Pontchartrain, the second day at the Penobscot Inn, and the third day at the Lone Cabin Inn. Afternoons and evenings were given to an inspection of the new Ford factory, yachting and theatre party and dinners.

American machines that at present are found in use.

A strong inducement for the people here to use American automobiles would be the arrangement to have a full assortment of such parts as are most liable to wear out or break, and to have such parts interchangeable. Should intending purchasers know that their machines would be repaired and broken parts replaced without the necessity of ordering from abroad they

tedious and expensive, the risk of such a move should be borne equally by manufacturer and agent. The best plan to pursue to win trade is to perfect satisfactory business arrangements with a reliable firm here and send the first automobile on consignment to be paid for when sold (within a reasonable time), as has been done in a number of instances with success. Should such a plan be followed the agent would push the business, with good chances of

suspensions and occasionally on the steering linkage of light cars, require to be wiped free of dust before being filled. Otherwise it is practically certain that the lubricant will wash into the bearing a certain amount of grit. It also is important to see that the caps or spring-controlled valves that close the opening under ordinary conditions are in working order, so that they will fulfil their proper function in protecting the bearing surfaces.

## NEW YORK HAS BUT 56,000 CARS

Count Made Possible by New Law Proves Disappointing—Number of Chauffeurs, too, Falls Short of Many Estimates.

According to the returns of the new Calan law, there are 56,000 motor cars in New York state and about 20,000 chauffeurs, these totals being made public by Secretary of State Koenig on Tuesday last, the law now being in full effect.

The number of cars which are thus disclosed to be in use is considerably less than even the conservative estimates. Under the old law, which had been in effect some 10 years, there were 109,000 registrations, and though many of these represented cars that long since were consigned to the scrap heap and many more represented cars which had changed hands, one or more times, it was not anticipated that they accounted for practically 50 per cent. of the total. The number of chauffeurs employed in New York always was grossly exaggerated, and the 20,000 now carried on the state's book will serve to revise many estimates, some of which placed the number as high as 50,000.

The receipts from all sources under the new law have been \$325,000, which sum is very disappointing to Secretary Koenig, who reckons that the full year of 1907 will bring in only about \$750,000, or about half the annual revenue which he expected would accrue. It also naively is remarked that "the cost of administering the new law is much heavier than was anticipated," which means that after paying the political appointees there will not be much left for road improvement, to which the law requires that the revenue, after paying expenses, be applied.

### Roadside Remedy for Slipping Clutch.

As a temporary, though drastic, remedy for a slipping clutch the leather may be raised off the surface of the metal cone at points between the rivets by inserting match ends or wooden toothpicks beneath it. The hint is applicable in general only where the leather is so worn that thorough cleansing of oil and grease, and even the application of rosin will not cause it to engage properly. It possesses the advantage that it can be applied at the roadside without any further delay than that necessary to lift the floor boards and depress the clutch pedal.

### Freakish Effects of an Accident.

One of the most peculiar accidents to motorists that have happened in some time occurred last week at Richmond, Ind., when Oliver H. Hampton, of Fountain City, was trying to cross the tracks of the Pennsyl-

vania railroad as the "flyer" came through. The automobile which Hampton drove had reached the first rail when the express struck it. The front wheels, engine and hood were ripped off cleanly, and although the car tilted forward Hampton retained his seat while the train whizzed by, a few inches from his face. He was too paralyzed to move, except to grip tightly the sides of the seat, and it probably was that what saved his life.

### Truck that Attacked a Navy Yard.

What damage a five-ton truck can do when it runs wild was demonstrated last Thursday in Brooklyn, N. Y. One of the heavy trucks used by Austin, Nichols & Co., wholesale grocers, and loaded with something like three tons of evaporated apples, was coasting down the long incline on High Street. Suddenly the connection between brake and brake pedal broke and the truck gathered speed. Finding it impossible to stop the heavy machine and seeing it headed straight for the brick wall of the United States Navy Yard, the chauffeur jumped in time to get away from the crash which happened an instant later. The truck went along clear through the three-foot wall, tearing a ragged hole 20 feet wide and brought up against one of the inner buildings of the Navy Yard. The hood of the truck was smashed, but the main body of it and its cargo were unharmed.

### Why Smolowitz Can't Change Name.

Mathias Smolowitz, a Roumanian automobile dealer of 3850 Park avenue, New York City, is having trouble with his name, which he wishes to change to Seeman. Justice Finelite, of the city court, who has a name of his own, denied the application and says Smolowitz must keep his old label, for it is honorable, readily pronounced and easy to spell. Besides Smolowitz is married and has a number of little Smolowitzes.

### White Plains Mixes Cars and Horses.

Spencer Wishart, of New York, again bobbed up conspicuously as an amateur racing man last Saturday, at the wind-up of the annual Westchester County Fair at White Plains, N. Y. He won the 20 miles free-for-all, driving an S. P. O. Thomas Maxwell in a Maxwell captured the 20 miles event, and A. J. Crawford in a Hudson the 10 miles contest. The motor races were so subordinated to the horse trotting that they were almost lost in the shuffle.

### Regal Plugger Begins Long Journey.

In its guise as a "good roads apostle," the Regal "Plugger," with Leo Sherard at the wheel, began its 10,000 miles "All Southern Tour" on Thursday last, 15th inst. It left Norfolk, Va., in a pouring rain but with a large escort.

## HOW PRICES WENT UP AND DOWN

Statistics Showing that Average Price of Cars Was Highest in 1907—Cause that Contributed to Reduction.

Based on the records of the sales of gasoline cars manufactured under the Selden patent, the statisticians of the Association of Licensed Automobile Manufacturers have evolved a chart showing the average price of American cars during the past eight years and indicating that from \$1,133.37, the average in 1903, the price went up by progressive steps until it reached the top notch, \$2,137.56 in 1907. Since that time it has decreased until the first six months of 1910 shows \$1,545.93 as the average retail list price of cars, the rise and fall being made apparent by the following tabulation:

1903 average price	\$1,133.37
1904 " "	1,351.45
1905 " "	1,609.79
1906 " "	1,853.93
1907 " "	2,137.56
1908 " "	1,926.94
1909 " "	1,719.93
1910 (to July 1st)	1,545.93

The gradual reduction since 1907—the so-called "panic year"—is not the result of any radical reduction in the price, but was brought about by the great increase in the manufacture and sale of machines selling at \$1,500 or less. In the early days the production was limited and in 1905, when the industry really began to expand, a car at less than \$2,000 was rare, while now the greatest volume of business and the greatest number of machines are sold at less than that figure. There of course has been a tremendous increase in the making of what are termed the moderate priced cars, and a normal and healthy increase in the number of the higher priced machines produced.

The figures, the A. L. A. M. statisticians point out, indicate that the trend in manufacturing has been each year to give more for the same list price, than to make any great cut in the selling figure.

### Book that Deals With Electrics.

There is something essentially domestic about the electric passenger car; it seems to belong in the same general class with a well-made and useful piece of furniture in points of utility, attractiveness and comfort. The idea is emphasized in the new electric vehicle catalog just issued by the Studebaker Automobile Co., South Bend, Ind. The booklet, which is beautifully printed and illustrated, enlarges upon the broad usefulness of the electric besides adding a word as to the skill and experience of the Studebaker designers in producing suitable types. Model "17," the

leader of the line, it is explained, is built with independent chassis so that it is adaptable to a variety of bodies, all of which are constructed on the interchangeable plan. A chapter also is devoted to the

and in the utility type of motor vehicle, whatever its specific application, the Knox Automobile Co., Springfield, Mass., has printed a 40-page commercial vehicle catalog that contains a large amount of use-

trucks is explained and illustrated as are the specifications and applications of a surprisingly large number of types suitable for municipal uses in fire, police and hospital service, trucking in all its forms and

### THE MEN WHO MAKE THE MARKET FOR HARTFORD TIRES

Hulings; 43, Chase Langmaid, Manager, Boston Branch; 44, G. H. Wright, Chicago Branch; 45, James Morgan, Connecticut; 46, H. F. Snyder, New York Branch; 47, W. H. Reed, Solid Motor Tire Department.

Business and pleasure were agreeably combined last week when the branch managers and salesmen of the Hartford Rubber Works Co. held their annual conference at the factory in that city. It occupied three days and opened with an address by J. D. Anderson, the president, after which two sections were formed for ses-

sions, the branch managers meeting with the executive officers, while the salesmen used the factory dining room for a convention hall, along with the heads of departments. The manufacturing processes were shown to the visitors, who had their first opportunity to see aeroplane tires in the making, as well as those for automo-

biles and bicycles. A dinner for the party was given the first evening at one of the local hotels. Business sessions also occupied the second day, while the third was devoted to an outing and dinner at Morris Cove. The trip was made by automobiles, which were equipped, of course, with Hartford tires.

subject of home charging with the aid of the alternating current rectifier.

#### Concerning the Knox Commercials.

For the benefit of those who are interested in the problem of motor truckage

ful information condensed within a relatively small amount of space. Besides enunciating briefly and forcefully the principles that are recognized as governing the commercial vehicle problem, the substantial mechanical construction of the Knox

also for the purposes of omnibuses and sightseeing wagons.

"The A B C of Electricity." Price, 50c. The Motor World Publishing Co., 154 Nassau street, New York City.

## MOTOR WAGONS FOR NEWSPAPERS

**Typical Service Rendered by One of Them in Baltimore—Long Hours and High Speeds Necessary.**

What service a motor wagon can render to a newspaper is well illustrated by the case of the Baltimore Sun, which since June 1st has used a White, 1500 pound delivery wagon for the delivery of papers to the sub-stations in the suburbs of that Maryland city.

In handling the early edition of the paper, the White truck is in service from

that there are few cities in the country with streets so hilly and so hard on tires as those in the city of Baltimore. The truck has averaged 12 miles to the gallon of gasoline. There have been no repairs necessary during the first two and one-half months of service.

### Hearst Promoting Chain of "Truck Tests."

Following the example of the Philadelphia North American in arranging a commercial vehicle test from the Quaker City to Atlantic City and return, William Randolph Hearst has determined to take enough respite from politics to conduct a series of similar affairs in the several cities where his newspapers are more or less assisting in

## TOURING TEST FOR ELECTRICS

**Two of Them Being Piloted Over 1,000 Miles of Much Mixed Going—Edison Battery Involved.**

While the electric vehicle ordinarily is not accepted as suitable for touring purposes, two machines of this class at present are being put through an extensive test that constitutes the most ambitious so far undertaken in the long series connected with the exploitation of the new Edison battery. The two machines, one a Bailey and the other a Detroit, each of which is equipped with a 40-cell nickel-iron battery, are covering the route of the so-called Ideal tour through the New England states. Twelve days have been allowed to complete the test, and to equalize the effect of the grades, the two machines are being sent over the 1,000 miles course in opposite directions.

The Bailey, driven by G. W. Langdon, F. V. McGuinness acting as observer, left New York last Saturday morning, 18th going by way of Waterbury, Lenox, Manchester and Bretton Woods to the Maine coast, and thence back to New York. The Detroit, which is being driven by R. E. Darling, with E. R. Alexander as observer, is running by way of Briarcliff, Hartford, Springfield, Worcester and Boston. The schedule laid down calls for at least 100 miles a day over the medium dirt roads, of which there are many miles outside the state and city boulevard stretches, while, to make up for delays in climbing the Franconia Notch, in the White Mountains, and the difficult Peru mountain in the Green Mountain range of Vermont, the better roads must be taken at the rate of 150 miles a day.

One of the most notable in the series of Edison tests was a run of 201.6 miles on a single charge, which was made in the vicinity of Cleveland, Ohio, on August 30th. In making this long-distance run, which is called a record for a single charge, an average speed of 12¾ miles an hour was maintained.

### Safety Loops for Shaft Driven Cars.

All shaft driven cars should be provided with safety loops to prevent the torsion rod, or tube and the driving shaft from dropping to the ground in the event of a broken connection or a disconnected coupling. The device is one that is simply and cheaply applied and that may save the overturning of the car in the event of an otherwise minor and improbable mishap. Owners of such cars as are not already equipped in this way by a thoughtful manufacturer may install the arrangement without difficulty. It constitutes an efficient accident insurance in itself.

WHITE DELIVERY WAGON IN THE SERVICE OF A BALTIMORE NEWSPAPER

1:00 to 8:00 o'clock in the morning during the seven days of the week, while in conveying the afternoon papers to their various destinations the truck works from 2:00 o'clock in the afternoon until 8:00 or 10:00 o'clock at night, with the exception of Sunday only.

In this car, deliveries are made to sub-stations and carriers in the city and suburbs, and the mail is delivered to and from the postoffice. The machine is in daily service from 14 to 16 hours.

"Conservatively speaking," says J. W. Magers, circulation manager of the Sun, "the car does the work of two teams on short hauls and would displace three teams on long hauls—by long hauls we mean those that would exceed eight city blocks. The service this car has given has been a pleasant surprise to us and the more so that we haven't had any trouble at all as yet, and we have been giving it considerably harder service than we had anticipated. Even the editorial department has found it of service on a couple of occasions in making rush runs to fires at night."

During the eight morning trips the truck has run as high as 40 miles an hour, while it generally makes the excellent average of 25 miles an hour during the day. This mileage is exceedingly good considering

the moral uplift of the masses. The first affair of the sort, which was announced several weeks since, and which will be given under the auspices of the Boston American, October 14-15, from the Hub to Newburyport and return, 65 miles, will be followed by a similar stunt in New York. The New York American will stand sponsor. As Hearst's papers in Chicago and Los Angeles have discovered that there is a "yearning" or "demand" on the part of the business men of those cities, it is evident that "truck tests" shortly will be announced in those localities.

### Carrying Oil Cans Under the Hood.

It is a simple and wise plan to install a little tray adapted to receive and retain two or three oil cans in an out-of-the-way corner underneath the hood. Some manufacturers take pains to see that their cars are so provided in the beginning, but in cases where the point has been overlooked by the builder it is possible to fit up a suitable tray at small cost. The particular advantages are that the oilers always are close at hand when needed, that the oils are kept warm in winter, that the cans are protected from injury and that there is no risk of their spilling the lubricant over tools and equipment in the kit.

### Hudson Owners Get Cash Prizes.

In competition with 485 other Hudson owners, A. P. Pearson, Dorchester, Mass., has been awarded first prize, \$150, by the Hudson Motor Car Co., Detroit, Mich., for the best story and photographs in the Hudson "experience run," held July 15-16. The contest was open to Hudson owners throughout the country, and prizes of a total value of \$950 were offered for the most unique photographs and stories of runs sent in. Four hundred and eighty-six cars, 18 of them driven by women, took part in the contest, and covered on an average 150 miles each. One of the conditions of the contest was that no tools be carried. None of the 18 women contestants won prizes, but as balm for their disappointment each received a cash bonus of \$25.

HOW AN AUTOMOBILE ENGINE WAS USED FOR DRILLING AN OIL WELL IN UTAH

Next to Pearson, the five highest prize winners were the following: Second, \$100, R. W. Hyde, Duluth, Minn.; third, \$50, J. M. Heffner, Mason City, Ia.; fourth, \$25, William Kemble, Kingston, N. Y.; fifth, \$20, A. P. Perry, McIntosh, Wash.; sixth, \$15, E. L. Jelks, Quitman, Ga.

Fourteen prizes of \$10 each were distributed among the following: H. Brewster Willis, New Brunswick, N. J.; W. B. Dobson, Alpena, Mich.; A. F. Boylan, Dennison, Ia.; G. W. Schwarzwald, Chichester, N. Y.; John Johnson, Chappell, Neb.; P. H. Combes, 3685 Olive street, St. Louis, Mo.; T. W. Brotherton, Jr., 4501 Finley avenue, Los Angeles, Cal.; E. Hoen, Fresno, Cal.; R. W. Peterson, 431 College avenue, Santa Rosa, Cal.; A. W. Wall, Walpole, Mass.; Donald McFadon, 511 Savage Schofield building, Tacoma, Wash.; Dr. F. J. Harter, Herkimer, N. Y.; Thomas M. Purves, Anthon, Ia.; G. M. Jones, 428 Washington street, Atlanta, Ga.

### Predicts Abandonment of Oiled Roads.

Spencer Miller gave a talk last week before the New England Society of Orange, N. J., during which he declared that it will not be long before the towns and cities of the United States which have been using oil to lay the dust on rural highways will wish they had never done it. He said

the oil kills the lawns and foliage along the sides of the highways where it has been used. "In Europe," he added, "the evil effects of using the oil are already sadly apparent. The oil-laden dust is picked up by the automobiles and scattered to the foliage and lawns, which it will kill."

### Uses Automobile Motor to Drill Well.

That a continuous circulating air current is not absolutely necessary to make a Franklin air-cooled motor perform its work satisfactorily, even in a temperature which occasionally reaches 135 degrees Fahrenheit, has been discovered by John R. Steele, at New House, Utah. The latter, who is an engineer in charge of oil-drilling operations at New House, was in a quandary as to what machinery to use for the drilling.

Light weight was imperative on the high mountains, and, as can be seen in the accompanying illustration, a six cylinder model 1907 automobile motor was chosen for the work. With the engine the transmission is used because of the difference in the speed and power required. The capacity of the drill, using core tools, is 800 feet with a six-inch core, and with churn tools a 12-inch hole may be driven to a depth of 400 feet. The ignition is by magneto, and the necessary flexibility of the engine is obtained by means of the change gear.

### Horsemen, as Usual, Object to Lamps.

Wholesale protests are being made by team owners and drivers to the commissioners of the District of Columbia, who have determined that lights must be carried on all vehicles. The principal objections seem to be over the expense of the lamps and oil. The horse interests, however, used a good deal of ingenuity in bringing up odd possibilities. Among other things they asked how they could hang a lamp on a load of hay, or at the rear of a dump cart. Nor was the danger of a lamp on a load of theatrical scenery forgotten. Figures presented showed, however, that twice as many accidents from collision fell on the horse-drawn vehicles as upon automobiles.

### Use Guns to Check Highway Improvement.

Road building operations on the Hudson road, under the direction of the Automobile Club of St. Paul, received a severe jolt a few days ago, when a score of residents of the village of Oakdale, Washington county, Minnesota, took exception to the way the work was being done and resorted to shotguns to stop it. The club is now threatened with a civil suit for \$200 damages. That is the amount which the citizens declare will be necessary to expend in order to put the highway into the condition it was before the club began work.

The Hudson road is the most direct route to the Anchorage, the country home of the automobile club, located on Lake St. Croix. Early this season club officials hinted to Washington county officials that

unless the road to club house was improved the club would be forced to seek another location, owing to the fact that the bad roads were keeping members away from the resort. The officials took the tip and at once ordered farmers along the highway to work out their road taxes. To help the movement the commissioners put a grader on the road, which proceeded to scrape the sod off the sides and put it in the middle of the thoroughfare. In due time the weeds began to grow in the middle of the road. They thrived on the turf which had been placed there by the grader. The automobiles had to take the sides of the road, and owing to the grade made for drainage the machines often traveled at perilous angles. Accordingly the club took a hand at making improvements on its own account, under the recommendation of the state highway commissioner, who was pleased with the progress made, if his constituents were not.

### Michigan Motorists Form a Club.

Thirty-five motorists of Ludington, Mich., have formed the Mason County Automobile Association and elected A. A. Keiser president. The other officers are: W. L. Hammond, secretary, and J. D. Hogstraet and J. F. Rohra, members of the executive committee.

# Rambler

## RECENT PATENTS.

966,510. Brace for Auxiliary Vehicle Springs. William Young, St. Louis, Mo., assignor to Supplementary Spiral Spring Company, St. Louis, Mo., a Corporation of Missouri. Filed March 1, 1909. Serial No. 480,619.

1. In a device of the character described, the combination of a vehicle body, a main spring of the leaf variety, an auxiliary spring of the helical type, a brace attached to a brace point, and means for attaching said brace to said helical spring consisting in a forked end for said brace and a bolt passing through eyes in said fork and said helical spring, one prong of said fork lying adjacent to one side of said helical spring and the other prong thereof lying adjacent the other side of said helical spring.

966,519. Motor Vehicle. Alanson P. Brush, Detroit, Mich. Filed Nov. 18, 1908. Serial No. 463,149.

In an automobile, the combination of a frame, a motor fixed to the front end thereof, a longitudinally extended main shaft driven by said motor, a rear axle structure which includes a casing having a forwardly extended tubular torque member which is removably connected with the differential gear casing of the rear axle structure and is enlarged near its front end, transmission controlling mechanism mounted in said enlargement, and two transmission shafts mounted in said torque member and adapted to be variously connected by said controlling mechanism, one of said shafts being operatively connected with the rotating mechanism of the rear axle structure and the other of said shafts having a telescoping universal joint connection with the main shaft.

966,586. Automobile Front Axle with Drive. Andrew O. Nordquist, Axel R. Nordquist, and Carl W. Nordquist, Minneapolis, Minn. Filed June 2, 1909. Serial No. 499,656.

1. The combination with an axle and a sprocket wheel loosely mounted thereon, of a clutch slidably mounted on the axle, a steering knuckle, a shifting collar for said clutch, means connecting the collar and the knuckle, and means for shifting the support of the collar, as and for the purpose set forth.

966,674. Elastic Vehicle Tire. William H. Eynon, Cleveland, Ohio. Filed Aug. 14, 1909. Serial No. 512,826.

1. An electric vehicle tire, comprising a tire body terminating in laterally extending tapered tread portions terminating in relatively thin tread wings projecting beyond the sides of said tire body.

966,722. Brake for Road Vehicles. William Herbert Weight, Bishopton, Bristol, England. Filed Dec. 15, 1909. Serial No. 533,182.

1. In a hydraulic brake system for road vehicles the combination with a brake ram cylinder carried by steering wheel of a vehicle, and a main pressure device, of a resilient tube connected at opposite ends to said cylinder and pressure device and a swivel joint interposed in the length of said tubing and aligned with the pivotal axis of the steering wheel.

966,785. Automobile Wind Shield. Frank W. Aurig, Philadelphia, Pa., assignor to Thomas S. Shibe, Philadelphia, Pa. Filed Feb. 19, 1910. Serial No. 544,743.

1. In a wind shield, a sash, a movable frame swinging thereabout, clamp members upon the sash and comprising concentric grooves and ribs and co-operating clamp members comprising concentric ribs and grooves interfitting with the members upon the sash and having the taper upon one side only.

966,864. Pneumatic Supporting Means. Gustaf von Schantz, New Britain, Conn. Filed Mar. 24, 1910. Serial No. 551,273.

1. An apparatus of the class described, comprising a pneumatic support having two relatively movable members, a low pressure tank in communication with said support, a check valve between said low pressure tank and support and closable toward said low pressure tank, a high pressure tank in communication with said support, and a check valve between said high pressure tank and support and closable away from said high pressure tank.

966,874. Charging Device for Pneumatic Tires. Fred O. Warrick, Nuremberg, Germany. Filed March 9, 1909. Serial No. 482,323.

A valve comprising a valve casing, a ball valve therein, an insertion piece in said casing extending from the bottom of the casing to a point adjacent the valve seat, said insertion piece dividing the bore of the valve into channels so that the air current passing through the valve is set in a whirling motion, said whirling motion turning the ball valve and cleaning the same from adhering dust particles.

966,972. Internal Combustion Engine. Sigurd Wiebe, New York, N. Y., assignor of one-half to John C. Quinn, Philadelphia, Pa. Filed Oct. 2, 1905. Serial No. 280,888.

1. In an internal combustion engine, the combination with a working cylinder provided with two annular chambers concentric therewith, and with separate inlets from said chambers to the interior of said cylinder, the one arranged above the other, of a piston in said cylinder, arranged in its stroke to uncover said inlets, one of said chambers communicating with the said cylinder at the rear of said piston, and having an air inlet, a charging cylinder and piston communicating with the other of said chambers, and a mechanically controlled exhaust for the working cylinder.

966,993. Detachable Wheel Rim. Thomas W. Broomell, York, Pa., assignor of one-third to George A. Lichtenberger and one-third to Charles H. Bear, York, Pa. Filed Nov. 28, 1908. Serial No. 464,952.

In a wheel, the combination of a felly having opposed square ends entirely sep-

So by Receivership Proceedings but  
Fails—Wanted 900 Per Cent.**

Despite the application of George De Fevre, a stockholder and former superintendent, there will be no receiver appointed for the A-Z Co., of New York, nor will the courts assist de Fevre in holding his job.

The A-Z Co. manufactures radiators and other automobile parts, and has proven such a profitable institution that De Fevre considered that he was entitled to a share of the earnings. His demand being refused, he applied for the appointment of a receiver as one way of obtaining what he sought, but on Monday last, 26th inst., Justice Bijur, of the New York Supreme Court, denied the application. De Fevre also sought the court's aid to prevent his displacement as superintendent of the company, but Judge Bijur likewise refused to issue the injunction for which De Fevre prayed and which would have served this purpose.

De Fevre holds 150 shares of A-Z stock, the remaining 350 being held by James E. Woodbridge, president of the company, and by his son, Robert, who is secretary. In his petition the plaintiff alleged that they made 300 per cent. profit during each of the past three years, and demanded that he be paid 900 per cent. on his holdings valued at \$1,500. The Woodbridges, he charged, had obtained large sums from the business, and are threatening to fix their salaries at \$10,000 each per year, while he had to worry along on a wage of but \$35 per week.

In their answer, the defendants said that De Fevre got all his stock free because of his knowledge of the business, and that he should consider himself fortunate to have secured ownership of fifteen-fortieths of the stock of a corporation which has assets

of \$60,000 and liabilities of less than \$5,000 without contributing a cent to the capital. They admitted that the corporation has made money but denied that the profits amounted to 900 per cent. in three years. They declared they offered De Fevre \$4,000 for stock having a par value of \$1,500, and that the litigation was inspired by the hope of compelling them to purchase his stock at an exorbitant price.

The court accordingly dismissed the proceedings.

### Eagle Takes Over Grossman Business.

On October 1st the Eagle Co., of Newark, N. J., will take over the wind shield and spark plug business of the Emil Grossman Co., of New York, and, in fact, will take over Grossman himself; he will become sales manager of the Eagle Co. and continue to direct the marketing of the wind shield and the "Red Head" spark plug, which he so quickly made a factor in the trade. The Emil Grossman Co. will go into liquidation and wind up its affairs. As the Eagle Co. manufactured the wind shields and plugs for Grossman, its acquirement of the selling end of the business is not such a radical step as may appear on the surface. The Eagle Co. is controlled by the Standard Co., of Torrington, Conn., a concern of great strength and resources. The connection is so close that henceforth B. S. Keefer, secretary of the Torrington establishment, will spend several days of each week in Newark assisting the development of the spark plug and wind shield business, which it is the intention to expand on a large scale.

### Larzelere Forms Company to Build "Six."

H. B. Larzelere, for five years sales manager of the Chadwick Engineering Co., Pottstown, Pa., has resigned that position and organized the Nance Motor Car Co. in Philadelphia, of which he will be president and general manager. N. A. Adams, who also was connected with the Chadwick company, will be the sales manager of the new concern, which purposes producing a popular priced six cylinder car.

### SUES OAKLAND FOR ITS \$85,000

**Pontiac Buggy Co. Wants Balance Due for  
Its Building—General Motors Involved  
as Oakland's Indorser.**

Because the Oakland Motor Car Co., of Pontiac, Mich., which is a part of the General Motors organization, has failed to pay the balance due of the agreed purchase price of a factory building which it bought from the Pontiac Buggy Co., the latter company has instituted suit in the Michigan courts for the amount unpaid, \$85,000. The Oakland concern gave its notes for the amount of the purchase price, and as the General Motors Co. indorsed these notes it is made a co-defendant in the action.

While it was known that the Oakland company had not been traveling on the sunny side of Easy street, the filing of the suit caused some surprise, as the matter was viewed more or less in the light of a family affair, the Pontiac Buggy Co. having been owned by the late Edward Murphy and his associates who in turn formed the Oakland Motor Car Co. The building which was purchased from the Buggy company was of course made over to the General Motors Co. when the latter absorbed the Oakland establishment and the General Motors indorsed and became responsible for the notes which had been issued. It appears that the agreed price was \$125,000, of which but \$10,000 was paid in cash. Three notes of \$10,000 each were promptly paid, but three others, two for \$30,000 and one for \$25,000, which fell due on the 10th inst., were not met and the prompt institution of the suit followed.

Since it was filed, Hal Smith, one of the new trustees of the Oakland Motor Car Co., has asked for a year's extension of the notes, and a meeting of the Pontiac Buggy Co. has been called to decide whether or not the favor shall be granted. The notes did not bear interest, the Oakland company paying rental in lieu of interest.

## POPE'S PROSPEROUS CONDITION

**Annual Report Shows Handsome Increase of Sales and Profits—Good Example of Conservative Management.**

With a balance sheet showing sales amounting to \$4,010,199.14, which netted a profit of \$745,390.87, the annual report of the Pope Mfg. Co., Hartford, Conn., for the 12 months ending July 31, 1910, which just has been made public, should prove of steadying influence to the entire industry and serve to further dissipate the alarmist rumors which had been set afloat.

The Pope Mfg. Co. is one of those which "had been through the fire" and which had learned the effects of booms and the expensiveness of over-expansion, and its solid condition as disclosed by its report may be accepted as typical of the condition of practically all of the old and long established companies possessed of proud reputations and which have not permitted a display of industrial fireworks to lure them from conservative management.

The sales of the company represent an increase of \$1,166,458.53 over the sales for the preceding twelve months, but even this satisfactory state of affairs is enhanced by the report of President Pope that the company has borrowed no money, nor has it given any promissory notes whatever during the year, having been able to take advantage of all cash discounts.

"The entire product of the company for the fiscal year was sold and delivered some weeks before the end of the period and no manufactured goods were carried over into the new fiscal year, leaving a very clean and most satisfactory inventory of merchandise on hand," continues Mr. Pope, who, with an eye to the future, adds:

"While the prospect for business for the new fiscal year is most encouraging, the management believes, in view of financial conditions throughout the country, that the conservative policy it has followed should be continued and no material expansion should be considered, and by keeping the affairs of the company well in hand, it can take care of as much business as its plants can produce, or contract its production, if conditions demand, to a point of economy and financial safety.

"During the year the company has acquired by purchase an additional manufacturing property in the city of Hartford, to which several manufacturing departments have been moved, giving much needed additional room for operations besides excellent shipping facilities by rail, which were lacking and much needed before the acquisition of this additional plant. The company now owns and operates three plants; the main factory and the West Works (the new plant) at Hartford, Conn.,

and a factory at Westfield, Mass., the two Hartford plants being entirely devoted to the manufacture of automobiles and the one at Westfield to the manufacture of bicycles and automobile bodies. During the previous two years the company had manufactured a portion of its automobile bodies but it has extended that branch of its business so that it is now manufacturing

successfully and to the advantage and profit of the company all the bodies it requires.

"The manufacture of Public Service vehicles, such as ambulances, police patrol and fire emergency wagons referred to in our last fiscal report has increased and promises to be a considerable factor in the company's product in the future."

The Pope financial statement follows:

### EARNINGS FOR YEAR ENDING JULY 31, 1910.

Income from operations (after deducting manufacturing and producing costs, including charges for depreciation, current repairs, replacements and renewals to plant, administrative, office and selling expenses).....	\$664,496.35
Add—Miscellaneous earnings, including discounts, interest and royalties received .....	127,989.00
	<u>\$792,485.35</u>
Deduct—Miscellaneous losses and expenses including discounts, provision for losses on bad and doubtful accounts, paid and accrued internal revenue tax on income.....	47,094.48
	<u>\$745,390.87</u>

### Assets.

Real estate, buildings, plant, equipment, machinery, tools, patents, licenses and good will, July 31, 1909.....	\$5,194,835.16
Add — Net Adjustments.....	50,767.37
	<u>\$5,245,602.53</u>
Deduct—Unoperated machinery and tools, sold or scrapped..	2,207.97
	<u>\$5,243,394.56</u>
Add—Expenditures on additions and improvements, complete and in operation.....	\$280,736.82
In process of construction and installation.....	54,114.28
	<u>334,851.10</u>
	<u>\$5,578,245.66</u>
Deferred charges and prepaid expenses, including prepaid insurance and advance work on models for future production .....	100,308.56
Contract to be liquidated by deferred instalments.....	190,871.41
Inventories of materials, supplies, work in progress and finished product .....	\$854,660.45
Accounts and notes receivable (less reserves for bad and doubtful accounts) .....	273,578.60
Cash and cash items in bank and office, including accrued interest on bank deposits, and fund for payment of unclaimed dividends .....	557,945.09
	<u>1,686,184.14</u>
	<u>\$7,555,609.77</u>

### Liabilities.

Capital stock—Authorized and issued:	
25,000 shares preferred.....	\$2,500,000.00
40,000 shares common.....	4,000,000.00
	<u>\$6,500,000.00</u>
Less—Stock held in treasury:	
2,018 shares preferred.....	\$201,800.00
3,092 shares common.....	309,200.00
	<u>511,000.00</u>
	<u>\$5,989,000.00</u>
Reserves for replacements and accrued renewals to plant....	\$402,313.30
Reserves for current repairs.....	1,821.88

Contingent liabilities .....	20,276.80
Surplus, July 31, 1909.....	\$482,866.76
Net earnings for year ending July 31, 1910.....	745,390.87
	<u>\$1,228,257.63</u>
Less—Dividends paid:	
On preferred stock for year ending July 31, 1909 .....	\$137,892.00
On preferred stock for year ending July 31, 1910 .....	137,892.00
On common stock.....	92,270.00
	<u>368,054.00</u>
	<u>860,203.63</u>
	<u>\$7,555,609.77</u>

**CHANGES AMONG THE TRADESMEN**

**Charles R. Stevenson Becomes Secretary of Thomas Company—Fosdick Sales Manager for Fiat—Other Shifts.**

Charles R. Stevenson, formerly of New York, has been elected secretary and auditor of the E. R. Thomas Motor Co., of Buffalo, N. Y. He also has been elected a member of the executive committee and will become one of the directors of the company. Mr. Stevenson for the last seven years has been a member of the firm of Miller, Franklin & Stevenson, business economists and public accountants, and has had to do with the work of introducing advanced methods of accounting and manufacturing in over two hundred concerns in all lines of industry. Previous thereto he was assistant metallurgical engineer of the Homestead plant of the United States Steel Corporation.

Harry Fosdick, former secretary of the Hol-Tan Co., of New York, importers of the Lancia car, has been appointed sales manager of the Fiat Automobile Co., of Poughkeepsie, N. Y., with headquarters at 1786 Broadway, New York City. Fosdick is one of the real pioneers of the industry, his connection with it dating from 1899. He has had experience with both American and imported cars, his going to the Fiat being in the nature of a return to an early love. While he now will have to do with the American model, he handled the overseas production first as Boston agent and later as one of the headquarters staff in New York.

L. B. Sanders, manager of the Brush Chicago Motor Co., has been promoted to the post of district manager of the Brush Runabout Co. for the Middle West. His headquarters, however, will remain in Chicago. The vacancy in the local establishment caused by Sander's advancement has been filled by the appointment of P. J. Pollock, a Brush traveler.

H. H. Thorpe, sales manager of the Lion Motor Sales Co., Detroit, has resigned to take the Michigan state agency for the Van "22," a new car made at Grand Haven, Mich. He will be succeeded by Richard E. Fair, now manager for the western district for the Lion company.

Wiley F. West has been appointed manager of the St. Louis branch of the Firestone Tire & Rubber Co. He hails from Atlanta, Ga., where he managed the branch store of another tire company.

**Detroit Carburetter Concern in Trouble.**

The Auto & Marine Appliance Co., of Detroit, Mich., which recently started business with a capitalization of \$100,000, little or no ready cash, and a patent on a car-

buretter, is trying to adjust its difficulties in the bankruptcy court. The liabilities of the company amount to about \$5,000, while the assets consist of some machinery, some finished carburetters and a contract with the Paige-Detroit Motor Car Co., calling for a supply of carburetters. All assets are tied up by a chattel mortgage and assignment to Sarah A. McLean and to the Michigan Lubricator Co., another creditor.

**Motor Car Equipment Changes Hands.**

Emil Grossman, president of the Motor Car Equipment Co., New York, has disposed of his entire holdings in that concern and no longer is connected with it in any way. His interests were purchased by Walter M. Taussig and C. F. Wiebush, of the New York importing firm Wiebush & Hilger, Ltd., and by Carl Kaufman, the general manager of the Equipment company, of which Taussig has become president, Wiebush vice-president and Kaufman secretary and treasurer. Kaufman also retains the general management.

**Selden Suit Against DeDion-Bouton.**

To the sixteen suits against importers for alleged infringement of the Selden patent, which were filed last week, the Association of Licensed Automobile Manufacturers has added another. This latest action is against the DeDion-Bouton Automobile Selling Branch and seeks an injunction, damages and profits. The suit is entitled: the Columbia Motor Car Co. and George B. Selden against Emanuel Lascaria, trading and doing business under the registered trade name of DeDion-Bouton Selling Branch.

**Regal Reaches Into Great Britain.**

The Regal Motor Car Co. has joined in the "invasion" of Great Britain. It has placed the British agency with Seabrook Bros., of London, who have contracted for 350 Regal cars to be delivered during the 1911 season. The arrangement was effected by R. M. Lockwood, a New York export expert, who recently was engaged by the Regal company and who already has accounted for several other substantial orders in other parts of the world.

**Selden License Issued to Garford.**

The executive committee of the Association of Licensed Automobile Manufacturers having approved its application, as the Motor World stated last week had been done, a Selden license formally has been issued to the Garford Co., of Elyria, Ohio. This brings the number of licensees to 83.

**Buick Branches Abandon Accessories.**

The Buick branches no longer will handle accessories. Following orders from headquarters, they are disposing of their stocks on hand "at less than cost," according to the advertisement of one of the branches.

**FIXES STATUS OF LOCK WASHERS**

**Appraisers' Decision on Hoffnung's Appeal—Assessed as "Washers," Not "Manufactures of Metal."**

In sustaining a protest filed by S. Hoffnung & Co. of New York, the Board of United States General Appraisers has decided that metal washers with an improved device to prevent the nut from slipping after it has been properly fastened are dutiable properly as "washers" under Paragraph 162 of the Tariff act of 1909 rather than as manufactures of metal not specially provided for in Paragraph 199 of the act.

The merchandise was invoiced as fast-nut washers, which were classified by the Custom House authorities as manufactures of metal, whereas the importing concern claimed that the articles are "washers" and properly dutiable at three-quarters of one cent per pound under Paragraph 162, which specifies "washers of wrought iron or steel." The question was raised at the hearing of the protest whether the articles are in fact "washers," and, secondly, whether if in fact "washers" they are not designed for use on automobiles and dutiable as parts of automobiles.

On this point General Appraiser Fischer rules that a patented metal washer, though it be used on automobiles, having no adaptation for that purpose, and in fact commonly and practically used otherwise, is dutiable as a "washer" rather than as "parts of automobiles." Discussing the question of the classification of the articles, the decision says in part:

"It is true that these articles are not the common washers well known to everybody, but they are nevertheless washers. They are intended for and in fact used only as washers, have always been so used, and differ from the old-fashioned article only in that they have an improved device to prevent the nut from slipping after it has been properly fastened. This extra device or improvement does not rob the article of its character as a washer, and the provision in the tariff for washers fully covers it. They fit the term as understood both commonly and in trade."

**Fire Destroys Salisbury Axle Factory.**

The No. 2 factory of the Salisbury Wheel & Mfg. Co., at Jamestown, N. Y., was totally destroyed by fire Wednesday evening of last week, 21st inst., entailing a loss of \$80,000. The plant, a four story structure devoted to the manufacture of front axles, will be rebuilt as soon as the insurance is adjusted. The Salisbury company, however, owns another factory in Greenville, Pa., which will permit its orders to be taken care of with comparatively little delay.

**THE WEEK'S INCORPORATIONS.**

Bangor, Pa.—Bangor Auto Co., under Pennsylvania laws, with \$10,000 capital.

DuBois, Pa.—Motor & Supply Co., under Pennsylvania laws, with \$25,000 capital.

Peoria, Ill.—Cummings-Rutherford Motor Car Co., under Illinois laws, with \$5,000 capital.

Brooklyn, N. Y.—Simplica Automobile Co., under New York laws, with \$2,000,000 capital.

Constantine, Mich.—Constantine Motor Castings Co., under Michigan laws, with \$15,000.

Philadelphia, Pa.—Warrington Garage & Machine Works, under Pennsylvania laws, with \$10,000 capital.

Waterville, Me.—Maine Supply & Garage Co., under Maine laws, with \$200,000 capital. Corporators—Ansene Cailler and others.

Chicago, Ill.—Woodlawn Park Garage, under Illinois laws, with \$5,000 capital. Corporators—V. B. King, A. Humphrey, E. J. Suhns.

Detroit, Mich.—Horton Autoette Mfg. Co., under Michigan laws, with \$100,000 capital; to manufacture automobiles and motor vehicles.

Chicago, Ill.—American Taxicab Co., under Illinois laws, with \$16,000 capital. Corporators—W. Huttman, M. Niestrom, John A. Herrine.

Eaton, Ohio—Cyriaks Auto Co., under Ohio laws, with \$15,000 capital. Corporators—F. R. Cyriaks, F. R. Christman, Rachel Christman.

Sewickley, Pa.—Sewickley Automobile Co., under Pennsylvania laws, with \$5,000 capital. Corporators—A. F. Mohn, P. M. & M. P. Feltwell.

San Antonio, Tex.—San Antonio Motor Car Co., under Texas laws, with \$15,000 capital. Corporators—W. Budd, Jr., L. R. Daniel, J. M. Lynch.

Toledo, Ohio—Warren Motor Sales Co., under Ohio laws, with \$40,000 capital. Corporators—S. P. Holmes, C. E. Voan, John McKenna, J. J. Duck.

Newark, N. J.—Economy Auto Supply Co., under New Jersey laws, with \$50,000 capital. Corporators—T. Kaplan, E. Elin, B. Miller, N. Salzman.

Indianapolis, Ind.—Phillips Demountable Rim Co., under Indiana laws, with \$30,000 capital. Corporators—J. N. Crabb, W. A. Zumpfe, J. F. Messick.

Boston, Mass.—Motor Car Service of Boston, under Massachusetts laws, with \$5,000 capital. Corporators—Frederick E. Dewey, J. Edward Lavell.

Memphis, Tenn.—H. A. White Auto Co., under Tennessee laws, with \$40,000 capital. Corporators—H. A. White, F. M. White, A. B. Clapp, Jane H. White.

Brooklyn, N. Y.—Newkirk Garage & Taxicab Co., under New York laws, with \$25,000 capital. Corporators—D. H. Spicer, W. L. Watson, F. A. Behrens.

Kansas City, Mo.—Case Auto Supply Co., under Missouri laws, with \$5,000 capital. Corporators—R. H. Alexander, Belle S. Alexander, Christine Alexander.

Havre de Grace, Md.—Havre de Grace Automobile Co., under Maryland laws, with \$3,000 capital. Corporators—M. Vandiver, Michael Fahey, Clarence Pussey.

Jersey City, N. J.—National Tire Fabric Co., under New Jersey laws, with \$50,000 capital; to deal in patents, etc. Corporators—J. Sullivan, M. Bowan, D. Hogan.

Chicago, Ill.—Marion Motor Co. of Chicago, under Illinois laws, with \$10,000 capital. Corporators—Robert E. Maypole, Alvar A. Landry, George F. Carpenter.

Carlisle, Pa.—Dillsburg & Wellsville Auto Co., under Pennsylvania laws; to operate automobile buses. Corporators—T. J. Seiple, R. L. Nesbit, Ed. W. Shapley and others.

Weatherley, Pa.—Miller Automobile Co., under Delaware laws, with \$100,000 capital; to manufacture automobile trucks. Corporators—Stanley E. Oberrender, Dr. Jenkins, Charles Miller.

Columbus, Ohio—Columbus Motor Car Transportation Co., under Ohio laws, with \$100,000 capital. Corporators—George W. Pope, James J. Liddy, M. J. O'Rourke, N. H. Wilson and others.

Indianapolis, Ind.—Commercial Car Sales Co., under Indiana laws, with \$10,000 capital; to manufacture and deal in motor trucks. Corporators—B. S. Dean, Tillis Huff, Calvin Shoemaker.

Westerly, R. I.—Dual Tired Wheel Co., under Rhode Island laws, with \$100,000 capital. Corporators—Herbert Stillman, Frank Hill, George B. Carpenter, Elisha C. Stillman, Samuel H. Davis.

Chicago, Ill.—American Taxi & Auto Owners' Protective Association, under Illinois laws, with no capital; for protective benefit. Corporators—Charles Roff, P. C. Kohler, E. M. Carew.

Newark, N. J.—Vroom & Co., under New Jersey laws, with \$25,000 capital; to manufacture and deal in wagons and automobiles. Corporators—C. W. Smalley, William Ward, Peter Vroom.

Denver, Col.—Limon Auto Transportation Co., under Colorado laws, with \$7,000 capital; to operate automobiles for public hire. Corporators—James W. Moorman, James M. Cochran, John H. Prewett.

White Plains, N. Y.—Ashco Mfg. Co., under New York laws, with \$10,000 capital; to manufacture and deal in accessories for automobiles and bicycles. Corporators—C. S. Ashley, Robert W. Ashley, Alfred Streuli.

New York City, N. Y.—Hydraulic Oil

Storage Co., of New York City, under New York laws, with \$50,000 capital; to manufacture and sell appliances for the storage of oil, etc. Corporators—B. Clark, F. C. Leubuscher.

Augusta, Me.—National Boat & Engine Co., under Maine laws, with \$10,000,000 capital; to erect and operate factories for the manufacture of power boats and vehicles of all kinds propelled by mechanical power. Corporators—R. S. Buzzell, M. M. Farrar.

**Increases of Capital.**

St. Louis, Mo.—Victor Motor Car Co. increases capital from \$30,000 to \$150,000.

Detroit, Mich.—Edmunds & Jones Mfg. Co. increases capital from \$25,000 to \$50,000.

Detroit, Mich.—Paige-Detroit Motor Car Co. increases capital from \$100,000 to \$250,000.

Richmond, Ind.—Westcott Motor Car Co. increases capital from \$100,000 to \$250,000.

Detroit, Mich.—Michigan Motor Truck Co. increases capital from \$1,000,000 to \$1,100,000.

Detroit, Mich.—Hudson Motor Car Co. increases capital from \$100,000 to \$1,000,000.

**Recent Losses by Fire.**

Philadelphia, Pa.—H. S. Groves' garage, 248 West Tulpehocken street; loss, \$2,500.

Hyannis, Mass.—George P. Holbrook's garage, stable and a dwelling; total loss, \$20,000.

North Andover, Mass.—Richard H. Russell's garage; building destroyed, five automobiles saved; loss, \$2,500. Fully insured.

Sheldrake, Cayuga Co., N. Y.—Cram Garage and two automobiles destroyed. Loss, considerable. Cause said to be incendiary.

New York City, N. Y.—Boylston Garage, 142 East 41st street; building and 31 automobiles destroyed. Estimated loss, \$200,000.

Denver, Col.—Denver Rubber Tire Works, 28 Colfax avenue; contents store rooms; loss, \$5,000. Cause unknown. No insurance.

South Manchester, Conn.—Williard Hunt's garage; building damaged, one automobile destroyed; loss, \$1,500. Cause unknown. Partly insured.

Boston, Mass.—James E. Wilbur, 299 Norfolk street; garage burned, automobiles saved. Loss, \$1,000. Cause, leaking gasoline tank on one of the cars.

Trenton, N. J.—Frank Cook's garage, 38 South Olden avenue; building damaged, one automobile burnt; loss, over \$4,000. Caused by explosion of lamp.

Peoria, Ill.—J. R. Harrison, 1601 North Adams street; garage damaged, one automobile destroyed; loss, \$3,000. Leaking gasoline tank explosion was the cause.

## IN THE RETAIL WORLD.

Matt Kerr, Archibald Gorman and Robert Kerr will open a garage in Stratford, S. D.

A. Hanson & Son, owners of a garage at Holdrege, Neb., have sold out to C. Engstrom.

Blough & Fisher are the proprietors of a new garage which just has been opened in La Grange, Ind.

The Milford Auto Machine Co. has purchased the Franklin Square Garage situated on Allen court, Worcester, Mass.

Harry Parker, of Cullman, Ala., has engaged in the automobile business. He has opened a garage on Main street.

H. D. Parks has purchased the City Garage in Springfield, Ill. He will continue the business under his own name.

R. C. Smith, of Washington, D. C., has secured the Overland agency for the city and established salesrooms at 829 14th street.

The Kelley Automobile Co., of Youngstown, Ohio, has opened its new garage at 221 Chapel place. It will specialize on electrics.

The Yorkville Auto Supply Co. has "opened up" at 1235 Lexington avenue, New York. Sidney Richmond is its owner and manager.

Huerth & Knipscheid is the style of a new firm which just has opened up in Sauk City, Wis. They will specialize in renting and repair work.

R. K. Luse and F. Rapp have opened a garage in the I. O. O. F. building at Oxford, Iowa. They will represent several makes of cars and will do general repair work.

A permit has been granted to J. L. Becker, of Syracuse, N. Y., to erect a garage at 209, 211, 213 Harrison street. The building is to cost, when complete, about \$5,000.

The Standard Motor Car Co. has been organized by the members of the Riddell Auto Co., in Des Moines, Iowa, for the purpose of selling Patterson automobiles. E. A. Kiser will manage the company.

The King Motor Car Co. is the latest arrival among the automobile firms of Sacramento, Cal. Warren-Detroit and Interstate cars will be shown at the salesrooms, which are located at 1207 11th street.

Earl Chambers, of the firm Chambers & Shea, Danville, Ill., has bought out his partner and will conduct the business hereafter in his own name. His garage is located at 27-31 North Walnut street.

The A. S. Johns Motor Car Co., which a few weeks ago was organized at San Antonio, Texas, has invaded Austin and established a branch house there. J. E. Faggard will be in charge of the Austin branch.

Work has been started on the erection of a garage at the corner of Moody and Alder streets, Waltham, Mass. E. C. Irish is building it with the intention of exhibiting Rambler cars in the building when completed.

Electric automobiles are to be featured at the new salesrooms and garage just opened at 1207-1211 Harmon place, Minneapolis, Minn., by the Electric Carriage & Battery Co. M. H. Hughes is president of the concern.

Bruce Rutherford, George E. Cummings and Howard Kinsey have formed a partnership under the style the Cummings-Rutherford Motor Car Co., with headquarters at 830 Main street, Peoria, Ill. They will handle Overland cars.

The Regal Garage Co. has been organized in Spokane to handle the Regal car in the eastern half of the state of Washington. Earl C. Finley is president and H. Preston secretary of the concern, which has taken 250 cars for its territory.

F. C. Hobbs, a machinist of Newark, N. J., has obtained the state agency for Pullman cars and leased the salesrooms now occupied by the Essex County Overland Co., at 211 Halsey street. He will have them ready for opening by November 1st.

The Elmore Auto Co., organized to handle Elmore cars in Des Moines, Ia., has opened up for business in temporary quarters at 614-616 Mulberry street. F. L. Kern, formerly secretary and treasurer of the Iowa Auto Club, is president of the company.

E. R. Wilson, formerly manager of the Paxton-Mitchell Co., has severed his relations with that concern and has formed the E. R. Wilson Automobile Co., with headquarters at 2010 Harney street, Omaha, Neb. Lexington cars will be his chief stock in trade.

The United Motor Charlotte Co., a subsidiary concern of the United States Motor Co., has established a branch in Asheville, N. C., of which J. H. Ham has been appointed manager. In addition to handling Maxwell and Columbus cars, the company will feature Sampson trucks.

Under the style the Bennett Motor Car Co. a new firm has been organized in Pittsburgh, Pa., with W. W. Bennett, formerly manager of the Standard Automobile Co., of the same city, as president. Pope-Hartford cars will be featured in the salesroom of the new company, at 5904 Penn avenue.

Mayor Frank Walsh, of West Allis, Wis., finding his executive duties light, has entered the automobile business by purchase of the garage of the Stephenson Motor Car Co., located on Eighth street, Milwaukee, Wis. The repair shops connected with the garage are said to be the largest in the city.

Having outgrown its quarters at Atlantic and Bedford avenues, Brooklyn, N. Y., the

Bruns Automobile Co. has taken the ground floor of the Cooper building, corner Bedford avenue and Fulton street. The salesrooms cover 5,000 feet of floor space, on which Chalmers-Detroit and Hudson cars will be featured.

A. M. Young, formerly a member of the firm of Bireley & Young, Columbia agents at Los Angeles, Cal., is to head a new organization which will handle the Thomas car. The new firm is to be called the Thomas Motor Car Co., and will occupy the building at 842 South Olive street as salesrooms and garage.

Glenn Frazelle, doing business in Springfield, Ohio, as the Frazelle Auto Co., has been petitioned into bankruptcy. Among other things the petition charges that he is giving some creditors preference over others and that he is endeavoring to settle with his creditors for 25 cents on the dollar, while possessing sufficient assets to pay more.

Franklin Leonard, Jr., has been appointed receiver of the Cloud-Marts Co., 1871 Broadway, New York City, selling agents for the Selden car, with a bond of \$5,000, upon the voluntary petition of the directors of the company. The liabilities are \$5,812; the assets, \$5,543. The business was started in September, 1909, with a capital of \$10,000.

Attorneys acting for nine creditors in Chicago, New York, Cleveland, Memphis and Newark, Ohio, have filed a petition in bankruptcy against the Cullen-Butler Auto Co., one of the pioneer automobile concerns of Memphis, Tenn. The extent of the liabilities has not been published, while assets are said to be large, including a handsome sales and garage building and numerous accounts.

R. H. Collins, manager of the Kansas City branch of the Buick Motor Co., has purchased the entire business of the Buick company in the Southwest territory, including all automobiles, notes, accounts, etc., and will conduct the firm's affairs hereafter under the style the R. H. Collins Motor Co. His territory includes western Missouri, Kansas, Oklahoma, Colorado, New Mexico and northern Texas. The company's headquarters are at the corner of Admiral boulevard and McGee street.

The Overland Sales Co., of New York, which was incorporated last week with \$100,000 capital, has taken over the agency for the Overland car for the entire metropolitan district, previously held by George L. Reiss. The new concern, of which Thomas Silver is president and manager, has located at 1599-1601 Broadway, New York, where it occupies a two-story structure. Silver is well acquainted with the Overland product, having controlled the sub-agency for Brooklyn. Reiss, the former metropolitan agent, has taken on the Abbott-Detroit car.

## The Arbiters of Elegance

**W**HAT the White Limousines are in their class, the White Landaulets are in theirs—the arbiters of elegance—the models—the patterns for correctness of style. The cars in which the subtle suggestion of graceful curves, the ensemble of harmonious lines, satisfies every sense of proportion.

The careful construction evident even in the most obscure details of these cars, makes them ideal town cars for practically all seasons of the year. Again, as the limousine, its size is greatly in its favor—not too large nor too small—massive and substantial-looking, yet not unwieldy. Because of its size it is easier on tires, and threads its way in and out among the larger vehicles of the crowded city, avoiding many of the delays of the more cumbersome cars.

It is convenient to enter or leave—in fact, satisfactory for shopping, theater, calling and the score of trips for which the city dweller needs a car. Richest leathers and handsomest broadcloths, cords, tapes, and every other detail, are of the kind found only in constructions as conscientious as the White. There can be no finer example of efficiency than the White Gasoline Landaulet—larger cars may be built, but none better.

### The Grade Crossing Must Go!

Apparently in need of publicity to justify its existence and having nothing better to do, the chief, if not the only, factotum of Mr. Henry Clews's "National" Highway Protective Association has let it be known that he is preparing for submission to the next legislature of New York a bill requiring all automobilists and horsemen to come to a full stop before venturing upon any railway grade crossing within New York state.

In commenting on the proposal, the New York Times sagely remarks that "to enforce such a law would require the presence of a policeman at every grade crossing," and while asserting that "there can be no excuse for the negligence" of drivers who suffer death or injury at such crossings, the Times nevertheless declares what is perfectly obvious, i. e., that the way to make an end of such fatalities is to abolish the grade crossing.

While motorists and others who have had

## THE MOTOR WORLD

unpleasant experiences at grade crossings which do not permit a view of the railway tracks for more than eight or ten feet in either direction or with a quietly "coasting" locomotive or with trains that do not whistle or, if at all, that whistle only when practically upon the crossing—while such persons will incline to disagree with the notion that there can be no excuse for accidents at grade crossings there will be no disagreement with the opinion that the way to terminate such occurrences is to abolish the grade crossings. And it should be the part of every man, woman and child who travels the public highway to cry out for and to lend assistance to any movement that has for its purpose the abolishment of the death-traps. The toll of human life which they collect each year is too enormous to be much longer countenanced.

Motorists have been such numerous victims and their safety is so particularly menaced by the existence of grade crossings, that they have cause for leading a campaign that seeks to put an end to the peril. The New Jersey Automobile and Motor Club has taken the first step in that direction. It has sounded the slogan: "The grade crossing must go," and has sounded it often enough to awaken a few echoes, at least. The cry should be taken up in all directions.

Every automobile organization and every other organization with which automobilists have to do should pass resolutions to that effect and call on their legislature to enact the necessary remedy, and in every other way public sentiment should be aroused to such a point that neither law maker nor railway president may longer remain insensible to the pressure. It will take a long time to make any considerable impression, but a beginning may as well be made now.

Human life is more valuable than stock dividends. If it is necessary to save life, let the railways reduce their dividends.

The legislators who permit the erection of "Stop, Look and Listen" signs to shift the burden of responsibility onto the road user should be ousted from office. That game has been played too long. The grade crossing must go!

### Advance of the Automobile Fire Engine.

In connection with the growing adoption of automobile apparatus for fire department use, one telling argument for its economy should not be overlooked: Unlike horse

drawn equipment its maintenance and operating cost depends directly upon the number of alarms to which it responds. This is one case in which the saying that the motor vehicle is cheap to maintain because "it does not have to be fed, rain or shine," is of real significance.

Ordinarily where horses are to be replaced by self-propelled vehicles calculation is based on continuous, or practically continuous, service during every working day. The saving effected by canceling the hay and grain bill thus is diminished by the constant use of fuel and oil. In the case of the fire department, however, the apparatus is idle save on the occasion of an alarm. Hence, as Chief Daggett, of Springfield, Mass., explains, "if a town has 1,000 fires a year there is naturally a great use of gasoline and hard usage on the machines. But in a town that has only 100 fires a year, there is but one-tenth of the expense per annum. Meanwhile, the saving for the small town is all the greater, because horses will eat all the year 'round whether there are 100 or 1,000 fires, and the horse-equipped departments become a proportionately greater expense on the community."

Barring this one argument, all other reasons why the automobile should be more effective in fire-fighting than the horse are of an obvious nature. Moreover, they are largely borne out by the facts, even considering that such experiments as have been, and now are being, conducted are at municipal expense, which is the same thing as saying great expense in many sad instances. The greater speed of the motor vehicle, its ever-ready and tireless qualities and the fact that it can be handled to better advantage in traffic would serve to bring about its general adoption in the course of time even without the added advantage of economy. That added factor is an argument that should not permit the horse to remain long in the service in which he has done such faithful and picturesque duty.

### Reducing the Risks of Fire.

Despite ample safeguards in the way of approved equipment for the handling of fuel and oils, the establishment of strict regulations by insurance underwriters and fire departments, and the wisdom of costly experience, possessed by more than one management, fire losses continue to levy a burdensome tax upon the profits of the

## COMING EVENTS

garage business. Granted that the fire risk is high at best, because of the inflammable nature of materials handled and the fact that the fuel system of every car on the floor may be considered a potential cause of fire, it is unquestionable that the aggregate loss throughout the country is much higher than it should be, and it is high time that sweeping measures were taken by that contingent of the automobile industry that so stoutly avers its profits are so pitifully small to conserve a portion of its income by reducing such unnecessary losses.

Modern methods of combating fire losses are two-fold in their application. Means are taken to prevent the starting and to check the spread of fires by isolating inflammable materials as far as possible, and provision also is made to extinguish any fire as soon after it starts as may be. The first method largely is employed in the construction and equipment of up-to-date garages; the second, unfortunately, is not so generally carried out to its logical conclusion.

Beyond the establishment of the chemical extinguishers and water hose that the authorities prescribe, it is not customary to employ other systems which, in different sorts of establishments, are considered invaluable. One of the most important and obvious of these is the organization of employees into regular fire-fighting corps. To inaugurate such organization, establishing regular fire stations, a crew to each, and an alarm system, involves very little trouble in a business that already is well regulated. Moreover, it entails very slight expense, even counting the shop time lost by the occasional drills, which are an essential part of the system.

In stores, warehouses, public buildings and on steamships, where the risk is most perilous to life and limb, fire drill is an important co-ordinate of the thermostat and sprinkler systems in preventing the spread of fire. The same applies to many factories—and should apply to all those that might suffer serious damage from fire. Yet such an organization in a garage, where the risk is notoriously great, is practically unknown, strange as it may seem.

Among the most wonderful of modern marvels is the success which has been achieved in the introduction of exhaust turbines in large power units. The subject

again is brought to notice by recent announcements to the effect that the capacity of the New York subway power plant has been doubled and the steam consumption per horsepower hour reduced by this means. The possibility of adapting the exhaust turbine to the small internal com-

bustion engine already has engaged the attention of inventors, as has the internal combustion turbine as an independent prime mover. But it looks as though motorists who are determined to await the marketing of such ideal motors must still possess themselves of considerable patience.

# FINE FIELD FOR SIXTH VANDERBILT

Thirty Representative Contenders Ready for Daybreak Start on Saturday—Fifteen More in Line for the Lesser Events—Incidents of Final Preparations—Old-Time Interest Promises Large Crowd and Old-Time Scenes.

It looks as if the Vanderbilt Cup race has "come back."

For the first time since it ceased to be an international event, the air is surcharged with much of that keen interest and expectancy that marked the earlier events, and there is promise of the midnight and daybreak scenes and crowds—the family parties, the "souse" parties and the individuals—that rendered them so highly spectacular. There are those who profess to believe the attendance will approach that of the memorable years of 1904 and 1905, and that from 500,000 to 1,000,000 people will group themselves about the course on Long Island. But such estimates probably are born of great faith and unwonted enthusiasm. It appears certain, however, that the crowd will be larger than for several years and that it will be made up in large part of motorists and those interested in motoring.

The great outpourings of humanity in 1904 and 1905 are not likely to be repeated. In those years the race largely was a team race, with Germany pitted against France and America against them both, and the heated popular fancy was over-full of roaring red devils and hurtling death defiers, and the great green public fairly stampeded toward Long Island in its desire to witness the devilish doings and have its hair raised on end by the dalliances with death. The spectators expected that crimson gore would spurt like fountains from mangled flesh, and that metal parts of large snorting monsters would roar heavenward, many a time and oft.

Since then, however, the motor car has become a commonplace sight. It now is easy to hear red devils snort and Willie boys defy death on almost any well traveled highway, and perforce the great green public, which once lined the Vanderbilt course now flocks where fly the aeroplanes, the newest toys in their eyes and those which promise more thrills and gruesome happenings. That likely the possible quarter million or more people who may gather on Long Island next Saturday to witness the sixth Vanderbilt, not to mention the two minor events, will hear more snorts and see more cars "ripping it out," and "get a real run for their money," than ever before is well forecasted by the size of the entry list. There will be more cars contending for the big cup than ever before

and the foreigners scarcely will be missed, although as a matter of fact there will be six imported cars in evidence; their drivers, however, will be, with one exception, home grown men.

There will be 30 contenders for the Vanderbilt cup. For the Wheatley Hills Sweepstakes—for the "big-little" cars—there are seven entrants. For the Massapequa sweepstakes for the "little fellows"—eight entrants are on the list, making a total of 45 cars which will be on the course at one time, by far the largest number that ever has competed in a road race in this country. The large number has required the building of 18 more repair pits in front of the grand stand.

Both cars and drivers are a thoroughly representative lot. All of the men who will hold steering wheels in Vanderbilt cup cars

#### THE CUP AND MEN LINKED WITH ITS HISTORY

GEORGE ROBERTSON  
The First American Who Won the Cup

W. K. VANDERBILT, JR.  
The Donor of the Cup

THE VANDERBILT CUP

HARRY A. GRANT (ALCO)  
The Present Holder of the Cup

literally were dashed to earth on Friday last. In a tryout on the course he turned a corner too swiftly or too sharply and was spilled out. The damage to the car will be repaired, but Robertson, at first made the victim of alarming rumors, was so badly muscle-strained that driving any car is out of the question for him. He has been replaced by Franz Heim, a tester from the Benz factory and a German to delight the heart of the Kaiser. Walter Jones and the Amplex also had a close call. A motorcyclist ventured on the parkway and was riding the wrong way of the course, in defiance of all rules and reason, and Jones in endeavoring to avoid him turned over. Both Jones and the car were badly bruised, but not vitally hurt, and both are expected to be in trim for the race on Saturday.

The only other accident incident to prac-

A. R. PARDINGTON  
Manager Long Island Motor Parkway

are men with reputations and are as skilful as they are daring. Most of them have been cavorting around the course during the past week, and press agents have been kept busy weaving tall yarns about swift flights. It has been "press agents' week," but despite fast rounds credited to them the clocking was unofficial and signifies no more than it has signified in other years. It is, as usual, any man's race and, as always, consistent performance is more likely to earn the victory than is mere breakneck or skyrocket speed for one lap or for ten. Fast laps mean little if anything.

It was consistent driving that last year enabled Harry F. Grant to win the cup, and the same sort of work achieved the same result for George Robertson the year before. Grant, again in an Alco, will endeavor to repeat on Saturday, and Robertson also hoped to do so, but in a different car, a Benz. Robertson's hopes, however,

tice work befell one of the entrants in the Massapequa Sweepstakes, William Knipper and his Lancia. He had overtaken Burman driving a Marquette-Buick and seemingly was about to pass him when the cars apparently touched hubs and Knipper and his assistant went sailing through space. Miraculously they escaped serious injury, and the damage to the car looked worse than proved to be the case. It will be repaired and a picturesque feature of the day thus be preserved, for with its torpedolike prow and unusual seating arrangement the Lancia easily is the most picturesque car that has entered the lists. In the accident Burman escaped with a bad fright and the loss of a hub cap. His fright was due not merely to the shock of collision but to what he thought he saw flying through the air. In his confused state of mind, he fancied that Knipper had been split in twain.

The course is the same as was used last

ONE OF THE "JUMPING-OFF PLACES" ON THE PARKWAY THAT MAKE THE DRIVERS' WORK INTERESTING

year, and is an irregular triangle of 12.64 miles, about one-third of which is the cemented surface of the Long Island Motor Parkway; the remainder is oiled country road, which just now is distinguished by a long succession of signs: "Parking Space To Let." Every front yard and every cabbage patch on the route is displaying the sign. It is the natural successor of the "Private Grandstand," which was so numerous in former years and which steeped so many Long Island fingers in financial loss.

So far as concerns the parkway, the course is hard and smooth but suggestively narrow; the country roads are wider, but of course not nearly so smooth. There is some rough going and not a few soft spots, and the corners are badly cut up; in fact, some of the intending competitors are complaining of its lack of condition, and despite reports of private lap trials at better than 70 miles per hour, it does not appear probable that much better than 60 or 61 m. p. h. for the full distance will be made in the big race itself. The Vanderbilt will go 22 laps or 278.08 miles; the Wheatley

Hills, 15 laps or 189.6 miles, and the Massapequa ten laps or 126.4 miles. The utter lack of anything suggestive of a hill is the one element of the course. All the grades are gentle ones.

The manner of conducting the three races will differ from last year's practice. Then the contenders in the Massapequa and the Wheatley Hills were started first at intervals of a few seconds and immediately were followed by the starters in the cup race. As a result there was a large number of cars on the course in the early hours and distressingly few when the Vanderbilt itself was concluded. On Saturday, however, the Vanderbilt cars will be sent away first; about an hour later the Wheatley Hills contenders will be given the word and after another lapse of about the same duration the littlest cars in the littlest race, the Massapequa, will be started. This procedure, it is hoped, will result in a bunched finish and serve to sustain interest to the end. It undoubtedly will lead to confusion of the three events, and the contenders in each, but if it serves to prevent the wear-

GENERAL VIEW SHOWING THE MOTOR PARKWAY WINDING OVER HEMPSTEAD PLAINS

ROUNDING THE MASSAPEQUA TURN IN PRACTICE

someness of a year ago, it will not have proved wholly in vain.

sistant to the president, A. R. Pardington. The race will be started at daybreak or

Long Island, permits. The first car may be sent away at 6 o'clock; more likely it will be later.

"At frequent intervals between 2 a. m. and 4:50 a. m.," to quote its official announcement, the Long Island railroad will run "special trains" direct to the grandstand. They will start from the new Pennsylvania railroad station at Seventh avenue and 33d street, New York, and all passengers will be afforded the disgusting experience of changing trains at Jamaica. Only special excursion tickets will be honored on these special trains, which probably will start at those "frequent intervals" when the cars are filled and which will reach the grand stand only the Lord knows when, if past experience means anything. In previous years, some of these "special trains" made the 20 miles journey in the swift time of three or four hours and landed the passengers at their destination in time to see the finish of the race, at least.

The management of the race has issued several "recommended routes" for those who purpose going to the scene in automo-

INCIDENTS OF PRACTICE WORK—ROBERTSON'S BENZ AND KNIPPER'S LANCIA AFTER THEIR SPILLS

For the first time, the cars will not "weigh in." Instead, their specifications have been verified by the technical committee, but the declared weights of the entrants are being accepted without question.

The order in which the cars will be started will be settled tomorrow when the drawing takes place, the numbers which they have carried in practice being merely their entry numbers. By leaving the drawing for positions and the numbering of the cars until the eleventh hour the sale of the official program is enhanced and the printing of a flood of "phony" programs is prevented.

As usual, W. K. Vanderbilt, Jr., will referee the races, and Fred J. Wagner do the starting. The other officials will be as follows: Judges, Henry Sanderson, Colgate Hoyt, Dave Hennen Morris, Robert Lee Morrell and Samuel M. Butler; technical committee, A. L. McMurtry, Henry Souther and Alexander Churchward; A. A. representative, Frank G. Webb; as-

as soon thereafter as the mist, which usually marks the rise of night's curtain on

biles. The route recommended from New York is the one via the Queensboro (59th

E. F. SCHEIFLER (JACKSON) NEGOTIATING A SHARP ANGLE

street) bridge and Hoffman boulevard, which undoubtedly is the most direct and most traveled route, but Hoffman boulevard is narrow and full of holes and there is deep sand on both sides of the roadway and it generally is in such a condition that New Yorkers who do not desire to invite accident in the congestion of cars—many of them sure to contain "souse parties"—which is certain to ensue in the dark and early hours of Saturday, will be wise to avoid the Queensboro bridge—Hoffman boulevard route and go via the Williamsburg (Delancey street) bridge to Brooklyn and thence to Bedford avenue, to Eastern parkway, to Jamaica avenue, and continue straight into Jamaica, where Hillside avenue and the "recommended route" beyond can be followed. Not all of Jamaica avenue is in good condition, but the street car tracks are available, and by not making the detour via Ridgewood avenue and Rockaway road, familiar to Brooklynites, the stranger is likely to escape a number of confusing turns.

The "recommended route" from New

POSSIBILITIES OF THE WESTBURY TURN

of 59th street to Long Island City, turn right to Crescent street, to end of street, approach to Thompson County Court House on the right. Cross viaduct into

yellow and black signs, which, on the nights before both races, will be illuminated by batteries of calcium lights. The road leading from Bethpage turnpike to the unreserved (fifty cents) field will also be illuminated by a battery of calcium lights. There will be no charge made for cars in this 50 cent admission field, which is unreserved.

#### Vanderbilt Racer in Odd Suit.

Ralph Beardsley, now more or less in the spotlight as a Vanderbilt race driver, is the central figure in two suits which his aunt, Mrs. Helen A. Boyd, of Highland Park, N. J., has brought against the Buick Motor Co. in the Supreme Court of that state. The cases are to be heard October 3d. Beardsley formerly drove a Buick racer which Mrs. Boyd asserts that she bought for her nephew, with the understanding that he was to be employed as a driver by the Buick company, which would pay for the maintenance of the car. She

**DEPALMA'S RECORD NOT REGULAR**

**Timing Device at Norristown Meet Too Crude for Approval—New Yorker was Almost the "Whole Show."**

Ralph DePalma was the whole show at the racemeet of the Norristown Automobile Club at Belmont Park, Narbeth, Pa., on Saturday last, 24th inst. George Robertson was to have shared the spotlight with him in a match race, and some 5,000 people who apparently had not heard that Robertson had been injured the day before in practice on the Vanderbilt Cup course gathered to see the duel that did not occur.

DePalma, however, did his best to entertain the crowd. He started in a handicap race and won it in hollow fashion; he drove his Fiat car an exhibition mile in 49½ seconds and later made a ten miles flight in 8:31½, which has been widely heralded as a record—a "dirt track record." But unfortunately the A. A. A. will not accept it. The Norristown club had no up-to-date timing apparatus, and made use of the home-made creation of a local electrician which was too crude to pass muster. Chairman Butler himself is authority for the statement that the record will not be booked.

The race which DePalma won was the five miles free-for-all. He allowed the other contestants 20 seconds starts, caught them all on the second mile and won as he pleased in 4:57¾. Tom Berger, Warren-Detroit, was the runner-up.

The other events did not fill well, but what they lacked in numbers was made up in exciting finishes. In the five miles for Class B, C. C. Fairman, J. D. Kerr and W. D. Morton, all in Kline-Kars, had a hammer and tongs fight all the way, Fairman finally winning in 10:44¾. In the ten miles for the same class, the same men "had it out" once more and again Fairman won, but by inches only. He also accounted for the ten miles free-for-all, making three victories for the day.

Tom Berger, who has a local reputation, added to it by winning another five miles contest in his Warren-Detroit, W. J. McFarland in an Otto being second and James Rockford in a Moon third. The summary:

Five miles, Class C—Won by Tom Berger, Warren-Detroit; second, W. J. McFarland, Otto; third, James Rockford, Moon. Time, 5:23¾.

Five miles, Class B—Won by C. C. Fairman Kline; second, James D. Kerr, Kline; third, W. D. Morton, Kline. Time, 5:28.

Ten miles, Class B—Won by C. C. Fairman, Kline; second, W. D. Morton, Kline; third, James D. Kerr, Kline. Time, 10:44¾.

Five miles free-for-all—Won by Ralph DePalma, Fiat (scratch); second, Tom Berger, Warren-Detroit (20 seconds); third,

G. Jones, Otto (20 seconds). Time, 4:57¾.

Ten miles free-for-all—Won by C. C. Fairman, Kline; second, J. D. Kerr, Kline; third, G. H. Jones, Otto. Time, 10:32¾.

**Chicago Prepares Its Endurance Contest.**

Five days instead of four have finally been decided upon for the 1,000 miles endurance contest of the Chicago Motor Club and November 7-11 inclusive are the dates which have been chosen. The daily journey thus will be 200 miles instead of 250 miles as originally proposed. The routing has not yet been made, but it is known that it will cover three states—Illinois, Indiana and Iowa. Five trophies are to be offered. There will be one for the touring car making the best showing, one for the best run-about score, and one for the make of car with the best total—a team affair in which a manufacturer with three cars entered can pick his two best scores. There will also be a trophy for fuel economy and another for the tire concern whose product makes the best showing. The entry fee will be graded. One car will cost \$100, the second car of the same make \$50, and the third one \$25.

**Asks President to View Philadelphia's Race.**

Mayor Reyburn, of Philadelphia, is doing his best to induce President Taft to cut out the golf links Saturday, October 8th in order to attend the third annual Fairmount Park automobile race as guest of the city. The mayor's letter emphasizes the attractions of the varied and picturesque course, also the fact that the fixture has become a household word, or two or three, and calls the attention of the great traveler to the fact that notwithstanding its contiguity he has not lately been in the Quaker City. Although the attendance has reached nearly 500,000 persons, the mayor assures the chief executive that there is always room for one more.

**Hungry Crew Ate the Confetti!**

Members of the Buffalo Automobile Co. are not the only ones whom confetti has helped out of difficulties. The Buffaloes made much of the fact that had they not dumped wads of "cold slaw" into certain bad holes on the route of their recent contest they might not have returned to tell the tale. But from St. Paul—the one in Minnesota—comes a yarn that goes the other "one better." In the St. Paul contest they used pop corn for confetti, and when the confetti car became mired in the mud, its crew was saved from hunger only by eating the confetti.

**Rain Drowns the Detroit Racemeet.**

The racemeet under the auspices of the Wolverine Automobile Club which was to have been held in Detroit in connection with the Michigan State Fair on Saturday last, 24th inst., was declared off because of rain.

**GREAT CROWD GREET'S OLDFIELD**

**He "Obliges" the Milwaukeeans by Doing Some Fast Work—Wins Hour Race and Cracks Records.**

The largest crowd in the history of automobile racing at Milwaukee turned out last Tuesday, 27th inst., at the state fair track for the annual meet of the Milwaukee Automobile Club. There were nearly 10,000 people in the grand stand alone, the great overflow taking up its stand on "Poor Man's Hill," and every other possible vantage point inside and outside the grounds. Barney Oldfield was there and was the star performer, and, subject to the approval of the A. A. A., he broke four "circular dirt track records," those for 15, 20 and 25 miles and for one hour.

Oldfield used Ben Kerscher's Darracq in his 25 miles time trial, in which he broke three of the records. He reached the 15 miles mark in 13:41¾—one-fifth of a second better than his old record—the 20 miles in 18:15½, and the 25 miles in 22:47. The two latter beat De Palma's records, the last named by 12 seconds.

The one hour race, in which the fourth record was set up, was the feature of the day. Oldfield, in a Knox, won, covering 60½ miles, against the 59 miles recently tallied at Brighton Beach.

The ten miles handicap proved the second best contest, which went to Nelson, a local driver, in a Pope-Hartford.

Only one heat of the five miles match race between Oldfield, in the Knox, and John Heber, in the Marion, was run, Oldfield winning by a few feet. Oldfield then whirled a mile in his big Benz, and cut the local time from 54 to 51 seconds. Ben Kerscher, having been injured at Detroit, was absent. The summary:

Ten miles, Division 1—Won by Fahr, Buick; second, Borsch, Warren-Detroit. Time, 10:31¾.

Ten miles, Division 2—Won by Fahr, Buick; second, Kent, Buick; third, Nelson, Pope-Hartford; fourth, Hughes, Fal. Time, 9:54¾.

Ten miles handicap—Won by Nelson, Pope-Hartford; second, Hughes, Fal; third, Borsch, Warren-Detroit; fourth, Kent, Buick; fifth, Heber, Marion. Time, 10:25.

Five miles match—Won by Oldfield, Knox; second, Heber, Marion. Time, 5:47¼.

One hour—Won by Oldfield, Knox, at 60½ miles; second, Nelson, Pope-Hartford; third, Fahr, Buick; fourth, Borsch, Warren-Detroit; fifth, Fisher, Buick; sixth, Hughes, Fal; seventh, Kent, Buick.

One mile time trial—Oldfield, Benz, in 51 seconds.

Twenty-five miles time trial—Oldfield, Darracq, in 22:47.

**"ACCORDING TO SHAKESPEARE"**

**Feminine Delver Into His Works Brings  
"Evidence" to Bear that He Foresaw  
Motoring Conditions.**

Those who assert that Shakespeare was not up to date don't know what they are talking about, according to a Wharton (Tex.) young woman. To demonstrate that the "immortal bard" was very much in advance of his day, she brings to bear these extracts from his writings:

Automobiles.—Fearful scouring doth choke the air with dust.—*Timon*, V-II.

Automobile Lamps.—Methought his eyes were two full moons.—*King Lear*, IV-VI.

Automobile Horn.—The horn, the horn, the lusty horn, is not a thing to laugh to scorn.—*As You Like It*, IV-II.

Gasolene.—The rankest compound of villainous smell that ever offended nostril.—*Merry Wives*, III-V.

Chauffeurs.—I'll come along and be thy waggoner, and while along with thee about the globe.—*Titus*, V-II.

Automobile Goggles.—Get thee glass eyes.—*King Lear*, IV-VI.

Automobile Caps.—These black masks proclaim an ensield beauty.—*Measure for Measure*, II-IV.

Automobile Veils.—Give me my veil; come, throw it o'er my face.—*Twelfth Night*, I-V.

Joy Riders.—I must become a borrower of the night, for a dark hour or twain.—*Macbeth*, III-I.

City Streets.—I do not without danger walks these streets.—*Twelfth Night*, III-III.

Country Roads.—Though our silence be drawn from us with cars.—*Timon*, V-II.

Mortgaged Automobile.—He, that dies pays all debts.—*Tempest*, III-II.

Automobile Races.—All the devils are here.—*Tempest*, I-II.

Speeding.—Here comes a pair of strange beasts, which in all tongues are called fools.—*As You Like It*, V-IV.

Pursued.—We may outrun by violent swiftness—and lose by overrunning.—*Henry*, VIII-I.

4-G-M.—Have a good eye, uncle, I can see a church by daylight.—*Much Ado About Nothing*, II-I.

Puncture.—I have done the deed. Didst thou hear the noise?—*Macbeth*, II-II.

Stuck.—He doth bestride the world like a colossus, and we petty men walk under his legs and peep about.—*Julius Caesar*, I-II.

Automobile Victim.—He jests at scars that never felt a wound.—*Romeo and Juliet*, II-II.

Mounted Police.—We will fetters put upon this felon, which goes too free footed.—*Hamlet*, III-III.

Pinched.—We plead like angels.—*Macbeth*, I-VII.

Judged.—The law hath not been dead, though it hath slept.—*Measure for Measure*, II-II.

**Making the Guide Board Picturesque.**

It is no longer sufficient that a guide post should "show the way," or even that it combines with utility the artistic. Another attribute is imperative, at least in California; there it must be melodious, also. This effect is due to the action of the supervisors

of Los Angeles, Ventura and Santa Barbara counties who some time since granted to a real estate association the privilege of marking the El Camino Real (the King's Highway) road by artistic bell guide posts. In Los Angeles the bells are familiar to all travelers, 36 of them being scattered throughout the county, while 14 not long since were put up in Ventura county; there are a few others in Orange county, Santa Barbara, Santa Clara, Monterey and San Francisco and 20 more are to be erected. The bells are counterparts of the Mission bells poetically handed down since the Spanish occupation. They are so suspended from metallic staffs about 18 feet high that even a gentle wind is sufficient to tinkle them. Below the bell a guide board is clamped to the post. Their picturesqueness is shown by the accompanying illustration.

**MOTORISTS ARE SQUEEZED AGAIN**

**British Government Lifts Their Taxation  
Almost Sky High—Prohibitive Rates  
on High Powered Cars.**

While there were but few 60 horsepower cars in use upon the highways of Great Britain, there are likely to be still fewer of them as a result of the new English motor vehicle law which went into effect September 1st. This law puts an almost prohibitive tax upon high-powered cars, jumping in geometrical progression from \$52.50 for 40 horsepower cars to \$105 for 60, and \$210 for those of more than 60 horsepower. Cablegrams assert that automobiles of from 40 horsepower upward now are at a discount—that they are being thrown upon the market almost regardless of price, some new highclass cars costing \$5,000 being offered for \$1,500 to \$2,000, not by some second hand dealer, but by the manufacturer himself. According to the same sources, the favorite car of Great Britain is the fifteen horsepower touring car, and since the passage of the new law the increase in production of the medium powered, medium priced vehicles has been remarkable. The old tax scale provided for a tax of \$10.50 on an automobile not exceeding one ton in weight, and \$21 in the case of a car of more than one and less than two tons, while the new scale is as follows:

Motor bicycle or tricycle, any horsepower, \$5.

Motor car not exceeding six and one-half horsepower, \$10.50.

Motor car exceeding six and one-half, but not exceeding twelve horsepower, \$15.75.

Motor car exceeding twelve, but not exceeding sixteen horsepower, \$21.

Motor car exceeding sixteen, but not exceeding twenty-six horsepower, \$31.50.

Motor car exceeding twenty-six, but not exceeding thirty-three horsepower, \$42.

Motor car exceeding thirty-three, but not exceeding forty horsepower, \$52.50.

Motor car exceeding forty, but not exceeding sixty horsepower, \$105.

Motor car exceeding sixty horsepower, \$210.

**Touring Kink to Protect Varnish.**

When it becomes necessary to carry suit cases or other impedimenta within the tonneau it is a good plan to affix a fairly heavy pad of canvas or carpet to the back of the front seat in order to protect the varnish. Where much touring is to be done and it is customary to carry the hand luggage in such a way, suitable strap hooks may be secured to the back of the seat and the pad fitted with loops on the back side through which the straps may be passed.

**BUILDING FOR BUSINESS NEEDS****Progress Shown by Consideration for  
Service Requirements—Seeking  
for Flexibility.**

Following the example of the stately and illustrious Col. Sellers, the discoverer of any commercial opportunity is apt to measure its possibilities in terms of population rather than on a basis of conservative probability. It is more or less so in the case of the commercial motor vehicle—the over-sanguine automobile enthusiast is apt to think he sees a sales opportunity whenever he beholds a horse and wagon, whereas he only witnesses a possible opportunity to demonstrate the advantages of motor vehicle transportation to a probably unwilling listener. This optimistic feeling, of course, is a part of the old spirit that is wearing away very rapidly; the disappointment that follows its suppression is one of the growing pains that auger hopefully for the future.

Automobile manufacturers who are paying close attention to the business vehicle are learning many things, and one of the most promising signs of their increasing wisdom is the way in which they are beginning to adapt their products to the manifold requirements of the different users, instead of attempting to force the users to adapt their services to fit certain fixed specifications. Flexibility is the word that best expresses the idea; for in order to meet with entire success, the commercial vehicle must be adaptable to a wide variety of uses, both freight and passenger. The manufacturer's aim must be to produce the least number of standard parts, combinations and units that shall be susceptible to assemblage in the greatest number of vehicular products.

It has taken several years clearly to differentiate between the commercial positions of the pleasure and business vehicles. It is now understood that they are at the opposite ends of the scale. The car that is used solely for purposes of recreation is salable, roughly speaking, to anyone who has the price; while the vehicle that is to be used entirely in a business way may be sold only on the basis of a conviction that it will prove an economy over existing transportation methods. A terse and unkindly way of putting it would be to say that one class of machine is intended to assist in the distribution of wealth and the other in its conversation.

Of course, the dividing line between the extremes is indefinite. A three-ton truck used for the purposes of a Sunday school picnic becomes, for the time being, a pleasure car, while many a high-speed runabout is employed by its owner chiefly in utilitarian and business ways. But the dis-

inction is important as illustrative of the real basis of the business wagon, whether intended for freight or passenger transportation. As automobile manufacturers come to this way of thinking they are able to take a sane and un-Sellerslike view of the opportunity that is open in the building and selling of motor cars for business and industrial purposes.

One of the most important points in connection with the installation of motor vehicle systems is the requirement that they shall "fit" the business which they are to serve. This is where the individual service differs from that of the common carriers. The latter determine the nature of their service on the basis of their total run of business; the individual patron must adapt himself to meet the resulting schedules. The power wagon user, on the other hand, adopts a system that is absolutely pliable and that may be adapted to his exact needs in every respect—at least that is the ideal.

One manufacturer may find it necessary to transport one and a half tons of empty paper boxes two miles over cobble stones in the course of the average working day; another may have to haul 15 tons of steel castings five miles over rough country roads and make four or five trips a day; another may be interested in a variety of lines, such that the motor vehicles that he employs will be forced to carry bulky loads at one time and heavy loads of small bulk at another. The service of one user may lie entirely over city pavements with no particular grades; another may be forced to use dirt roads; a third may be located in a hill country, and a fourth may be in need of quick service above all else. Yet in terms of bulk and weight of loads all four may exhibit similar requirements at the outset.

Such differences in demand suggest a portion of the various elements in the manufacturer's problem when he sets out to build commercial vehicles. So long as the motor wagon be considered in the light of a common carrier system in miniature, such variations in requirement need not be considered, but when the motor vehicle is considered in the light of a commercial utility that needs to be nicely fitted into the business of every individual, no matter what his line, no matter how limited or how extensive his need may be, it is essential that the very last details of his work be studied with care and selection made accordingly. By way of corollary, it follows that the prospective user who has not studied his business impartially, who is not familiar with the details of automobile operation, is not likely to be able to determine wisely the nature of the equipment that is best suited to his needs.

As indicating how some of the more sagacious manufacturers of commercial vehicles look at it, it is interesting to observe the marked differences in methods

of advertising and cataloguing pleasure cars and trucks. In the case of the former the possible customer is openly invited to investigate for himself the merits of the proposition and to purchase. Where the commercial vehicle is concerned, however, in several instances the prospect is urged not to buy hastily, but to consult with the manufacturer's expert salesman.

In the back of the catalog will be found, not a "clinching" selling argument, but a series of such suggestive questions such as these:

"How many horse-drawn vehicles are in your employ? What capacity are they? How many horses do you keep for each vehicle? In what sized packages are your goods delivered? How many times in each 24 hours does each vehicle leave your place of business loaded for a delivery trip? How many miles does it cover in one trip? How many stops does it make in one trip? State what kind of streets you must cover. What per cent. grades? Do you have extreme mud or heavy snow? How many men accompany the driver? Does your driver collect money or take receipts when he delivers? If you employ motors what radius of territory do you wish to cover?"

In response to such questions, the up-to-date manufacturer learns enough of the prospect's business to enable him to determine wisely the general nature and extent of the equipment that is required. Not all commercial car builders follow this excellent plan, it is true, but the exigencies of the business fast are increasing the number of those who do carry out the general idea in one way or another.

But what is quite as important as the details of the selling plan is the effect that such a course is having, and is likely to continue to have in the future, upon design. The broad question at once follows: "Does the adaptation of the motor truck to specific uses involve the partial or complete suppression of the stock machine? Undoubtedly it has a most important bearing on the continuance of the complete stock machine; that much already is evident. So, it must have an equally important bearing upon the industry in general; for in reducing the number of stock specifications and increasing the amount of special work on each lot of machines sold, the chance for profit is diminished.

Owing to differences in the bulk of different commodities body sizes cannot be standardized on a basis of net load. Therefore, body design must be carried out largely in accordance with the nature of the loads to be carried. This involves flexibility in specifications sufficient to allow variations in wheel base, overhang and width of load platform.

Similarly, because of the difference in highway conditions in different localities, it is somewhat questionable whether it is possible absolutely to standardize the ratio of engine power to useful load. Indeed,

even three or four years ago one manufacturer announced the plan of adapting engine capacity to load and road requirements at the very outset, being assisted in doing so by the production of several engines of different power that were interchangeable in the standard sub-frame used on all his truck chassis.

Even the question of useful vehicle speeds must be determined to some extent by local conditions, the ratio of final transmission thus depending on the exact nature of the use to which the vehicle is to be put. The same applies to suspension, control, clearance and tire equipment in greater or less degree.

Expressing one method of solution, a New England truck builder has adopted the phrase "master unit system," and divides his product into these five components: first, the engine; second, the change gear; third, the countershaft; fourth, the chassis and springs; fifth, the axles and wheels. By paying suitable attention to interchangeability among these units it is evident that a wide variety of vehicle purpose may be served with a maximum of manufacturing economy. In the unostentatious, though effective, progress of the electric vehicle much the same sort of flexibility and production economy has come into service.

This by no means involves the entire elimination of the stock vehicle; rather, so to speak, the creation of a new stock type for each new variety of service encountered. For it develops upon consideration, that as the business of all express companies, all foundrymen, all tire manufacturers and all flour and feed merchants is closely similar a certain sort of standardization by goods is possible. Such standardization applies to body sizes and structure and to certain other factors as well.

Viewing the commercial problem in this way, its apparent profits begin to dwindle and it loses some of the attractiveness that it possessed at the outset and becomes just an ordinary clean business proposition with most of the glamor left out. Col. Sellers' way of looking at it would have been something like this:

"The city of New York employs 1,000 horses in the business of cleaning its streets and removing potato peelings from your back yard and mine. Now one truck will replace three horses, so there are 333 trucks sold right away."

The modern commercial vehicle salesman begins by figuring, not how many trucks can be placed in a given location, but how few trucks can be employed to accomplish a given amount of work. To Col. Sellers's way of thinking, this would be a suicidal business method, perhaps, but at all events, the salesman who follows these lines and the manufacturer under whose instructions he works are finding this a profitable and not unappreciated method of procedure.

## HOLDS THE MAKERS RESPONSIBLE

**Manufacturer of Well-Known Accessory  
Discusses the Price-Cutting Evil—  
Offers Effective Remedy.**

Editor of the Motor World:

This letter has to do with a matter of such pressing importance to manufacturers of automobile accessories that I doubt if any other general problem today quite takes its place.

Briefly, I refer to price cutting.

As you are well aware, the cut rate house is fast establishing itself throughout the country, wherever trade is best. Its existence, already a serious menace to the regular dealer, whose business has been built up steadily through fair dealing and regular methods, is likewise certain to prove disastrous in the end to the manufacturer.

But there is an ethical as well as a business side to the matter.

The manufacturer looks to the regular and legitimate dealer to handle his product and sell it at list prices—to maintain strictly these prices, moreover, to their mutual advantage, and yet—around the corner, perhaps, from the regular dealer—a cut rate house is offering the same article, and probably advertising it extensively, at a reduced price.

What is the regular dealer to do? What can he do except to pit good reputation and good salesmanship against the heavier odds of low prices? But what of the manufacturer—he who asks and expects the dealer to uphold his list prices? What is he doing?

As a matter of fact the solution of the difficulty is altogether up to the manufacturer.

Ethically, the manufacturer ought to be responsible. His duty to the dealer doesn't cease when goods are sold and shipped. He should see to it that the dealer makes a legitimate profit and is given the same protection that he himself expects from the dealer. Personally, I believe that the dealer is fully within his rights in demanding such protection.

But what I want to prove here is: that every manufacturer, provided only that his product is patented, can effectively stop price cutting, and that, moreover, it is to his own best business interests to stop it.

This company has perfected and had in successful operation for some time a license system, consisting of license labels, tags and bill-heads, all governing the sale of the Klaxon warning signals.

A complete description of the system and its operation cannot be given here, for lack of space, but I will gladly send same, together with specimen labels, etc., to any manufacturer who is interested. With

simple changes it can be applied to any patented accessory.

As to the complete effectiveness of this system I can only say that today, so far as this company is aware, it is impossible to obtain a Klaxon under its list price from any house anywhere.

During the summer past we issued injunctions against ten firms in New York, two in Philadelphia and one in Pittsburg. As a result of these injunctions the above dealers are effectively prohibited from dealing in Klaxon signals at any price, from cataloging them or from securing them from any source whatever.

This summary action may, at first thought, strike the manufacturer as bad business. As a matter of fact, we have proven it to be decidedly good business. The comparatively small trade which it lost for us has been made up many times over by increased business of permanent value from firms of real merit and stability.

Logically and practically that is the way the matter is bound to work out.

We have on file a large number of letters from the trade in Boston, Philadelphia, New York, etc., all of them incited by our campaign against price-cutting, and all of them testifying warmly to their appreciation of our efforts in their behalf.

A manufacturer has only to glance over these letters to convince himself of how vital the issue is to the dealer.

The matter is pressing and the solution is possible and practicable. I trust that the manufacturers will appreciate both these statements and unite at once to protect their trade and themselves.

Yours respectfully,  
F. HALLETT LOVELL, JR.,  
President Lovell-McConnell Mfg. Co.

## Discriminating Between Storage Customers.

Because some of its patrons who store cars in its garage go elsewhere to purchase their gasoline, oil and grease, the Van Automobile Co., of St. Louis, Mo., has given notice that henceforth all such patrons must pay 33½ per cent. more for storage than those who buy their supplies from the Van company. Other St. Louis garagemen are said to contemplate similar discrimination, the profit from the sale of gasoline and oil representing a snug sum in the course of a year, which they are reluctant to sacrifice.

## Street Car Strikers Form Bus Company.

Having failed to win their fight, which twice required that militia be called out, the striking street car employees of Columbus, Ohio, have adopted another means of discomfiting the local traction magnates. They have organized the Columbus Motor Car Transportation Co., capital \$100,000, for the purpose of operating a line of motor buses in competition with the street cars—a novel method of fighting "capital" with its most trusted weapon.

**"REACTION" IN AMERICA DID IT!**

**Caused British Rubber Shares to Slump,  
It Did—Light on This and Other  
Rubber Situations.**

That a "reaction" in the automobile industry of the United States in some way may be responsible for the decline of the rubber market at the present time, was the interesting suggestion offered by the chairman of the Malacca Rubber Plantations Co., of London, on the occasion of its recent annual stockholders' meeting. The Malacca company being one of those concerns that had been held up to investors as a high velocity vehicle to rapid wealth, the showing made at the end of its fiscal year was such as to create consternation among the stockholders. Their fortunes were not being materially increased. The consequence was that the chairman was put to the task of giving a somewhat long-winded and highly ingenious explanation. Incidentally he paid high tribute to commercial enterprise in America "where," to use his words, "there can be no such thing as a permanent setback in any trade."

"Three or four months ago no doubt was entertained as to a maintenance of high values for this year and next year," said the chairman in the course of his "explanation." "Sales of 1911 and even 1912 crops were easily negotiable, and a basis for the valuation of the shares of producing companies was provided upon which all speculation rested. Without any warning, and for no apparent reason, the price of plantation rubber has fallen in the course of four months from 12s. to 7s. per pound, and in the meanwhile there has been no unexpected increase in production."

"From all that one hears the European manufacturers of motor cars are extremely busy, but in the United States a period of unprecedented and feverish activity in the automobile trade has been followed by a reaction. Is there anybody in this room who doubts that reaction will be followed by a recovery? In the United States there can be no such thing as a permanent setback in any trade—(hear, hear)—and so far as the motor industry there is concerned it would appear to be capable of great expansion."

"When hard, fine Para sold at 12s. per pound this price created so little suspicion in the mind of the buyer that he willingly paid a premium for plantation rubber, because of its greater purity, hard fine Para containing about 15 per cent. of water or impurities. Today, when the price of hard fine Para is 8s. the buyer is so convinced that this price is unreal, fictitious, nominal, and the mere consequences of wicked manipulation, that he will not consider it to be a true value, and proceeds to take a

shilling off that price in order to arrive at the real value of plantation rubber.

"Now, whatever the price of rubber in the more immediate future is to be, it is obvious that the price of the shares of a producing company cannot remain unaffected while the commodity which they sell falls nearly 50 per cent. in the course of a few months and in so mysterious a fashion. For the fall in rubber, which must inevitably occur in the course of time as a legitimate consequence of larger production no company is better prepared than the Malacca Company. (Hear, hear.)"

The "hear, hears" are instructive, and the innocent surprise of the chairman, over the fact that consumers who bought enthusiastically at top prices should have been shy buyers at the bottom, is almost amusing. The meeting ended oddly. One wicked shareholder, after making caustic remarks, moved a resolution of want of confidence in the directors. The chairman ruled it out of order. Another shareholder moved a resolution of confidence, but the wicked shareholder's friends demanded that that resolution too should be excluded, and it was done.

Incidentally, as shedding a somewhat different light on the situation, it may be stated as the experience of certain American rubber manufacturers that, insofar as the local market is concerned, nominal price quotations have little real effect on actual sales in considerable amounts. When it is endeavored to take advantage of a low quotation by large purchases, for example, it is said that prices have been found subject to sudden and unexplained fluctuations, which always are sharply upward. Hence although fine Para is now quoted in New York as low as \$1.57 per pound, the manufacturers insist that as far as affecting their manufacturing costs is concerned, it might as well be quoted at either \$1 or \$3 per pound. In other words, the actual volume of rubber sales in New York is held to be so small that it cannot be said to create a "market" in the sense in which the term usually is applied in dealing with the transfer of staples in large bulk.

**Dust Shield and Adjustable Rear Seats.**

By way of a novelty in body design a British builder lately has hit upon the expedient of erecting a glass dust shield at the back of the tonneau. In the original design the glass follows the contour of the body, which otherwise is of the true torpedo type, and is high enough to afford protection for the heads of the passengers. In addition to this feature, the body in question is provided with adjustable rear seats. The seats are individual in form and may be varied in both height above the floor and in inclination, while, upon occasion, they may be reversed, so that the occupants may sit facing to the rear if they so desire.

**NOW RIVALS GASOLENE FOR FUEL**

**Phenomenal Increase in the Use of a Coal  
Distillate—Its Cheapness and Volatility Recommend It.**

While American and Russian exporters of gasoline are fighting tooth and nail for the trade of Continental Europe, and still more violently for that of the United Kingdom, cutting prices right and left, there has arisen a rival to gasoline, which bids fair to play an important part in the future development of the automobile and motor-cycle industry. As J. I. C. Clarke, publicity manager of the Standard Oil Co., said when the question of gasoline supply recently was put up to him, "there is more than enough of the raw product in sight; the difficulty lies in the lack of facilities for distillation of the crude oil." This difficulty of distilling gasoline in sufficient quantities is one which is likely to continue for some time to come.

The recent phenomenal growth of the benzene industry in Germany and the United Kingdom seems, however, to point a way out of the difficulty. Benzene—not benzine—is obtained by destructive distillation of coal; every ton of coal yields nearly two gallons of rectified benzene. Its chemical formula is C<sub>6</sub>H<sub>6</sub> and its chemical name is Benzol. It is the nucleus of the almost unlimited number of organic compounds which make up all organic life, and which are all derivatives of C<sub>6</sub>H<sub>6</sub>. Benzene, however, is an entirely different product. It is manufactured by fractional distillation of crude petroleum and is slightly less volatile than gasoline, which also is one of the products of distillation of petroleum.

The new gasoline is not what may be called a "dark horse." It has been known to the chemical industry for a long time; it is being used by millions of people daily all over the world; but in its application to internal combustion engines it is something of a novelty. For several years benzene has been used in Germany, where it is produced in great quantities, for the purpose of driving motors, automobiles and motor boats, as well as for use in many trades as a general cleansing liquid and in the manufacture of aniline colors. The recent rise in the price of gasoline has given an enormous impetus to the manufacture of benzene, and now the time has come when it not only is imported into France, but threatens to drive out of the French market the gasoline made in America, Roumania, Galicia and Russia.

The gasoline situation in France is an extremely interesting one. There is a duty of 12.50 frs. per 100 kilos (or \$22.50 per ton of 390 gallons) on gasoline manufactured from petroleum. The words "man-

ufactured from petroleum" constitute the joker in the tariff law, for by means of it the 37,000 tons of rectified benzene (90 degrees) which enter into France every year over the German frontier are admitted free of duty, and thereby enabled to compete successfully with the gasolene imported from America. Benzene costs in Paris about 18 francs per 100 kilograms, or approximately 10 cents per gallon, while gasolene costs at least 20 cents a gallon. France consumes annually 19,000,000 gal-

### DEVELOPS NEW DUMPING BODY

**White Produces Special Truck Equipment for Coal and Gravel Haulage—Adopted by New York Contractor.**

After considerable study of a problem, which is far more involved than might appear, the White Co., Cleveland, Ohio, has developed a new form of dumping body for its gasolene truck, the vehicle now

In hauling wet ashes from a power house on the Harlem river at 224th street to a new street which is being filled at Broadway and 240th street, the truck is called upon to transport a load of seven cubic feet a distance of more than a mile. Since being put into service the machine has averaged from 10 to 12 trips per day.

The regular horse drawn equipment which previously had been employed on the work was able to take care of only three and one-half cubic yards of ashes per trip, making on the average from five to six trips a day. The motor truck thus has done four times the work of the horse drawn unit, or, in other words, it has replaced four teams.

As the accompanying illustrations show, the body is of the end-gate type and is built in gondola form. In discharging its load the body is slid back on the chassis until it overbalances and tilts back over the rear of the frame.

### Planning More Motor Truck Tests.

It is getting to be really fashionable to conduct a motor truck test. Following the recent "endurance" affair for commercial vehicles in Philadelphia under newspaper auspices, as noted last week, William R. Hearst saw a beacon and announced similar affairs in Boston and New York, under the lead of his dailies in those cities. There were indications also that he intended to gain publicity and advertising of the same sort along the other links of his chain in San Francisco, Los Angeles and Chicago.

NEW WHITE DUMPING TRUCK LOADING FROM A CHUTE

lons, 14,000,000 of which are imported from other countries.

There is no doubt but that benzene could be manufactured in the United States just as cheap as or even cheaper than in Germany. The coal fields in Pennsylvania offer unlimited quantities of coal of poor quality which is particularly suited to distillation. The products, benzene, tar and coke, always are valuable. There really is no need of fearing a famine in gasolene, for benzene from coal tar can be produced easily and of a high quality.

The benzene made of coal tar differs in many respects from the present commercial gasolene. In the first place it is far more easily evaporated. Carburation is therefore much more thorough and easy. Being free from impurities, it leaves less residue after combustion.

The present production of benzene is distributed as follows: England and Wales, 13,650,000 gallons; France, 5,070,000 gallons; Germany, 27,300,000 gallons.

### Makes Buffer for Rear of Cars.

The Rear-End Buffer Co. is the style of a new concern which has commenced business at 1777 Broadway, New York. As its title indicates, it is marketing a buffer designed to prevent damage to the backs of cars from rear-end collisions.

SHOWING THE TRUCK DISCHARGING ITS LOAD

having been in successful operation for some two months in New York City. This style of body is intended especially for the handling of coal, ashes, gravel and the like, and the first vehicle of its class at present is being employed by the firm of McDonald & Barry, which has a contract with the city.

It appears, however, that he is to be forestalled in the city by the Golden Gate, for the San Francisco Call announces such a contest, in which the San Francisco Motor Club will co-operate. No date for the affair has yet been named, which indicates that great celerity was made in heading off Mr. Hearst.

**MAKING PATTERNS BY NEW METHOD**

**System that Greatly Facilitates Process of Moulding—How it Operates and Compares with Usual Methods.**

Because so much attention has been drawn to the manufacturing economies that have resulted from the development of new and improved machinery it may not be generally known that almost equally important improvements have been made in automobile production in other departments than the machine shop. No more sweeping benefits have resulted than from intelligent study of metallurgical problems, and in this connection ordinary foundry work, particularly in the duplication of large numbers of small castings. Such progress has not always been at the hands of independent experts, but frequently has resulted directly in the automobile maker's plant.

A pertinent example is the adoption of a new method of pattern making by the Maxwell-Briscoe Motor Co., incidental to the recent installation of new machinery and equipment at the Tarrytown, N. Y., plant. The method, which is the invention of Hugh McPhee, superintendent of the Maxwell foundry, has proved so successful in experimental service that a permanent department has been created for its employment, while a new building, especially equipped for aluminum casting, is being added to the bronze and brass foundry in order to accommodate it.

The duplication of small castings naturally is expedited by the use of moulding machines in which the hand labor of "rid-dling," or sifting, the sand over the pattern, as it lies within the flask on the moulding board and then of "ramming" it firmly into place, is performed by mechanical means. By the hand method, one section of the flask, or sand box, is inverted on the moulding board with half of the wooden or metal pattern laid flat upon the board and the sand rammed hard down around it until it is packed sufficiently hard so that the "nowel," as the lower section of the flask is called, can be capsized without disturbing the pattern. The remainder of the pattern then is superposed on the part already embedded in the sand, the matching of surfaces which, in the casting, are to be continuous, being secured by means of dowel pins and sprockets in the two parts of the pattern. Afterward, the upper portion of the flask, known as the "cope," is affixed to the drag and sand rammed into place around the exposed portion of the pattern. When the two portions of the flask are separated thereafter the sections of the pattern likewise separate and each can be "drawn" from the sand, leaving a clear imprint in each part of the flask which, when the two again are matched, will leave

a perfect matrix for the reception of the molten metal in forming the casting.

In the match plate method of machine moulding, this process is rendered much more rapid by duplicating the patterns in metal and attaching corresponding parts to flat plates that form the moulding board upon which the flask sections are placed and the respective halves of the mould prepared. This greatly facilitates the moulding process, the most laborious and hence the most expensive portion of foundry processes, and renders possible the production of uniform castings in casting a great number of small and similar pieces.

The ordinary match plate process in its simplest form, however, fails to be satisfactory when parts are to be cast that have projecting bosses or lugs that do not "part" on the center line—in other words, where there are projections that would overhang in the sand, the simple plate process is not available. It is a modification of this method that has been worked out for use in the Maxwell foundry.

In the McPhee system a master pattern of the required casting first is made in wood. From this enough white metal duplicate castings are made to fill the flask.

By the McPhee system patterns with an uneven parting line are as easily moulded as are those that have a straight parting line, for it is nothing more nor less than a method of mounting the individual patterns on the plate by a special casting, rather than a mechanical fastening process. A master pattern of the required casting first is made of wood. From this enough white metal duplicates are cast to fill the flask in which the moulding is to be done.

A perfect mould of these patterns, both nowel and cope, is then rammed up, and after taking apart the flask and drawing the patterns metal is poured into each impression separately until it is filled flush with the parting line. This is done in each half of the flask and results in a series of half-patterns together with "prints" that correspond to irregularities in the parting line.

Iron frames taking the place of the plates on which the patterns generally are mounted for the machine moulding process then are placed on each half of the flask and a composition poured in completely filling all open spaces. The frames are so formed that the metal is held in place, cross bars acting as a reinforcement for the composition and stiffening the entire plate. The same process also serves to weld the demi-patterns and prints firmly into the frames, and automatically to ensure their exact position with relation to the flask, and so to the duplicate patterns in the other section, which must match perfectly when the two halves are joined in order to complete the mould. When this is done, of course projections on one section that were formed by irregularities in the parting line exactly fit corresponding depressions in the

other section, leaving the open matrix in the exact form required to produce the desired castings.

Even where the plate moulding system is employed on the bench, exactly as plain patterns would be, a great saving in expense is brought about, since it is possible to mould a half dozen or more parts in the time that otherwise would be required in moulding a single piece. But when the plates are used in the moulding machines the work is done so much more rapidly that the extra cost of the patternwork and the machine is wiped out and an enormous saving in final cost achieved. Add to this that the plate-moulded castings are far more uniform than those handled separately and the advantages both of the general process and of such refinement to it as that described as not hard to appreciate.

**Truck Test that Lasted 27 Days.**

Of 34 machines that started in the industrial vehicle trials organized by the Automobile Club of France, on August 12th, no less than 28 finished the extended test, but the winners have not yet been declared. The contenders were De Dion, Latil, Peugeot, Delahaye, Panhard, Berliet and Vinot vehicles, and two Malicet-Blin. Of all the tests in the long series of annual events conducted by the French club, this has been the least appealing to the general public, owing to its technical nature; nor is the condition materially remedied by the delay occasioned by the tardy action of the committee in charge, which still is engaged in working out the fuel and oil consumption records of the entrants in order to determine the winners. Unlike the "endurance tests" promoted by some American newspapers, this French trial was a very severe one, extending over four weeks.

**Nightwork that Led to Jail.**

Working at night may be a commendable act when performed by a young man anxious to make a little extra money, but when carried to extremes is likely to land the over-anxious one in jail. At least that was the experience of Harry Konover, of Trenton, N. J. He was employed as machinist in a garage, and after his regular hours did odd repair jobs all over the town. He, however, was somewhat liberal in his views, for he utilized his employer's supplies, tools, accessories, etc., in making these repairs or replacements, with the net result that he was arrested on complaint of the garage owner, the Mercer Automobile Co., charged with grand larceny of \$200 worth of tires, magnetos and lamps.

**Reed that Changes Tone of Horns.**

The General Novelty Mfg. Co., 3972 Olive street, St. Louis, Mo., is marketing what is styled Bishop's bullfrog horn reed, which is designed to render the tone of bulb horns sharper and more commanding. The reed is applicable to all sizes of horns.

## FEW CHANGES IN THE THOMAS

**Buffalo Manufacturer Has Closed-Front Bodies, of Course, but Mechanical Essentials Remain Unaltered.**

Although it is now two and a half years since a half dozen motor cars commenced the great and only New York to Paris race, the memory of the feat still lingers and the prestige that the winning Thomas car achieved by outstripping its competitors continues to shed luster on the reputation of the E. R. Thomas Motor Co., of Buffalo, N. Y. And it is noteworthy that although sundry new features have been added to the line and alterations made which are by no means of minor importance, the general construction of the machine remains about the same as that embodied in the round-the-world model. Indeed, be-

Technically, this particular chassis model is in only its second year. In point of general design, method and materials of construction, and in respect to workmanship, however, it is strictly in the same class with the remainder of the extensive line. As for its individual characteristics, it has the long-stroke motor, the cylinder dimensions being  $4\frac{1}{4}$  by  $5\frac{1}{2}$  inch bore and stroke, the large valve areas and shaft drive that distinguish the smaller from the larger of the two Thomas six cylinder chassis models. As compared with last year, it has been altered but very slightly. A double jet form of carburetter now is used, in place of the single jet type formerly employed, and in consequence the speed range of the motor has been increased. The driving ratio now is 33-7 to 1, instead of 3 to 1, and the car speed range on high gear now is quoted at 3 to 55 miles an hour, instead of 5 to 55.

The equipment, which is very liberal, includes, uniformly for all models, the top,

ing the top and wind shield, luggage carrier, combination oil and electric side and tail lights and cigar light, together with a suitable equipment of the 40 horsepower line.

The Thomas town car chassis is a third important factor in the line and is suitable for use with either of the three favorite types of body that are considered especially adapted to city and suburban use, namely, the cab or brougham, landaulet and limousine. It is of the same form as hitherto, having the block type motor of four cylinder formation and 28 horsepower output; and the selective change gear, mounted in the waist, and double jointed propeller shaft that were adopted last year.

### Riga Doubles Its Demand for Cars.

Although the number of automobiles in Riga, Russia, has doubled within a year, the American consul there reports that the United States has had no share in the business. There is not a single American automobile on the market, nor was it possible to sufficiently interest the local dealers in the American product. The principal reason appears to be the unfavorable conditions for payment. Nobody can be induced to pay cash in advance for a machine the durability of which is not sufficiently known, and this is the case with American machines. One American machine is well introduced in St. Petersburg because it has a special representative looking after the business in that city. This consulate has suggested that the St. Petersburg agent appoint a subagent in Riga.

### Moline Again Enlarging Its Plant.

Having completed the resurfacing of its quarter mile cement testing track, the Moline Automobile Co., Moline, Ill., is erecting in the center of the plot a large and thoroughly modern chassis testing building. This structure will incorporate a novel feature in that the heating pipes will be placed in the concrete flooring, thus providing against the cold floor so often complained of by workmen in cement buildings which are more or less open to the weather. The R. & V. Engineering Co., of Moline, which produces gas engines of all sorts and which is closely allied with the Moline Automobile Co., also is enlarging its plant.

### Why Grease Cups Should be Probed.

It is equally important with the regular filling of the grease cups, which discerning manufacturers now distribute so liberally about the machine, to see that the passages leading from the cups to the bearings that they feed are free from obstruction. It is a good plan occasionally to run a wire through the hole in the bottom of the cup and down into the duct to which it leads in order to make sure that it is not clogged with hardened grease or some more serious impediment.

THE NEW THOMAS "6-40" CLOSED FRONT TOURING CAR

tween the models announced for fall and spring delivery and those produced during the past spring and summer, there are but few points of distinction.

As is the case in so many instances just now, the chief element of novelty in the so-called "new" models, lies in the adoption of closed front bodies, either in the outright torpedo form or in the rationalized four door touring car equipment. As in all the Thomas products the new bodies that have been built for the more radical class of customers reveal not a little ingenuity of line and finish, though introducing no very startling divergence from what may be termed standard body design. The accompanying illustration shows one of the new "6-40" cars, E. L. Thomas, general manager of the Thomas company, seated behind the wheel. The same general effect as is here produced is secured in the mounting of both the seven and five passenger closed front cars that are built for the six cylinder 40 horsepower chassis. By way of a somewhat more racy offering, there is also the Torpedo Flyer, so-called,

glass wind shield, speedometer, shock absorbers, head, side and tail lamps, horn, tire irons and Prest-O-Lite gas tank. In addition to the three closed front models mentioned, the same chassis is sold with touring bodies for either five or seven passengers, "Flyabout" and "Tourabout," limousine and landaulet bodies. The five passenger touring car, "Flyabout" and "Tourabout," are listed at \$3,750 now, instead of at \$3,500. The prices of the other types are, respectively: Seven passenger touring car, \$3,850; closed front touring and "Flyabout," \$3,900; closed front seven passenger touring car, \$4,000, and limousine and landaulet \$5,000 and \$5,100.

The "6-70" model chassis, which is the heavier, chain driven pattern of chassis, is produced, practically, in the same form as heretofore, with seven passenger touring, limousine and landaulet, "Flyabout" and single and double rumble runabout bodies. This machine has a more elaborate equipment even than the one previously described, its allotment of accessories includ-

## FIRE HORSES TO BE DISPLACED

**New York City Makes First Serious Move in that Direction—Big Orders Placed for Automobile Apparatus.**

Although only a couple of months ago Edward F. Croker, chief of the New York fire department, classified the rumor regarding the instalment of additional motor equipment as "mere talk," this talk rather suddenly has become an established fact. For not only has the department let contracts for the building of five automobile hose-wagons and one combination motor-propelled and pumping engine in combination with a hose wagon, as well as for two 1½ ton trucks, and has asked for bids on an aerial hook and ladder truck of self-propelling design, but there is every probability that the horse as a tractor of fire engines soon will be a thing of the past in New York City.

Commissioner Waldo, when seen in his office at 157 East 67th street, by a Motor World man, spoke in an optimistic tone about the efficiency of the modern motor fire truck and its economical operation. He let it be understood that in all probability the equines now utilized in the departmental work will be permitted gradually to "die out," i. e., when replacement of engines becomes necessary hereafter such replacement will be accomplished by suitable installation of motor-propelled engines. Ultimately—in a few years at the most—there will be nothing but motor-driven fire engines in Greater New York.

The specifications inviting bids for the machines which have been ordered were exhaustive and carried down to the minutest details. Among other things they stated: "No bid will be considered from any contractor who has not manufactured and had in operation at least 25 chassis with the type of engine transmission, ignition and lubricating systems, which it is proposed to furnish under the following specifications."

This clause narrowed possible bidders down to a small number, and of these the Webb Motor Fire Apparatus Co., of St. Louis, Mo., carried off the biggest order, one calling for five automobile hose wagons and one smaller combination wagon. The accepted price for these six vehicles was \$5,350 each for the hose wagons, and \$4,350 for the smaller combination truck, or a total of \$31,100. The Knox Automobile Co., of Springfield, Mass., received the contract for the gasoline propelled pumping engine at \$8,500, and for the two 1½ ton trucks costing \$6,205. No other bids were considered, although the Alden-Sampson Co., of Pittsfield, Mass., the W. Walter Mfg. Co., of New York City, and two smaller concerns submitted tentative terms.

No bids whatever were received for the

aerial hook and ladder truck, which has been made the subject of very exacting specifications. Not only is the material, the springs, frame, size of wheels and tires, ignition, carburation and lubrication named in detail, but the field of possible bidders is restricted by the requirements as to the propelling mechanism, the guarantee of the manufacturer to repair the truck free of charge within two years of purchase time (excepting in the case of an accident not due to the mechanism of the car), and the details of the ladder equipment. Most interesting of these special requirements is that referring to the propelling mechanism. It is distinctly stated that the driving power is to be electricity, supplied by a power-driven generator; the power to be applied to each wheel through electric motors, the motors being enclosed in and geared to the wheels. These motors are to be of three horsepower each, having a momentary overload of 200 per cent., the mechanical losses through the gearing not to exceed 3 per cent. These motors must be of standard design and be produced by a responsible manufacturer, so that spare and repair parts may be obtained at any time, all parts being strictly interchangeable. The steering is to be through all four wheels; front wheels to be operated by large hand wheel, with worm and sector on axle; rear wheels to be operated by similar gearing, but wheel removable from shaft, and shaft removable from gear and axle.

The generator to be used in driving these trucks must be specially designed for this class of work. The maximum rise of temperature in any part of the generator after an hour's run, under the average operating conditions, shall not exceed 40 degrees C. It is to have an overload of 200 per cent. for two minutes. Its frame is to be of cast steel with heavy aluminum bearing houses. Bearings shall be of plastic bronze, easily removable, dust-proof and lubricated by means of oil reservoirs and rings. The armature shaft shall be turned from one piece of 35 point of carbon steel, the flange for coupling with the engine being integral therewith. The winding and insulated parts of the generator shall be subjected to a high potential test of 500 volts alternating current for one minute between windings and ground.

There are but three or four companies in America making a specialty of such propelling mechanisms as specified for these aerial ladders, and as none of them reached out for the order the fire department again has published the specifications inviting bids, and it is expected that either the Couple Gear Freight Wheel Co., of Grand Rapids, Mich., or the Commercial Truck Co. of America, Philadelphia, Pa., will submit at least tentative figures. In the meantime the building of the hose wagons and small trucks has started, and they shortly will be installed in the most important engine districts.

## FAVORS MOTOR FIRE APPARATUS

**Massachusetts Fire Chief Enthuses Over Its Efficiency and Economy—Springfield has Happy Experience.**

"We have thoroughly tested motor apparatus for our fire department and have found it more feasible, faster, less expensive and easier to handle than horses. We have put \$20,000 into our present equipment. We have \$40,000 more to spend, and our present outfit will be more than doubled shortly. In five years I predict that there will be no horse-drawn apparatus on the Springfield department."

This striking tribute to the efficiency of the motor vehicle in the special and exacting work of fire-fighting apparatus was paid by Chief W. H. Daggett, of the Springfield (Mass.) department in the course of a recent interview. The statement followed the announcement that Springfield's present equipment of five automobile pieces is about to be augmented by the installation of an electrically driven hook and ladder truck having an 85-foot aerial ladder while another truck of the same kind is to be put into service later, and, within a year's time, four additional motor vehicles of various descriptions.

During the two and one-half years that automobile apparatus has been in use in Springfield, the annual fire loss has decreased by a striking amount, despite an increase in the number of fires. In the two periods from December to December 1906-7 and 1907-8, the first year the self-propelled equipment was in use and the year previous, for example, the net saving to the city was more than 80 per cent. on the total annual fire loss, or from \$535,549.74 in 1906-7 to \$88,690.38 the following year. At the same time the number of fires increased from 498 in 1907 to 530 in 1908.

"Three or four years ago, one of the fire commissioners began to think favorably of the plan to try an automobile in the department and secured the money for its purchase," said Chief Daggett in explaining the success of the new form of equipment. "Auxiliary apparatus was first installed. The scheme worked, the citizens began to see that the efficiency of the fire fighting work was being increased, and gradually money was appropriated to purchase trucks, and later to build new buildings intended only for autos.

"In less than three years, therefore, we have acquired five pieces of apparatus, namely, a chief's car, an assistant chief's car (both equipped with searchlight, extinguishers and axes), two auxiliary squad cars carrying nine men and two chemical combination wagons.

"At first we had intended to keep ac-

## THE MOTOR WORLD

### PULLMAN'S CLOSED-FRONT CAR

Wherein Its Body Differs from Other Four-Door Models—Mechanical Features in Common with Pullman Line.

curate track of the cost of each machine for comparison with the cost of horses, but we soon found that this was impossible with the machines of the chief and the assistant chief. As soon as the experiment was known to be well under way, visitors from all over flocked in to see how the scheme was working and the two machines have been in constant use for showing these people around. Their expense therefore cannot be said to be a normal one.

"But with the hose wagon it has been possible to do this. Previous to the use of automobiles, the expense of a pair of horses for their feed, bedding, horse-shoeing, veterinary care and other items, had been about \$600 a year.

"The figures for the fiscal year just passed, as well as for the year before, show that the chemical wagon and each auxiliary wagon have cost about \$18 a year apiece.

"This expense has been for gasoline, fixtures and repairs, and has excluded the cost of tires. This latter item, which motorists might expect would be a large one, we do not expect to find so. In the first place the fire automobile does not make the mileage that an ordinary machine makes. We have found that in the average year each piece of apparatus goes to about 150 fires, and that an annual mileage of 750 would be large. So there is not much wear and tear, and I am sure that we can make a contract for tires that will come to a very low figure.

"Now, that this apparatus has proved a success, we are going ahead for more. So far we have spent about \$20,000, and as yet have not touched an appropriation of \$40,000 for additional automobile wagons.

"In a week's time, however, we expect to get an 85-foot aerial ladder, which is guaranteed to make 20 miles an hour. It will be made along special lines, however, that have never before been utilized in fire departments.

"Electricity will be the propelling force, and in each wheel there will be a motor of three horsepower, and capable of 200 per cent. overload. The truck will weigh ten tons, and we do not have to accept it unless it makes 20 miles an hour, which is a far higher speed than the horses on a truck of this sort attain.

"As soon as this apparatus proves a success our present 85-foot truck will immediately be converted so as to run by electricity. And the truck propelled in this way will have an additional advantage in the fact that both sets of wheels turn, so that the whole affair can be turned around in its own space.

"Already one of our new fire houses, built without any provision for horses, is well under way, and a second has been started. In the new headquarters station will be housed our great water tower, which will be towed by an automobile. Already, in fact, three of our machines have been equipped with towing apparatus."

As the number of closed front bodies multiplies in the market it becomes apparent that despite the simplicity of the idea involved there is room for the utmost variety in its execution. No two respective makes of closed front touring bodies are exactly alike, even though they may be similar to a marked degree, any more than two makes of open front touring body are exactly alike, despite striking similarity.

THE PULLMAN IDEA OF CLOSED-FRONT CARS

In the long series of new-style bodies which have been brought out within the past few months, for example, none has been exactly like the new Pullman creation that has been designed for the model "M" chassis of the Pullman Motor Car Co., York, Pa., whose productions have earned the right to be reckoned with.

Although the new Pullman line was announced several weeks ago, it was then stated that a new form was being developed for the largest model of the trio; and this is shown by the accompanying illustration. Its claims for distinctiveness rest upon the fact that the front doors and the dash, which are of the same height as the bonnet, are lower than the rail between the front and rear seats, while the hand rail at the end of the rear seat is still higher. The result is a sort of char-a-banc effect, very suitable for so large a car as the Pullman "M."

The car in question is of 50 horsepower, driven by a four cylinder motor of  $5\frac{1}{4}$  by 6 inches cylinder dimensions. It has four-speed, selective change gear, shaft drive, 127 inch wheel base and 36 by  $4\frac{1}{2}$  inch tires. The front axle is drop forged of I-beam section; the rear one is of the Timken full floating pattern.

Very solidly built throughout, the car is of characteristic Pullman construction, save in point of the engine cylinders, which are separately cast, as in the model "K," and in the number of speeds secured by the

gearset. It has double ignition, with Bosch magneto, and is equipped with oil and gas lamps, generator, top and tools.

#### Telling the Story of the Stearns.

"White line radiators" are pretty well known, but in order that the details of the car behind the white line radiator should not be overlooked, the F. B. Stearns Co., Cleveland, O., has just brought out a new catalog in which they are very fully explained and picturesquely illustrated. Rather a good idea in connection with the embellishment of the crisply assertive text matter is the use of panel pictures which show different portions of the car and also portions of the shops in which they are completed. The result is that the

reader is given a good impression both of the method of design and the manner of construction. The models described, of course, are the very latest series of what its makers are pleased to term "The ultimate car," which already have been dealt with in these columns.

#### What Sometimes Affects Braking Force.

In cars that have been designed without due reference to the layout of the braking system it sometimes happens that the surging of the chassis over the axles has a very marked tendency to alter the force with which the brake shoes are applied. The difficulty arises when the radius of motion of the brake rods is shorter than that of the radius members that regulate the position of the back axle. In such cases, the obvious thing to do is to adjust the brake linkage when the springs are loaded down to about the average position that they occupy when the car is on the road.

#### Overhauling a Water-Jacketed Carburetter.

Two important points must be considered in connection with the overhauling of a carburetter that is equipped with a water-jacketed mixing chamber. One is to see that the piping is properly connected in order to secure a natural flow of water through the jacket. The other is to make sure that the connections are perfectly clear and free from deposits and encrustations.

**SELDEN ANNOUNCES NEW STYLES**

**Closed Fronts in Four Models Including  
Three Passenger Roadster—Longer  
Wheel Bases and Larger Tires.**

Five distinct models, not including runabout variations, will be produced by the Selden Motor Vehicle Co., Rochester N. Y., during the coming year, and they will be calculated to afford the purchaser all the option a reasonable motorist possibly could require when selecting a car of 40 horsepower, or 36.1 horsepower, as the Selden is rated. In making this announcement it is disclosed that the variety is not secured

roadster forms. The accompanying illustration shows the four passenger style, known as model "44." The distinctive elements of the class, which are shared by the four passenger touring and roadster models, "46" and "40-R," as they are catalogued, and, to some extent, by model "45," a closed front touring car seating five passengers, readily are apparent.

Following the spirit of the torpedo the sides are made absolutely flush, the door handles being placed inside and the exterior left free of mouldings, while the hood is flared slightly toward the dash, the latter being of the scuttle type, and tapering out at the sides to a smooth curve where it joints the surfaces of the sides. The mud guards also are distinctive, being drawn

the shape of a readily removable sod pan which is held in place by means of spring fasteners. With one exception, all new models have two universal joints in the propeller shaft, instead of one, such as was used before in connection with the enclosing torque tube construction. That arrangement, however, is retained in the case of the five passenger touring car "40-T," because of its suitability where the wheel base is short.

All models are to be sold with a liberal equipment of fittings and accessories, the allotment being practically uniform with all models. It includes top, curtains, slip covers, wind shield, headlights and Prest-O-Lite gas tank, side and tail oil lamps, tire irons, horn and the usual outfit of tools.

**Opening Bermuda to Modern Methods.**

Replacing the lighterage and packet-boat methods of freight transportation that have obtained hitherto, an automobile freight line is being formed in Bermuda, according to consular advices. The undertaking, which is being organized by leading business men on the island, will be capitalized for \$100,000, and a bill for its incorporation will be presented at the next session of the legislature. It is planned to get into operating condition by the first of January next. How significant is the movement will be appreciated from the statement that at present the local transportation methods are of the most antiquated order, the final installation of the proposed 'bus line, indeed, awaiting an amendment to the present law which forbids the use of motor vehicles of any sort on the island.

**Economy of the Motor Fire Engine.**

According to the report of the fire chief of Alliance, a saving of \$349.27 was effected by the use of a motor-propelled engine in that little Ohio city during a period of 11 months, as compared with the team of horses previously employed. The expense for the motor fire engine for this period was \$78.41, including all supplies and all repairs to tires. As the effectiveness of the motor fire engine was at least twice that of a single team engine, the citizens of Alliance are rather inclined to pat themselves on the back for their wisdom in making the investment.

**Furniture Mover Makes a Record.**

What probably is a record for long-distance furniture moving by motor truck was accomplished last week when a Frayer-Miller truck loaded with three tons of household goods, valued at over \$5,000, ran from Boston, Mass., to Bristol, Me., in three days, making about ten miles an hour average speed over the rough country roads. The truck is one of several owned by Warner & Co., furniture movers, Boston.

THE NEW SELDEN FOUR PASSENGER TORPEDO

merely by mounting different bodies on a single size and style of chassis, as sometimes is done, but that two distinct styles of chassis will be used. Both chassis, however, will be equipped with the same type of motor, and in respect to most essential features will be similar.

In producing the new cars but few changes have been made, the motor and change gear being of the same style that at present is in use. The dimensions of the engine are  $4\frac{3}{4}$  by 5 inches, bore and stroke. The clutch is of the plain cone type, and the change gear is of the selective order, affording three forward speeds. The two new chassis, which are used for the closed front bodies, are made with drop frame and 125 inch wheel base; the straight line frame that was employed last year still being used on the remaining models. Tire sizes have been increased, 36 by 4 by 4 being the standard for all except the seven passenger touring model, which has  $4\frac{1}{2}$  inch equipment on the rear wheels. The previous models, it may be mentioned, had 34 by  $3\frac{1}{2}$  by 4 inch tires, save for the seven passenger model.

The most striking alteration, naturally, is in the appearance of the closed front models, which are produced in six and four passenger touring and three passenger

practically in straight lines with short radius curves in the angles. The four enclosed models have semi-elliptic front springs, 38 by 2 inches, and three-quarter elliptic rear members, 51 by  $2\frac{1}{2}$  inches in size, the latter being an innovation in this line.

The standard touring models, in five and seven passenger styles, are designated as "40-T" and "40-S," respectively. They follow pretty closely the form of the cars that have been produced during the current year, but partake of such general refinements as have been introduced into the entire line.

Such changes as have not been mentioned already include the elevation of the oil pump and timer to a point higher up between the cylinders than that which it formerly occupied, it thereby being rendered more readily accessible; the placing of the oil filler for the crank case in a more convenient position, a similar improvement in the relation of the oil level gauge with respect to surrounding parts, and the use of an endless fan belt, which is so arranged that it can be replaced without dismantling the pump shaft.

The three entirely new models, "44," "46" and "40-R," as well as model "45," are provided with a new and desirable feature in

## PITS MOTOR AGAINST THE HORSE

**Maxwell Inaugurates Unique Six Day Test**  
—Guarantees Two Cents a Passenger  
Mile to Purchasers.

Pitting the small runabout directly against the horse and buggy, the Maxwell-Briscoe Motor Co., Tarrytown, N. Y., has instituted what may be termed a living demonstration or parallel. For the purpose a horse and buggy and a Maxwell runabout are making a six days' competitive cost trial in New York, each being driven five or six hours a day, the distances and items of incidental expenditure carefully being noted and checked by impartial observers appointed by the contest board of the American Automobile Association. The practical side of the program is an offer to sell to any resident of Greater New York and vicinity a Maxwell model "Q-11" runabout with a positive guarantee to return the purchase price, less two cents per passenger mile for each mile traveled, if, at the end of 60 days, it is found to have cost more than that to operate.

The tests for Monday and Tuesday employed routes on the streets and boulevards of Manhattan and Brooklyn, Long Island City and Jamaica, respectively. Wednesday the scene was transferred to Newark and Jersey City and today (Thursday) Staten Island is being invaded.

During the first two days of the trial, the respective costs worked out at one and one-third and three cents per vehicle mile for the runabout and the horse and buggy, respectively, using round numbers, while the costs per passenger mile were a fraction over six-tenths of a cent for the car and nearly two cents for the horse and buggy. In figuring the cost of the mileage 17 cents a gallon is allowed for gasoline, 65 cents a gallon for oil, 25 cents per peck for oats and one cent per pound for hay. The record in detail is as follows:

### Automobile.

	Monday	Tuesday	Totals
Mileage .....	67.4	76.1	143.5
Gasolene .....	\$0.85	\$0.92	\$1.77
Oil .....	.15	.12	.27
Total costs.....	1.00	\$1.04	\$2.04
Comparative cost			
per mile.....	\$0.014	\$0.013	\$0.0135
Cost per passen-			
ger mile.....	0.007	0.006	0.0065

### Horse and Buggy.

Mileage .....	28.8	35.5	64.3
Oats .....	\$0.75	\$0.75	\$1.50
Hay .....	.20	.20	.40
Totals .....	\$0.95	\$0.95	\$1.90
Comparative cost			
per mile.....	\$0.032	\$0.026	\$0.029
Cost per passen-			
ger mile.....	0.016	0.013	0.0195

The two-cents-a-mile sales guarantee, which is in some respects the more re-

markable feature of the campaign follows:

"We will sell a 1911 model "Q" Maxwell runabout (4 cylinder, 22 horsepower, sliding gear transmission) made for attachable rear seat, and we will give you a positive guarantee that it will not cost you to operate it more than two cents per passenger mile. This guarantee will provide for each car we sell under this offer, that it shall be equipped with an odometer or speedometer, and at the end of 60 days, if the car has cost to operate over two cents per passenger mile, we will return to you, at your request, the money you paid us for the car, less two cents per mile for distance traveled, minimum of \$1.00 per day charged for its use."

### Radiator Without Seams or Joints.

By the acquisition of the sole manufacturing rights for America under the do-

mestic and foreign patents of the Societe des Radiateurs et Refrigerateurs, of St. Ouen, France, the McCord Manufacturing Co., Detroit, Mich., has been enabled to produce a type of radiator that is made in the form of a solid copper block without joints or seams of any sort. The special processes employed result in the formation of a true honeycomb structure with hexagonal air tubes, as the accompanying illustration shows, increasing the radiating efficiency of the apparatus and at the same time precluding all possibility of the leaks that arise from poorly made joints and seams or those which have been strained in service. While the exact details of the process are not revealed, it is indicated that it is largely electrolytic in its nature. The construction is known as "le Sans Soudure" in France, where it has been adopted by a number of well-known makers, and though the McCord company has not definitely decided on the name under which the American product will be marketed the characterization "solderless" seems to suit it very aptly. At the present time an engineer from the French works is at the factory in Detroit, installing production machinery, while sample radiators are being made for a number of automobile manufacturers. The elimination of from 6,000 to 10,000 soldered joints effected by the new method is claimed to be revolutionary in its nature.

## MAY BE DUE TO POROUS PISTONS

**How Poor Castings Sometimes May Cause Losses of Power—Replacement the Most Certain Remedy.**

It is likely that if some motors, particularly those of the cheaper grades, that occasionally exhibit strange and almost inexplicable losses of compression, were to be fitted with one or more new pistons the difficulty immediately would disappear. Peculiar as the assertion may appear it is based on the well-substantiated fact that occasionally an engine may be sent out with one or more pistons the metal of which is sufficiently porous to cause trouble. With a well tested engine, of course, there is little likelihood that such a defect can escape detection, since carefully conducted dynamometer and compression tests soon reveal any serious loss of compression. With engines of the sort that are turned out in great quantities and given little more than a tryout for adjustment, however, it sometimes happens that a piston casting that is either porous or possesses one or more minute blow-holes may get into service unnoticed. Several instances of the sort have come to light.

In such a case, of course, the effect will be noticed only when the motor is thoroughly heated and generally only when it is working slowly under heavy load, as for example, when climbing a long hill. At such times the piston travel is so slow that the slight leakage through the pores in the piston may have a noticeable effect on the compression, the heated condition of the piston head serving to enlarge the openings to more than their normal area. With the same temperature in the metal, but with the engine running at high speed, the same rate of leakage, naturally, would have less total effect in reducing compression.

Such a defect, of course, is purely a constructional one and is about as difficult to remedy as it is to locate. A piston that is found to be defective in this way should be replaced with a new one. At the same time it is possible to fuse the upper surface and so heal the little pores by the well-directed use of the autogenous blowpipe. As it is extremely difficult to develop the high heat necessary for such an operation without injuring the bearing surface at the sides or cracking the metal, it had better not be undertaken save by an expert.

### The Cleaning of Stained Greys.

"Battle-ship" grey and other dull and unvarnished body surfaces that have become stained may be cleaned by means of gasoline or, that failing, with kerosene oil. If the oil is used, however, it will be found necessary to go over the entire body in order to avoid visible stains.

# Rambler

**Fifty-Four Toy Tonneau**  
With lamps, Prest-o-Lite tank or generator, magneto,  
storage battery, horn and tools, \$2250.

*Gear shaper cutting Rambler  
bronze gear. The workman  
stands ready to gauge the gear  
for accuracy when completed.*

Silence, smooth running qualities and perfect balance have been attained through the careful grinding of Rambler parts and their accurate fitting. Reciprocating parts, such as pistons, connecting rods, crank shafts and fly wheels are weighed and balanced to eliminate vibration. These points alone illustrate the superiority of the Rambler engine.

## **The Thomas B. Jeffery Company**

**Main Office and Factory, Kenosha, Wisconsin**

**Branches: Boston, Chicago, Milwaukee, Cleveland, San Francisco**

### Chauffeurs' Scheme that Miscarried.

Despite the ingenuity which some chauffeurs, or would-be chauffeurs, develop in their attempts to get around the provisions of the Callan bill, these attempts rarely end successfully. Attorney-General O'Malley a few days ago was advised that a number of chauffeurs who had failed to pass the examination as professional chauffeurs were trying to circumvent the provisions of the Callan law, by buying a dollar's worth of interest in the automobile they desire to drive, and then register themselves as "part owners," thereby dodging the chauffeurs' license requirement. As they, however, keep on getting a salary for "chauffeuring," the scheme miscarried, for the attorney-general very naturally ruled that all persons driving a car for wages or for hire must have chauffeurs' licenses.

### One City Official Ends Joy Riding.

Comptroller Prendergast, of New York City has decided that there is entirely too much joy-riding being done on city-owned automobiles, and that the up-keep expenses of the cars are out of all comparison to the real service which they accomplish for the good of the city. Therefore the automobiles belonging to the finance department will be sold, and when necessity demands cars will be rented under contract, for which service the comptroller expects to pay about \$450 per month. As the four cars at present used by the department cost \$15,000 per year, chiefly for "repairs," Mr. Prendergast figures on a saving to the city of about \$9,000 per year.

### To Teach Motoring in High School.

Due to conditions made possible by John Hays Hammond, the mining engineer, who has a summer home nearby, motoring is to be given a place in the curriculum of the Gloucester (Mass.) high school. The professional chauffeurs are said to have made strenuous objections to their vocation being made as common property as the other indispensable branches, but some of the smaller colleges have tackled automobiling in a dilettante way for a year or two, but it remained for the Gloucester folk to start that business in the high school.

### Automobile Funeral "Scandalizes" Paris.

According to the cables, Paris has just had its first complete automobile funeral, although the city has long boasted several motor hearses. The gasoline obsequies moved at such a rate as to scandalize cynical observers. "As if the dead did not vanish quickly enough!" says one chronicler.

### One Market the Horse Holds Safe.

Hippophagic butchers, is the designation applied to the increasing class of meat dealers in France who handle horseflesh, the consumption of which at present is

said to exceed 200,000 animals a year in Paris. That city has about 600 shops where little other meat is sold, and they are not confined to the poorer sections of the city, either. The average price of the horse meat is about 12 cents a pound, but the low cost is not the only cause of its popularity. It would cost much less but for the tax designed to encourage breeding in France. These facts make evident that Dobbin will long continue in the market, no matter how rapidly motor trucks may multiply.

### When Motor Car Meets Coal Truck.

E. Willis Welch, of Riverhead, L. I., probably banked too much on the strength of his touring car, or underestimated the stability of a loaded coal truck, when he tried to bump the latter out of his path. For the net result of the attempt was a thoroughly smashed car and a broken arm belonging to its driver. The coal combination of man, team and truck was not damaged in the least. In order to obtain at least a financial balm for his hurt feelings he has sued the company for \$300 damages. The automobile crashed from the rear into the coal cart, which was being driven along the road at a pace that was too slow for the impatient Mr. Welch.

### Magistrate Makes a Queer Threat.

Although the officially appointed taxicab inspectors of New York City repeatedly have admitted that there is no law in existence which can compel "taxicabs" to carry taximeter instruments on their cabs, Magistrate Herman, sitting in the Harlem police court, threatened a driver with a \$50 fine when the latter proposed to take off the taximeter and drive without one, charging \$1 per hour under the New York City hack license law. The magistrate apparently had not heard of the suit pending between the Universal Taxicab Co. and the city of New York, in which the Supreme Court decided the point involved.

### Mail Collecting Not Minus Excitement.

It is to be feared the collection of mail by automobiles would not prove a success, if the result approached the record made last Monday by Charles Black, a chauffeur, who had a busy day in Washington. He wrecked two automobiles, smashed a carriage, probably fatally injured a mail collector, bruised another person and sent two horses to the hospital.

### Abbott Heads Duluth's New Club.

Duluth (Minn.) automobilists met last week in the Zenith City and formed the Duluth Automobile Club with nearly a hundred charter members. Howard T. Abbott was elected president, while the other offices were divided as follows: Charles H. Thornton, vice-president; Casius Bagley, treasurer, and C. F. McCarthy, secretary.

### Capetown to Cairo by Motor Car.

The automobile journey which probably will rank next to the not-to-be-forgotten New York to Paris "race," in the annals of motordom at least, will be started in the early part of November, when, it now is announced, B. F. J. Bentley, an English explorer and ardent motorist, and Captain R. N. Kelsey, a veteran of the Boer war, will undertake the trip from Capetown, South Africa, to Cairo, Egypt, a distance of 6,000 miles, in an almost due north direction. A journalist and a bioscope operator will be the other members of the party of four which will try to make this trip. The route as laid out will be as follows: Capetown, Bloemfontein, Victoria Falls, Livingstonia, Bismarckburgh, Lake Tanganyika, Visumbi, Kodok, Khartoum, Wadi Halfa, Cairo. The greatest trouble probably will be the fuel supply in Equatorial Africa, as north of the Zambesi and south of Lake Tanganyika no motor vehicle yet has penetrated. The trip is scheduled to take about four months.

### Local Communities Arrange Reciprocity.

While the inhabitants of New York City may not enter Hoboken or Jersey City via the automobile route without paying a license fee, the authorities of Cincinnati, Covington and Newport, although located in different states, have reached an agreement under which the three cities will be practically one big city, as far as traffic regulations, etc., are concerned. Ohio owners of automobiles and other vehicles will be permitted to travel in the streets of the Kentucky towns, and vice versa, without the red tape of registration, licenses, etc., heretofore exacted.

### Cuba's Move to Encourage Touring.

The Treasury Department of the republic of Cuba has given notice that henceforth automobiles taken to the island by tourists will be admitted free of all duties and customs charges. It will be necessary, however, to deposit a sum equal to the duty, the deposit being returned to the owner when leaving the island. The only condition attached to the privilege is that the owner shall not use his machine for financial gain while on the island.

### To Auction Automobile for Good Roads.

To assist a good roads movement which is in progress the Studebaker Bros.' Oregon branch has donated an E-M-F car to the fund which is being raised in Portland, Oregon. The automobile will be sold at auction and the proceeds turned over to the Crater Lake Highway Commission.

### Athol Automobilists Get Together.

The Athol Automobile Association has been organized at Athol, Mass., with nineteen charter members. Joseph Wilcox is president; P. B. Swift, vice-president; A. N. Ellis, secretary and treasurer.

# A Car Embodying Many Advanced and Original Features in Engineering Design

Price, Completely Equipped, Top of Special Imported Mohair, Wind Shield, 5 Lamps, Prest-O-Lite Tank, Tire Irons, 2 Extra Demountable Rims, Speedometer, Bosch Magneto, Shock Absorbers, Complete Set of Tools and Tire Kit, Robe and Foot Rails, \$3,500.

Although we have been building motor cars for the best part of three years, this is the initial trade announcement of the Cunningham car.

Most of this time has been consumed in developing the kind of a car that we would feel justified in trade-marking with the name "Cunningham"—a name that has stood for the best and highest quality in the vehicle world for several generations. And, too, this car is **manufactured** by us, in our own plant, which is completely and thoroughly equipped in every department with the most modern automobile machinery. We have taken ample time and have spared neither pains nor expense in designing and constructing this car to meet every requirement of the most discriminating buyer.

## Cunningham

In style, material, workmanship and finish it will be found fully up to the standard of the world's best cars. Mechanically it possesses every good feature of the world's best and in many respects it contains new and advanced engineering ideas impossible to elaborate on in this limited space.

Reliability and accessibility have been aimed at above any other considerations. The model car, from which the above photograph was made, has been driven since it was put on the road a distance equal to three trips across this continent, over every kind of road, up and down mountains, hub deep through miles of sand, and all this, too, without a single breakage or replacement of any kind whatsoever.

### SPECIFICATIONS

**BODY**—Aluminum.

**SEATING CAPACITY**—Seven persons.

**COLORS**—Standard color black and olive green, vertical French striping, as per cut. Other colors optional without extra charge, extra time only being required to meet the special specifications.

**POWER PLANT**—Unit construction, overhung transmission.

**LONG STROKE LARGE VALVE MOTOR**—40 H. P., 4 cylinders, 4¼-in. bore, 5¾-in. stroke, valves in the head in cages (see cuts) and completely housed by easily removable aluminum caps. The valves are of large diameter. Cylinders cast in pairs. Crank shaft offset. Water cooled from gear driven centrifugal pump.

**TRANSMISSION**—Selective sliding gears, three speeds forward and one reverse. All gears and shafts of chrome nickel steel, heat treated and bearings imported annular ball.

**WHEEL BASE**—124 in.

**CLUTCH**—Leather faced cone with cork inserts, carried on roller bearings.

**GEARING**—3¼ to 1 or 3 to 1 as wanted, according to locality where the car is to be used most.

**DRIVE**—Propeller shaft with double universal joints to bevel gears in rear axle.

**IGNITION**—Bosch dual system. One set of spark plugs.

**GASOLINE CAPACITY**—20 gallons, of which 2 gallons is held in reserve for emergency.

**LUBRICATION**—Circulating splash system. Main bearings, front gears and splash compartments supplied to gear circulating pump.

**STEERING COLUMN**—Irreversible nut type, adjustable for wear, 18-in. mahogany steering wheel with aluminum spider.

**FRAME**—Special pressed steel and heat treated, raised over rear axle.

**SPRINGS**—Front, semi elliptic, length 40 in. Rear, ¼ elliptic and scroll 50 in. long.

**TREAD**—56 inches.

**TIRES**—36 x 4½ in. front and rear.

**RIMS**—Universal, quick detachable, demountable.

## JAMES CUNNINGHAM, SON & COMPANY

Rochester, N. Y., U. S. A.

Established and Reputable Dealers Write for Open Territory

## RECENT PATENTS.

965,847. Vehicle Wheel Rim. John M. Alderfer, Sharon Center, Ohio. Filed Dec. 3, 1909. Serial No. 531,263.

1. A vehicle wheel comprising an annular body portion the outer face of which constitutes a seat for a tire and having along one edge thereof an outwardly-extending flange constituting an abutment and along the opposite edge an inwardly-extending flange provided with a laterally-extending annularly-fashioned face constituting a seat, said latter flange provided with a transversely-extending notch, an annular tire-holding means mounted on said rim seat and abutting against said outwardly-extending flange having the inner lateral face thereof formed to engage a tire, a second tire-retaining means having the inner lateral face thereof conforming to the first-mentioned tire-retaining means and adapted to be mounted on said laterally-extending seat, said last-mentioned tire-retaining means provided with a notch registering with the notch in said inwardly-extending flange, an obliquely-severed self-expansible locking ring provided with a groove in its outer face adapted to be sprung over the inner portions of the inwardly-extending flange of said rim and the inner portion of the second mentioned tire-retaining means for holding the latter in co-operating relation with said rim for sustaining a tire, said locking rim provided with a member positioned in the groove thereof and lapping the severed portions of the same arranged to be seated in said registering notches for holding the tire-retaining means against circumferential movement and means for holding the severed ends of said locking ring against unintentional displacement.

965,971. Variable Speed Gearing. Edward D. Westrip, Rockford, Ill. Filed Aug. 20, 1909. Serial No. 513,894.

1. In a variable speed gearing, the combination with rotary driving and driven members, of gear connections between the members, a rotatable plate having a plurality of cam grooves in its opposite side faces, clutches for connecting and disconnecting certain gears and the members, and clutch operating devices having portions engaged in the cam grooves.

966,012. Frictional Power Transmission Apparatus. Walter C. Guildler, Elyria, Ohio, assignor to Arthur L. Garford, Elyria, Ohio. Filed Sept. 18, 1909. Serial No. 518,436.

1. In friction driving mechanism, the combination of a driving shaft, an aligned longitudinally movable shaft having a driving connection with said driving shaft, two friction driving disks fixed to said longitudinally movable shaft having a driving connection with said driving shaft, two friction driving disks fixed to said longitudinally movable shaft, two axially aligned driven shafts whose axis is at right angles

to the axis of the longitudinally movable shaft and is located in the same plane, two driven rolls which are located between the two disks on opposite sides of the axis thereof and are longitudinally movable upon said two shafts respectively and have driving connections therewith, means for moving both of said rolls simultaneously and equally toward or away from the axis of said disks, and means for moving the longitudinally movable shaft in both directions whereby either disk thereon is moved into frictional engagement with the peripheries of both rolls.

966,034. Ignition Timer for Internal Combustion Engines. Francis C. Mason, Grand Rapids, Mich. Filed June 19, 1909. Serial No. 503,253.

1. An ignition timer, comprising a case, insulated terminals projecting through the case and having plane inner surfaces chordal to the axis of the case, a rotative body in the axis of the case, a transversely movable plug in the rotative body, a spring to move the plug outward, an adjustable stop to limit and adjust said outward movement, and a roller projecting from the plug and successively engaging the terminals when the body is rotated.

966,074. Non-Skidding Device. George A. Bell, Norwalk, Conn. Filed Nov. 23, 1909. Serial No. 529,552.

1. A non-skidding device comprising a pair of brackets each having a longitudinally curved body adapted to embrace the sides of a wheel felly, spaced apart arms extending from said body and adapted to lie along and contact with the spokes of a wheel, said arms being provided with hooks, clamping means connecting each pair of brackets, and chains removably connected at their ends to said hooks.

966,146. Testing Device for Spark Plugs. Harvey R. Willard, Chicago, Ill. Filed May 6, 1909. Serial No. 494,365.

1. A testing device of the class described affording a small interior pressure chamber having a view aperture closed by a transparent medium, a gage connected in said pressure chamber, a threaded aperture opening into said chamber to receive the spark plug to be tested, a threaded stem adapted to fit in the spark plug aperture in an engine and a valve for cutting off communication between the pressure chamber and gage.

966,302. Tire Repair Vulcanizing Device. Frederick A. Blanchard, Norfolk Downs, Mass., assignor of one-half to Alfred L. Blanchard, Norfolk Downs, Mass. Filed Sept. 24, 1908. Serial No. 454,586.

1. The combination in a device of the class described, of means adapted to be placed in said tire, said receptacle comprising a flexible outer tube having apertures in its ends, a flexible inner tube contacting with said outer tube along its central portion, and two distinct and independent

closures extending across said apertures and detachably attached to opposite ends, respectively, of said outer tube.

966,345. Exhaust Muffler Cut-Out Valve. Hugh Miller, Attica, N. Y., assignor to Oliver A. Miller, New York, N. Y. Filed July 30, 1907. Serial No. 386,216.

1. The combination with an explosion motor and an exhaust muffler therefor, of a cut-out device located between the motor and the muffler and comprising a puppet valve adapted to open inwardly against the pressure of the exhaust, a casing having a discharge-outlet for the escape of the gases posterior to the valve, said casing being composed of two parts having a separable connection, one of said parts carrying the valve and the other having means connecting it with the exhaust-line of the engine, and operating means for said valve mounted on the casing and having connection with the valve through said discharge outlet.

966,381. Carburetter. Evert P. Brooks, Cincinnati, Ohio, assignor, by direct and mesne assignments, of one-third to Charles A. Gibson and one-third to John Remmers, Jr., Cincinnati, Ohio. Filed July 28, 1909. Serial No. 510,107.

1. A carburetter including a vertical vaporizing tube, and a feed-tube in the vaporizing tube and having a hollow combined feed-head and vaporizing head thereon that has a conical upper end and an outlet opening in the apex thereof, the conical end having a trough extending about the base thereof.

966,391. Chain Gear Casing. Joseph P. Fillingham, Lansing, Mich., assignor to

## TOO SWIFT, SAYS STOCKHOLDER

**Therefore He Wants Receiver for \$300,000  
Automobile Company Not Yet Doing  
Business—Alleges Mismanagement.**

Although its factory in Wayne, Mich., is not yet completed and, perforce, it has not commenced to produce cars for the market, the appointment of a receiver for the Swift Automobile Co., capitalized at \$300,000, has been applied for. This unusual state of affairs is due to the belief of one of the large stockholders, E. R. Potts, that such mismanagement has characterized the conduct of the young company that the court's assistance is necessary to insure its future.

In his petition Potts represents that the present directors and men in charge of the affairs of the company are incompetent and unfit to carry the project to success. He alleges that the company incurred liabilities to the extent of \$20,000 for building operations and that several judgments for debt already have been secured against it. Potts further avers that there are plenty of assets in sight for the continuance of the company, but he insists on different management. At the present time two complete cars have been turned out by the concern, which occupies temporary quarters in Detroit. The complainant asks the appointment of Albert I. Jacob, of Detroit, as receiver.

The Swift Automobile Co. is of recent organization, but its plant is in course of construction at Wayne, Mich., where 22 acres were purchased for a site. As organized, the Swift company has a capital stock of 300,000 shares, valued at \$1 each. The large stockholders are William A. Montgomery, 30,000 shares; George M. Stellwagen, Wayne, Mich., 25,500 shares; A. McKinnon, Detroit, 10,000 shares, and E. R. Potts, Detroit, 9,000 shares.

### Plans for Rider-Lewis Reorganization.

Creditors of the Rider-Lewis Motor Car Co., of Anderson, Ind., have asked the

court to order the receiver, T. J. Delahunt, to continue the operation of the Rider-Lewis factory until the creditors make further investigation of a plan for a reorganization of the company and also that the receiver be authorized to employ an expert accountant to audit the books. The receiver reported that he had reduced the operating expenses to \$32,000 against \$40,000, and that the factory is now turning out eight automobiles a day. The receiver further reported the receipts of a contract for 200 cars.

### Million Dollar Company Formed in Iowa.

Dave W. Henry, one of the veterans of the industry who helped organize two other automobile manufacturing companies, has "done it again," this time in Mason City, Iowa, where he has assisted in the formation of the Colby Motor Co., of which he has become general manager and a director. The other officers are as follows: W. M. Colby, president; I. W. Kurl, vice-president; G. W. Howland, secretary; A. H. Gale, treasurer. The company, which is capitalized at \$1,000,000, already has broken ground for a factory 450 x 150 feet. Its product will be a five passenger touring car listing at about \$1,600 and built along standard lines.

### Brady Organizes a Parts Company.

James J. Brady, former vice-president and superintendent of the Chalmers Motor Co., Detroit, Mich., and William J. Nagel, former deputy controller of that city, have organized the Brady-Nagel Mfg. Co. and will engage in the production of automobile parts in the Michigan metropolis. Brady is the president of the company, and Nagel the secretary-treasurer. The vice-president and superintendent is George Henderson, formerly assistant superintendent of the Chalmers company.

### Cole Triples Capital; Declares Dividend.

The Cole Motor Car Co., of Indianapolis, has certified to an increase of its capital stock from \$100,000 to \$300,000. Concurrently it has declared a cash dividend of 30 per cent.

## WALL STREET COMES TO RESCUE

**Syndicate Agrees to Loan General Motors  
\$20,000,000—Takes Mortgage and Con-  
trol of Company for Five Years.**

Wall Street now is firmly seated at the steering wheel of the General Motors Co. and for the next five years, at least, its representatives will control and guide its destinies. The \$60,000,000 merger, which set out to dominate the automobile industry and which fell so lamentably short of doing so, has so keenly felt the pinch of financial stringency that to secure the funds necessary for its relief it has passed the control of its affairs from its stockholders and directors to the banking interests which finally have agreed to advance the much-needed money, the deal for which was consummated yesterday.

Even when the Buick Motor Co., the chief link in the General Motors chain, was seeking the loan of \$2,500,000, which it finally arranged to obtain on a 24 per cent. basis, the General Motors Co.—the holding company—was negotiating for the much larger sum, which the Wall Street houses finally have agreed to provide. It has been an open secret that the Buick company was far from being the only department of the General Motors Co. that was hard pressed for ready money, and even when Buick arranged to borrow the \$2,500,000, it was apparent that that sum would merely bridge its difficulties for the moment; the need for more money to assure its future and to prevent a crash was, therefore, imperative.

According to the transaction consummated yesterday, the banking houses chiefly interested, Lee, Higginson & Co., of Boston, and J. W. Seligman & Co., of New York, will accept General Motors five years' 6 per cent. notes to the extent of \$20,000,000 secured by first mortgage, of which \$15,000,000 will be issued and sold and the unsold balance, \$5,000,000, remain in the treasury for future use. In addition to the bankers named, it is stated that Kuhn,

Loeb & Co. and other banking houses are parties to the syndicate that will underwrite the note issue. The cost of the underwriting has not yet become public, but the notes are redeemable at 102½ and interest. The proceeds of the issue will be used to take up the floating indebtedness of both the parent company and the subsidiaries, which, according to Wall Street figures, amounts to \$14,500,000.

The sale of the notes to the bankers marks the passing of control of the company from the shareholders for the next five years, one of the terms of the loan requiring that the bankers be allowed to name a majority of the directors yearly until 1915, during the life of the notes, and also to name six out of the seven members of the finance committee. In this way the interests of the noteholders will be carefully conserved.

The previous loan of \$2,500,000 arranged by the Buick company, will not now be taken up.

The new note issue was preceded by some strong publicity work on the part of both parties to the deal, apparently to prepare the market for what was coming and to let those who incline to invest know what a good thing was in store for them. No later than Tuesday last, the press bureau of Lee, Higginson & Co. issued what in newspaper vernacular is styled a "hand-out," which in adroit language forecasted the deal and painted the beauties of the General Motors Co. and its properties and prospects, and which sought to show why despite such beauties profits had not been reaped. Among other things, this Lee-Higginson "hand-out" said:

"Practically the whole trouble with the General Motors Co. has been in its financing problems. The purchase of the Cadillac Motor Car Co. within the past 18 months, for some \$4,000,000 cash, is a case in point. Such a purchase could undoubtedly have been more wisely effected through sale of General Motors stock. There are now 19 subsidiary companies owned outright or nearly so by the General Motors Co. While their rapid coralling without adequate permanent financing has been embarrassing, the value of the acquisition is shown in striking manner by their past year's earning records.

"About \$3,000,000 profits have resulted from operations of the Cadillac Co. during the year ended Oct. 1, 1910, and there is every prospect of its making \$4,000,000 in the fiscal year which it has just entered. This company is at present turning out automobiles at the rate of 40 a day. Orders for its proposed entire output of 12,000 1911 model cars are already booked.

"During the year ended with the past month the Buick Co. cleared about \$4,000,000 net. Owing to its method of marketing its output, its business is subject to seasonal fluctuations to an extent that the Cadillac company does not experience. Its heaviest deliveries come in March, April

and May. The Oldsmobile company estimates that it could sell twice as many cars this year as its capacity permits; its earnings last year reached about \$700,000.

"These three companies comprise the 'backbone' of the General Motors Co. Aggregate net earnings of the General Motors Co. for the year ended October 1, were about \$10,500,000 after deduction of depreciation. Several of the subsidiary companies make a specialty of truck and general business vehicles. This is a branch of the business which the company is not overlooking, and which should add considerably to future profits.

"Of the entire production of 33,000 1910 models of the General Motors Co. subsidiaries, less than 2,000 cars now remain unsold or in agents' hands. It is believed that 40,000 of its 1911 models could be disposed of profitably if it is thought best to turn out that many."

#### Intercontinental Still Has No President.

According to the annual report of the Intercontinental Rubber Co., that corporation, which is supposed to have a great deal to do with shaping the price of crude rubber, earned a net profit of \$2,268,184 during its fiscal year which ended July 31st last. The details of the statement are as follows:

Gross profits .....	\$2,369,795
Administration and general expenses .....	101,611
Net profits .....	\$2,268,184
Dividends .....	912,441
Surplus .....	\$1,355,743
Previous surplus .....	248,944
Total surplus .....	\$1,604,687
Deduct amount transferred to general reserve account, equal to preferred stock retired during year .....	1,050,000
Preliminary expenses charged off .....	24,320
Profit and loss surplus .....	530,366
The cash in bank July 31, 1910, amounted to .....	\$1,131,518.

At the annual meeting of the company last week, at which the financial statement was rendered, Charles H. Sabin, vice-president of the Mechanics & Metals Bank, and Walter Dutton, secretary of the Intercontinental company, were elected directors, increasing the number from nine to eleven. Later the directors re-elected Edward A. Aldrich vice-president and treasurer and Walter Dutton secretary and assistant treasurer. Willard T. Smith was elected assistant secretary. The office of president still remains vacant.

#### Oliver Pays \$50,000 for National Cutlery.

The Oliver Motor Car Co., which recently was organized in Detroit to manufacture light delivery wagons, has purchased the entire plant of the National Cutlery Co., located at Lawrence avenue and Buchanan street. The purchase, which cov-

ers the machinery, includes four brick buildings, each 40 x 200 feet. The consideration was \$50,000.

#### Detroit Lamp Makers Enlarge.

The Edmunds & Jones Mfg. Co., which manufactures lamps in Detroit, has increased its capital stock from \$25,000 to \$50,000, and is preparing to erect an addition to its plant. The new building will be 67 x 200 feet, of brick and steel construction.

#### Receiver for Detroit Motor Company.

The Detroit Trust Co. has been appointed receiver for the Thrall Motor Co., Detroit, Mich., following the petition in bankruptcy filed by three creditors. The latter alleged that the Thrall company committed an act of bankruptcy on September 12th last when it made an assignment of its stock and machinery.

#### Changes Among Prominent Tradesmen.

Cash F. Barker, former sales manager of the American Motor Car Co., has been appointed assistant manager of the Fiat branch in Chicago.

Wiley F. West has been appointed manager of the St. Louis (Mo.) branch of the Firestone Tire & Rubber Co. He was formerly manager of the Atlanta (Ga.) branch of another tire company.

George L. Schofield has been appointed general manager of the Elkhart Motor Car Co., Elkhart, Ind., makers of the Sterling car. He succeeds John T. Knott, who has retired from the automobile business to go into real estate.

James Bourquin, superintendent of the Chalmers Motor Co., has resigned that position to become factory manager of the Paige-Detroit Motor Co. Previous to his Chalmers connection he had been identified with the Olds and Peerless companies.

R. M. Palmer has been transferred from the general management of the Cartercar Co., Pontiac, Mich., to the similar office in the Oakland Motor Car Co., of the same city, both concerns being General Motors' properties, Palmer takes the place vacated by Lee J. Dunlap.

J. Henry Glismann has been elected president, treasurer and general manager of the Syracuse Rubber Co., Syracuse, N. Y., to fill the vacancies created by the death of Frank C. Howlett. Glismann had been associated with Mr. Howlett for many years, latterly as assistant treasurer of the Syracuse Rubber Co., which is an extensive jobber of tires and accessories.

F. Carleton Dole, of Boston, has been appointed district manager of the United States Motor Co., Brush runabout department, with headquarters in the Hub. To accept the post, Dole retires from the presidency of the George J. Dunham Co., of Boston, which has the New England distributing agency for Royal Tourist cars.

## DISCUSSED RAILROAD MATTERS

### Factory Traffic Managers Hold Conference in New York—Freight Rates Claim Much of Their Attention.

Traffic managers and men in charge of shipping and receiving departments of factories met at the offices of the National Association of Automobile Manufacturers, 7 East 42d street, New York, Monday and Tuesday of this week, when the freight rate situation as pertaining to automobiles and factory material and supplies was discussed in detail.

The meeting was called by J. S. Marvin, general traffic manager of the National and Licensed associations, and dealt particularly with matters pertaining to the Official Classification committee, which controls freight rates east of the Mississippi and north of the Ohio, the Official Classification committee also being in session in New York at this time.

Marvin presided at the conferences, and specifications considered vital by railroads in fixing rates were submitted by the various factory representatives in relation to engine and gear parts, hoods, wind shields, seats, flanges, bodies and various other items in which the automobile industry is interested, and which the railroads had on their docket for consideration. Argument on the various ratings was presented at the meeting of the Official Classification committee on the 27th ult.

Factory representatives at the meeting included: O. F. Baughman, Winton Motor Carriage Co.; T. E. Drews, Hupp Motor Car Co.; W. J. Gordon, Anderson Carriage Co.; R. C. Hurd, Hudson Motor Car Co.; John A. Moore, United States Motor Co.; H. R. Moule, Chalmers Motor Co.; C. J. Shaar, Packard Motor Car Co.; F. Shaw, E-M-F Co.; H. S. Stebbins, General Motors Co.; W. E. Tigges, Willys-Overland Co.; C. L. Warner, Locomobile Co. of America; A. C. Westfall, Cadillac Motor Car Co.; E. L. Wratten, Mitchell-Lewis Motor Co.; and W. L. Miles and W. M. Young, representing Willys-Overland Co., Nordyke & Marmon Co., and other Indiana manufacturers.

### Miller Opens His Twelfth Branch.

Charles E. Miller has opened a branch store at Dwight and Bridge streets, Springfield, Mass. It is twelfth in the Miller chain of supply houses. Incidentally, his Brooklyn (N. Y.) store is being removed to 1421 Bedford avenue.

### Chicago Show Space is Apportioned.

Allotment of space at the Chicago show constituted the chief business transacted at the meeting of the National Association of Automobile Manufacturers held in New York yesterday. The applications were

more numerous than ever before, 101 manufacturers asking for space for pleasure cars at the first week's display and 49 applying for room for commercial vehicles which, with the overflow of pleasure cars, will occupy the second week. The Motor and Accessories Manufacturers will as usual apportion space to their own members.

### Prices of E-M-F and Flanders Reduced.

The prices of E-M-F "30" and Flanders "Twenty" cars have been reduced, according to announcement made in Detroit on Wednesday of this week. The larger car, which heretofore has sold for \$1,250, will be listed at \$1,000 in the future, while the price of the Flanders has been lowered from \$750 to \$700. Reductions in the cost of materials together with the E-M-F company's heavy paid investment in tools, are given as the causes that enable the cut to be made, it being stated that the cars can be produced at the new figures with the same margin of profit enjoyed two years ago. It is the understanding that the change of price will not affect dealers' discounts. While the two present models remain unchanged mechanically, it is intimated unofficially that a third model of seven passenger capacity and built to sell for less than \$2,000 is in process of construction.

### Dexter Heads the Grout Company.

At the annual meeting of the Grout Automobile Co., Orange, Mass., last week, the following officers were elected: President and secretary, G. E. Dexter; treasurer, E. S. Hall; directors, E. S. Hall, G. E. Dexter and H. F. Misener; general manager, E. S. Hall; selling agent, Reginald Wade; superintendent of factory, H. F. Misener.

### Gear Makers in Bankruptcy Court.

Alleging insolvency and preferential transfers of property and accounts, creditors have filed a petition in bankruptcy against the Carpenter-Kerlin Gear & Machine Co., of New York City, importers of machinery and manufacturers of automobile gears. Liabilities are \$30,000 and assets \$8,000.

### Wants to Build Engines in Detroit.

The Rapp Motor Co., which has been incorporated in Michigan with \$1,000 capital stock, and which purposes manufacturing automobile engines, is seeking a location in Detroit. Its principal stockholders are James H. Christian and Hiram B. Sackett.

### Hupmobile Gets Into Great Britain.

As the result of a visit to this country by Messrs. Whiting and Truscott, of Whiting, Ltd., of London, that company has been appointed British agent for the Hupmobile. The contract calls for 500 cars, 200 of them for immediate delivery.

## COURT RULES IN VELIE'S FAVOR

### Wisconsin's Supreme Bench Rules Against Four A. L. A. M. Defendants—\$500,000 Damage Suit Must Go to Trial.

Whether or no the Association of Licensed Automobile Manufacturers is "intended and does constitute an unlawful agreement or combination in restraining of trade," and whether or no its members are liable as parties to such an illegal combination apparently will be passed upon by the Wisconsin courts at least, the supreme bench of that state by a close decision having cleared the way for a trial of the action instituted by the Velie Motor Vehicle Co., of Moline, Ill., in which the allegation of "unlawful agreement or combination" was set up.

The Velie company was one of those which had not obtained a Selden license and, as will be recalled, several months since instituted suit against some twenty odd members of the A. L. A. M., making service on their agents in Milwaukee and also making one of the agents a party to the suit, which fixed \$500,000 as the amount of damage which the Velie company has sustained by reason of the "unlawful agreement or combination."

The various defendants sued out writs of prohibition to prevent progress of the action, basing their position on the ground that while the agents in Milwaukee on whom service had been made sold their goods, and thus represented their wares, they were not, in the legal sense, agents for the respective companies. The court accepted this view in the cases of all save four of the defendants. These four, the Pierce Motor Car Co., Chalmers Motor Co., Locomobile Co. of America and Pope Manufacturing Co., were held to have been properly served. They then appealed to the supreme court for the necessary writ of prohibition and it is this case which that tribunal just has decided. It rendered its decision on the 4th inst., denying the applications for the writ, thus requiring the suits to go to trial. The court was divided, three of the seven judges being opposed to the decision rendered.

### Dates Selected for Toronto Show.

February 25th to March 4th have been set as the dates for the annual show in Toronto, Can. As heretofore, it will be held under the auspices of the Ontario Motor League, with E. Wilcox as manager.

### To Make More Axles in Fort Wayne.

The Wayne Auto Co., of Fort Wayne, Ind., has let contracts for the construction of a new building at Hayden and McCulloch streets in that city. Work on it will be commenced before snow-fly.

**The Week's Incorporations.**

Charleston, S. C.—Rouse-Pegues Co., under South Carolina laws, with \$10,000 capital; to deal in motor cars.

Cleveland, Ohio—Cuyahoga Mfg. Co., under Ohio laws, with \$10,000 capital; to deal in automobiles and other vehicles.

Tacoma, Wash.—St. Helens Garage, under Washington laws, with \$5,000 capital. Corporators—G. D. Rushmore, T. W. Little.

Plainfield, N. J.—Century Tire Co., under New Jersey laws, with \$125,000 capital; to manufacture automobile and motorcycle tires.

Houston, Texas—Diamond Rubber Co., a corporation of New York, admitted to do business in the state of Texas, with capital of \$10,000.

Detroit, Mich.—Nederlander Auto Co., under Michigan laws, with \$5,000 capital. Corporators—Harry, George, Robert and David Nederlander.

Chicago, Ill.—Automatic Engineering Co., under Illinois laws, with \$100,000 capital. Corporators—A. C. Allen, A. E. Root, George T. Clithers.

Kansas City, Mo.—R. H. Collins Motor Co., under Missouri laws, with \$50,000 capital. Corporators—R. H. Collins, D. B. McCoy, J. F. Martin.

Toledo, Ohio—McLeary Engineering Co., under Ohio laws, with \$25,000 capital; to manufacture and sell motors for automobiles and aeroplanes.

Newark, N. J.—Wilson Motor Car Co., under New Jersey laws, with \$50,000 capital. Corporators—Samuel L. Wilson, John Foley, Jr., Gustave A. Lutz.

Oklahoma City, Okla.—Oklahoma Ford Co., under Oklahoma laws, with \$25,000 capital. Corporators—Wm. Bennington, Lee W. Melcher, L. T. Bennington.

Otterbein, Ind.—Opp-Holder Automobile Co., under Indiana laws, with \$4,000 capital; to deal in automobiles. Corporators—A. T. Summer, George Holder, J. R. Opp.

Portland, Ore.—United Auto Co., under Oregon laws, with \$50,000 capital; to conduct general garage business. Corporators—E. E. Cohen, Arnold Cohen, J. C. Beck.

New York City, N. Y.—West Side Garage & Motor Co., under New York laws, with \$10,000 capital. Corporators—William M. Higgins, David H. Higgins and others.

Augusta, Me.—Colby Motor Co., under Maine laws, with \$1,000,000 capital; to manufacture and sell motor cars and parts thereof. Corporators—R. S. Buzzell, M. M. Farrar.

Camden, N. J.—Eastern Motor Sales Co., under New Jersey laws, with \$100,000 capital; to operate motor vehicles. Corporators—F. R. Hansell, William F. Eidell, John A. McPeak.

Joliet, Ill.—Acme Auto Appliance Co., under Illinois laws, with \$5,000 capital; to manufacture automobiles and supplies.

Corporators—Harvey Wood, Maurice Lennon, John Garnsey.

Merchantville, N. J.—Merchantville Auto Co., under New Jersey laws, with \$25,000 capital; to deal in automobiles. Corporators—Harry E. Bodine, Milton R. Vail, Charles F. Woodhill.

Hamilton County, Tenn.—J. C. Green Automobile Co., under Tennessee laws, with \$15,000 capital. Corporators—Sam Erwin, J. C. Green, E. B. Craig, Jr., J. C. Guild, J. A. Chambliss.

Newark, N. J.—American Auto Co. of New Jersey, under New Jersey laws, with \$100,000 capital. Corporators—John DeWitt, Albert B. Aschenbach, Harry W. Morehouse, all of Newark.

Chicago, Ill.—Commercial Electric Motor Mfg. Co., under Illinois laws, with \$10,000 capital; to manufacture motors for all purposes. Corporators—Charles Endorf, Jr., C. V. Mount, F. S. Schooler.

Chicago, Ill.—German-American Ball-Bearing Mfg. Co., under Illinois laws, with \$100,000 capital; to manufacture automobile machinery and tools. Corporators—R. A. Schultz, L. Gaines, C. F. Schultz.

Boston, Mass.—New England Auto Specialties Co., under Massachusetts laws, with \$50,000 capital; to manufacture all kinds of accessories and specialties. Corporators—F. M. Snyder, E. A. Wonsor.

Buffalo, N. Y.—Richardson Auto Tire Co., under New York laws, with \$100,000 capital; to manufacture tire protectors for automobiles. Corporators—J. Richardson, O. Richardson, V. Hoeffner, all of Buffalo.

Atlanta, Ga.—Consolidated Motor Co., under Georgia laws, with \$25,000 capital, with privilege to increase to \$100,000; to deal in motor cars. Corporators—R. B. Ridley, Jr., Marshall Johnson, R. C. Howard.

Portland, Me.—Roader Car Co., under Maine laws, with \$1,000,000 capital; to manufacture and deal in automobiles and other motor vehicles, power boats, motorcycles, etc. Corporators—P. J. Larrabee, C. L. Beedy.

Lawrence, Kan.—Lawrence Auto Wheel Co., under Kansas laws, with \$10,000 capital; to manufacture patented wheel for automobiles. Corporators—F. H. Durgin, W. K. Folks, Clyde D. Faler, J. P. Cosand, S. D. Bishop.

Brooklyn, N. Y.—The Powell Engine Corporation, under New York laws, with \$10,000 capital; to manufacture automobiles, machinery, motors and engines. Corporators—L. P. Powell, R. W. Powell, C. I. McLaughlin.

Akron, Ohio—American Tire & Rubber Co., under Ohio laws, with \$200,000 capital; to manufacture and sell all kinds of rubber articles, motor car and motorcycle tires. Corporators—Frank L. Kryder, Adam Duncan, G. C. Waltz, Harvey Musser, J. R. Huffman.

**Increases of Capital.**

Akron, Ohio—A 1-Ton Motor Co. increases capital from \$50,000 to \$100,000.

Indianapolis, Ind.—Cole Motor Car Co. increases capital from \$78,000 to \$100,000.

Cincinnati, Ohio—Cincinnati Panel Co. increases capital from \$50,000 to \$100,000.

Princeton, Ohio—DeWitt-McIntyre Co. changes name to H. H. DeWitt Co. The firm manufactures gears for automobiles.

**Recent Losses by Fire.**

New York City, N. Y.—Eureka Garage, Eighth avenue and 122d street, damaged.

Minneapolis, Minn.—Frank A. Cotter, 2650 Pleasant avenue; garage destroyed. Damage heavy; cause unknown.

Cincinnati, Ohio—Suburban Automobile & Garage Co., building and 20 automobiles destroyed; loss estimated at \$40,000.

Salt Lake City, Utah—Utah Motor Car Co.'s garage, 127 South State street, damaged by fire caused by gasoline explosion. Loss, \$1,000.

**Victor Enlarges Capital and Plant.**

The Victor Motor Car Co., which in a small way has been manufacturing cars in St. Louis, Mo., for several years, has increased its capital stock from \$30,000 to \$150,000 and has let contracts for a considerable enlargement of its plant at Boyle avenue and Papin street. Two stories will be added to the present one story building, 9 x 112 feet, and another three story concrete structure will be erected, which, when completed about January 1st next, will permit the company's working force to be increased from 40 to 300 men.

**Newark Leaves, Rands Joins United.**

The United Manufacturers, of New York, have lost a wind shield account and gained one. The account lost is that of the Newark (N. J.) Rivet Works, makers of the Friction windshield, which has withdrawn from the United organization; the account gained is that of the Rands Mfg. Co., of Detroit, which, of course, has entered into the United Manufacturers' selling arrangement. The Newark Rivet Works henceforth will market its own product.

**Cartercar Takes Over Chicago Business.**

The Cartercar Co. has leased the premises 324 Michigan avenue, Chicago, which will be equipped and conducted as a factory branch. It will be in charge of Charles E. Hammerly, who has had the Chicago agency for the Cartercar for several years.

**To Handle Trucks in Los Angeles.**

The Buffalo Motor Truck Co. is the name of a new concern which just has started in business at 321 San Fernando building, Los Angeles, Cal. I. G. Lewis is the moving spirit of the new company, which will handle Buffalo commercial cars.

## IN THE RETAIL WORLD.

George H. Cram has opened a garage on Pleasant street, Beloit, Wis.

F. T. Lisco, of Hood River, Ore., is erecting a garage at a cost of \$14,000. The structure will be three stories high.

The Tri-State Rubber Co., of Minneapolis, Minn., has moved to new quarters at 1017 Nicollet avenue. Charles J. Parker is in charge.

Fred C. Neidermiller has been elected secretary of the Autoparts Mfg. Co., of Detroit. Previously he was receiving teller of a savings bank in that city.

The Warren Automobile Co. is the style of a new concern which has engaged in business at 1 State street, Cambridge, Mass. W. S. Sandeman is in charge.

The Duncan Automobile Co., of Bagley, Ia., has sold its business to the Gardner Automobile Co., a new concern organized by several business men of the same town.

Wells Matthews, a business man of Dayton, Ohio, has been appointed receiver for the People's Motor Car Co., of the same city, upon application filed by Lucien A. Seward, one of the creditors.

The Fort Worth Auto Supply Co. has been organized in the Texas city of that name and has located at 509 Commerce street. It will carry a full line of supplies and maintain a vulcanizing department.

Charles L. Rodgers, formerly with the Inter-State agency in Attleboro, Mass., has opened a garage of his own on Wall street, the same town. He will confine himself strictly to renting, storing and repair work.

The Hale Motor & Machine Co., of Detroit, Mich., is erecting a new factory, 194 x 64 feet, on Franklin street near Chene street. The building is of brick and mill construction and will be completed by December 1st.

The Wilson Motor Car Co. is the style of a new concern which has opened a garage at the corner of Clinton avenue and 21st street, Newark, N. J. Samuel F. Wilson, John Foley and Gustave Lutz are the men interested in the enterprise.

Russell & Albrecht, owners of a garage at 432-438 West Main street, Kalamazoo, Mich., have sold their business to David Reid, of South Haven, Mich. Reid expects to instal a taxicab service in connection with his regular garage work.

The Olds-Oakland Co., of Boston, Mass., has been dissolved, and each car hereafter will be represented by separate agencies. George W. Houk has been placed in charge of the Oldsmobile agency, with headquarters at 97 Massachusetts avenue.

The Economy Auto Supply Co. has been organized in Newark, N. J., where it will occupy the two-story building comprising No. 268 Halsey street. Theodore Kaplan and Edwin Elin are the responsible men. They will handle accessories only.

E. J. DeVille and W. H. Yeazell have organized the Standard Motor Car Co., of Dayton, Ohio, with headquarters at 25 North Jefferson street. Marmon and Hudson cars are to be featured.

Storm Lake, Ia., reports "something doing" in its automobile trade. T. R. Brader & Son have purchased three vacant lots, and are erecting thereon a big garage, while J. C. Cleaveland has sold his business to C. F. Wellberling, of Rembrandt, Ia.

On Saturday next the Hartford Rubber Works Co.'s Boston branch will take possession of the handsome building comprising 863 Boylston street, which just has been completed. It is a five story structure and the Hartford branch will occupy all.

M. C. Crutchfield, formerly manager of the Factory Auto Supply Co., Chicago, Ill., has been made manager of the newly organized Manufacturers' Auto Tire Co., of which W. A. McGivern is president. Its headquarters are at 3029 Michigan avenue.

Pope-Hartford and Overland cars will be shown in the salesrooms of the Pope-Hartford Motor Car Co., 5883-87 Delmar boulevard, St. Louis, Mo., which just have been opened. The company is capitalized at \$50,000, with a privilege to increase it to \$150,000.

F. R. Sunderlin and C. W. Simpson, both of Des Moines, Iowa, have formed a company under the style Sunderlin & Simpson and taken over the business of the Collins Garage Co., with headquarters at 2126-28 Cottage Grove avenue. Rebuilding and repairing will be a specialty of the new firm.

Under the style the Crown Garage & Machine Co., a new concern has been formed in Corona, Cal., with headquarters at the corner of Sixth and Ramona streets. Besides carrying E-M-F, Flanders and Buick cars, the firm will handle accessories, motorcycles, bicycles, electric supplies, engines, pumps, etc.

The Herring Motor Car Co., of Des Moines, Ia., has bought out the business of the Campbell Automobile Co. and will continue the distribution of Rambler cars in connection with its own business as Ford agents, at 912-914 Locust street. I. R. Campbell has gone to the Rambler factory to become a district manager for the T. B. Jeffery Co.

Dr. E. G. Watts, who owned 98 per cent. of the stock of the Western Automobile Co., Portland, Ore., has sold his holdings to the East Side Automobile Co., for the sum of \$15,000. The East Side company, of which J. H. Kelly is manager, will handle Knox, Premier and Moline cars at 531 Alder street, the former headquarters of the Western concern.

Heralded as the most modern and best equipped automobile building on the Pacific coast, a new garage and salesroom is being built by the Covey Motor Car Co.,

at 21st and Washington streets, Portland, Ore. J. G. Edwards is the manager of the new company. The building will be 120 x 120 feet, four stories high, of reinforced concrete, and will cost \$90,000.

After hearing arguments in the matter of the Frazelle Auto Co., of Springfield, Ohio, Judge Hollister denied the application for a receiver. The creditors of the company had petitioned it into bankruptcy, alleging preferential treatment of some creditors on the part of Glenn Frazelle, and attempts of settling on the basis of 25 cents on the dollar, while sufficient assets are said to have been extant to pay all creditors in full.

Greatly enlarging the scope of its business, the Means Automobile Co., of Des Moines, Ia., has opened a new salesroom at 309-311 East Walnut street, adjoining its former place. In addition to Moline, De Tamble and Hupmobile cars, the firm hereafter will act as distributor for Cole "30," Fal cars and Gleason trucks. George Means, president of the company, is distributor of all these cars, excepting the Cole, for the entire state of Iowa.

D. F. Patterson, H. V. Kell, D. S. Walraven, C. M. Love and G. W. Hanson have sold their holdings in the Georgia Motor Car Co., Atlanta, Ga., to J. J. McLendon and several associates. The business will be carried on under the same name, and National and Everitt cars will be shown as heretofore. The price paid is said to have been \$30,000, while an additional \$40,000 is to be spent on a new garage and salesroom in course of construction at 33-35 Auburn avenue.

Under the style the Thomas-Mercer Motor Co. a new firm has been organized at Los Angeles, Cal., F. W. Force, of the Mercer Auto Co., and A. M. Young, Columbia agent, having joined forces and taken the garage formerly occupied by the Wilson & Buffington Co., agents for the Thomas. Young has relinquished his claims to the Columbia agency, and the latter has been merged with the Maxwell line under the control of the United Motors Los Angeles Co. The headquarters of the new firm are located on Olive street, near Ninth.

Due to the formation of C. R. Teaboldt & Co. in New York, Owen and Bergdoll cars have obtained an unusually auspicious entry into the metropolitan district, Teaboldt being one of the most widely known and most favorably acquainted tradesmen in the territory which he will control. Teaboldt, who was successfully identified with the Packard and Thomas branches, is president and treasurer of the new concern, of which G. F. Aitken is secretary. They temporarily are located at 1896 Broadway, but shortly will occupy permanent quarters at No. 1547 on the same thoroughfare. An aggressive campaign in the big city itself and in the surrounding counties will be immediately instituted.

## The Cost of a Car

**T**HE cost of an automobile is not what you pay for it, or the initial investment—but what it costs to maintain—the number of miles on a gallon of gasoline—the number of miles on a set of tires—the oil bills—the incidental repairs. It is the answer to this question that either makes a car a luxury afforded by few, or the proper kind of transportation at a reasonable cost.

The White Gasoline Cars have solved these problems economically. A White Gasoline Car has a four-cylinder motor cast en bloc, which economizes in size and weight—it has extreme length of stroke, which allows the cylinders to be of moderate size. In consequence, the car is of moderate weight and easy on tires—one of the most important items in up-keep.

The car has four forward speeds, a flexibility found only on the most expensive cars, which allows the engine to run at a speed more economical, and more suited to the purpose of the driver. Again, White Cars are marvels of simplicity, which makes them easy to operate and easy to keep in order. When it comes to mechanical features, ask any engineer, regardless of his personal bias, and his answer must be that no car is better built.

Many agencies now open for White Gasoline cars and trucks, also steam and passenger cars. Demonstrators should be bought at once for early delivery.

#### Opportunities for City Garagemen.

Whatever may be said of inflation in the automobile industry and of the truth or exaggeration of the impression which obtains in some quarters as to its magnitude there can be little question that the garage business is in danger of being overdone. With the conversion of stable keepers to the business and the transformation of large numbers of their establishments to the uses of motor vehicles, there is a constant influx to the ranks of garages and repositories that already is threatening the prosperity of the business in more than one locality.

The garage business is peculiar. It always has possessed certain characteristics not shared by any other line of business effort, and its unusual features seem to be multiplying instead of diminishing as time goes on. For example, most garagemen who devote themselves exclusively to the storage and repairing of cars are ready to

declare that it is extremely difficult to extract a competence from the business by legitimate conduct of its affairs. Yet the phenomenon is witnessed of a constant increase in the number of such establishments and, at least in some instances, of that invariable accompaniment of competition, a "revision downward" of charges for storage, etc.

This may be good for the motorist but it is not altogether good for the garageman who has been striving in an honest way to build a solid and enduring business. It puts him to the unpleasant task of reducing his own expenses while trying to meet his competitors and at the same time forces him to redouble his efforts to obtain and retain his trade. The condition, of course, is beginning to be felt only in the great cities; the great majority of cars that are being sold to the agricultural element are housed in barns and wagon sheds.

Examining the growth in motor vehicle usage in the larger communities, however, it is plain that a great and growing number is of the business vehicle class—a class in many respects less exacting upon garage service than the light passenger vehicle and far more uniform and dependable in the nature of its patronage. The increased adoption of motor trucks by business houses already is creating a demand for suitable garaging facilities, a demand which must be satisfied in the most expedient and economical manner, and that garageman who, finding himself pressed for business, does not reach out for the commercial vehicle trade, is overlooking an opportunity that is full of rich promise. He would be likely to find it more stable and profitable than the pleasure vehicle field.

#### "Truck Tests" that Prove Nothing.

At present the industry is threatened with an epidemic of power wagon contests that is entirely unsought by the manufacturers and that promises to be of doubtful value in the upbuilding of that portion of the market which should be cultivated so cautiously. The situation is peculiar in that the honor of this publicity is being thrust upon the builders of commercial vehicles by the usually coy and reluctant newspapers. To that extent, the promotion of such trials is not without its element of humor.

The difficulty is that the common run of such undertakings are devised to show results that are bound in the circumstances to

be falsely inspiring, though not intentionally misleading. By the delightfully simple process of sending a large number of laden vehicles over a course and subsequently dividing the product of their load weights and the distance traversed by the cost for fuel and oil, a ton-mile cost is derived that is boldly compared with freight rates and kindred expenses which the dissatisfied shipper may be inclined to consider as exorbitant. To add to the enormity of the offense, machines of all classes are marshalled under the same contest formula, the only allowances granted them being in the way of concessions in the speed schedule; even electric vehicles are taken out of the proper zone in city service and put to the arduous test of endurance contests over country roads!

The idea of publishing figures obtained by this wholesale, if elementary, method of calculation would not be so objectionable were it not for the fact that they are destined to be projected into the public prints for the supposed education of the public. The almost inevitable consequences of thus placing the motor truck in a false position are not pleasant to contemplate. Popular education in this, as in other directions, cannot be advanced materially by any species of campaign in which important items, facts which in other commercial undertakings always are seriously considered, are ignored in obtaining favorable results. The effect might not be so harmful if the "ton-mile costs" developed were treated merely as competitive scores. To hold them up as items of educational importance is plain folly. They are not ton-mile costs, but supplies costs figured on a ton-mile basis, which is both a distinction and a big difference.

It is not to be imagined that no sort of commercial vehicle contest can be of true value to the industry or to the public. The recent tri-fuel competition of the Automobile Club of France has its serious purpose, although it is held by some authorities that fuel consumption tests are apt in themselves to be of a misleading nature, even when carried out in a wholly scientific manner. The objectionable point about the present epidemic of newspaper tests, however, is that they are designed to include all sorts of vehicles irrespective of the specific purpose for which they are built, and that they really demonstrate practically nothing of the motor vehicle economy which they purport to indicate.

## FAIRMOUNT GETS NEEDED ENTRIES

**Success of Philadelphia's Big Race on Saturday Next Now Assured—Representative Field Will Start.**

Although up to a couple of weeks ago the prospect for entries for the Quaker City Motor Club's third annual road race in Fairmount Park, Philadelphia, on Saturday next, 8th inst., was not at all exhilarating, the list took a sudden up turn this week, 26 entrants having been corralled, most of them by missionaries of the club who attended the Vanderbilt cup race for the purpose. The complete roll to October 5th was:

Al. Mitchell and Len Zengle, Chadwick; Irwin Bergdoll, Edward A. Hearne, Al Hall Apperson; E. F. Schiefler, Jackson, William Endicott and Louis Edmunds, Cole; J. Fred Betz, 2d, W. C. Mullen and R. E. Beardsley, Simplex; Frank Kulick, Ford; Ray W. Harroun and Joseph Dawson, Marmion; Tobin De Hymel and Hugh N. Harding, Stoddard-Dayton; G. J. Wosser, Mercedes; J. D. Aitken and Howard Wilcox, National; H. P. Frey, Mercer; Joe Matson, Corbin; Mortimer Roberts and two unnamed, Warren-Detroit.

The race is 200 miles long and wholly within the city limits, part of the eight miles circuit being over Philadelphia streets. The course has so many sharp curves and corners as to afford unlimited spectacular effects. The lap record is seven minutes 41 seconds, made last year by Zengle in a Chadwick.

Following the fatalities of the Vanderbilt race it is announced that 3,000 patrolmen have been secured, which will permit of a guard being stationed at every 100 feet. It is declared that no person will be allowed to cross the track.

As the proceeds from grand stand seats and other privileges go to charitable institutions, the city of Philadelphia has given \$2,000 and the Quaker City Motor Club \$750 for the five silver trophies, there being five classes of cars, according to cylinder displacement. The winning driver in each of the five classes will get \$1,000 in cash, while the driver making the best time for the 200 miles, regardless of class, is to receive the chief prize of \$2,500.

### New Phase of "Joy Riding."

Of all the trends in motordom that toward utilitarianism is the most pronounced. Joy riding, especially after nightfall, was formerly the proper caper for chauffeurs, but now it is nearer the "correct thing" to be moving household effects with the boss's car or like the captain of a tug boat doing "general touring." It has been found that a limousine makes a fine moving van. Its closed body affords considerable storage space and on the rail protected top can be

## COMING EVENTS

October 6-7, Chicago, Ill.—Chicago Automobile Club-Chicago Athletic Association inter-club run for Myers trophy.

October 6-8, Santa Anna, Cal.—Automobile meet.

October 8, Richmond, Va.—Automobile races at state fair grounds.

October 8, Spokane, Wash.—Automobile meet at Interstate Fair.

October 8, Philadelphia, Pa.—Quaker City Motor Club's third annual 200 miles road race in Fairmount Park.

October 10-12, Amarillo, Tex.—Panhandle Fair Association's annual race meet.

October 10-15, Hot Springs, Ark.—Automobile races at Arkansas State Fair.

October 14-18, Washington, D. C.—Second annual Washington "Post" tour to Richmond, Va., and return.

October 15, Mineola, L. I.—Motor Cups Holding Co., 278 miles international road race on Motor Parkway, for the Grand Prize of the Automobile Club of America.

October 15, Chicago, Ill.—Chicago Motor Club's reliability contest.

October 15-16, Philadelphia, Pa.—Automobile Club of Philadelphia fall tour, Atlantic City and return.

October 21-22, Boston, Mass.—Boston "American" commercial vehicle contest.

October 24, Lawrence, Mass.—Automobile races.

October 27-29, Dallas, Tex.—Dallas Automobile Club's race meet.

October 28-29, New York City—Commercial vehicle test, under auspices New York American.

November 3-5, Atlanta, Ga.—Atlanta Automobile Association's fall meet on Speedway.

November 5, Los Angeles, Cal.—Los Angeles-Phoenix (Ariz.) desert road race.

November 5-6, New Orleans, La.—Automobile meet.

November 7-11, Chicago, Ill.—Reliability contest under auspices Chicago Motor Club.

November 10-13, San Antonio, Tex.—San Antonio Automobile Club's races at International Fair grounds.

November 22-26, Lake Charles, La.—Louisiana Fair Association's race meet.

November 24, Redlands, Cal.—Mile High Hill Climb Association's contest.

November 24, Santa Monica, Cal.—Southern California Automobile Dealers' Association's annual road race; 200 miles.

November 24, Savannah, Ga.—Savannah Automobile Club's road race.

November 26-27, Los Angeles, Cal.—Motordrome races.

December 3-18, Paris, France—French Automobile Manufacturers' Salon in Grand Palais.

December 25-26, Los Angeles, Cal.—Races at Motordrome.

January 5-21, Detroit, Mich.—Detroit Automobile Dealers' Association's annual show in Wayne Pavilion.

January 7-14, New York City—Association of Licensed Automobile Manufacturers eleventh annual show in Madison Square Garden. Pleasure cars and accessories.

January 16-21, New York City—Association of Licensed Automobile Manufacturers eleventh annual show in Madison Square Garden. Second week devoted to commercial vehicles.

January 28-February 4, Chicago, Ill.—National Association of Automobile Manufacturers' tenth annual national show in Coliseum. Pleasure cars and accessories only.

February 6-11, Chicago, Ill.—National Association of Automobile Manufacturers' tenth national show in Coliseum. Second week devoted to pleasure and commercial cars, motorcycles and accessories.

March 4-11, Boston, Mass.—Boston Automobile Dealers' Association's annual show in Mechanics building.

March 15-18, Louisville, Ky.—Louisville Automobile Dealers' Association's annual show in First Regiment Armory.

carried family surplusages, including baby carriages, velocipedes, etc., just as on the delivery wagons of department stores.

In this connection William L. Colt, president of the Colt-Stratton Co., of New York City, tells of a motorist in the Bronx who is forced to keep his Cole touring car in a public garage of the section. Somehow its riding condition was not what it should be, considering the moderate use to which he put it, and, as a result, he kept watch several evenings on the boulevards, but the mystery seemed impenetrable. The other night, however, while crossing a downtown business thoroughfare he received a jolt when he saw his vehicle drawing an apparently disabled truck loaded with

household furniture. There was no mistaking the license number. Investigation proved that his chauffeur was regularly using it for such purposes.

### Red Rear Lights for All Vehicles.

Alderman Bent, vice-chairman of New York City's board of "city fathers," has introduced a resolution requiring all horse-drawn vehicles to display a red rear light as well as the white front one already provided for by law and which is displayed when the horseman feels like displaying it. A public hearing on the Bent resolution, which is much needed and which will add immensely to the safety of night travel, will be held on Monday next.

## GRANT RENEWS HIS GRIP ON THE CUP

**For the Second Time, He Triumphs in the Vanderbilt Race—Completes the 278 Miles in 256 minutes—But Dawson, an Indiana Whirlwind, Shares the Glory—Louis Chevrolet Emulates the Skyrocket—Fastest and Most Stirring of All Cup Races.**

Not only did the Vanderbilt cup race "come back" on Saturday last, 1st inst., but Harry F. Grant "came back" with it. He won the famous trophy last year and he won it again on Saturday. He completed the 278.08 miles in 255 minutes 58.64 seconds, an average speed of 65.1 miles per hour, which is the fastest sustained speed ever made on the Long Island course, on which, with variations, the five preceding cup races were decided.

Grant, a native of Cambridge, Mass., is the first man to "repeat;" and, unusual to relate, he "repeated" in the identical car, a 60 horsepower Alco, in which he triumphed in 1909. His victory, too, was earned in exactly the same fashion. He let those who would emulate the "skyrocket" and while they split the air with magnificent flight, and while the "ohs!" and "ahs!" re-echoed, Grant, driving as magnificently, if less impressively, never flickered. He simply kept "everlastingly at it"—steadily, consistently. When the skyrockets burst and their sticks were coming down or, figuratively, and in several instances literally, had struck the earth with dull thuds, Grant began to go up, that is, to forge to the front. He assumed the lead on the eighteenth lap and never lost it.

But Joe Dawson, a round-faced, sturdily-built young man hailing from Indiana and driving a war-stained yellow Marmon car, gave Grant the fight of his life. He "lost out" by a scant 25 seconds. But for a flicker—that is, trouble due to a leaking

gasolene line—on the eighteenth lap, Dawson simply must have won. Up to that period he was four minutes ahead of Grant. He lost all of this advantage and four min-

HARRY F. GRANT

utes more, and yet with slightly less than 50 miles to go he made up all but 25 seconds. That surely is "going some." Perhaps Grant may count himself lucky. Though he won the cup he simply must share honors with Dawson.

Dawson was one of the skyrockets, too. But the power behind him was sustained and sustaining power. Though he drove like a streak, his stick refused to descend. And the marvel of the man's performance lies not only in his skill and daring but in the performance of the car he drove. The Marmon was the "littlest car" in the race.

It was a four cylinder model, was rated at but 32 horsepower, and had a piston displacement of but 318 cubic inches. Grant's six cylinder 60 horsepower Alco had a displacement of 579.9 cubic inches. What a difference! Nor did the Marmon have marked advantage in weight. Its declared weight was 2,200 pounds; the Alco's 2,300 pounds. The heaviest car was Stillman's Oldsmobile—4,000 pounds. When laurels are being strewn, it's a fair shake, therefore, to cast a few sprigs in the direction of the men who made that Marmon.

But in the early stages of the big race it was neither Grant and the Alco, nor Dawson and the Marmon, that filled the public eye. It was Chevrolet—two Chevrolets—and Burman and their Marquette-Buicks that occupied the center and both ends of the stage. The big hyphenated Buicks were near to the displacement limit of 600 cubic inches—and how they did go! Except to skeptics who actually laid wagers as to how long the Buicks would last, it soon seemed all over but the shouting. Their pace was tremendous—their roar magnificent; the race looked like a runaway for the three dare-devils who drove them. They were tearing off the fastest laps; they steadily were drawing away from all rivals, and then—one after the other the sticks of the skyrockets tumbled swiftly downward and the skeptics collected their bets. Louis Chevrolet, however, scored the fastest lap, 10:12, on his third round.

There were accidents; unfortunately they

THE SCENES WHEN GRANT AND DAWSON FINISHED THE CUP RACE.

GRANT (ALCO) RENEWING HIS GRIP ON THE CUP—FINISHING FASTER THAN HE STARTED

JOE DAWSON (MARCONI) COMPLETING HIS CYCLONIC PERFORMANCE, 25 SECONDS BEHIND GRANT

seem inevitable; in two of them, the mechanics of the racing cars involved met death. On the very first lap of the race the Columbia car, driven by Harold Stone, of Los Angeles, Cal., plunged through the railing of one of the overhead bridges on the Motor Parkway itself and rolled down the embankment, killing Milton R. Bacon, Stone's assistant, and fracturing both of Stone's legs. On the sixteenth lap, while he was moving at a tremendous pace on the straight road between Hicksville and Westbury, the steering gear of Louis Chevrolet's Marquette-Buick went wrong and the

car dashed from the course, crashing into and smashing the touring car of a spectator which was parked at the roadside, and then overturned after breaking three trees in its path. Chevrolet escaped with a dislocated shoulder, but the neck of his mechanic, Henry Miller, was broken. The spectators who occupied the touring car suffered one a broken arm, another bruises. Two other spectators had both legs broken; both men unwisely attempted to cross the course, and one was struck by De Hymel's Stoddard-Dayton; the other by Dawson's Marmon. Several other on-lookers sus-

tained minor injuries. Incidental to the race there were two deaths. In one case a car overturned in the dark of the early morning and the driver was killed and his wife injured; in the other a car supposed to have been en route from the course struck and killed an aged man miles from the scene of the race. The more sensational of the New York papers promptly acquired hysteria and by using a magnifying glass made appear that the race was akin to a slaughter house and that Long Island had been converted into a shambles. Some of them have not yet quieted their hysterics.

## Men and Things and Scenes Disclosed by the Dawn of the Day

GENERAL VIEW OF SCENE AT THE STARTING AND FINISHING POINT

The "coming back" of the Vanderbilt and the return to the daybreak start were attended by most of the scenes and no small part of the crowd that made the occasion such a spectacle and added to its fame. Of course there was no such crowd as marked the first race in 1904 or the one in the following year when France and Germany sent men and cars to "lift" the cup, and when automobiles and automobile racing were so novel that the superheated public fancy fired by a superheated press expected all manner of fantastic and diabolical doings. But there was, nevertheless, a huge crowd present on Saturday last, and very many of those who five or six years ago viewed the automobile as a devilish contrivance came to the scene in their own automobiles.

It is doubtful if ever before so many motor cars were gathered in a given space. There may have been 20,000 of them; there certainly were 10,000. For nearly three hours after the race there was an unending procession of cars nearly 20 miles long wending its way from the course to New York, not to mention shorter processions headed in other directions. Practically every foot of ground surrounding the circuit of 12.64 miles had been employed for parking purposes, and the car owners or other auto-

mobile interests had paid from \$5 to \$60 per car for the parking privileges. In the Pope-Hartford space near the grand stand, the cars, some 400 of them, were parked four to six deep. And the outpouring of that portion of the great green public which knows automobiles only by sight was unexpectedly great. Spectators fringed practically the entire course. At the danger points, the corners of the course, they massed in overwhelming numbers and projected themselves onto the course with the usual heedless disregard for personal safety. As always, the wonder is that so few were injured.

The country cops, recruited for the day and wearing borrowed coats and helmets many sizes too large or too small for them, were as grotesque and as useless as ever, and not even the two carloads of grey-coated Pinkertons brought from New York can be said to have covered themselves with glory. They may have been fatigued by the railway ride of 20 miles, as one of their superiors in all seriousness declared was the case. And the railway service, by the way, was, for the first time, more nearly what in theory it is supposed to be. It was reasonably expeditious and there were few delays either coming or going. The police service, however, showed no im-

provement. The yokels in their borrowed and ill-fitting clothes made the occasion a holiday, and if they had thoughts other than viewing the race and collecting their stipends, the result was not reflected in their action. One of the uniformed yaps spent the entire morning in the press stand perched on a bench. Another with an eye to "easy money" did a brisk business permitting spectators, for 10 cents each, to pass through an opening in the wire fencing which had been erected to keep them out of harm's way.

So far as the actual management of the race was concerned, it was well nigh flawless. Everything was conducted with promptness and despatch and with a snap that was reflected in the race itself. Even the task of starting the two minor races, the Wheatley Hills Sweepstakes and the Massapequa Sweepstakes, while the cup race itself was in progress, was performed so well that the scent of danger which it suggested quickly evaporated. The cars entered in these minor races had been parked in position before the big race started and at intervals of one hour the Wheatley Hills and the Massapequa contenders were under way so quietly that many persons failed to take notice when they were being given the word.

ONE OF THE MOST DESIRABLE VANTAGE POINTS—ONE OF THE BRIDGES OVER PARKWAY

LOOKING TOWARD GRAND STAND AN HOUR AFTER THE RACE WAS OVER

When the curtain of night lifted and the great army of moving objects, each marked by two huge bullseyes, had settled into place and assumed the forms of automobiles—when the ghostly spectres which dotted the Hempstead Plains were discovered to be tents, and when the early comers had awakened and disposed of a quick coffee and quicker sandwich or doughnut—when day broke the sixth Vanderbilt was ready for its running. "Society" folk and near-Society folk who are supposed to fill the boxes in the grand stand had not yet filled them; they came late and even then there were boxes to spare. But the tiers of hard \$5 per seat benches in the rear of the boxes soon were comfortably occupied, although there, too, there was elbow room.

The Clara De Veres and Montgomery Montmorencys were present, of course; also some others who at a distance of a mile and a quarter easily might be mistaken for a De Vere or a Montmorency. Clara wore the very latest style of inverted flower pot, but it was too warm for her to display her furs. "Monty," he wore

"just clothes," and nothing that he might have worn could have excited more remark than the coat of "Willie K." He's the young man who gave the big silver mug for which the racers raced and who always acts as its referee. Vanderbilt looked scarcely a day older or a pound heavier than when first he played the part in 1904. But he wore a new suit of clothes. It was his motoring toggery, attire or apparel—choose your own word. It was of grey; jacket, Norfolk style; breeches, baggy equestrian pattern with cuffs buttoned at the knees; leggins, tan leather. Nowadays leggins are the mark of the professional chauffeurs—but no matter! It was the shoulders of "Willie K.'s" jacket that caused the wonder and remark. On each was a broad patch or pad of grey suede.

As it is not believed that any member of the Vanderbilt family has grown so poor as to wear patched clothing or that "Willie K." in particular has engaged, even playfully, in the hod-carrying profession, the reason for his shoulder pads was not apparent and remains a mystery of the 1910 race.

His chief deputy, so far as the Motor Parkway is concerned, and the "real works" of the Vanderbilt cup race, A. R. Partington, was in frequent conference with the referee, but his sartorial appointments were in no wise out of the usual. It goes without saying, however, that Mr. Frederic Wagner, who "starts things," Vanderbilt cup races among them, wore his "Vanderbilt pants." No race would be complete without those plaid knickerbockers. Wagner wore leggins and a coat, of course, but, oh! those pants—those Vanderbilt pants!

The same shafts of light that rendered these things easily distinguishable also disclosed the cup contenders lined up in two rows, the odd numbers on one side, the even numbers on the other. The morning mist so prevalent on Long Island was absent and the sky was slightly overcast, and ten minutes before 6 o'clock, the hour set for the start, a gentle sprinkle fell; a brisker shower descended after the last car had been despatched, but it, too, was of short duration. The sun then came out and with his cheerful beams chased the clouds away.

## The Start of the Race and Its Spectacular Running and Finish

The competitors were given the word at 15 seconds intervals, the Wagner "Go!" being accompanied by the Wagner slap on the back, after Referee Vanderbilt had been careful that the tire of no car should protrude even one one-hundredth of an inch over the starting wire. With his own hands he helped push back several such offenders. The contenders were despatched in the following order:

No.	Car.	Driver.
1—	National.....	Al. Livingston
2—	Lozier.....	Ralph Mulford
3—	Marquette-Buick.....	Arthur Chevrolet
4—	Mercedes.....	Spencer E. Wishart
5—	Simplex.....	Ralph Beardsley
6—	Benz.....	E. A. Hearne
7—	Benz.....	Franz Heim
8—	Amplex.....	Walter Jones
9—	National.....	John Aitken
10—	Simplex.....	Leland Mitchell
11—	Columbia.....	Harold Stone
12—	Corbin.....	Joe Matson
13—	Stoddard-Dayton.....	Hugh Harding
14—	Benz.....	D. Bruce Brown
15—	Pope-Hartford.....	Jack Fleming
16—	Alco.....	Harry F. Grant
17—	Jackson.....	Ernest Schiefler
18—	Oldsmobile.....	Harry B. Stillman
19—	Marmon.....	Ray Harroun
20—	Pope-Hartford.....	Bert Dingley
21—	American.....	William Wallace
22—	Stoddard-Dayton.....	Tobin De Hymel
23—	Marmon.....	Joseph Dawson
24—	Haupt-Rockwell.....	Carl N. Limberg
25—	Marquette-Buick.....	Robert Burman
26—	Apperson.....	Harris Hanshue
27—	Marquette-Buick.....	Louis Chevrolet
28—	Royal.....	P. Harry Jardine
29—	National.....	Louis Dishrow
30—	Knox.....	Fred Belcher

The only non-starter was No. 5, Joe Nelson, whose Oldsmobile struck a stump en route to the tape and broke an oil pump and punctured its oil pan.

The getaway was without special inci-

dent. It took two men and a stout rope attached to the starting crank to "wind up" Arthur Chevrolet's Marquette-Buick, but he got away with a roar and a rush. His brother, Louis, also in a hyphenated Buick, was the only man to suffer delay. Just after crossing the wire his engine stalled. To the accompaniment of a round oath, Chevrolet's ill-fated mechanic, Miller, leaped out and re-cranked the car. He did it in a jiffy, but the delay cost 15 seconds, Chevrolet finally getting away abreast of Jardine (Royal Tourist)—a post entry—who received the word after him. Practically everyone jumped away. The only slow starters were Fleming (Pope-Hartford) and Limberg (Haupt-Rockwell). It was difficult to distinguish just how Stillman (Oldsmobile) got off. When "Go!" was shouted in his ear he gave his engine such a charge of oil that it spouted great billows of dense smoke that completely hid him from view and blotted out the entire scene. It suggested an oil well afire. It is rare indeed that a car exhausts such volumes of smoke. It was a sight worth seeing.

With the great pack in full cry, it seemed no time at all before the red flags of the signalmen went up in quick succession and the sound of the bugle atop the press stand aroused the old familiar cry "Car Coming!" Anyone with a field glass and knowledge of the "lay of the land" did not require either flag or bugle to inform him of the fact. From the west end of the grand stand or press stand or other elevation there is to be had as spectacular a view of the race as ever can be obtained of such a contest. All of a mile away, and

with the naked eye, the cars, looking like tiny automatic toys, can be seen suddenly to pop over the crown of one of the overhead bridges on the Parkway, dart down the grade, disappear for a moment around a curve, then like fleeting shadows they seem to dart across the field, and, growing larger every moment, they turn into the long straight homestretch and thunder past. The view is one that would justify the Parkway management in so perching extra-reserved seats—and charging for them—that advantage may be more generally taken of the unusual spectacle.

The first car that hove in sight was not the first one that had been sent away. Livingston's National had been passed by Mulford's Lozier, while Arthur Chevrolet's Buick darted by within sight of the crowd. They had started 1, 2, 3, and though Chevrolet had gained on Mulford, the latter was hailed as the leader and re-acclaimed on the next lap when the Frenchman had trouble and lost his advantage. None of the score boards gave the seconds—not even the new one with movable number plates; they merely recorded the minutes and the crowd thus was none too wise. If the hopes of Mulford's adherents were raised they were false hopes; for though he remained in front it was because he was an early starter. Behind him were men in cars that were moving faster. Most of them, like Mulford, were ripping off laps of 12.64 miles in less than 12 minutes. One of them, Louis Chevrolet, the same who had lost 15 seconds in starting, had turned the first lap in less than 11 minutes, and another, Belcher, in the Knox, had flashed around in 11 minutes flat. They

## THE MOTOR WORLD

THE OVERS AND UNDERS OF THE PARKWAY—THE BRIDGES NEAR MEADOWBROOK

1. OVER—GRANT (ALCO) LEAPING THE SKYLINE AT ONE OF THE BRIDGES
2. UNDER—STILLMAN (OLDSMOBILE) PROVING THE ADAGE OF THE STERN CHASE
3. AND OVER—HEARNE (BENZ) CROSSING THE BRIDGE WHERE STONE CAME TO GRIEF

then were first and second in point of time. Burman (Buick) and Dawson (Marmon) were third and fourth, respectively.

When the crowd awoke to the apparent paradox that the first man was not the leader, it was because the stupendous pace and the battle roar of the Marquette-Buicks compelled the awakening. Their going was positively wicked, and the reckless dash and abandon of their drivers, Burman and the Chevrolets, was a sight to make eyes bulge. It appeared as if they would run away from their rivals and that the race was between them. There were those,

did not emit such a gloriously impressive roar or seem to split the air with such a whack. But it was splitting it just the same. Belcher was the first of the rockets to descend. He improved on even his first fast lap, and when in third position on his fourth lap his Knox suffered two broken exhaust valves and that was the end of him. Arthur Chevrolet was the next of the first fliers whose stick returned to earth. He evidently knew what was coming. Once he secured a spare chain at his repair pit and then dropped it in the road a few yards beyond. He had trouble on

glory of the Buick standard. He maintained it for just one lap. A broken chain and an engine that rebelled at its fearful work laid him low on the tenth round and his weary motor found its rest. It was then that Dawson first made the crowd take real notice of his Marmon.

With Burman out and Louis Chevrolet now engaged in a stern chase, Dawson was in command. He was more than four minutes "to the good," and Louis Disbrow (National), little noticed and little fancied, was in second place. Chevrolet, going great guns and driving with even more

DAWSON (MARMON) OVERTAKING BRUCE-BROWN (BENZ) NEAR THE GRAND STAND

however, who were not deceived by appearances.

It was the bulkiest Vanderbilt that was ever run. There was something doing all the while. The bugler was kept busy. The field was so big that there were cars passing or in sight nearly all the time. Some thundered; some flew lightly by. And as happened many times, when two cars came down the stretch abreast, occasionally with hubs almost touching, it was a sight to make the pulse beat faster. Their speed was terrific and their front wheels fairly danced on the cement surface, as each strained for the mastery. The changes of position were so frequent and so hard to follow that until toward the end of the race few knew "who was where." All knew that the Marquette-Buick trio was leading the others a merry pace and not many realized that Dawson at all times was so closely at their heels, so to speak. His Marmon

the seventh lap and on the eighth his chain and radius rod broke and he was heard of no more. A Motor World man saw him lying beside his car at the roadside near Westbury, and if he was not weeping he certainly looked it.

Louis Chevrolet, however, remained to uphold "the honor of the family." Long before, he had scored the fastest lap, 10:12, and left his brother far behind and indeed everyone else. Could he but maintain his awful speed the silver cup was his so easily that it would be "like taking candy from a kid." On the eighth lap (101.12 miles) he was nearly three minutes ahead of the next best man, and the next man was Burman—and Burman also drove a roaring Buick. On the very next round Chevrolet began to flicker. He suffered a "bad time" and lost the lead. The cynics smiled knowingly. But Burman was right there to take up the leading and maintain the

reckless abandon, was third and gaining fast in his effort to make up lost time. He overtook Disbrow on the next—the eleventh—lap, but Dawson was possessed of speedier stuff. The Frenchman gained on him slowly but surely, and after a chase of 50 miles he wore down Dawson's lead and on the fourteenth lap was again in front. But his was the pace that kills. On the fifteenth round he had another bad spell, and Dawson regained the premier position, while Chevrolet went from bad to worse. On the sixteenth lap his end came tragically. Near Hicksville his steering gear went wrong and his car bounded off the road, charged into and upset a touring car filled with spectators, broke down three trees in its path, and then turned over. Chevrolet was thrown clear of the wreck and escaped with minor hurts, but Miller, his mechanic, was killed instantly. News of the accident was slow in reaching

## Summary of Three Races on the Long Island Motor Park

REFEREE VANDERBILT AT EASE

the grand stand, and the anxiety of the men in the Buick repair pit as they strained their eyes long and longingly for the last of their heroes who came not constituted a picture that must have been amusing were it not so real and so earnest.

And while all these things were happening, a man with cheerful face and clear head

behind the steering wheel of an Alco car had been "going some" himself, though he refused to rival the rockets. He was Grant, driving a heady, careful and consistent race. He knew his pace and held it. He was in ninth place on the third lap when the fireworks were whizzing fiercely, and gradually he worked forward as they flickered or sputtered and "died." When Louis Chevrolet went down and out, only Dawson was in front of him—two minutes in front and moving faster than the wind. Grant stopped for oil and fuel on the seventeenth round and Dawson added two minutes more to his advantage, and then a gasoline pipe sprung a leak and he had to stop for repairs. He had stopped once before, on the twelfth round, for fuel and a change of tires, and made a long five min-

utes job of it, and his stop on the eighteenth lap to fix the gasoline pipe was another long one—all of four minutes—which added to time lost on the road due to the leak gave Grant what looked like a safe lead. It did not seem that he could be overtaken. Even John Aitken (National), who also had driven a marvelously consistent race and worked forward almost unnoticed, passed Dawson. But once the leak had been stopped, Dawson returned to his work like a fury. He overhauled Aitken in less than 25 miles and closed on Grant with astonishing rapidity. With two laps to go he had cut down the cup holder's lead to 43 seconds, and a portion of the crowd at least realized that a rare struggle was on, and when Grant stopped to change a tire on the twenty-first round, it seemed

that the cup must change hands and be removed to Indiana. But the tire change was a lightning fast one. It was but a matter of seconds, and Dawson had not quite closed the gap. Grant's margin of safety was close, but it was just enough to win. Dawson gained 18 seconds on him, but both were going faster than at the start, and, fast as Dawson moved, it was exactly 25 seconds too slow.

As the score boards did not give the seconds, only those who kept tabs on score cards from the megaphoned announcements were aware what a battle had been waged. It was in the press stand and in the trade camps and pits where interest was keyed highest, for had the crowd known how splendid had been the duel between Grant and Dawson and how consistency

had brought Aitken into third place, surely more than feeble and scattered cheers must have rewarded each of them.

When Grant stopped and was informed of his new triumph he asked concerning his time, and when it was told to him, he remarked, quietly:

"That's slower than it was last year, isn't it?"

But it isn't slower; it is the fastest time ever made in a Vanderbilt race.

From the time that the Buick trio began their spectacular flights with Dawson at their heels until the time that Dawson, Disbrow, Aitken and Grant "mixed it" in the closing rounds, much else had occurred. Of the 30 cars that started, one, the Columbia, never was seen again at the starting

STARTER WAGNER, HE SEES 'EM COMING

point. It was on the very first lap that it plunged off the bridge, breaking the legs of Harold Stone, its driver, and hurling his mechanic, Milton Bacon, into eternity. First reports that reached the stands had Stone killed and Bacon injured. For hours this belief prevailed. How the accident occurred is not clear. It was attributed to a burst tire, but a Motor World man who saw the wreck after the race found no evi-

dence of tire failure. Ghoulish youths were there, however, and purloining movable parts of the battered hulk as souvenirs. One of them used a stone to break the magneto; another pried off a piece of the radiator. It seems likely that Stone was the victim of his own daring. The Motor World man stationed at the Westbury turn saw no driver who took the dangerous angle at more reckless speed than Stone; he seemed to think not of consequences, and when he rounded into the straight road his car zigzagged from side to side for several rods before it ran true. Its action suggested that the steering gear had been wrenched. It was only a mile beyond that the accident occurred.

One round was enough for Jardine, the Royal Tourist's post entry. He stopped at the pits because of tire and engine trouble, and it was too great to be overcome. There was lots of "action" and interest at these pits, too, and it was there that the race was won and lost. There were some lightning changes of tires and refillings of tanks and performing of repair jobs, and there were others that were distressingly slow. It was slow work at the pits that undid Dawson, who himself dismounted from his car as if he had all day before him. It was quick work that helped Grant. It was inexperience and

#### Average Speeds in the Cup Race.

Driver and Car	Ave. Miles Per Hour	Ave. Time Per Mile
Grant, Alco	65.18	55.18
Dawson, Marmon	65.02	55.37
Aitken, National	64.30	55.98
Disbrow, National	63.18	56.98
Mulford, Lozier	63.07	57.12
Fleming, Pope-Hartford	62.54	57.58
Mitchell, Simplex	61.33	58.70
Hearne, Benz	61.25	58.77
Harding, Stod.-Dayton	60.99	59.05
Dingley, Pope-Hartford	60.14	59.85

newcomers at the pits that delayed Dingley and Fleming and their Pope-Hartfords. Once both cars stopped at the same time for spare tires—they stopped for nothing else—and Fleming's were not ready for him; he took chances and went on without them; and when tire changes were made, the Pope-Hartford pit crew used small jacks where the more experienced used large ones. Hanshue and his Apperson and Schieffler and his Jackson spent the longest periods at the pits. Hanshue was the victim of his own folly, or someone's persuasiveness. He had been induced to try a new carburetter; after one lap it struck work and he spent nearly half an hour replacing the old one. Schieffler was the victim of downright hard luck. On the very first round the radius rod bracket of his Jackson broke—a most unusual mishap—and for more than an hour he and his mechanic labored at the repair. Finally they succeeded, and although hopelessly out of the race, went on and gave a demonstration of consistent running by

THE MASSAPEQUA TURN, SHOWING ONE OF THE WHEATLEY HILLS CARS HALTED AT ROADSIDE

repeating lap after lap in approximately the same time.

There were many stops at the pits and the officials were very much alive to their duties. They kept close watch that the men in the pits did not do more than handle tires and replenishments. Two or three

excited or over-anxious repairmen who leaped out, tools in hand, to assist in mechanical repairs were unceremoniously fired back into their pits. Once, too, in the case of Limberg and the Houpt-Rockwell, the officials demonstrated their keenness. Limberg's brakes were suspected and, tests

proving them weak, he was required to make them good even at the expense of much precious time.

Franz Heim, Benz, was one of the three who made no stops at the pits. His gasoline line broke and his German car caught fire and was rendered hors de combat.

## At the Turns Where Cars Skidded and Spectators Tempted Fate

Hicksville was one of the points on the course that promised doings. There's a bend in the road there and as soft as it speedily became in the Vanderbilt race of 1909, it was not a marker to its condition this year after the first few laps had been run. The stretches in each direction, too, never before seemed so lumpy. The road leading north at the junction is always fenced across during the race hours, and while no such banking had been attempted there as in previous years, the surface had nevertheless been somewhat built up with macadam. The cars speedily cut into the cracked stone as if it were corn meal, with the result that it soon lay in long ridges. Those ridges were the cause of putting the Mercer, No. 47, out of commission, C. H.

Frey, the driver, and C. M. Kittrell, the mechanic, barely escaping with their lives when it struck a telegraph pole just beyond. The Mercer upon reaching the soft spot skidded, causing the right rear tire to explode. Within two seconds the car had made a lunge into the crowd of observers and would doubtless have killed someone but for the telegraph pole behind which the group dodged. There was a resounding whack and the splinters flew in every direction.

The fore right wheel was carried away except its hub, the radiator was jammed out of shape, and half of the steering wheel was carried away. Spectators involuntarily turned their heads expecting to see both men pitched headlong against the pole.

They got out of the wreckage instantaneously, however, and asked for help to draw the debris out of the path of on-coming cars. Later both men found their hands cut in several places, but it seems likely the cutting was done in pushing and handling the car after the collision. The two men perched themselves on guard over the wreck and remained there until the contest was finished, otherwise the car would have been carried off piecemeal by souvenir hunters, as was the case with the ill-fated Columbia car on the opposite side of the course.

Within a quarter of a mile of the Mercer to the westward was laid up the disabled Royal Tourist, No. 30, with Driver P. H. Jardine and his assistant sprawling over

ANOTHER VIEW OF THE MASSAPEQUA TURN, WHERE THERE WAS SOME FEARFUL SKIDDING

the machine in an attempt to protect it from curiosity seekers. The trouble was a broken cam shaft. Al. Livingston in the National also boasted a passing acquaintance with the telegraph pole that undid the Mercer. Nobody thought it necessary to tear off the big splinters left at the bottom

for the score of near-policemen was unable to cope with the unruly mob of men and youths congregated at that point. The turn was fenced in, but the fencing was entirely inadequate. It did not extend over about 50 or 60 yards in all, beginning 20 yards east of the right angled corner and

enough for the car to rush through. On several occasions the drivers were compelled to stop at or near the turn for a change of tire or some hurried mechanical adjustment, and in order to leave a free

HARROUN ROUNDING HICKSVILLE TURN; WRECKED MERCER AT ROADSIDE

of the pole by the collision, although they projected several inches. Livingston's fore wheel soon caught one of the splinters and sent it flying over the heads of the

THE REFEREE AND TWO JUDGES

crowd. After that the policemen got busy with the balance of the wreckage.

It was at the Westbury turn that things happened and nearly happened! There the crowd was thickest and most unmanageable,

ONE OF THE TURNS WHERE THE CROWD TEMPTED FATE

extending to 30 yards south of the same. Behind this fence there were crowded no less than 5,000 people, with probably more than twice that number overflowing onto the road where the fence ended. Whenever a driver turned the corner, the human line would open and leave a space barely wide

little red flags in the hands of the signalman first began to wave wildly at the turn and the cry went up "Car coming!" It was Ralph Mulford in the Lozier, and the expression on his face and on that of his mechanic when he skidded around the turn, almost crashing into the outer fence, gave

THE NEW "BIRDCAGE" SCORE BOARD

track for the racing cars coming from behind they had to charge almost directly into the crowd at the right side of the track. A large number of people were slightly bruised in these charges, but no one seemed to take sufficient interest in the matter to look for a remedy.

It was five minutes past six when the

an inkling of what might be expected later on when the track was torn up and the drivers in highly excited state. Following the Lozier came the National, the Buick, the Benz and others, the drivers and mechanics of which had each something to grunt about the moment they struck this abominable turn. The first few rounds most of them negotiated it at considerable speed—some of them almost recklessly;

had to charge into the crowd to get out of the way of the Stoddard-Dayton car, which was a few hundred feet behind. While all other people in the way of the Pope-Hartford jumped backward towards the sides of the road, Miller rushed into the middle of the road directly in front of De Hymel's Stoddard-Dayton. In an instant a pair of shoes were flying in the air while Miller shot fully 15 feet upwards and crashed

of the turn hair-breadth escapes were plentiful, and there hardly was a moment when the crowd could remain undisturbed. About one-eighth of a mile south of the turn a woman sat on the edge of the track, with a baby in her arms. She was within six feet of the cars flying past her at top speed, and a slight deviation from the proper line on the part of any one of these cars would have killed her instantly. Yet she would

ARTHUR CHEVROLET IN DESPAIR WHEN FORCED TO QUIT

WHERE STONE PLUNGED FROM THE PARKWAY BRIDGE  
WHERE FREY (MERCER) SKIDDED INTO A TELEGRAPH POLE

but gradually the speed made at this turn decreased until nearly all cars took it at from 15 to 20 miles an hour. Only Burman and Chevrolet continued to send their cars at high speed around the curve, often missing death by inches.

Harold Stone in the Columbia was another who spun around at frightful speed, and though he passed but once there were those at Westbury who were not surprised to learn that a tragic accident had cut short his career but a short distance away. The one accident that did actually happen at the Westbury turn was the fault of the man who was injured, Thomas Miller, who was run into by De Hymel's Stoddard-Dayton. One of the racers, a Pope-Hartford, stopped a short distance before the Westbury turn for some slight adjustment, and

among the spectators. Besides complicated fractures of both legs, one of which was practically severed from the body, he suffered concussion of the brain.

To the south of the road, in the area enclosed by the right angle, a large number of touring cars had been parked by their owners, the prices for parking at this particular place reaching fifty dollars per car. The parties encamped there evidently expected something to happen at this spot and were willing to go to some expense to be present when it did happen. They were disappointed in this, however, for directly at the turn nothing of importance occurred, although the fancy skidding executed by some of the cars taking the turn certainly was spectacular enough to command attention. But a few hundred feet to either side

not move from her dangerous position, and one interested spectator who endeavored to call her attention to her danger received in answer a very curt and snappy "Mind your own business!"

From the tire standpoint the Vanderbilt was a Michelin race. Excepting the three Benzes, every car that started was shod with Michelins; it was the fifth time those tires had served Vanderbilt winners. The Benzes were fitted with Continentals. In respect to ignition, the Bosch was predominant; it was the equipment of all save four cars. The Splittorf magneto sparked for the three Marquette-Buicks, which performed so swiftly and spectacularly. Warner Auto-Meters were the speed-gauges on the first four cars in the race.

TYPICAL SCENES AT THE REPAIR PITS, WHERE QUICK ACTION WAS THE RULE

1—RAY HARROUN (MARION) STOPS WITH BROKEN GASOLINE PIPE. 2—FLEMING AND DINGLEY (POPE-HARTFORD) BOTH CALL FOR TIRES. 3—WHEN MULFORD (LOZIER) HALTED WITH A BROKEN VALVE. 4—BASLE (MARION), ONE OF THE WHEATLEY HILLS CONTENDERS, FINDS CAUSE FOR WORK

## The Story as Told by the Repair Pit Record

### H. F. Grant, Alco.

- 6:50, 17th lap—Took on oil and gasoline. Delay, about two minutes.  
10:08, 21st lap—Changed left front tire. Delay, 30 seconds.

### Joe Dawson, Marmon.

- 8:18, 12th lap—Changed left rear tire; took on gasoline. Delay about five minutes.  
9:33, 18th lap—Repaired gasoline line. Delay, about four minutes.

### John Aitken, National.

- 7:13, 6th lap—Changed tires; took on oil and gasoline.  
9:19, 17th lap—Changed right rear tire.

### Louis A. Disbrow, National.

- 9:02, 15th lap—Took on spare tire, oil and gasoline.

### Ralph Mulford, Lozier.

- 8:19, 7th lap—Put new valve and spring in rear cylinder; took on oil and water. Delay about six minutes.  
9:11, 16th lap—Changed two front and right rear tires. Delay, about four minutes.  
9:37, 18th lap—Changed right rear tire.

### Jack Fleming, Pope-Hartford.

- 7:56, 9th lap—Changed two front and right rear tires; took on gasoline.  
9:25, 17th lap—Changed front and rear left and took on spare tires.  
9:40, 18th lap—Took on supplies.

### Leland A. Mitchell, Simplex.

- 8:12, 11th lap—Made oil pump adjustment and took on oil. Delay, about three minutes.  
9:15, 16th lap—Changed left rear and right front tires and took on one spare tire and oil and gasoline. Delay, about four minutes.

### Edward A. Hearne, Benz.

- 7:28, 7th lap—Changed tires.  
8:39, 13th lap—Changed front and rear left tires. Delay, about three minutes.  
10:16, 21st lap—Changed left rear tire. Delay, two minutes.

### Hugh Harding, Stoddard-Dayton.

- 8:08, 10th lap—Engine trouble; took on gasoline and oil. Delay, about four minutes.  
9:39, 18th lap—Secured broken strut rod under rear axle and took on water. Delay, about four minutes.

### Bert Dingley, Pope-Hartford.

- 7:52, 9th lap—Took on extra rear tire.  
8:30, 12th lap—Changed right rear tire and took on gasoline. Delay, about four minutes.

- 8:47, 13th lap—Changed right front and took on spare tires. Delay, about two minutes.

- 9:28, 16th lap—Took on spare tires. Delay, about one minute.

- 10:18, 20th lap—Took on extra spare tire.

### Harry Stillman, Oldsmobile.

- 8:34, 12th lap—Took on oil and gasoline.  
10:02, 18th lap—Took on supplies.

### David Bruce-Brown, Benz.

- 7:30, 7th lap—Changed left rear and took on spare front tires and water. Delay, about three minutes.

- 8:08, 10th lap—Took on supplies.

- 9:09, 15th lap—Changed left front tire, demountable rim out of order. Delay, about four minutes.

- 9:19, 17th lap—Changed left front tire. Delay, caused by rim trouble, about seven minutes.

### Al. Livingston, National.

- 6:50, 2nd lap—Dirt in auxiliary air valve; tires inflated.

- 9:43, 17th lap—Clutch pedal adjusted; changed tires and took on water. Delay, about five minutes.

### Walter Jones, Amplex.

- 7:24, 2nd lap—Gasoline tank adrift and leaking. Delay in repairing, about 20 minutes.

- 8:39, 11th lap—Changed left front and rear tires. Delay, about six minutes.

- 9:09, 13th lap—Changed front and rear right tires.

### Ralph E. Beardsley, Simplex.

- 8:28, 12th lap—Took on oil and gasoline. Delay, about four minutes.

- 9:33, 18th lap—Changed front tires and took on spares. Delay, about four minutes.

### Harris M. Hanshue, Apperson.

- 6:20, 1st lap—Carburettor adjustments; took on water.

- 7:04, 2nd lap—Changed carburettor. Delay, about 36 minutes.

- 9:29, 13th lap—Took on gasoline and oil. Time lost wiping oil spilled on seats. Tire rack loose and ordered removed. Went on without extra tires. Delay, about four minutes.

### Spencer E. Wishart, Mercedes.

- 6:22, 2nd lap—Took on spare tire. Delay, about two minutes.

- 8:19, 10th lap—Changed spark plugs, adjusted magneto. Delay, nearly 15 minutes.

- 9:12, 12th lap—Took on water. Delay, one minute.

### Carl Limberg, Houpt-Rockwell.

- 8:41, 12th lap—Endeavored to stop at pit

but brakes failed to hold; stopped beyond grand stand and went on.

- 8:56, 13th lap—Overran pit owing to weak brakes, and backed up. Changed left rear and right front and two spare tires; took on oil and gasoline. Condition of brakes challenged by technical committee and test ordered. Brakes failed to hold on two tests and car ordered back to pit. Left brake band lining fabric worn through. Riveted up by crew. Delay, nearly 50 minutes.

### Louis Chevrolet, Marquette-Buick.

- 7:48, 9th lap—Took on spare tires and oil. Delay, about two minutes.

- 8:59, 15th lap—Changed right front and rear tires; took on oil and gasoline. Delay, about three minutes.

### E. F. Schiefler, Jackson.

- 7:00, 1st lap—Broken strut rod bracket. Delayed in repairing until 7:45.

- 10:02, 11th lap—Valve trouble. Delay, about four minutes.

### Ray Harroun, Marmon.

- 6:40, 1st lap—Broken gasoline line.

- 8:47, 9th lap—Took on gasoline. Delay, about three minutes.

### Tobin De Hymel, Stoddard-Dayton.

- 7:03, 5th lap—Repaired leaking water connection.

- 8:08, 10th lap—Took on water. Delay, about two minutes.

### Robert Burman, Marquette-Buick.

No stops at repair pits.

### Joe Mason, Corbin.

- 6:52, 3rd lap—Water gasket trouble; drained radiator and took water.

Delay, about 12 minutes.

- 8:02, 7th lap—Leaking water gasket; drained radiator and took water.

### Arthur Chevrolet, Marquette-Buick.

- 7:41, 7th lap—Took on spare tire and extra driving chain. Mechanic lost chain overboard as car was leaving the pit.

### W. Wallace, American.

- 7:40, 6th lap—Took on water; engine hot. Played hose on radiator.

### Franz Heim, Benz.

No stops at repair pits.

### Fred Belcher, Knox.

No stops at repair pits.

### H. Jardine, Royal Tourist.

- 6:31, 1st lap—Changed tires; engine trouble.

HOW THE SKIDDERS SKIDDED—GRAPHIC VIEW OF FLEMING (POPE-HARTFORD) SLEWING AROUND THE WESTBURY TURN

AITKEN (NATIONAL) RIDES ANOTHER RING AROUND THE MUCH-TRoubLED WISHART (MERCEDES)

## The Races Within the Race—The Wheatley Hills and the Massapequa

When one big race and two little ones are running on the same course at the same time it is inevitable that the little ones must suffer at least partial eclipse. When the big race is as big as the Vanderbilt cup race it follows that the two little races which were running concurrently were almost completely eclipsed. This was the case last year with the Wheatley Hills sweepstakes and the Massapequa, and it was more than ever the case on Saturday last. The Vanderbilt was bigger than ever before, and the interest in it was so absorbing that the two minor events attracted practically no attention and created practically no comment. Unlike last year, when the three races were started in quick succession, on Saturday last the Wheatley Hills was started one hour after the Van-

derbilt was started. The cars in the lesser races awaited their turns to start

qualified by the technical committee because its makers could not satisfy that body that the output of the car in question had been sufficiently large to justify its recognition as a stock car machine.

Marmon, and Maisonville, in a Corbin, began a fight for the leadership. They were moving at better than a mile a minute and were but three seconds apart the first time around. The Corbin then suffered engine trouble and retired but Heinemann maintained his superb pace and steadily left

WILLIAM ENDICOTT  
Winner Wheatley Hills Sweepstakes

derbilt get-away had been made and the Massapequa sweepstakes, for the littlest cars, was started one hour after the Wheatley Hills. In each instance they slipped away so quietly and mingled so quickly in the fray of the big race that the average spectator was not aware that they were not a part of it unless he was well posted and had kept close count on his score card.

There were eight starters in the Wheatley Hills sweepstakes, which was restricted to cars of 231-300 cubic inches displacement. The distance of this race was 15 laps, or 189.6 miles. While the Vanderbilt cars were roaring past, the Wheatley Hills entrants were sent away in the following order:

No.	Car.	Driver.
41—	Fal	W. H. Pearce
42—	Mercer	E. H. Sherwood
43—	Marion	Marcel Basle
45—	Marion	Fred Heinemann
46—	Fal	J. F. Gelnaw
47—	Mercer	H. P. Frey
48—	Corbin	Alvin Maisonville
49—	S. P. O.	Jean Juhasz

The only non-starter was Montague Roberts in a Correja; which car had been dis-

HOW THE CARS IN THE LESSER RACES AWAITED THEIR TURNS TO START

An eighth of a mile from the starting point it dashed off the cement surface and appeared to lunge into the crowd packed behind the wire fence at the roadside. In the cloud of dust which it had picked up

the others far behind. On the sixth lap he was nearly four minutes ahead of his nearest rival, Pearce, in a Fal car, and nearly seven minutes ahead of Pearce's team mate, Gelnaw, who ultimately won. On the

STARTING THE WHEATLEY HILLS CARS WHILE THE VANDERBILT WAS ON

it appeared that a tragic accident must have occurred, but the car straightened out in time and itself suffered no delay.

In the very first lap, Heinemann, in a

seventh lap, however, Heinemann suffered the same trouble which afflicted both of the Marmons in the Vanderbilt race. His gasoline line broke and he lost his lead.

WHEN EXCITEMENT PROMISED—CONTENDERS OVERHAULING RIVALS APPROACHING THE GRAND STAND

He made repairs as best he could, but they did not serve him to the end and on two other occasions, when gaining some of the lost ground, he was forced to slow.

When Heinemann fell on evil times, Pearce seemed to have the race won. In the tenth lap he was some five minutes ahead of his team mate and the next thing he ran into trouble and lost all of his advantage and considerably more. He never was able to regain his stride and Gelnaw went ahead and won by more than ten minutes, completing the 189.6 miles in 194 minutes 39.67 seconds, an average speed of 58.44 miles per hour.

the pits in the Wheatley Hills sweepstakes is as follows:

**J. F. Gelnaw, Fal.**

8:10—Made carburetter adjustment. Delay about two minutes.

**W. H. Pearce, Fal.**

9:55—Changed right rear tire and took on water. Delay about two minutes.

10:10—Gasolene line repaired. Delay about two minutes.

**E. H. Sherwood, Mercer.**

7:18—Adjusted accelerator pedal and took on two spare tires.

When the Wheatley Hills sweepstakes had been in progress an hour, and the Vanderbilt race two hours, the five cars starting in the Massapequa sweepstakes, restricted to cars of 161-230 cubic inches displacement, were sent away in the following order:

No.	Car.	Driver.
51—	Cole "30".....	Bill Endicott
52—	Cole "30".....	Louis Edmunds
53—	Abbott-Detroit ....	Mortimer Roberts
54—	Lancia .....	Billy Knipper
56—	Abbott-Detroit ....	V. Padula

Immediately he received the word "Go," William Knipper, in the torpedo-shaped Lancia—the only foreign car in the event—proceeded to make a runaway race of it. He drew further and further ahead on each succeeding lap, until the eighth, and then again was it proven that "the race is not always to the swift." On the Massapequa turn the Lancia skidded into a telegraph pole, charging into a group of spectators and pinning one of them against the pole, but, marvelous to say, without inflicting serious injury. The car turned over and that was the end of it.

Padula in the Abbott-Detroit was another skidder who suffered. He, too, struck a telegraph pole and rendered his car hors de combat and himself was slightly injured.

When Knipper went down and out, William Endicott, in a Cole "30," who had been driving a consistent race, passed into the lead and was never thereafter in danger. He completed the 126.4 miles (10 laps) in 138 minutes 4.32 seconds, an average of 54.93 miles per hour. Roberts, Abbott-Detroit, was second, four minutes to the bad, and Louis Edmunds, in another Cole "30," was third, four minutes behind Roberts. Edmunds had run true but suffered a long delay. When passing the grand stand he was signaled by the officials and required to stop and fasten the spare tires which were dragging on the ground from the rear deck. The straps had broken and as Edmunds was unable to stop until nearly half a mile beyond the point at which he was hailed he appeared at a loss what to do to keep the tires in place and spent an unusually long time fiddling with them before he restarted.

KNIPPER AND THE LANCIA WHICH STRUCK A TELEGRAPH POLE

Pearce, Heineman and Sherwood, the latter in a Mercer, were the only others running when the race was completed. Sherwood had had tire and valve trouble. It was Frey, Sherwood's team mate, who came near to providing a tragedy in the Wheatley Hills sweepstakes. Near Hicksville, a tire blew up, and the car skidded into a telegraph pole, narrowly escaping the great crowd gathered there. Fortunately he struck the pole in such a position that although the car was practically wrecked neither of its occupants and none of the spectators were injured.

The unofficial record of repairs made at

8:14—Exhaust valve trouble; changed tires and took on gasolene and oil. Delay about 25 minutes.

10:30—Took on supplies.

**Fred Heineman, Marmon.**

10:06—Stopped for conference with pit foreman; went on without delay.

**Marcel Basle, Marion.**

7:58—Changed right rear tire and took on water. Delayed, by spark trouble, about four minutes.

**Alvin Maisonville, Corbin.**

Did not stop at repair pit.

**GRAND PRIZE CAUSES TURMOIL**

**Newspaper Clamor Threatens the Big Race  
—Savannah Bids for it—Oldfield Spouts  
and Froehlich is Jolted.**

Due to newspaper hysteria born of the accidents incident to the Vanderbilt cup race, the supervisors of Nassau county and the Motor Cups Holding Co., which latter is promoting the Grand Prize race, due to occur Saturday, 15th inst., on the Long Island Motor Parkway and the public roads comprising the Vanderbilt course, were placed in a discomfiting position and for a while it seemed doubtful if the Grand Prize contest would be held as scheduled. In fact, not all of the doubt has been removed, but that part of it which lingers is of the vanishing variety. One of the Nassau supervisors was much upset by the newspaper clamor which demanded that the permit to use the highways be revoked and he was for heeding the cry instant, but other counsel prevailed and by requiring that the Grand Prize package be opened at 10 o'clock a. m. instead of at day break, as originally purposed, the supervisors stilled some of the clamor.

By 10 o'clock it is believed that the natives will have rubbed the sleep from their eyes and that there will be no occasion for other race-goers who travel in automobiles to the scene to court disaster by making the journey thither during the hours of darkness.

The present condition of the Jericho turnpike is declared to be such that Barney Oldfield, who hasn't seen it, wired Bill Pickens, his business manager and advertising agent—or at least Bill says he received such a message—to withdraw the Oley Barnfield entry unless troops guarded the entire course, in place of police, with whom he seems at some time to have had unpleasant experiences. Although only six weeks ago he furnished the newspapers with a list of the gasoline encounters he had survived—most of them on railed and guarded tracks—he now values his life far above rich men's gains. By first getting in his protest he leads all the drivers; so long as he is in the van somehow he seems likely to be happy. As a matter of fact, however, Oldfield stated several weeks ago that he had no serious intention of competing for the Grand Prize. Other drivers, too, are objecting to the condition of the road, its surface, narrowness and lack of banking. However, as the local authorities already have granted the necessary permission, with sundry modifications, the race is well nigh certain to be held on the Vanderbilt course as originally selected. Although there are those who favor postponing the event until November, in order to give Nature and the management an opportunity to wet down and otherwise put the course into

better shape, as the official permit specifies October 15th, the race almost certainly will be held on that date. Fifteen entries are in hand, as follows:

Car.	Driver.
Benz .....	Edward Hearne.
Benz .....	Victor Hemery.
Benz .....	Franz Heim.
Fiat .....	Louis Wagner.
Fiat .....	Ralph De Palma.
Fiat .....	Felice Nazzaro.
Marmon .....	Ray Harroun.
Marmon .....	Joe Dawson.
Marmon .....	
Marquette-Buick .....	Louis Chevrolet.
Marquette-Buick .....	Robert Burman.
Marquette-Buick .....	Arthur Chevrolet.
Roebeling-Planche .....	Wash. Roebeling, 2d.
Alco .....	Harry F. Grant.
Mercedes .....	Geo. M. Armstrong.

In addition to changing the starting hour, the distance also has been altered. The race will go 379.2 miles, or 30 laps, instead of 278.8, or 22 laps, as originally specified. Wagner won the first Grand Prize by averaging 65.08 miles an hour. Being a free-for-all affair, without restriction as to weight, cylinders and dimensions, this year's contest, it has been argued, may prove a blow to the progress of the stock car by placing a premium on freaks. The insignificant restrictions imposed by the Automobile Club of America, which controls international racing, were announced as due to the failure of the International Association of Clubs this year to adopt a racing formula.

The first development regarding the race following the decision of the supervisors that the hour of starting must be changed, came Tuesday, when the Motor Cups Holding Co. sent to Jesse Froehlich, managing director of the Benz Import Co., a check covering the amount of the entry money for the three cars entered by that concern. Taking his cue from Oldfield, Froehlich threatened to withdraw the Benz cars from the approaching contest unless the course was "properly protected." He also tossed bouquets at the Savannah management of the first Grand Prize and advised all other entrants to lend their aid toward carrying the contest to that Southern city, which, as soon as the newspaper reports of the Vanderbilt "shamble"—so called—reached it, promptly filed a bid for the race. Froehlich's communication was addressed to A. R. Partington, in a rasping, bumptious style, and, to cap the climax, Froehlich sent copies of it to all the newspapers, several of which gave him the advertising he sought by printing it in full. In returning the German entry money, W. K. Vanderbilt, Jr., who signed the letter, declares that Froehlich's criticisms made upon the management of the Vanderbilt race are unwarranted and their tone, as well, making it unwise that the cars under his management should compete. Froehlich apparently did not count on such a quick snap-back, but whether or not the management can keep out the Benz entries remains to be seen.

**LOCAL TALENT MEETS AT OMAHA**

**Two Days' Racing on New Speedway Develops Protested Victories—Reichenberger Captures Eight Events.**

Two days of good racing on the new Omaha Motor Speedway helped break the monotony of that Nebraska City on Saturday and Sunday last, 1st and 2d inst. The meet, which was under the auspices of the Omaha Motor Club, was confined to local talent. E. Reichenberger in a Firestone-Columbus was greatly in evidence the first day, taking the 20 miles free-for-all, two 10 miles events for cars of different values, and the mile at flying start.

H. E. Frederickson in a Chalmers captured the five miles open, and William Bruner, Hudson, the five miles for cars costing less than \$1,000. Reichenberger did almost as well the second day, carrying off the 25 miles free-for-all, the 10 miles for cars selling for \$3,000 or less, the 10 miles for cars selling for \$2,000 or less, and the mile flying start. George F. Reim, Cadillac, took the 10 miles event for equipped touring cars. The Velie was awarded the five miles obstacle race, in which the award was protested. The 10 miles fully equipped race also suffered protest.

Exception was taken to the Firestone-Columbus entries on the ground that the price of that car did not permit of its being in certain of the classes it entered, but Reichenberger promised to make good his claim or not accept any prizes. The summaries:

Twenty miles, free-for-all—Won by E. Reichenberger, Firestone-Columbus; second, H. E. Frederickson, Chalmers; third, J. Stickney, Velie. Time, 21:45½.

Ten miles for cars selling for \$1,500 to \$2,000—Won by E. Reichenberger, Firestone-Columbus; second, J. Stickney, Velie; third, Nygard, Cadillac. Time, 11:06.

Ten miles for cars selling for \$1,000 to \$1,449—Won by E. Reichenberger, Firestone-Columbus; second, William Bruner, Hudson; third, Walter Smith, Hupmobile. Time, 13:34½.

Five miles for cars selling for less than \$1,000—Won by William Bruner, Hudson. Time, 6:25.

Five miles for fully equipped touring cars—Won by H. E. Frederickson, Chalmers; second, Ashley, Midland; third, Harry Woodruff, Stevens-Duryea. Time, 6:05.

Mile time trial with flying start—Reichenberger, Firestone-Columbus. Time, 1:07.

Twenty-five miles free-for-all—Won by E. Reichenberger, Firestone-Columbus; second, Reim, Cadillac; third, J. A. Ashley, Midland. Time, 26:57½.

Five miles obstacle—Won by J. Stickney, Velie; second, Frederickson, Chalmers.

Ten miles for cars selling for \$3,000 or

less—Won by E. Reichenberger, Firestone-Columbus; second, Carl Holt, Warren-Detroit; third, Frederickson, Chalmers. Time, 11:54½.

Ten miles for cars selling for \$2,000 or less—Won by Reichenberger, Firestone-Columbus; second, Stickney, Velie; third, Reim, Cadillac. Time, 11:25½.

Ten miles for fully equipped touring cars—Won by Reim, Cadillac; second, Ashley, Midland. Time, 11:45.

#### Long Run for Thomas Car on High Gear.

Although "high-gear" endurance tests have been carried out both in this country and abroad, it remained for the E. R. Thomas Motor Co., Buffalo, N. Y., to demonstrate the efficiency of its new model "M" 6-40 car, by sending it over a varying, and at times mountainous, route of 2,500 miles with its gearset stripped of all pinions except the reverse, and sealed, thus making it impossible to use any but the high gear in forward travel. George Miller, of the old New York-to-Paris crew, and Fred Nehrbas alternated as drivers, and in addition to an official log-keeper, various observers were taken on at different points during the tour.

The test was completed last Saturday, 1st inst., upon the return of the car to Buffalo after ten days of continuous running. The route covered included the 1,600 foot climb over Meadville mountain between Erie and Pittsburg, the ascent of the Allegheny range in going from Pittsburg to Gettysburg, Pa., and the difficult roads through the Laurel range between Ligonier and McConnellsburg. The portion of the course lying toward New York, and beyond to Boston, offered fewer obstacles to a test of this nature, and the arrival of the party in the latter city was marked by the ascent of the redoubtable Corey hill—still on high gear, of course. In traversing the White and Green mountain ranges unfavorable highway conditions again were encountered, one of the most difficult stretches being the ascent of Crawford's Notch, with its continuous climb for six miles.

#### Tragedy Terminates Springfield Racemeet.

The automobile races held in connection with the state fair at Springfield, Ill., Saturday, 1st inst., were cut short at the very beginning, owing to the spectacular accident that caused the death of Larue Vredenburg, president of the Springfield Automobile Club. He was driving his own car at the time in the first of the events scheduled. Plunging into a cloud of dust he was so blinded that he crashed into a fence, and was instantly killed. A spectator was struck, but, though seriously injured, is expected to live. On Monday Ben Kerscher who has recovered from recent injuries and Oldfield "performed," and obligingly broke three of the alleged "state dirt track records" which they usually leave in their wake.

## MAKE THEIR MARKS IN MANITOBA

### Canadian Contestants Establish Three "Dirt Track Records"—Power Again Wins Dunlop Trophy.

Three Canadian dirt track records were established at Kirkfield Park, Winnipeg, Manitoba, at the fourth annual race meeting of the Winnipeg Automobile Club on September 24th. The new marks were made in the 25 miles event for the Dunlop trophy, the 10 miles for Class C cars and the mile time trials, and while the 25 miles trophy event was supposed to be the feature of the day, the 10 miles for Class C cars was a battle royal. It was won by less than a yard by D. A. Brown, Warren-Detroit, in 12:40, after a hammer and tongs fight with Henderson's McLaughlin-Buick. Horn, Maytag, was a close third.

W. C. Power in a McLaughlin-Buick, who won the Dunlop trophy in 1909, captured it again, covering the 25 miles in 25:19½. Of the seven starters, Richard Husk, Knox, lost a chance for first place, when he ran out of oil on the twenty-third mile. Horn Maytag, met with the same setback, while R. Roach, Ford, completed only two miles. W. Guest, National, was second, and A. Moore, Kissel, third. The existing mile record of 1:07½ was beaten by three cars. Husk, Knox, first covered the distance in 1:03. Then Guest, National, made 1:01½, only to have W. C. Power follow him in a McLaughlin-Buick in 59 seconds. W. Guest in the McLaughlin-Buick captured the 10 miles event for Class D cars in 11:19, a new mark, with D. A. Brown, Warren-Detroit, second, and Houghton, Knox, third. Horn, Maytag, took the five miles contest for cars not exceeding 100 cubic inches displacement in 6:25, J. Kline, McLaughlin-Buick, being second. Although the weather was cold and damp the attendance was large. The summary:

Ten miles, Class C (161 to 230 cubic inches)—Won by D. A. Brown, Warren-Detroit; second, J. Kline, McLaughlin-Buick; third, Horn, Maytag. Time, 12:40.

Ten miles, Class D (231-300 cubic inches)—Won by W. Guest, McLaughlin-Buick; second, D. A. Brown, Warren-Detroit; third, Houghton, Knox. Time, 11:19.

Twenty-five miles—Won by W. C. Power, McLaughlin-Buick; second, W. Guest, National; third, A. Moore, Kissel Kar. Time, 25:19½.

Five miles (for cars under 100 cubic inches)—Won by Horn, Maytag; second, Kline, McLaughlin-Buick. Time, 6:25.

Mile time trials—Won by W. C. Powers, McLaughlin-Buick. Time, 59 seconds.

#### Motorists Buried Under Liquid Steel.

While the automobile has been productive of many unusual and extraordinary accidents, it is doubtful if there ever was one

which in its horrible details equals the running of a motor car into a flood of liquid steel—an accident which happened in South Chicago, Ill., a few days ago. The automobile, in which were three women and one man, tried to cross the railroad track leading from the Wisconsin Steel Co.'s plant to the dumping place in the lake. At that moment one of the regular work trains came along, loaded with several tons of molten steel refuse. In the collision the automobile and its occupants were covered with the white hot steel, three being killed outright and one seriously burned.

#### Clubs and Club Elections.

The Frankfort (Ky.) Automobile Club has been organized. Dr. John G. South, president; Basil Kenney, secretary.

At a meeting of Columbia (Tenn.) automobile owners the Maury County Automobile Association was organized, with the following officers: Fred R. Gamble, president; G. T. Hughes, secretary.

Incorporated in the state of Minnesota, with a capital of \$50,000, the newly formed Minneapolis Automobile Owners' Association has elected officers as follows: H. M. BcAllister, president; T. G. Newgood, vice-president; A. C. Raymond, secretary.

Twenty automobilists of Maroa, Ill., have formed the Maroa Motor Club with the following officers: James Pulliam, president; George Conover, secretary; J. T. Keats, treasurer. J. Crocker, C. J. Cooper and J. T. Keats were appointed a committee on rules.

The Owensboro Automobile Club has been organized by motorists of the Kentucky town of that name. Its officers are: Dr. J. R. Anderson, president; W. H. Brannon, vice-president; D. C. Stinson, second vice-president; H. L. Scharlach, secretary; W. L. Reno, treasurer.

Forty automobile owners of Leominster, Mass., have formed an automobile club, taking its name from their home town. The officers for the first year are: W. H. Chase, president; Arthur H. Hall, vice-president; Murray C. Damon, secretary and treasurer; George P. Jones, Alfred N. Litch, Charles H. Howe and John W. Pickering, directors.

#### Says Owner's Brother is a Chauffeur.

Although it has been decided by the New York state officials that any member of a family may drive an automobile belonging to a member of such family, without a chauffeur's license, Magistrate Fitch, of the Flushing (L. I.) police court held William G. King, of New Brighton, S. I., and Harry Weber, of 244 West 72d street, New York City, for the Court of Special Sessions for driving an automobile belonging to King's brother without having a chauffeur's license. King and Weber were arrested on Hoffman boulevard, Newtown, and King was also charged with violating the speed law. Pleading guilty to this charge cost him a fine of \$20.

**REFINEMENT OF THE RAMBLER**

**Detachable Doors, Larger Wheels and Longer Base—Spare Wheels and Offset Crank Shaft Retained.**

In adopting the closed-front bodies for their new products not a few of the American automobile manufacturers appear to go upon the assumption that all of their customers will want closed-fronts all of the

machines are designated, readily to be distinguished from their predecessors.

Model "65," for example, is regularly produced with nickel-plated trimmings. In addition, it is equipped with 40-inch wheels and 4½-inch tires, a drop frame and underslung front springs. Both of the two styles of chassis produced have longer wheel base than before, while the distinction of the new bodies is added a mark of identification in the shape of a new radiator saddle, filler cap and a modified method of radiator fin-

The 45 horsepower chassis is used for models "64" and "65." The former is built in the form of a five passenger touring car, small tonneau or landaulet. The latter is made as a seven passenger touring car or a seven passenger limousine. Model "63" is furnished as a five passenger touring car, a two passenger roadster, a four passenger coupe and as a town car. It is recommended as being a more economical car to drive than the larger model and therefore is especially intended to satisfy the re-

NEW BODY WITHOUT DOORS

RAMBLER MODEL "63" WITH DETACHABLE FRONT DOORS

time. It is by no means inconceivable, however, that for many purposes the old standard open-front arrangement may seem preferable to many motorists for at least a part of the time. It is with this idea that The Thomas B. Jeffery Co., of Kenosha, Wis., has introduced a detachable front door design in the new Rambler models which just have been announced. The arrangement enables the motorist to enjoy the full protection of the high sides and front doors during cold and windy weather, while during warm weather or when it is

ish; while an innovation in the rear suspension is the adoption of so-called "seven-eighths elliptical" springs.

The line as now constituted is composed of nine different styles of open and closed cars, all of which are mounted upon the standard Rambler chassis. The chassis are built in two different sizes of 45 and 34 horsepower output. In revising the construction in the general way already indicated, the fundamental characteristics of Rambler construction have been retained. As is well known, these include the offset

quirements of the owner who prefers to drive his own machine rather than to entrust it to the tender—and sometimes expensive—mercies of a paid chauffeur.

In increasing the tire sizes of the larger chassis from 36 by 4½ to 40 by 4½ inches, the wheel base has been lengthened from 123 inches to 128. Despite the increase in wheel diameter, however, the device of perching the front springs beneath the axle instead of above it, together with the dropping of the frame have combined to maintain the body level at the same height

RAMBLER MODEL "65" SEVEN PASSENGER TOURING CAR

NEW RAMBLER, FRONT VIEW

necessary to enter and leave the car frequently the front may be left open.

This is but one of a number of interesting features that have been introduced into the new line. Though most of the changes are of a minor nature, the general design of the machines remaining much the same as during the past two or three years, several are of the sort that will enable the models "63," "64" and "65," as the new

crank shaft, straight line drive and the spare wheel in addition to a number of ingenious minor details. Shock absorbers, of the Truffault-Hartford pattern, now are a regular equipment feature, the shock specifications also including such liberal items as tops and envelopes, wind shields, combination electric and oil side and tail lamps and gas headlights with Prest-O-Lite tanks.

above the ground as that of the five passenger model with its 36 inch wheels. Reckoning as assets the superior riding qualities of the larger equipment, the increased cost of the large tire mounting is but \$10 per tire in excess of the cost of the 36 by 4½ inch size.

The "64" model, in the main, is the same as the "65." It is, however, equipped with 36 by 4½ inch tires, has 120 inch wheel

base, standard front springs, straight line frame and brass trimmings. Model "63" has 112 inch wheel base and 36 by 4 inch tires, as against 109 inch base and 36 by 3½ inch tires—the specifications of the previous corresponding model. This model is equipped with dual ignition by Splitdorf magneto and 6-80 Vesta storage battery. The 45 horsepower models have Bosch

and in changing the side brackets, which now are flush with the floor level. The front doors for all models are practically dash high, the arrangement for the right side being merely a solid panel with the gear changing lever placed inside and the emergency brake lever outside.

In developing the new form of rear spring suspension the general form of the

further by an increase in the size of the wheel spokes.

In the new models the carburetter is mounted on the right side, instead of on the left, as in the past, the inlet manifold being carried above the exhaust. Two priming cups are conveniently located to facilitate starting during cold weather. The Stromberg carburetter has been adopted as

RAMBLER TRANSMISSION AND AXLE CONSTRUCTION IN DETAIL.

THE NEW RAMBLER ENGINE

magneto and 6-80 accumulator. Both systems operate with a single set of spark plugs through the agency of the Rambler high tension switch and timer, which are original contrivances that have proved effective through long-continued service.

As has been indicated, the general construction of the two models of chassis is

three-quarter elliptic has been retained, but the upper member has been made longer and is secured at two points instead of at one only, two bars passing through the frame from side to side to hold the spring members in place and thus relieve the frame of twisting stresses and minimizing side sway. All spring joints

the new standard. Among other minor changes in engine and auxiliary construction may be mentioned the adoption of a bolted coupling for the magneto shaft; the mounting of the lubricator directly on the engine, instead of on a bracket attached to the frame; the addition of 28 square inches to the bearing surface on the crank shaft

RAMBLER MODEL "64" CHASSIS SHOWING BRAKE ADJUSTMENT AND OTHER DETAILS

practically the same, both embodying, with the exceptions already noted, the same changes over previous products. Therefore it is possible to mention in detail several of the novel points in the new line as applying to the entire product. In the construction of the new closed-front bodies, for example, a redesign of the foot boards has been necessary to the extent of altering the inclination of the toe rests

now are equipped with grease cups. Four shock absorbers are specified for the larger models and two for the smaller.

Larger and heavier brakes with increased leverage are employed. The diameter of the drums has been increased from 2 to 2¾ inches, the increase in area thus amounting to 97 square inches. Both sets of brakes are evened and the efficiency of the equipment has been increased even

of the larger engine; the bolting of the fly wheel to the crank shaft, instead of the former key fastening; and the concentration of an increased amount of metal at the rim of the fly wheel.

The change speed gear, as formerly, is mounted in the solid line housing which encloses the driving mechanism, and is supported in a universal mounting back of the fly wheel. The connecting universal joint

shaft now is made longer than before, however so that this coupling between the clutch and change gear may be removed without disturbing either member. The expanding ring clutch, which is a feature on all models, has been simplified in design and in adjustment. Instead of separate shoes and toggles a single expanding shoe now is employed, with a single adjusting device.

The transmission gears have been increased in size and a lock has been placed on the second gear to hold it in place. Taper roller bearings now are used instead of ball bearings in supporting the differential, and, on the 45 horsepower

### FIRESTONE'S FORCE CONFERS

**Annual Convention in Akron Largest and Most Notable of Such Gatherings—The Men Who Were There.**

Each September the branch managers, agents and salesmen of The Firestone Tire & Rubber Co. gather in Akron, Ohio, to listen to words of President H. S. Firestone and to discuss tires and selling plans in general and Firestone tires and Firestone plans in particular.

This year's convention, which ended last

W. A. Simonson, W. L. Esterly, J. H. Irwin, F. E. Gahagan, W. A. Clark, C. C. Eichelberger, S. N. Harris, J. G. Robertson, S. G. Carkhuff, R. J. Firestone, H. S. Firestone (president), A. C. Miller, Will Christy, T. J. Glenn, E. L. Campion, W. F. West, W. A. Harshaw, O. Fenstermacher, A. F. Sheldon, R. H. Turner, W. C. Mayville, C. E. Jackson, J. V. Mowe, D. C. Swander, W. R. Walton, F. H. Martin, Chas. Habegger, W. H. Rowerdink, R. E. Warner, A. G. Partridge, O. A. Lazenby, F. L. Black, W. T. Brown, D. B. Price, J. A. Smith, J. F. Singleton, E. S. Firestone, W. W. Robertson, P. B. Bosworth, B. N. Beedon, D. F. White, W. F. Bailey.

FIRESTONE CONFEREES GROUPED IN FRONT OF NEW FACTORY BEING ERECTED IN AKRON

model, they are now employed on the front steering knuckles. A combined distance and torsion rod now replaces the old distance rod and serves to relieve the driving shaft housing of torsional stresses. At the forward end each of these two rods is secured by means of a ball and socket joint to a bracket bolted to the side frame member, instead of to a cross frame member, adding rigidity to the system.

In the way of finish, in addition to the points noted above, an improvement has been made in the upholstering of the backs of the front seats, to protect them from scratching and also to provide pockets for the top side curtains. The headlights on the larger model are one inch larger than formerly, being 8 and 9 inches in diameter for the five and seven passenger cars. These and the dash lamps also are placed higher than before, thus adding to the appearance of the machines and also affording better illumination by throwing the rays a greater distance forward of the car.

week, exceeded all previous gatherings both in numbers and enthusiasm, for the Firestone company has enjoyed a rapid growth and has attained a proud position in the tire industry. The accompanying photograph, taken on the site of the new Firestone plant, which will include the largest single building in the world devoted to tire manufacture, portrays those who were present. They are as follows: H. E. Riker, R. E. Wolcott, F. H. Moyer, L. Greenwald, C. A. Myers, Ole Hibner, W. E. Fouse, A. W. Moore, H. L. Beers, J. P. Patterson, K. R. Corner, H. Kubler, C. H. Gerhold, P. B. Talbott, E. M. Pumphrey, M. C. Brenizer, J. W. Thomas, E. P. Palmer, L. F. Birdsong, A. L. Schavoir, O. E. Johnson, F. C. Burt, H. E. Esterly, F. W. Telford, R. L. Harpham, F. M. Moore, G. M. Martin, Geo. Eckel, P. F. Rohrbacher, C. M. Folger, G. A. Talbott, W. H. Jenks, N. B. Burwell, H. W. Makley, W. F. Ridge, W. G. Bedford, R. D. Barr, R. W. Phelps, R. W. Ingersoll, J. F. Cast, Wm. O'Neil,

The new factory is to be completed in February. In addition to being of record-breaking size and capacity, its equipment will be composed of the latest appliances.

### Washington Adds Taxes to License Fees.

Although in New York state and in the majority of other states which have introduced the license system for automobiles, the license fees are considered as paid in lieu of other taxes on the value of the machine, the state of Washington is preparing to collect regular property taxes in addition to license fees from the unlucky automobile owners living within its borders. Dating from October 1st, all applications for licenses must be made to the assessors' office, instead of at police headquarters. By this shrewd move the state officials connected with the former department expect to get a better line on the several hundred cars on which no taxes were collected this year, because the assessors never could locate the owners in time to collect.

## MOTOR BUSES IN MALAY SERVICE

As "Feeders" to the Federated States Railways They Prove Advantageous—Suggestive Experience Gained.

Commercial motor service in the Malay Peninsula has reached a far greater degree of development than is generally known among Americans, except those interested in the culture of rubber. An extensive service of motor mail wagons and motor buses has been in operation there since late in 1906, according to A. E. Meaden, an English engineer who has spent several years in the service.

All the Malay states have finally been federated under British protection, although 25 years ago they were little more than virgin jungle. Much of the advancement should be credited to the Railway department, which is said to compare favorably with any railroad east of Suez. The omnibuses are used mainly in connection with the principal passenger trains, being operated by native drivers who are skilful handlers although not natural mechanics.

The first cars put on were 18 horsepower vehicles, with single decks and covered an average of about 64 miles a day, except during holidays and Chinese fetes, when the mileage was greatly increased. Previously the manner of conveyance to the estates of many planters was by bullock carts and pony gharries. Of course, the bullock men cut their tariff savagely, but owing to their slowness the motor vehicles soon had a monopoly on quick transit goods. Many natural obstacles were speedily encountered. During the period of heavy rains, the first three months in the year, land slides and falling trees proved so numerous that a full equipment of saws, axes and shovels had to be carried.

In some sections it was found necessary, owing to the narrowness of the road, and its sharp turnings, to run on a regular time table, so as to have the passing points at safe places. In some places that arrangement still prevails. The 18 horsepower cars first used were in certain districts soon replaced by 30-40 horsepower cars, seating 25 passengers. As a rule they make 10 miles an hour over the hard roads. In Pahang where a service of motor lorries was established last October the receipts were seriously reduced by the necessity of returning the lorries empty on the return journey, little coming out of the state except tin ore, which, not being perishable, goes mostly to the bullock man. Rubber raising, however, will within a few years completely change the situation.

All the repairs are made at the central locomotive works shops of the Railway department. It has been found that the average service given by cars between

periods of repair is about 15,000 miles, although the range is from 10,000 to 22,000 miles, according to the surface of the roads. Most of the repairs necessary consisted of adjustments and renewals of worn chassis parts, such as spring pins, clips, radius-rod pins and double eyes, but in few instances was any serious defect apparent in the speed or differential gears.

The engine parts gave little trouble, and, with the exception of some damage to light engines by heavy loads on stiff gradients, they required little in the way of heavy repairs.

The Chinese and Tamils (South Indians) form the mechanical element among the native laboring population. The former have the energy and the latter the intelligence. Consequently the Chinese predominate at headquarters, while the Tamils are more numerous at the out stations where their readiness in diagnosing troubles comes in handily. The Chinese are too fond of playing with the engine to become good drivers.

The running sheds at out-stations are of steel-girder construction with corrugated iron sides and roofing. Cement floors and one or two repair pits properly drained are used; a drained and cemented wash for cars is made outside all the sheds. If the town or village has a water supply, stand-cocks are fitted and the water for washing and filling is obtained from the town supply. In all other cases, wells have been sunk as close as possible to the sheds.

The road surfaces differ greatly in various parts of the country. On the Selangor side of the Pahang trunk road, white granite, quarried from the sides of the roads, has been used throughout. On the Pahang side, blue shale has been obtained from the gold mines of Raub, and, although that material insures a beautiful surface, it is dusty in dry weather and slippery in wet.

The sharp-pointed metal from the white limestone appears after heavy rains have washed away the loose top dressing. Such roads are slippery after heavy rainfalls, and are certainly hard on tires, owing to the chipping and the pinching of the rubber. In the Selangor Valley, red laterite makes a smooth surface, but wears away rapidly, and accounts for excessive dust in the dry weather and slippery mud in the wet. Such fine dust and mud are particularly destructive to bearings and wearing parts, and the use of tire brakes is entirely prohibited. The life of the rubber tires depends, of course, on the nature of the roads. On the Pahang service there are 21 miles of 1 in 30 gradient, on which there are innumerable corners involving constant braking. All this road is heavily rain-washed, and the life of the endless tires only averaged about 6,000 miles. Under such conditions "grip" tires proved themselves absolutely useless; even on a 16 horsepower vehicle they were unsatisfactory, constantly creeping on the rims

and cutting away at the flanges. On the level but rain-washed roads of Perak, with the sharp limestone and flint all bare, an average of 10,000 to 12,000 miles was the rule. On the red-laterite highways, between Klang-Kuala and Selangor, a life of 22,000 miles was frequently secured. No satisfaction was obtained from grip-pattern tires on vehicles of more than 3900 pounds gross weight. Pneumatics for front wheels were found advisable on light vehicles; they wore as long as the solids on the rear wheels, and saved any amount of money by the reduction of wear and tear from road shocks upon the chassis parts. Stud-pneumatic covers showed no longer life than plain ones.

Taking everything into consideration, says Mr. Meaden, the average cost of running was about 36 cents a car mile. Most of the expenditure went in tires; it has also to be remembered that the lubricating oil consumption was necessarily heavy for the exceedingly long gradients. Petrol, even when purchased in bulk, could not be obtained under 50 cents. So many different types of machines being in service, a heavy spare-part stock had to be maintained, and this involved an additional charge on the maintenance account.

In making recommendations as to this class of service Meaden in the Commercial Motor favors cars of from 30 to 40 horsepower, and says the ordinary home wheel bases have proved satisfactory. A four cylinder engine is preferable as the ordinary native can bring such a car home if only two or three cylinders are working. A low tension magneto is the best type of ignition, for it is simple to understand. The multiple disc type of clutch proved satisfactory on many vehicles. The lock on the front wheels must be of wide angle and equal on each side. Leather clutches have been used, but great difficulty has been found in obtaining satisfactory leather for renewals.

With regard to gears, little trouble was experienced, and, in some cases, wonderful wearing qualities were displayed. After 22,000 miles, some of the gear wheels showed hardly any sign of wear. For the heavier machines, chain transmission was employed. Experience with radiators went to prove that the gilled-tube type, with top and bottom headers, was the correct thing. The honeycomb cooler, as a rule, was too heavy, was liable to leak through vibration, and was practically impossible to repair, as the natives were without the experience to carry out such specialized jobs. There was never found any serious overheating trouble, although the sun temperature is, as a rule, between 140 and 170 degrees Fahrenheit. Too much importance cannot be attached to the necessity of driving the pump independently of other mechanism. In cases where the pump was driven off the same spindle as the magneto there was endless trouble.

### SHERIFF STEPS IN AT SAGINAW

**Attaches Office Fixtures of Lovely Co-Operative Company—And Simply Because Stock Salesmen Seek \$1,900.**

Apparently that spirit of co-operation which was to constitute the mainspring of the Buick Auto Supply & Garage Co., of Saginaw, Mich., did not sink deep into the hearts of Gordon Grant and B. G. Appleby, who had to do with that magnificent and all-compassing project. As, of their own free will and despite inspiring pictures painted by the company's literature, automobile owners did not rush in overwhelming numbers to subscribe for the stock of the enterprise, Grant and Appleby were engaged to beard the owners in their homes and offices and to emphasize the beauties of such a co-operative institution that the necessary subscriptions and the cash incident thereto should be forthcoming. The two men worked on a commission basis and when, as they allege, they had earned \$1,900 and their demands for it produced no results they called the law to their assistance, and last week the sheriff seized the furniture and fixtures of the company's office in Saginaw.

The sheriff's action will prove in the nature of a shock to very many persons; for of the countless co-operative and other schemes to which the word "auto" has been attached few if any proposed to do so much for so little as the Buick Auto Supply & Garage Co. About a year since the parent company was incorporated under the laws of Maine, which are so generous that there is no need for a showing of much real money or property. The parents, however, were located in distant Michigan and they purposed organizing sub-companies in every state, or nearly every state, in the Union, and they actually did form one in Michigan—the one whose office equipment has been attached.

In addition to opening the office in Sag-

inaw, the company also had drawn the plans and a pretty picture of "the largest garage in the world." It was to be but one of many that was to dot the countryside, and at each of them or any of them local residents or tourists who were so fortunate as to have become stockholders, would be able to store their cars and have them repaired and to buy supplies at such prices that must have made all un-co-operative establishments curl up and die. And of course the stockholders would share the handsome dividends, also.

It was a beautiful picture that was painted and to add to its irresistibility the stock of the company was offered for sale in blocks of 10 shares at 50 per cent. discount; its par value is \$10, but it was so lovely that any appreciative individual could purchase it for \$5. It was this "good thing" that Gordon and Appleby were engaged in selling and of which they had sold enough to make them so mercenary as to cry out for the \$1,900 which they claim to have earned and to ask the sheriff to help them collect it.

### Court Sets Date for Selden Appeals.

On Monday, last, 10th inst., the U. S. Circuit Court of Appeals for the Second Circuit heard a motion to give preference to the hearing of the appeal in the suits under Selden patent against the Ford Motor Co. and Panhard company and the test suits. The court inclined favorably, and accordingly set these cases at the head of the Court of Appeals' calendar for hearing November 9th, 1910.

In the case of the injunction under Selden patent against John Wanamaker, a motion was brought by the defendant to suspend the injunction, but this was opposed and Judge Hough denied the application, so that the injunction continues in force.

### Briscoe to Sail for European Sojourn.

Benj. Briscoe, president of the United States Motor Co., will sail next Wednesday to Europe on pleasure bent. He will be absent about six weeks.

### SELLING GENERAL MOTORS NOTES

**Wall Street Sets Price and Offers a Bonus—Additional Details Bring General Motors' First "Show-Down."**

In marketing the \$15,000,000 worth of General Motors' notes, not to mention the \$5,000,000 worth which is held in reserve, it appears that the Wall Street interests which advanced the loan and assumed control of the embarrassed \$60,000,000 company, are to make plentiful use of the abundant common stock, which the company itself employed when it was deemed desirable to impress the investing public by "cutting a melon." According to authentic information, there is no underwriting price on the notes, but they are being offered at 96 and interest with a bonus of common stock, which bonus in the case of those who "buy right" reaches as high as 20 per cent.

According to the plan sinking funds of \$1,500,000 each for 1911 and 1912, and of \$2,000,000 each for 1913 and 1914 will be set aside to go toward the retirement of the notes. The \$15,000,000 will be secured through deposit with the Central Trust Co. of mortgage notes and shares of stock of subsidiaries, representing total assets of \$37,383,000.

Recently some additional preferred and common stocks were distributed among the General Motors Co.'s subsidiaries so that with the present note issue, its outstanding capitalization will be as follows: \$15,000,000 first lien 6 per cent. notes, \$17,835,400 7 per cent. cumulative preferred, and \$20,374,030 common stock, making a total of \$53,209,430 out of an authorized aggregate of \$80,000,000. Real estate, plants and equipment, exclusive of good will, etc., are valued at \$12,127,000, and current assets at \$25,256,000. The mortgage provides that "net quick assets" must never be less than 133⅓ per cent. of the notes outstanding, and with Wall Street mathematicians in control the

provision would seem in small danger of being unfulfilled at any time.

In connection with the launching of the new note issue, the exact composition and the exact amount of holdings of the General Motors Co. in its subsidiary companies was made public for the first time. It has 20 subsidiary companies with a total of \$550,000 preferred and \$15,440,710 common stock, of which the General Motors Co. owns \$498,500 preferred and \$13,845,383 common. The Buick Motor Co. has outstanding \$500,000 preferred and \$2,000,000 common stock, of which the General Motors Co. owns all the common and \$498,500 preferred. It also owns all the \$1,500,000 outstanding stock of the Cadillac Motor Car Co., the \$3,132,200 outstanding stocks of the Olds Motor Works; the \$793,000 stock of the Marquette Motor Co.; the \$800,000 stock of the Oakland Motor Car Co.; \$552,720 common stock of the total outstanding \$50,000 preferred and \$557,720 common of the Cartercar Co.; \$364,650 of the outstanding \$500,000 stock of the Rapid Motor Vehicle Co.; all of the \$725,000 stock of the Northway Motor & Manufacturing Co.; all of the \$600,000 stock of the Elmore Manufacturing Co.; \$474,223 of the \$481,200 stock of the Reliance Motor Truck Co.; all of the \$275,000 stock of the Welch Co. of Detroit; \$747,000 of the \$1,500,000 stock of the Weston-Mott Co.; \$299,400 of the \$399,400 stock of the Randolph Motor Car Co.; all of the \$224,000 stock of the Welch Motor Car Co. of Pontiac; all of the \$240,000 stock of the Jackson-Church Motor Co.; all of the \$100,000 stock of the Michigan Motor Castings Co.; \$75,000 of the \$100,000 stock of the Champion Ignition Co.; \$50,000 of the \$1,003,000 stock of the Michigan Auto Parts Co.; all of the \$10,000 stock of the General Motors Co. of Michigan, and \$133,000 of the \$200,000 stock of the Oak Park Power Co.

The new financing, it is stated, will leave the company with about \$23,000,000 current assets and \$3,000,000 cash.

#### Stearns Company Doubles Its Dividend.

Directors of the F. B. Stearns Co., Cleveland, Ohio, manufacturers of Stearns motor cars, have declared a dividend of 25 per cent., as against 12 per cent. the preceding year. The following officers and board of directors have been elected: F. B. Stearns, president; R. F. York, vice-president; E. McEwen, secretary and treasurer. Philip Wick has been elected director, succeeding his father, the late Myron C. Wick, of Youngstown, Ohio.

#### Canadian Goodyear to Absorb a Rival.

According to reports from Toronto, the Goodyear Tire & Rubber Co. of Canada, Ltd., is about to take over the Durham Rubber Co., which operates a plant in Bowmanville, Ont. It is expected that the deal will be consummated some time this week.

## AMERICA IS DISCOVERED AGAIN

### This Time Wearing a Selden Tag on Broadway and Purchasable on Instalments

—A. L. A. M. Prepares to Sue.

Whether or not purchasers of motor cars made by a licensed manufacturer and bearing the Selden license plates have the legal right to "rechristen" such cars with names of their own choosing and sell them without making plain the sources of the cars' origin, is a point which probably will be settled by a suit which the Association of Licensed Automobile Manufacturers is about to file against the Motor Car Co. of America, of New York. The fact that the A. L. A. M. is making ready to take action leaves no doubt about the opinions of its legal advisers, whose purpose it is not merely to sue the New York concern for infringement of the Selden patent but for unfair competition also.

The Motor Car Co. of America established itself several weeks since at Broadway and 73d street in a room so small that did it contain an automobile there would not be space for much else. No automobile was in sight, however. A sign on the window heralding the "America 40," "Licensed under the Selden patent," and a desk and a few chairs and a supply of catalogs within is practically all that is visible to the eye. The catalog, which bears the imprint of two American flags, also bears the "Licensed under the Selden patent" caption, and the most remarkable part of it is that the pictures of the three cars, an engine and an unlabeled factory building—to which no reference is made—which it contains were not made from photographs or drawings, but from pictures which had appeared in other publications.

The fact that the "America 40" never before had been heard of inside or outside the ranks of the Selden organization, was sufficient to arrest the notice of the New York trade. But what most appealed to the prospective purchaser who dropped in the little place of the unknown concern with the large name was the information that he could obtain an "America 40"—"licensed under the Selden patent"—on the instalment plan.

Secure in the knowledge that the "America 40" came from the factory of the W. H. McIntyre Co., at Auburn, Ind.,—a Selden licensee—one of the Motor World's "prospective purchasers," to whom strange concerns and instalment sales always appeal, dropped into the cubbyhole of the Motor Car Co. of America on Monday last and learned some things that will cause even the McIntyre company to gasp for surprise. After the usual preliminaries common to "prospective purchasers," the Motor World man asked:

"How is it that the name 'America' does not appear in the list of licensed cars? Is it not likely that I may have trouble on that account?"

"Not at all—not at all! When the car is delivered to you, you will find a license plate on it, showing that the makers have paid the royalty. It doesn't make any difference what name appears on the car. I can put 'John Jones' on the car, if I want to and it would still be licensed."

"Oh, I see," remarked the "prospective purchaser." "You mean that the car is manufactured by a member of the A. L. A. M. but marketed under a 'pseudonym.' But why is that necessary?"

"Well, you see, it's this way: The factory making this car are good manufacturers, but they haven't made much success in selling their product. We took over the entire selling end of it, and not a piece goes out of the factory, nor does any material come in, that this office does not have to arrange for. We have contracted for the entire output, but we really do not make any effort in this office to sell cars direct to the public—we haven't even a car here to show you; but we appoint agents, and if an interested person like you comes in, well, we can make arrangements for a demonstration."

"How much did you say the torpedo model of forty horsepower costs?"

"We charge \$2,250 for it."

"And is there a guarantee with it?"

"Yes. We give you a full year's guarantee on each car."

"That's very nice, I'm sure; but what is to prevent you from repudiating the guarantee afterward, or not living up to it? You see this is only a 10x12 office; there is no real estate, factory or other such security behind your guarantee, and how do I know that you will be here four weeks from now? Of course, I don't mean to doubt your statements, but the guarantee does not seem to amount to much when I do not even know who makes the car."

"That's the chief reason why we allow you to pay for the car in instalments. You pay about one-half cash down, and we let you pay us the rest in monthly instalments of about 10 per cent. each; for instance, you pay us \$1,150 down and \$110 per month for ten months. We couldn't do this if we were afraid the car wouldn't last a year without giving trouble."

"I was told that this car is made by the McIntyre company," boldly ventured the Motor World man. "Is that so?"

"McIntyre? McIntyre? Never heard of the name before. Do they make automobiles?" in turn queried the Motor Car Co. of America with an air of innocence that was not short of charming.

The assurance that they did so, and that they had been doing so for several years, did not cause the manager to blink an eyelid. He reiterated his statement that he did not know the McIntyre company.

## EXPORTS STILL GOING UPWARD

**All but Two Foreign Markets Increase Their August Demands—Great Britain the Biggest Buyer.**

Despite the waning of the export "season," the upward tendency in the figures showing the exports of American made motor cars during August, 1910, still is plainly in evidence. With the exception of France and Bermuda, every one of the 12 geographical divisions took a greater number of cars than in the same month of the preceding year. Although the rise in the actual value of exports is greatest in the case of the United Kingdom, it is the gratifying increase shown by Germany and Other Europe which is most significant and encouraging. Germany took \$49,334 worth, as compared with \$11,923 worth in the same month of the preceding year, an increase of over 313 per cent., while Other Europe accounted for \$69,075 as against \$23,205 in August, 1909, an increase of over 197 per cent. The greatest actual increase was shown by the United Kingdom, which bought \$205,007 worth, which is a gain of over 97 per cent. over the figures of August, 1909, which were \$103,880. The total number of cars exported in this month was 656, valued at \$897,322, as against 368 cars, valued at \$557,934 in August, 1909.

Consistent with the continued increase shown in the single months, the figures for the eight months ending August, 1910, show a decided gain over the same period of 1909. Here also the greatest actual gains are made by the two great English speaking countries, the United Kingdom and Canada, the former taking \$2,286,984 worth as compared with \$1,612,726 in 1909; while Canada accounted for \$3,889,539 as against \$1,746,453. Although these were the greatest actual gains recorded, they were not heading the list in proportionate increases. First place herein belongs to Other Asia and Oceania, which took \$280,961 worth, representing a gain of over 400 per cent. over the \$70,107 worth exported last year.

The report in detail:

	August		Eight months ending August		
	1909	1910	1908	1909	1910
Automobiles, and parts of—					
Automobiles .....	\$557,934	\$897,322	\$3,569,962	\$5,107,953	\$8,266,808

Exported to—					
United Kingdom.....	103,880	205,007	1,491,465	1,612,726	2,286,984
France .....	78,693	15,699	526,323	739,764	613,737
Germany .....	11,923	49,334	138,039	151,711	284,772
Italy .....		7,510	219,229	214,345	347,629
Other Europe.....	23,205	69,075	169,350	267,086	593,450
Canada .....	306,523	398,825	866,604	1,746,453	3,889,539
Mexico .....	21,564	70,492	202,774	294,286	431,594
West Indies and Bermuda.....	28,198	23,293	111,578	203,646	270,638
South America.....	30,256	60,443	86,179	125,978	286,651
British Oceania.....	30,969	68,212	50,504	137,766	262,495
Other Asia and Oceania.....	14,416	46,806	98,732	70,107	280,961
Other countries.....	8,929	19,063	44,034	70,577	126,853
Total.....	\$658,556	\$1,033,759	\$4,004,811	\$5,634,445	\$9,675,303

## Imports Still on the Toboggan.

Accompanied by a big drop in the value of parts, not including tires, the imports of foreign automobile products for the month of August last reveals a decline in the total figures of from \$448,933 to \$206,143, as compared with the returns of last year. The parts totals have decreased from \$114,973 to \$9,469. Only 92 complete cars were imported, as compared with 194 during August, 1909, the most noticeable decline being in the case of France, the largest contributor, which sent over only 36 cars this year as against 109 last. Italy sent in 30 cars, as against 52; the United Kingdom five, as against eight, and other countries, excepting Germany, 11 as against 16. The German manufacturers disposed of 10 cars during the month, as compared with nine in August a year ago. Figures for the eight months ending with August 30th graphically show how the import trade is shrinking: But 726 cars were imported, 1,058 being the corresponding total for last year. The total value of cars and parts fell from \$2,502,574 to \$2,008,276.

## R. E. Olds Forms Big Truck Company.

To produce a motor truck which he has had in daily use for some time, R. E. Olds, of the Reo Motor Car Co., has organized a separate company, the Reo Motor Truck Co., which on Saturday last was incorporated under the laws of Michigan with \$1,000,000 stock, of which Mr. Olds himself holds 49,998 shares of a par value of \$10 each. The new company already has acquired a disused stove plant in Lansing which it is remodeling and re-equipping for its purposes. The Reo Motor Car and the Reo Motor Truck companies will work in close relation, the office force of the former handling the truck business and the R. M. Owen Co., which markets the Reo cars, performing the same service for the trucks. In addition, the old company is turning over to the Truck company all the parts business pertaining to its one and two cylinder cars, which last year amounted to \$468,743.40, gross, and which, it is stated, "is sufficient to return a good income on the stock of the company exclusive of truck possibilities."

## COULD NOT FIND ROOM FOR ALL

**Applicants for Space at Chicago Crowded Out—Those Who Are in and Where They will be Located.**

Of the 101 manufacturers of pleasure cars—a record-breaking number—who applied for space at the Chicago show, January 28-February 4 (the first week), the National Association of Automobile Manufacturers were able to find room for but 96 at the allotment last week. The five who were of necessity left out may be able to obtain positions in Chapter II of the show which will occupy the following week and which will be devoted to commercial vehicles. There were 42 applicants in the commercial vehicle section who took about 80 per cent. of the main floor of the Coliseum. There were also five whose applications arrived after the date of closing who will occupy practically all of the remainder of the floor.

All of the gallery of the Coliseum and second floor of the Coliseum Annex has been taken by members of the Motor and Accessory Manufacturers, leaving only the gallery of the First Regiment Armory for other makers of accessories. Of these it is possible to take care of about 40; the remainder of the applicants are now on a waiting list.

Applications from makers of commercial vehicles for such space as remains in the Coliseum and in the Armory will be received up to October 31st. A section will be set aside for motorcycles and the remaining space, if any, will be allotted to makers of pleasure vehicles, starting with those who were unable to obtain space during the first week of the show.

The applicants who were allotted space during the first, or pleasure car, week, and the building in which they will be housed, are as follows:

## Coliseum.

Winton Motor Carriage Co.  
 Buick Motor Co.  
 Stevens-Duryea Co.  
 Chalmers Motor Co.  
 National Motor Vehicle Co.  
 Pierce-Arrow Motor Car Co.  
 Moline Automobile Co.  
 Hudson Motor Co.  
 Lozier Motor Co.  
 Reo Motor Car Co.  
 H. H. Franklin Mfg. Co.  
 Olds Motor Works.  
 Packard Motor Car Co.  
 Thomas B. Jeffery Co.  
 F. B. Stearns Co.  
 E-M-F Co.  
 Cadillac Motor Car Co.  
 Peerless Motor Car Co.  
 Maxwell-Briscoe Motor Co.  
 Willys-Overland Co.  
 Pope Mfg. Co.  
 E. R. Thomas Motor Co.  
 Locomobile Co. of America.  
 Dayton Motor Car Co.

Woods Motor Vehicle Co.  
Columbia Motor Car Co.  
Atlas Motor Car Co.  
Premier Motor Mfg. Co.  
Knox Automobile Co.  
White Company.  
Matheson Motor Car Co.  
American Locomotive Co.  
Baker Motor Vehicle Co.  
Corbin Motor Vehicle Corp.  
Elmore Mfg. Co.  
Haynes Automobile Co.  
Metzger Motor Car Co.  
Mitchell-Lewis Motor Co.  
F-A-L Motor Co.

#### Coliseum Annex.

Brush Runabout Co.  
Studebaker Bros. Mfg. Co.  
Nordyke & Marmon Co.  
Inter-State Automobile Co.  
Jackson Automobile Co.  
Bartholomew Co.  
Babcock Electric Carriage Co.  
Apperson Bros. Automobile Co.

#### Coliseum Basement.

Southern Motor Works.  
Great Western Automobile Co.  
Metz Company.  
F. A. Paterson Co.  
Ohio Electric Car Co.  
Enger Motor Car Co.  
Benz Auto Import Co.  
Cole Motor Car Co.  
Westcott Motor Car Co.  
Diamond Automobile Co.  
Otto Gas Engine Works.  
Middleby Automobile Co.  
Lexington Motor Car Co.  
The Carriage Woodstock Co.  
B. C. K. Motor Car Co.  
Rayfield Motor Car Co.  
McFarlan Motor Car Co.  
Parry Automobile Co.

#### First Regiment Armory.

Hupp Motor Car Co.  
Waverley Co.  
Dorris Motor Car Co.  
Kissel Motor Car Co.  
Selden Motor Vehicle Co.  
W. H. McIntyre Co.  
Pierce Motor Co.  
American Motor Car Co.  
Cartercar Co.  
Austin Automobile Co.  
Garford Company.  
Royal Tourist Car Co.  
Anderson Carriage Co.  
Moon Motor Car Co.  
Pullman Motor Car Co.  
Buckeye Mfg. Co.  
Speedwell Motor Car Co.  
Fiat Automobile Co.

Courier Car Co.  
Midland Motor Co.  
Chadwick Engineering Works.  
Staver Carriage Co.  
Schacht Motor Car Co.  
C. P. Kimball & Co.

The manufacturers who obtained space during the second, or commercial vehicle week of the show, are as follows:

Mack Bros. Motor Car Co.  
Mais Motor Truck Co.  
The United States Motor Truck Co.  
The White Company.

Hart-Kraft Motor Co.  
Studebaker Bros. Mfg. Co.  
Alden Sampson Mfg. Co.  
Courier Car Co.  
Peerless Motor Car Co.  
Packard Motor Car Co.  
W. H. McIntyre Co.  
The Waverley Co.  
Reo Motor Car Co.  
Willys-Overland Co.  
Cartercar Co.  
Grabowsky Power Wagon Co.  
The Garford Co.  
Avery Co.  
The Pope Mfg. Co.  
American Locomotive Co.  
Rapid Motor Vehicle Co.  
Pierce-Arrow Motor Car Co.  
Metzger Motor Car Co.  
H. H. Franklin Mfg. Co.  
Knox Automobile Co.  
Kissel Motor Car Co.  
The Gramm Motor Car Co.  
The Kelly Motor Truck Co.  
Harder's Fire Proof Storage & Van Co.  
Adams Bros. Co.  
Randolph Motor Car Co.  
Chase Motor Truck Co.  
Saurer Motor Trucks.  
Chicago Commercial Car Co.  
Lansden Co.  
Federal Motor Truck Co.  
Automobile Maintenance & Mfg. Co.  
Washington Motor Vehicle Co.  
Economy Motor Car Co.  
Marquette Motor Vehicle Co.  
Monitor Automobile Works.  
Clark Delivery Car Co.

#### Day Brings "Utility" Car to Detroit.

Taking its name from its president, Thomas W. Day, who at one time sold Locomobiles in the West, and who is the designer of the car that will be produced, the Day Automobile Co. has been organized in Detroit, Mich., with \$300,000 capital stock. Hugh Jennings, manager of the Detroit baseball club will be vice-president of the company, while Cameron F. Roberts, general auditor of the Cincinnati Discount Co., will be secretary. Wallace E. Brown, president of the Michigan Gas Mantel Co., is among the others interested. The company will manufacture a "utility" car—one having convertible or removable seats which will permit the vehicle to be used for either pleasure or business purposes. It will employ a four cylinder, 21 horsepower engine and will be placed on the market for \$1,000.

#### Keeton Securities Co. Asserts Itself.

The referee in bankruptcy has granted the application of the trustee of the Croxton-Keeton Motor Co. for authority to dispose of the plant at Massilon, Ohio, at his convenience and meanwhile to continue its operation and complete the unfinished cars on hand. Several of the prominent creditors who believe that the property should be immediately disposed of were granted the privilege of filing an exception and appealing to the higher court. At the creditors meeting at which this action was taken, it developed that there is in existence the Keeton Securities Co., of New York, which owns such patents as were em-

ployed, and that before the trustee can dispose of any of the cars he may make up, arrangements for the payment of royalty must be completed with the Securities company.

#### How Goes the "Independent" Show.

According to Herbert Longendyke, who with C. C. Conant, of Troy, N. Y., is the active man in the American Motor Car Manufacturers Exhibit Association, which is promoting the "independent" show to be held in Grand Central Palace, New York, Dec. 31-Jan. 7, 37 manufacturers of cars already have contracted for space and nearly 60 per cent. of the entire available room has been apportioned. Longendyke promises "there will be nothing small or cheap about the show," on which "a cash outlay close to \$50,000 will be made before the doors are opened." He has issued invitations to the trade press to join him at a luncheon in the Automobile Club of America's restaurant on Thursday next, 20th inst.

#### Topeka May Lose the Smith Factory.

Unless the citizens of Topeka, Kan., "step up to the captain's office" and subscribe for about \$75,000 worth of a new stock issue, that city is liable to lose the Smith Automobile Co. That company has the necessary equipment to double its output, but it needs more money to enable it to do so and to keep going. To that end, the Smith principals have proposed to reorganize the company under Kansas laws—it now is a Missouri corporation—and increase its capitalization to \$1,000,000. If the citizens will advance \$75,000 it will be viewed as a loan which will be paid for with shares in the reorganized company on a basis of four for one. The Topeka Commercial Club is dealing with the matter and already has raised funds to the amount of something like \$45,000.

#### McQuaid Sues and is Sued in Turn.

James Addison, treasurer of the Berkshire Motor Car Co., Pittsfield, Mass., and Stuart Clapp, its general manager, have brought suit against John McQuaid for \$25,000. The action grows out of the sale of McQuaid's interest in the company to the two plaintiffs and is in the nature of a counter suit, McQuaid previously having sued them for \$11,000 alleged to be the balance due of the purchase price.

#### Seven More Join Credit Association.

At its last meeting the Automobile Trade Credit Association elected to membership the following applicants: Connecticut Tel. & Elec. Co., Meriden, Conn.; Fletcher & Co., L. V., New York City; Gibbes Machinery Co., Columbia, S. C.; Martin-Evans Co., Brooklyn, N. Y.; Morrison-Ricker Mfg. Co., Grinnell, Iowa; The Sireno Co., New York City; Wenz-Ludy Equipment Co., Brooklyn, N. Y.

## IN THE RETAIL WORLD.

Quant & Pierson have engaged in the automobile business in Mapletown, Iowa.

Gilmore City, Ia., has its first garage. H. W. Heath has just finished building it.

A new garage has been opened on North Barron street, Dayton, Ohio, by F. R. Christman.

The Maxwell-Briscoe Chicago Co. has certified to a change of name to the United States Motor Chicago Co.

The San Jacinto Garage, in the California town of that name, has been sold to M. L. Baisley. It formerly was owned by W. D. Jacobs.

The Oakland Sales Co. has been organized in Detroit, Mich., with headquarters at 742 Woodward avenue. A. L. Zeckendorf is the manager.

Under the style the Burd Auto Co. a new concern has started business in Grundy Center, Ia. It will do general repair and garage work.

E. L. Bailey, of Dundee, N. Y., is building a garage on Main street. It will be 36 x 100 feet, of concrete and terra cotta, and one story high.

O. L. Early, dealer in automobiles and accessories in Earlham, Iowa, has made an assignment of his stock to E. M. Crosswait, of the same town.

Joseph Oschwaid is building a garage at 418 Washington street, Newark, N. J. The structure will be three stories high, of brick, and will cost \$20,000.

J. Stewart Allen has purchased the City Garage in South Fourth street, Springfield, Ill., from Frank Smith. He will show Hudson, Hupmobile and Benz cars.

Rambler cars will form the mainstay of the Williams Garage, which has opened its doors in Waukegan, Ill. Henry Williams, of Kenosha, Wis., is the manager.

Chas. E. Hall & Sons, of Malden, Mass., have opened a garage in that town on Summer street. The building has more than 10,600 square feet of floor space.

Arkadelphia, Ark., soon will have another garage in "its midst." W. L. Fodrea, formerly connected with the Carter Automobile Co., of Little Rock, is building it.

Bert Richards has purchased a half interest in the Cadillac Motor Co., which has salesrooms at 304 Barnes block, Wichita, Kan. T. C. Cowley is the other partner.

Arnim C. Blankenburg, of Fond du Lac, Wis., and Frank E. Hallman, of Norris-town, Pa., have formed a partnership and opened a modern garage on the Isle of Pines, Cuba.

Temporary quarters have been established at the corner of Ninth and Nicollet streets, Minneapolis, Minn., by R. W. Munzer & Sons. They will specialize in Oldsmobile cars.

The old Heurich Brewery in 20th street,

Washington D. C., has been purchased by the Terminal Taxicab Co. for a sum of \$50,000. The buildings will be remodeled for garage purposes.

Under the management of John F. O'Toole, a branch has been opened in Atlanta, Ga., by the F. B. Stearns Co., of Cleveland, Ohio. Temporary headquarters are at 34 James street.

O. A. Jones, of Chicago, Ill., has gone into the garage business in Minneapolis, Minn., where he will sell Stanley steamers. His headquarters are at the Gavin Garage, 1900 Lyndale avenue, south.

The Elmore car has entered Des Moines, Ia., where it will be handled by D. C. Korn. He has established his headquarters at 612-614 Mulberry street under the style the Elmore Auto Co. of Des Moines.

David S. Kendricks, formerly of the firm of Barnes & Kendricks, has gone into business himself and established himself at the Central Garage, Washington, D. C. He will handle the Thomas line.

W. G. Parker, of Troy, N. Y., has sold his garage and contents to Burdick & Hartwell, of the same city, and quit the business. The garage will be continued under the management of Joseph Z. Lafave.

The firm of Coughlin & Davis, dealers in automobile supplies at Seventh and Walnut streets, Cincinnati, Ohio, has dissolved partnership by mutual consent. A. C. Davis will continue the business in his own name.

With S. T. Mallory, Harry Davis and W. H. Karr as the moving spirits the White Steamer Co. has been formed at Muskogee, Okla. As indicated by the name, White steam cars will be featured by the new concern.

Hugh R. Fisher, formerly secretary of the Atlanta Buggy Co., has gone into business on his own account and opened an agency for Whiting cars. His offices are in the Fourth National Bank building, Atlanta, Ga.

The Albertson Motor Car Co. is the style of a new concern which has opened salesrooms at 1527 Grand avenue, Kansas City, Mo. Fred Albertson is the manager of the company, which will feature the Marmon line.

The Keeler-Hupp Co., of Detroit, Mich., has been dissolved and the Hupp Motor Co. succeeds to its business. As the name indicates, Hupmobiles will be handled in its salesrooms, which are located at 730 Woodward avenue.

The Inter-State agency for Western Pennsylvania has been taken over by the Pittsburg Inter-State Co., which just has been organized for the purpose. The temporary headquarters of the company are at 5706 Penn avenue, East End.

Styling themselves the Charles B. Benton Co., C. B. Benton, chief tester for the Stearns company, and D. F. Jones, also of

the Stearns factory, have opened a garage and repair shop in Cleveland, Ohio. It is located at 1851 East 65th street.

F. D. Bennett and William T. Buck have formed a partnership and purchased the three-story building on East Main street, Freehold, N. J., belonging to the Bennett estate. They will remove the present building and erect an up-to-date garage on the plot.

John Muldoon, president of the recently formed Motor Transportation Co., of Chicago, Ill., has leased the property at the northeast corner of Lake and Curtis streets, where he will erect a large garage. The structure will be 100 x 100 feet, and will cost \$11,000.

R. H. Magoon and W. S. Cramer, of Minneapolis, Minn., have purchased the business of the Moore Carving Co., which handled the Woods electrics. Until new quarters are finished they will continue to exhibit these cars at the old address, 725 Third avenue, south.

Emile Berg, of Jersey City, has bought out the interest of his partner, Jos. Rogers, in the LaReine Garage on Main street, Bradley Beach, N. J., and will continue the business in his own name. Rogers has purchased a garage in Trenton, N. J., and will go into business there.

The Wheeler & Wuestefeld Co., of New Haven, Conn., has been reorganized and its stock increased to \$10,000. C. E. Wheeler has sold his interest to George B. Wuestefeld, who will continue the business in his own name. The company handles Owen and Stoddard-Dayton cars.

The Hearne Motor Car Co., of Milwaukee, Wis., has taken possession of the salesrooms and garage of the Stephenson Motor Co., at 18 Eighth street. J. E. Morehouse is the manager of the new concern, which will handle the Benz and Hupmobile gasoline cars and the Hup-Yeats electrics.

H. A. White & Co., Cadillac agents for Tennessee, have taken Aubrey B. Clapp, their salesman, into partnership and changed the name of the firm to H. A. White Auto Co. Simultaneously they have moved into more commodious quarters at 62 South Second street, Memphis, Tenn.

Under the style the Overland Co. of Kansas City, a new concern has been formed in the Missouri town of that name, with H. A. Dougherty as president and H. G. Kirkland as secretary. Its headquarters will be at 1523-1525 Grand avenue, former salesrooms of the Midland Motor Co.

The Ford Automobile Equipment Co., 1735 Michigan avenue, Chicago, Ill., has been adjudged bankrupt and the Central Trust Co. appointed receiver. It is alleged that the company has liabilities amounting to \$7,500 with little if any assets. The company has no connection with the Ford Motor Co.

## Why Pay More?

**E**XPERTS say that it is impossible to build a better auto than the White Gasoline car—they could be built larger, but no better. The size of the White car is very favorable for most uses—it has five-passenger capacity. Being moderate of size and weight, it is economical upon tires and other accessories. Having a long-stroke engine but with moderate-sized cylinders, it is economical in the use of gasoline. Being mechanically perfect and economical in operation it is moderate-priced, and leaves no occasion to pay more.

## Why Pay Less?

The original analysis of the cost of an automobile is not the original outlay for the car but the monthly outlay for up-keep. Judged by this standard, the White car is the cheapest car on the market, being a car that must most surely be economical in operation. The monthly bills for up-keep continue as long as the car lasts—the original investment comes but once.

The economical White Gasoline Car is the car for men who need to consider maintenance cost.

Many agencies now open for White Gasoline cars and truck, also steam passenger cars. Demonstrators should be bought at once for early delivery.

#### The Penalty for Playing With Fire.

When a man plays with fire he has only himself to blame if he is singed. Barney Oldfield and his redoubtable manager have been playing with it for a long time and possibly the ease with which they have earned money throwing "circular dirt track records"—national, state, county, local—in the public eye has emboldened them to toy with fiercely burning fagots. In selecting a pugilistic brand and a black one, and in attempting to inject the methods of the prize ring and other rings into the sport of automobiling, they seem to have found a fagot that is just a little too hot for handling.

None can blame Oldfield for making hay while the sun shines, but the A. A. A. is right in declaring that he shall not make chaff appear hay nor introduce undesirable elements and malodorous methods into the sport to which it administers. Permanent suspension is rather too much of a penalty

to exact for the mere attempt to do that sort of thing, but if Oldfield persists, as he threatens to do, he should be placed on the other side of that pale which is indicated by permanent disqualification. The combination of Oldfield, negro pugilists, book-makers or near-bookmakers and moving picture men is something from which the public and the sport of automobiling well may be saved. It is impossible even to think of it without holding the nose. In some places, remarkable to recall, somewhat similar things are styled "barneys."

#### The Use of Motor Cars in Winter.

This is the season when reams of advice are handed out for the guidance of motorists who purpose laying up their cars for the winter. But while that practice is largely adhered to, the number of owners, particularly in the larger cities and towns, who do not put their cars away during cold weather but use them either occasionally or continuously, yearly is increasing. And there no longer is any reason, so far as the capability of the modern motor car is concerned, why it should not be as useful and effective at one time of the year as another.

So far as recreation is concerned, of course the winter months afford less attraction than the summer. At the same time in many parts of the country there are many days and even weeks during the winter, when the air is clear and bracing, the temperature not excessively low, and when general conditions render motoring as pleasant and profitable physically as it is during hot weather. The ability to take advantage of such conditions, to do away with the traditional confinement within doors that the old-fashioned winters used to enforce, is one of the privileges given to the motorist who is farsighted enough to keep his machine in working condition 12 months in the year.

When it is designed to employ the car during cold weather, however, it is well to fortify it against the rigorous conditions it is destined to encounter; it is advisable that it be given a careful overhauling designed to locate any serious flaws in the mechanism, such as might render operation over bad roads in any way perilous, and to forestal difficulties of the sort that might arise from the clogging of the lubricating system or the freezing of the cooling water. Elsewhere the Motor World gives directions for such an overhauling,

at the same time indicating the advisability of carrying out the work in the most expeditious manner possible.

#### Motor Cars in the Field of War.

Effective demonstration that the motor vehicle is a valuable adjunct to military operation of all sorts has been secured so many times that it is useless to reiterate the statement that it is destined to a great future in this rigorous and exacting class of work. But it is possible to draw one or two useful conclusions from the recent manoeuvres of the Third Army Corps of France at Gournay. It was a "war game" played on a larger scale than ever such a game has been played before, and the automobile fulfilled an important role in carrying it on. It is noteworthy, however, that the use of self-propelled vehicles went no further than the limits more than one authority has placed upon them already; they were used in forwarding supplies to the front, and in general service work. Apparently the day of the motor driven caisson and light artillery is not yet.

In the particularly important work of feeding the army, the motor vehicle rendered conspicuously effective duty. Thirty large vans were employed in hauling the daily food supplies of General Meunier's force, which numbered 30,000 troops. Eight of the vans were used in transporting the day's supply of meat, the remaining 22 being used for the transportation of other supplies. The meat vans brought beef and mutton each morning from the military slaughter houses at Gournay and Gisors, about 30 miles to the rear of the encampment. The vans were in in constant telephone communication with headquarters at all times. Incidental to the work of the new "fourth arm"—the aerial contingent—two types of aeroplane destroying guns, automobile mounted, also were employed.

It is so easy to permit the imagination to dwell on vague future possibilities that it is quite possible to overlook present realities. While the time may come when animals will be dispensed with in all army transportation movements, at present that is impracticable. Although wide tires of special construction that will negotiate soft ground successfully with medium loads may be provided, heavy weights still must be moved by the more antiquated means. But for transporting troops, food, forage, ammunition and supplies, and in hospital service, the motor vehicle already excels.

**THE WEEK'S INCORPORATIONS.**

Detroit, Mich.—Rapp Motor Co, under Michigan laws, with \$1,000; to do general garage and renting business.

Lewiston, Me.—Maine Supply & Garage Co., under Maine laws, with \$200,000 capital; to do a general garage, renting, and taxicab business.

Milwaukee, Wis.—Hearne Motor Co., an Illinois corporation with \$3,000 capital, to do business in the state of Wisconsin with a capital interest of \$1,000.

Brooklyn, N. Y.—Hartford Garage Co., under New York laws, with \$10,000 capital. Corporators—Moses Spiero, Michael Brayer, Clarence A. Leavitt, all of Brooklyn, N. Y.

Columbia, S. C.—Roddey Automobile Co., under South Carolina laws, with \$10,000 capital; to deal in automobiles and supplies. Corporators—J. B. Roddey, J. J. Cain.

St. Louis, Mo.—Grand Motor Car Co., under Missouri laws, with \$8,000 capital; to operate a garage and renting business. Corporators—A. O. Heisel, R. W. Anselm, R. J. Ganahl.

Lakota, N. D.—Inter-State Motor Car Co., under North Dakota laws, with \$25,000 capital; to deal in automobiles. Corporators—George L. Barrett, H. J. Simons, E. F. Hughes.

Cairo, Ill.—Cairo Motor Co., under Illinois laws, with \$3,000 capital; to deal in automobiles, accessories and supplies. Corporators—W. J. Johnston, W. H. Wood, D. S. Lansden.

New Haven, Conn.—Broadway Garage Co., under Connecticut laws, with \$25,000 capital; to do general renting and garage business. Corporators—Anton Mai, Frank Mai, B. J. Curran.

Charleston, Mo.—Charleston Motor & Garage Co., under Missouri laws, with \$2,000 capital; to operate garage and supply store. Corporators—J. L. Devers, Roy L. Devers, J. B. Penny.

Windsor, Can.—Canadian Commercial Motor Car Co., under Ontario laws, with \$40,000 capital. Corporators—Celestin Thibeault, Ernest D. Craig, Charles F. House, all of Windsor, Ont.

Columbia, Tenn.—Maury Motor Co., under Tennessee laws, with \$5,000 capital. Corporators—William A. Dale, Horace Rainey, G. E. McKennon, George T. Hughes, J. M. Dedman.

Portland, Me.—Automobile Sales & Supply Co., under Maine laws, with \$5,000 capital; to deal in automobiles. Corporators—Lewis A. Goudy, George B. Merrow, James B. Soule, David E. Moulton.

Newark, N. J.—Nicol-Winckelhofer Co., under New Jersey laws, with \$5,000 capital; to deal in automobiles and other motor vehicles. Corporators—J. C. Nicol, L. C. Nicol, A. A. Winckelhofer, all of Newark.

New York City, N. Y.—Hengel-Addis Mfg. Co., under New York laws, with \$1,200 capital; to manufacture incidental equipment for automobiles. Corporators—Frederick Hengel, Jacob Addis, Julia Addis.

Lansing, Mich.—Reo Motor Truck Co., under Michigan laws, with \$1,000,000 capital; to manufacture and sell commercial motor vehicles. Corporators—R. E. Olds, James H. Thompson, J. Edward Roe, of Lansing.

**Recent Losses by Fire.**

Colusa, Cal.—J. C. Monk's garage and one automobile burned. Loss, \$2,000; no insurance.

Sturgeon Bay, Wis.—J. C. Dana Co.; garage damaged, four cars burned. Total loss about \$5,000.

Omaha, Neb.—Velie Auto Garage, 19th and Farnam streets; building damaged, two automobiles destroyed. Loss, \$2,000.

Utica, N. Y.—Utica Taxicab Co.'s garage at Blandina and First streets; four touring cars and three taxicabs destroyed. Loss, \$21,500.

Richmond, Va.—Richmond Motor Co., garage at 319 West Main street; building destroyed, seven automobiles burned. Loss, \$22,000. Partly insured.

**Changes in capitalization.**

Streator, Ill.—Streator Motor Car Co. increases capital from \$30,000 to \$600,000.

Muskegon, Mich.—Motor Mfg. Co. increases capital from \$100,000 to \$150,000.

Milwaukee, Wis.—Stephenson Motor Car Co. increases capital from \$50,000 to \$100,000.

Bowling Green, Ohio—Bowling Green Automobile Co. reduces capital from \$5,000 to \$3,000. The directors are W. F. Toops, C. H. Smith, L. H. Conklin.

**Meeting to Discuss Electric Vehicles.**

The recently organized Electric Vehicle Association of America will hold its first open meeting on Tuesday next, 18th inst., in the concert hall of Madison Square Garden, New York, during the Electrical show which now is in progress there. A number of papers pertaining to electric vehicle subjects will be read and discussed. The session will be opened at 10 o'clock. At the show there are several exhibits of electric vehicles, including Babcock, Baker, Studebaker, Bailey, General Electric, Lansden and Detroit cars.

**Speir Joins Pennsylvania Staff.**

John C. Speir, who has been associated with the Locomobile, Autocar and other well known concerns, has been appointed superintendent of the mechanical department of the Pennsylvania Auto Motor Co., Bryn Mawr, Pa., makers of the Pennsylvania car. He already has assumed the duties.

**COMING EVENTS**

October 15, Chicago, Ill.—Chicago Motor Club's reliability contest.

October 15-16, Philadelphia, Pa.—Automobile Club of Philadelphia fall tour, Atlantic City and return.

October 21-22, Boston, Mass.—Boston "American" commercial vehicle contest.

October 21-25, Washington, D. C.—Second annual Washington "Post" tour to Richmond, Va., and return.

October 24, Lawrence, Mass.—Automobile races.

October 27-29, Dallas, Tex.—Dallas Automobile Club's race meet.

October 28-29, New York City—Commerce city vehicle test, under auspices New York American.

November 3-5, Atlanta, Ga.—Atlanta Automobile Association's fall meet on Speedway.

November 5, Los Angeles, Cal.—Los Angeles-Phoenix (Ariz.) desert road race.

November 5-6, New Orleans, La.—Automobile meet.

November 7-11, Chicago, Ill.—Reliability contest under auspices Chicago Motor Club.

November 10-13, San Antonio, Tex.—San Antonio Automobile Club's races at International Fair grounds.

November 12, Savannah, Ga.—International road race for the Grand Prize of the Automobile Club of America.

November 22-26, Lake Charles, La.—Louisiana Fair Association's race meet.

November 24, Redlands, Cal.—Mile High Hill Climb Association's contest.

November 24, Santa Monica, Cal.—Southern California Automobile Dealers' Association's annual road race; 200 miles.

November 24, Savannah, Ga.—Savannah Automobile Club's road race.

November 26-27, Los Angeles, Cal.—Motordrome races.

December 3-18, Paris, France—French Automobile Manufacturers' Salon in Grand Palais.

December 25-26, Los Angeles, Cal.—Races at Motordrome.

January 5-21, Detroit, Mich.—Detroit Automobile Dealers' Association's annual show in Wayne Pavilion.

January 7-14, New York City—Association of Licensed Automobile Manufacturers eleventh annual show in Madison Square Garden. Pleasure cars and accessories.

January 16-21, New York City—Association of Licensed Automobile Manufacturers eleventh annual show in Madison Square Garden. Second week devoted to commercial vehicles.

**SAVANNAH GETS GRAND PRIZE**

**Long Island Promoters Finally Abandon Race—The Georgia City Acts Quickly—Date Already Set.**

Savannah has secured the Grand Prize package. Although newspaper clamor had not forced or induced the Long Island authorities to revoke their permit to run the Grand Prize race on the Long Island course on Saturday next, and it was believed therefore that the contest would be run as originally scheduled the Motor Cup Holdings Co., wearied of the turmoil and on Thursday last formally abandoned the undertaking. Following the decision W. K. Vanderbilt, Jr., president of the Cup Holdings company, wired Savannah of the action taken and Savannah, in the person of its mayor and other distinguished citizens, promptly boarded the train for New York and arriving there had no great trouble in securing the "plum," nor was much time lost in naming the date, November 12th. At first it was thought that Thanksgiving Day might be selected, but most of the drivers were anxious to get back to their factories as soon as possible, in order to "spruce up" the exhibits for the Madison Square Garden show. Their view of the matter prevailed and the earlier date was fixed.

Last Thursday's meeting, when Long Island surrendered its rights to the race, was in the nature of a joint conference of the officials of the Motor Cup Holding Co. and of the entrants for the race. It was held at the Automobile Club of America. W. K. Vanderbilt, Jr., Henry B. Sanderson and A. R. Pardington were present for the Cup Holding company. The entrants were represented by James Joyce (Alco), Gaston Plaintiff (Ford), E. R. Hollander (Fiat), W. B. Easton (Sharp-Arrow), W. C. Durant (Marquette-Buick), Washington Roebling (Roebling-Planche) and George W. Loft (Mercedes). The meeting was private, but it is known that the discussion related chiefly to the policing of the course.

The entrants were anxious to have the contest carried out, but they insisted upon better patrol service. The promoters finally admitted that it was impossible to secure enough policemen to protect the stretch according to the notions advanced, so it was decided the only thing possible was to abandon the affair. The following statement explaining the situation was issued the same evening by the Motor Cups Holding Co.:

"At a joint meeting of the executive committee of the Motor Cups Holding Co. and the entrants in the second international grand prize race, scheduled to be held on Long Island on Saturday, October 15, 1910, it was, by unanimous vote of the entrants

present, with full knowledge of the fact that every reasonable precaution was taken to control the immense crowds attracted to the Vanderbilt Cup race, held on the 1st inst., and further, realizing that no greater precaution can be taken for the Grand Prize race, and upon the request of the Motor Cups Holding Co. that they be relieved of the responsibility of conducting said Grand Prize Race,

"Resolved, That the request of the Motor Cups Holding Co. be acceded to, and it is further unanimously

"Resolved, That the thanks of the entrants be extended to the Motor Cups Holding Co. for the sportsmanlike manner in which the Vanderbilt Cup race was conducted, and for their offer to conduct the Grand Prize race, should it be the desire of the entrants."

When the mooted abandonment of the race first was published, telegrams were received from about a dozen cities asking for the contest, but Savannah having held the first Grand Prize contest, when the military patrol was found uncommonly efficient, was given the preference. Other leading applicants were Philadelphia, Indianapolis, Atlanta, Los Angeles and Cheyenne. Savannah promised to straighten and improve its course, which has been greatly bettered since the first race two years ago. The circuit has lately been shortened and can now be made 17.2 or 18.5 miles on short notice. The undesirable section of the old circuit through the Isle of Hope has been eliminated.

The foreign drivers almost without exception would prefer the race near New York, but that being out of the question they almost to a unit approve of Savannah, particularly as several of them participated in the first Grand Prize held there.

The delegation representing Savannah, and consisting of Mayor Tiedeman, Judge A. B. Moore, Harvey Granger, chairman of the executive committee of the Savannah Automobile Club; Judge Oliver T. Bacon, road commissioner, and Judge George T. Cann, of the Superior Court, already has returned South, while Arthur W. Solomon, secretary of the S. A. C., will remain in New York for a day or two more to fix up the details in connection with the race.

**Death the Penalty for Looking Backward.**

To be instantly killed while running at a speed of less than 15 miles an hour, without having a collision, breakdown, steering gear trouble, or similar accident, was the unusual fate of C. W. Reinoehl, superintendent of the Pennsylvania Steel Co. While touring with a party of friends near Buena Vista, N. J., on Sunday last, he violated that first rule of safe driving by raising himself in his seat and looking backward to see if friends in another car were following. As might have been expected, the car ran off the road, turned over and crushed him.

**HARD UPPERCUT FOR B. OLDFIELD**

**A. A. A. Delivers It and Spoils the Black and Tan Game—Pickens and Jack Johnson Feel Effects.**

When Barney Oldfield, the white automobilist, assisted by "Col." Bill Pickens—also white—decided to try conclusions on a race track with Jack Johnson, the black pugilist, he played with a fiercer fire than even the "colonel" himself imagined existed—and he is reputed to possess quite an imagination, at that. Preceded by a cloud of theatrical defies and stage sniffs the two great men—with no reflections on Bill, or on the Sheepshead promoter, who expected to make a big clean-up—got together and signed up for a match on the Sheepshead Bay track, near New York, where playing the ponies no longer is as profitable as it used to be.

The preliminary work was conducted in true pugilistic style. In addition to an elaborate campaign of press work and the signing of articles, it later developed that there were moving picture privileges and that Barney disposed of the "rights" for the occasion to a Chicago investor, receiving therefor the munificent compensation of \$9,000. With his large and imposing array of "dirt track records," to which he hoped to add yet another, and with a bonus for the race snugly tucked away in his clothes, matters were looking decidedly rosy from the white "champion's" point of view.

Unfortunately for all concerned, however, they had reckoned without the American Automobile Association; they had not even gone to the trouble of obtaining a sanction for the affair before making announcements and issuing elaborate and thrilling posters heralding what may have been "the race of the century." Nor had Johnson become possessed of an A. A. A. registration card.

When the latter fact first was remarked it was announced that such registration would be denied when applied for. But in pugilistic parlance Johnson "put one over" on the Three-A's. On a day when Chairman Butler was absent from the office, he sent a boy up with his dollar, making application in the name of John Arthur Johnson. As they are not well up on prize fighting in the office of the association, none recognized the name of the "hero of Reno." Registration card No. 669 was therefore issued to John Arthur and everybody connected with the financial affairs of the meet chuckled audibly.

They chuckled too soon, however, for a couple of days later the registration was canceled and John Arthur's dollar was returned to him. Furthermore, the contest board of the A. A. A., at a meeting held on Tuesday of this week meted out sum-

mary punishment to Oldfield for announcing his intention of competing in an unsanctioned event and on an unlicensed track by suspending his license temporarily and ordering him to show cause why the suspension should not be made permanent. Likewise the activities of Mr. Pickens in the affair were not overlooked, and he has been disqualified from competing in any sanctioned event and from acting as the manager of an entrant, or as a promoter, entrant, owner, driver or in any other capacity. The official displeasure of the Three A's was expressed in the following language:

"Whereas, Barney Oldfield, under the American Automobile Association rules a recognized and registered automobile racing driver, has announced or caused to be announced in the public press and upon posters his entry in a so-called track race with Jack Johnson at the Sheepshead Bay track (unlicensed for automobile contests), to be held on October 20th, official sanction for which contest has neither been applied for nor issued, which action is a direct violation of the provisions of Rule 58 of the 1910 contest rules of the American Automobile Association, . . .

"An entry in any unsanctioned contest, or an authorized announcement in public print that an entry has been or will be made, shall be deemed sufficient cause for the immediate disqualification by the contest board of the owner, entrant, driver and car, or any or all of them; and

"Whereas, The conduct of W. H. Pickens, now Mr. Oldfield's manager, and his statements in the public press in connection with the proposed unsanctioned contest are injurious to the welfare of the sport and industry and destructive of the confidence of the public in automobile contests; and

"Whereas, The entrance into an organized and well accredited sport of the leading exponent of an unorganized so-called sport, which is under the ban in most of the states of the Union, and who is, as we believe, without requisite experience in automobile track racing and has yet to demonstrate his competency as a racing driver, would preclude the granting of official sanction for such so-called contest as detrimental to the interests of regularly organized automobile competitions; therefore,

"Barney Oldfield is, under Rule 58, hereby suspended and disqualified until further notice from future competition or participation in sanctioned automobile contests, and

"W. H. Pickens is hereby disqualified from participation in any sanctioned automobile contest, either as manager of an entrant, promoter, entrant, owner, driver or in any other capacity; and they are each of them hereby directed to show cause why such disqualification should not be made permanent."

Meanwhile Oldfield has declared his intention of "keeping faith" with the promoters and the dear, dear public, as well as of living up to the terms of his contracts, regardless of the ban that has been placed upon the affair. John Arthur also is in a rebellious mood, and is represented as declaring that he will have his registration from the contest board if he has to go to law about it. In explaining to the board that it was "in error" in representing that he obtained his card by trickery he acknowledges a sentiment to the effect that he should not be blamed for what he terms "lack of office system" among the Three A's employees who are not familiar with pugilism. Also he has returned the fee that had been returned to him and the wandering dollar again has found its way to the desk of Chairman Butler.

#### Westgard Off on "Routing Expedition."

A. L. Westgard, accompanied by Mrs. Westgard, left New York Tuesday morning last, 11th inst., for an overland voyage to San Francisco. Mr. Westgard constitutes about 60 per cent. of the Touring Club of America; Mr. F. H. Elliott, the remaining 40 per cent., saw his partner take his departure in a Premier car, which is described as "one of the club's official cars." When the energetic Elliott is not acting as part of the Touring Club, he is one of the cogs in the New York state automobile bureau—chief examiner, or something like that, and as invitations had been issued to see the start of such a large part of the organization on such a momentous voyage, Mr. Sam Koenig, secretary of state and head of the automobile bureau, was among those present to wish Westgard Godspeed, etc. Mr. Westgard has letters of introduction to most of the governors on his route, but nevertheless expects to complete his journey in about 60 days. Westgard's objects are variously stated. The official definition of the trip is a "routing expedition," but Mr. Willie Randolph Hearst's newspapers say that Westgard is laying out the line or a line which may be followed by the aviators who may compete for his \$50,000 coast-to-coast prize. Other people guess that Mr. Westgard will devote even more time to explaining to hotel keepers on the route the beauties of the Touring Club's aim, scope and co-operative plan, and how they help bring lodgers and spending money to all places which figure on the maps which grow out of its "routing expeditions."

#### Rabbit's Influence Won Vanderbilt Race.

That it was the mystic influence of a rabbit's foot, tucked away in the car, that enabled Harry F. Grant to win the Vanderbilt Cup for the second time this year did not become known until several days after the race. The secret was disclosed by Grant himself at a dinner tendered him at the Engineers' Club by the American Locomotive Co., manufacturer of the Alco car

which he drove to victory both this year and last. When asked to speak, Grant modestly told the story of the giant colored man, "Footsey," who visited the camp in 1909 and again this year, and blessed the car just before the race. This year he left a rabbit's foot on the hood, it was explained, which was put away and carried in the race. The dinner was made the occasion for presenting the winning driver, his mechanic, F. H. Lee, and his other helpers, with substantial checks in token of the company's appreciation of their services. Incidentally, Grant expressed the wish that the names of the men who made the lighting tire change at the pit, during the crucial point in the race when he was on his twenty-first lap, be made public and due credit given them. They were Robert Cleland, one of the Michelin Tire Co.'s racing force; George Babcock, foreman of the engine testing room at the Alco factory, and the mechanic, Lee.

#### Illinois Horsemen Object to Oldfield.

Just three minutes was allowed Barney Oldfield, Saturday, 8th inst., to show his paces with the Blitzen Benz over the State Fair grounds at Springfield, Ill. The long slumbering animosity between the horsemen and automobile racing interests of that locality suddenly burst into flame and at first Oldfield was barred altogether from the track. At the request of Gov. Deneen, who was present, the equine fanciers relented to the extent of 180 seconds, however. Oldfield had announced one of his innumerable attacks upon dirt track speed records. The horsemen say it is a fight to a finish against gasoline invasion of horse tracks.

#### A. A. A. Stops Exhibition of a Trophy.

Although the joint endurance run of the Kansas City Automobile Club and Kansas City Star was ended almost a month ago, no rulings on the protests entered, following the award, have yet been made by the American Automobile Association. The trophy, however, was delivered to the Buick No. 17, despite the protests of the Reo and Ford representatives, on technical points, and the Buick people quickly trotted the cup around to their various agencies for exhibition purposes. After the contest committee of the three A's had telegraphed that such display of a prize under protest was prohibited, the cup was finally returned to the Kansas City Club.

#### Aberdeen Motorists Organize a Club.

At a meeting of business men of Aberdeen, S. D., the Aberdeen Automobile Club was organized, and the following officers elected: President, H. C. Jewett; vice-president, J. C. Bassett; secretary and treasurer, John B. Roumans. F. H. Barnard, R. D. Alway, S. H. Jumper, W. C. Allen, F. W. Boettcher and L. J. Swanson form the board of governors.

# Tire Change Decides Fairmount Park Race

Zengle and Mulford Have a Rare Duel but Mulford's Flat Tire Enables the Pennsylvanian to Win by Five Seconds—E. R. Bergdoll, Once Dangerous, but Only One Driver of a Foreign Car is Able to Finish—Two Accidents to Contestants but Philadelphia Police Keep Big Crowd of Spectators Well in Hand.

WHEN THE QUAKERS QUIVERED WITH EXCITEMENT—ZENGLE (No. 12) OVERHAULS AITKEN (No. 3) AT GRANDSTAND

Leonard Zengle, a Pennsylvanian, driving a car made in Pennsylvania, won the Fairmount Park road race run in Philadelphia, Pa., on Saturday last, 8th inst. Good guessers estimate that 500,000 Pennsylvanians saw him perform the feat. "Len"—that's what he's called by the home folk—completed the 202.5 miles in 209 minutes 7.88 seconds, an average of 58.10 miles per hour. When he dismounted from his car he was presented with a huge bouquet of roses and was hoisted on the shoulders of some of his enthusiastic fellow citizens and others, while still others hurraed respectfully.

In strictest truth, however, it must be said that Zengle, in keeping the honors at home, had a close squeak. Ralph Mulford, of New York, driving a Lozier, finished less than six seconds behind him. Tobin DeHymel (Stoddard-Dayton) was third, and John Aitken (National) fourth. W. G. Jagersberger, who piloted a Mercedes, and who finished fifth, was the only man in a foreign car to survive.

The race, however, held honors for more than Zengle, for while all of the 32 contenders who started were privileged to strive for the first prize it was almost a foregone conclusion that one of the big

cars would gather it in. To attract entrants, therefore, the cars had been separated into five classes and a silver cup and cash award provided for the winner in each.

It was not until after the race had been completed and the times had been sifted that it was possible to evolve the several winners, who proved to be as follows:

Division 6C—601-750 cubic inches.	
Leonard Zengle, Chadwick.....	3:29:07
Division 5C—451-600 cubic inches.	
Ralph Mulford, Lozier.....	3:29:13
Division 4C—301-450 cubic inches.	
John Aitken, National.....	3:42:21
Division 3C—231-300 cubic inches.	
Ernest Gellard, Pullman.....	3:57:41
Division 2C—161-230 cubic inches.	
Vincent Padula, Warren-Detroit....	*3:55:27

\* Twenty-two laps only.

The race, with the five races within itself, is one of which the Pennsylvanians are proud, for not only does Zengle's time shatter the record for the complete distance, but the record for one lap, 8.1 miles, also was broken. Ray Harroun, in a Marmon car, was the man who earned this latter glory. On his twelfth lap he went around in 7 minutes and 38 seconds, but, figuratively speaking, he did not live to tell the tale. He was still running when the race was called, but does not figure as a survivor.

The Pennsylvanians are proud also of the manner in which the race was conducted. Although two contenders suffered spills and one mechanic was badly injured, not a spectator was hurt, and the Fairmount Park race, be it understood, was quite unlike other races of its caliber. Most of them are conducted out in the country. The Philadelphia contest was conducted practically in the heart of the city—in the city's most famous park, in fact, a small part of the course actually being on a city street overlooked by stately and not so stately residences.

The promoters, however, did not have to rely on Pinkertons or country constables to handle the huge crowd that gathered; the Philadelphia police force itself attended to that part of the function and attended to it admirably. A perfect fringe of these bluecoats surrounded the course. They permitted no one, or practically no one, who had no business to do so to place a foot on the course after the race was started.

The police themselves constituted a picturesque feature of the day. Their helmets with their metal "skylights" in the crown singled out even the ordinary patrolman, while the mounted cops so closely

AT THE REPAIR PITS—DeHYMEL (STODDARD-DAYTON) AND MULFORD (LOZIER) PERFORMING SOME QUICK WORK

resemble United States cavalymen that it is hard to distinguish them at a distance. The caps and uniforms of the officers of the force resembled those of the majors and major-generals of the United States army, so imposing is the gold braid. Despite the braid, however, they "seen their duty and they done it," on Saturday last at any rate.

The race was started on the stroke of twelve, when Starter Gantert gave the word "Go!" to Harris Hanshue. The other contestants were despatched at intervals of 10 seconds. The order of starting was as follows:

No.	Car.	Driver.
1—	Apperson	Harris Hanshue
2—	Abbott-Detroit	Mortimer Roberts
3—	National	John Aitken
4—	Lozier	Ralph Mulford
5—	Benz	Erwin R. Bergdoll
6—	Abbott-Detroit	Montague Roberts
7—	Stoddard-Dayton	Hugh Harding
8—	Pullman	Harold Hardesty
9—	Apperson	Geo. E. Davis
10—	Pullman	Ernest Gellard
11—	Marmon	Ray Harroun
12—	Chadwick	Leonard Zengle
13—	Simplex	W. C. Mullen
14—	Jackson	Harry Cobe
15—	Mercer	H. P. Frey
16—	National	H. S. Wilcox

17—	Berz	Willie Haupt
18—	Cole	Harry Endicott
19—	Simplex	J. Fred Betz
20—	Mercedes	W. G. Jagersberger
21—	Abbott-Detroit	Vincent Padula

26—	Benz	Edward A. Hearne
27—	Cole	William Endicott
28—	Marmon	Joe Dawson
29—	Stoddard-Dayton	Tobin DeHymel
30—	Benz	Chas. Bergdoll
31—	Corbin	Ice Matson
32—	Otto	Frank Yeager

ZENGLE, HIS GRIN AND BOUQUET

22—	Simplex	Ralph Beardsley
23—	Westcott	Harry C. Knight
24—	Ford	Frank Kulick
25—	Chadwick	Al. Mitchell

Immediately he got under way, Al. Mitchell (Chadwick) proceeded to make a runaway race of it. He at once went to the front—in point of time—and for five laps he ran faster than a scared rabbit ever ran and then he "blew up" almost tragically, which is to say that on the Neil Drive he flew off the road and ran into an embankment, spilling both himself and his mechanism and rendering his Chadwick hors de combat. Mitchell and his assistant escaped with nothing worse than severe shakings and bruises.

E. R. Bergdoll—there were two Bergdolls; don't confuse them—in the big Benz, the biggest car in the race, after a bad first lap had been working steadily forward, and when Mitchell spilled he went to the front. He is rated an amateur in Philadelphia, but he drove as daringly as ever professional drove and cut out such a furious pace that he steadily drew away—in point of time—from all of the others. He was

PADULA (ABBOTT-DETROIT) AND HARROUN (MARMON) GIVE THE GRANDSTAND A THRILL

\* Running when race was called.

some four minutes ahead on the sixteenth lap, when he "got his." It came in the form of a broken oil pipe—not much of a break, but sufficient to give Bergdoll his quietus.

When Bergdoll first became dangerous, Mulford (Lozier) was in second place, and although he could not match the furious pace of the Philadelphian he trailed, not wholly respectfully, in second place, and when Bergdoll ceased his running Mulford took command and Zengle moved up into second position. He stayed there until the sixteenth lap, which marked the beginning of a rare duel between the two men. Each of them suffered tire trouble and as a result their positions shifted several times. Mulford's tires gave him pause on the twentieth lap. It was not much of a pause for the tire change was quickly made, but it was enough to permit Zengle to assume the leadership. Mulford did what a polite New Yorker termed "his damndest" to make good his loss, but it was not until the twenty-fourth lap that he succeeded. Then both of Zengle's tires blew out and Mulford once more was in front; but not very far

in front, at that. In fact, he then led Zengle by but nine seconds and the excitement of those who had kept tabs on the running was at fever heat. It was either man's race with the advantage, of course, in favor of Mulford; but the fortunes of sport were against him and on the very last lap, while passing the grand stand a tire went down, and though he made a lightning change it was not fast enough. He pursued Zengle like a demon possessed, and though he gained on him he lacked five seconds of being his master when the flag fell; but the consolation which comes of being a victor in his class, Division 5C, was his. The big prize, however, was Zengle's, and then it was because of it that the bouquet of roses was thrust into his hand and that the photographers singled him out. In these races-within-a-race, no one really follows others than the "big" race itself; the minor ones may as well be off the map for all the spectators know of them; they figure chiefly in the newspaper reports.

However—while Zengle and Mulford were engaged in their rare fight, other

things were happening to other men, of course. In fact, before either Zengle or Mulford assumed the lead many of their rivals had fallen by the wayside, two of them tragically. One of these was Mitchell, as already stated. The other was Ralph Beardsley (Simplex), who while negotiating the Sweet Briar curve, on the thirteenth lap, ran into a stone wall under the railroad bridge and suffered severely. Beardsley himself was badly bruised and shaken up, and Glenn Eldredge, his mechanic, sustained a broken arm and a broken leg, and at first was thought to be fatally injured.

His sensational performance in the Vanderbilt Cup race the week before had led not a few to pick Joe Dawson, the Marmon whirlwind, to figure prominently in Philadelphia. Joe, however, could not repeat. He drove a slightly less powerful car, to begin with, and while he acquired a good gallop he showed no such pace as that which his little car in the Vanderbilt affair developed and which landed him in second place in that classic contest. He never was dangerous at Fairmount Park, that is so

far as the big prize was concerned. However, he was leading his class, Division 3C, on the thirteenth lap when his engine "struck" and put him out of it. The running in that class then was taken up by E. Gellard (Pullman), who drove with impressive consistency and led his nearest classmate by more than a full lap.

It was Dawson's team mate, Ray Harroun, that scored the fastest lap, and though Harroun did fairly well, and was still running when the race was called, he never was able to get among the first flighters.

DeHymel (Stoddard-Dayton) and Joe Aitken (National), two other Vanderbilt performers, had a pretty little scrap between themselves for third position in the big race, and DeHymel won out, which, seeing that he had the larger car, was not wholly surprising. Aitken, however, led his class, Division 4C.

When nine contenders had completed the full distance the race was stopped, although there were four others still in the running, viz., Frey (Mercer), Yerger (Otto), Harroun (Marmon) and Padula (Abbott-Detroit). Padula was the only man remain-

ing in his class, Division C2—for the littlest cars—and after he had completed 22 laps he was stopped and adjudged the winner in that division.

If the Pennsylvanians who braved the leaden sky and the chill wind that prevailed found joy in the conclusion of the race, the first round surely brought them some pangs of regret, for it was on that lap that two of Philadelphia's own candidates, J. F. Betz (Simplex) and Charles Bergdoll (Benz) were put out of the running, Betz with a broken crankshaft and Bergdoll by a fuel tank which sprang a leak. Another Pennsylvanian went out on the second lap, Harold Hardesty (Pullman), who twisted a pump shaft.

The third lap, however, was the one which brought the greatest number of failures. In that round Montague Roberts (Abbott-Detroit) suffered ignition trouble, which he could not overcome; William Endicott (Cole) was put out by a differential which locked; Hanshue (Apperson) stripped a gear; Beardsley (Simplex) collided with a stone wall, as previously stated, and Hugh Harding (Stoddard-Day-

ton) sustained ills which were not reported. On the fourth lap Matson (Corbin) and Mullen (Simplex) were the victims, the former with magneto trouble, the latter with a cracked cylinder. It was on the sixth lap that Al. Mitchell, when leading, spilled and was heard of no more.

For the next four laps all of the survivors were in the running. On the tenth, however, Hearne (Benz) retired because of what was said to be spark plug trouble and on the thirteenth Joe Dawson followed him with an engine that had balked.

It was on the sixteenth lap, when E. R. Bergdoll (Benz) seemed to have the race well in hand that his broken oil pipe laid him up at the roadside. On the nineteenth Haupt, another of the numerous Benz contingent, suffered double trouble, an overheated engine coupled with a stone which lodged in his gearshift quadrant. On the same lap Wilcox (National) broke his radiator, and Harry Endicott (Cole) also retired.

On the twenty-first, Mortimer Roberts (Abbott-Detroit) threw a wheel, and Frank Kulick (Ford) suffered a disabled one. In

## THE MOTOR WORLD

his anxiety to replace it he permitted two outsiders to render assistance and as a result was promptly disqualified. Kulick had a narrow escape on the Sweet Briar turn. Once in attempting to negotiate it he ran off the road, jumped the curb and meandered on the lawn, narrowly escaping an electric light pole. By rare skill he got back to the road again and suffered apparently little delay. He was leading his class in the fourth lap when he ran into trouble. His delays and disqualifications were a disappointment to many, as his car weighs less than 800 pounds and for this reason was expected to do things.

R. E. Ross was the referee of the race and also chairman of the contest committee. The general managing committee, made up from the Quaker City Motor Club and municipal boards, consisted of Mayor Reyburn, chairman; L. D. Berger, secretary of the Quaker City Motor Club; William F. Gleason, Harry C. Harbach, Frank Hardart, Fred C. Dunlap, A. T. James, J. R. C. McAllister, Dr. Joseph S. Neff, Henry Clay, Dr. J. J. Moylan and Jacob Lit.

After spending about \$12,500 for prizes and paying all other expenses, five local charities are likely to divide at least \$10,000 as the result of the contest.

The winning driver in each division received a cash prize of \$1,000 and a municipal trophy valued at about \$400. In addition, Zengle won \$2,500 for making the fastest time, the race therefore netting him about \$4,000. As usual, the drivers formed a "death pool" of \$100 each, which totaled \$3,200; as there were no deaths it was refunded.

From a trade standpoint the race, like the Vanderbilt Cup contest, was largely a Michelin-Bosch affair. Michelin tires were on the wheels of the winners in each class, save one—Zengle's class—and Bosch magnetos equipped all the winners without exception. Zengle's Chadwick was shod with Firestone tires.

Saturday's race was the third of the series and George Robertson, who won both the previous events, was an interested spectator, not having thoroughly recovered from the injuries sustained during his practice for the Vanderbilt Cup contest. In 1908 Robertson won in a Locomobile, his time being four hours two minutes and 30 seconds. His average time was about nine minutes to the lap, his best round being in eight minutes 23 seconds. Cyrus Patchke in an Acme was second, finishing in four hours 14 minutes 54 seconds, while Mulford in a Lozier was third in four hours 17 minutes 26 seconds. Last year Robertson drove a Simplex to victory in three hours 38 minutes 58½ seconds. Bert Dingley in a Chalmers was a close second and Hugh Harding in an Apperson third. Their times, respectively, were three hours 44 minutes and 20 seconds, and three hours 52 minutes and 17 seconds. Zengle, in a Chadwick, made the fastest lap in the race.

## "ATHLETES" DEFEAT MOTORISTS

## Chicago Athletic Team Proves "More Reliable" in Inter-Club Contest—Two Days of Strenuous Travel.

By a score of 543 demerits to 866, the Chicago Athletic Association won the inter-club reliability run to Waukesha, Wis., and return, from the Chicago Automobile Club, which occurred Oct. 7-8. Heavy rains for days preceding the contest had put the roads in almost impassable condition, and as a result heavy penalizations were fre-

the day were 237 points, 204 of which were for repairs on a broken spring. A. S. Ray (Stearns), C. A. C., received 71 debits, having been hauled out of the mud. W. Eggermann (Rambler), C. A. C., replaced the bearings in a front wheel and lost so much time doing it that he was penalized 150 points for being late. C. Bosch (Stearns), C. A. C., drew 11 black marks for tardiness and repairs, the car finally being left behind.

C. A. Briggs (Chalmers) was the only C. A. A. representative to be very heavily penalized in the first half, he getting 117 points for repairs on a broken clutch and lateness due to that cause. W. W. Harlass

quent, one contestant being obliged to abandon his car and return home by train. There probably has never been as exacting a trip of the sort held around the Windy City. The conditions were such that 10 of the rocking chair clubmen refused to start at all. Nevertheless, eleven perfect scores were made, seven of them by the athletic club.

(Mora), however, aggregated 71 points, 34 of which were for engine trouble.

The second day Briggs, C. A. A., blew out four tires and had enough minor troubles to bring his aggregate demerits to 216 points for the last half, or 333 all told, and but for that and the fact that W. E. Davis (Chalmers) lost 108 points for a broken oil pipe, the Chicago Athletic Association

The worst part of the trip was encountered the first day when the Automobile Club lost 690 points to 203 for its rivals. Because of the conditions the officials upon reaching Harvard decided to cut off the jog to Oconomowoc, saving about 40 miles thereby. C. A. Tuttle (Chadwick), C. A. C., did not know of the change of plans, however, and so kept to the original route and had a terrible jaunt. His demerits for

would have made a fine showing. C. Bosch (Stearns) received 150 points the second day, that being the only debit of consequence on the Chicago Automobile Club's side the second day. The run as set was 307.2 miles, about equally divided between the two days. The omission of the Oconomowoc detour, however, saved nearly 40 miles on the first half, so that the distance actually covered was but 268 miles.

**MOTOR CAR VS. HORSE MATCH****Maxwell's Unique Test Affords Interesting Cost Comparison—Car Develops Quarter of a Cent Advantage.**

Following the completion of its unique contest to determine the passenger-mile cost of operating a Maxwell runabout as compared with a horse and buggy, the Maxwell-Briscoe Motor Co., Tarrytown, N. Y., has announced the final results obtained. These show the average cost of transporting one person one mile by the automobile method to be 1.57 cents, as compared with 1.81 cents when the horse and buggy are used. Under the conditions of the test the two conveyances were driven a certain number of hours each day. Thus the total mileage covered by the automobile was more than twice as great as that covered by the horse and buggy. The total mileage figures are 457.9 and 197.3 miles, respectively.

Under the inspection of official observers appointed by the American Automobile Association the competitors were driven over a different route each day, the object being to secure the widest possible range of practical working conditions. The routes covered included portions of Manhattan, Brooklyn, Staten Island, the Bronx, Westchester county and suburban New Jersey. The average daily travel of the runabout was 76.3 miles; the horse and buggy, on the other hand, only covered an average of 32.8 miles during the same period.

Accurate record was obtained of the distances covered and the costs of supplies. No repairs were necessary in either case, but an allowance for depreciation was made in both instances. Allowing five years as the useful life of the car, 20 per cent. depreciation was charged against it, on the basis of \$180 per year, or, assuming that the car was capable of making 10,000 miles per year, 1.8 cents per mile. Allowing 10 years for the useful life of the horse, buggy and harness, and basing the charge on a first cost of \$275 and 10 miles of travel per day, the depreciation of the horse-drawn outfit was charged at the rate of 0.75 cents per mile.

To simplify calculation, certain other items of necessary cost were offset against each other in the two instances. Thus the cost of shoeing, bedding and wagon grease was supposed to more than equal the expense of cup grease for the car and both were neglected in figuring the respective costs. No attempt was made to compare the relative costs of upkeep, and questions of interest, insurance, taxes and labor were not considered. What the figures actually reveal is a comparison of the expenses for gasoline and oil and for hay and oats, in

the two cases, with an added allowance for depreciation. The record follows:

Automobile.				
Day	Miles	Gasolene gal.	Oil pt.	Cost
1	67.4	5	1	\$1.00

**Sure Profits Lead to Prison Cell.**

John Nimitz, of Highland, Ind., at present is in jail, meditating over the failure of his business, which promised sure and large profits. Of course his business was rather unusual, and that's why he sits behind the iron bars. He sold parts and accessories without having gone to the bother of buying them in the regular and established way. He had them stolen from the factory of Thomas B. Jeffery & Co., Kenosha, Wis., and George A. Marble, keeper of the store-room, was the dishonest employee who did the stealing. Both have made a confession to District Attorney Baker, of Kenosha, and as a result a number of other employees are implicated, and warrants for their arrest have been issued. It is even claimed that the ramifications of the robbing plot extend to Chicago, and the district attorney made a hurried trip there to work up the Chicago end of it. No one knows exactly how much has been stolen, as the thefts have been going on for many months.

**To Mix Motor Cars and Flying Machines.**

The promoters of the international aviation meet at the Belmont Park race track at Queens, L. I., October 22-30, hope to have a display of automobiles as one of the "sideshows." The exclusive right to exhibit cars there had been obtained by the Licensed Automobile Dealers of New York through their general manager, James M. Carples, but later the directors of the association decided not to officially take advantage of the privilege, thus leaving the field an open one.

**WON'T HAVE TO SHOW RED LIGHTS****New York Aldermen Shelve Resolution Proposing Rear Signal for Horse Vehicles—May be Revived Later.**

The resolution of Alderman Bent, of New York calling for red rear lights on horse vehicles has gone upon the general calendar of the board of aldermen. The aldermanic committee on law and legislation discussed the matter in executive session Monday afternoon, and reported favorably upon it, but at the meeting of the board the next day, when it came to ballot, as less than 40 members voted yea, it failed of adoption. The matter is likely again to be taken up in the near future. The ordinance which Mr. Bent seeks to amend follows, new matter being in parenthesis:

"Section 458. Lights—Each and every vehicle using the public streets or highways of this city, except vehicles of licensed truckmen, shall show, between one hour after sunset and one hour before sunrise, a light or lights, so placed as to be seen from the front and each side; if dash lantern is carried it shall be placed on the left-hand side; such lights to be of sufficient illuminating power to be visible at a distance of 200 feet; said light or lights shall show white in front, but may be colored on the sides, excepting licensed truckmen; (other horse-drawn vehicles shall exhibit a red light, suspended in the rear, and visible therefrom a distance of 200 feet to the rear.) Every automobile shall exhibit during the same period two lamps showing white lights visible at a distance of 300 feet in the direction which the automobile is proceeding, and shall also exhibit a red light, visible in the reverse direction. The lamps shall be so placed as to be free from obstruction to light from other parts of said automobile. No operator of any automobile or other motor vehicle, while operating the same upon the public highway, within the city, shall use any acetylene, electric or other headlight, unless properly shaded so as not to blind or dazzle other users of the highway, or make it difficult or unsafe for them to ride, drive or walk thereon. In the borough of the Bronx, excepting south of Tremont avenue and 177th street, east of Jerome avenue and west of the Bronx river, and in the boroughs of Richmond and Queens, and in the twenty-sixth, thirtieth, thirty-first and thirty-second wards of the borough of Brooklyn, every car or other vehicle between said hours, while moving on, along or standing upon the portion of streets in said boroughs or parts of boroughs, shall also carry a light or lights of such illuminating power as to be plainly visible 200 feet, both ahead and behind said car or vehicle."

## PREPARING THE CAR FOR WINTER USE

"About this time expect heavy rain-storms"—as the Farmers' Almanac would have it. Likewise the motorist who is blessed with experience will take advantage of this or any other seasonable opportunity that presents itself to lay up his car for the partial overhauling that is considered a wise precaution if the machine is to be run through the winter months. For although many owners still prefer to put away their machines during cold weather, the number of those who prefer to take advantage of the crisp weather of the late fall and the occasional mild days of winter itself, constantly is increasing as is the number of those who use their cars the year 'round, practically regardless of weather conditions. And it is quite generally recognized that if the car is to be run over frozen ground and through roads from which the frost is working out, and particularly if it is to be driven through the snow, it requires to be put in good condition in order to withstand the severe strain.

As almost everyone knows, the coming of cold weather requires that certain precautions be taken to safeguard the cooling system against the effects of freezing and to ensure proper lubrication under low temperature conditions. But it is almost equally important to forestall as far as possible the effects of the racking and twisting that the machine is likely to undergo in order to prevent serious injury of the sort that may result from the neglect of worn and disarranged members. It is a foregone conclusion that the automobile that has been in use all winter will require a pretty thorough going over in the spring, together with a new coat of paint. But it is also the part of wisdom to get ready for the winter by giving the parts a thorough inspection and altering the equipment in any way that may be desired by way of preparation for cold weather work.

The greatest stresses, of course, come upon tires and wheels. Therefore it is very important that at the outset the running gear and the steering mechanism be inspected and put into perfect running condition in order to make sure that no half-hidden flaws exist to render the use of the car on a rough or uneven road positively dangerous.

In the same connection it must be borne in mind that such is the constitution of the automobile that shocks and strains received through the wheels are distributed pretty much throughout its entire structure. It is on this account, as well as to provide against the contingencies that arise from cold weather alone, that it is wise to give the machine a complete inspection some

time during the fall when it can be spared for two or three days.

In doing the work it is well to bear in mind that after a hard winter's work the car is bound to require a second going over, and further that such damage to paint and varnish is likely to follow that it would be poor economy to pay much attention to the question of appearance at this time. Therefore considerable good judgment should be employed in determining just what measures shall be taken in the way of renewals and repairs to faulty parts. In general a good rule to follow is that of making adjustments rather than expensive replacements of getting the work out of the way as rapidly and cheaply as may be consistent with perfectly trustworthy running results.

In going over the bearings, for example—whether in engine, transmission or axles, it is well to take up lost motion rather than to renew bushings, taking great pains in the matter of correcting any loss of alignment—since this difficulty sometimes may be a symptom of sprung or disarranged parts—and making sure that the studs and bolts which secure the adjustments are fastened in such a way as to be in no danger of working loose.

In regard to the engine in particular, there are the questions of carburation, ignition and lubrication to be investigated. As cold weather approaches, the carburetter must be provided with additional heat for the mixture. Most cars are equipped with means for heating the mixing chamber, either from the water jackets of the cylinders, or by means of an air intake in the vicinity of the exhaust manifold. It is essential that such provision, whatever it may be, be in working order, and that the operator be watchful in regulating it to suit the temperature conditions of the alternate warm and cool periods which are likely to succeed one another during the fall. Furthermore, in respect to the carburetter itself, it is important that the throttle and regulating devices are clean and free from dust and gummy oil, which might interfere with their action when cold, and also that the controlling arrangement are in good order and free from lost motion.

In a similar way, it is a good plan to give the ignition system a general going over, although there is nothing about it to be affected seriously by even an extreme drop in temperature. In particular the insulation of the wiring should be looked after, and worn spots, or those which have been rotted with oil, carefully wrapped with insulating tape and shellacked over. The connections also should be inspected to make sure that the strands of the wires

have not been broken by too frequent flexing and that the threads of binding screws are not so greatly worn that they will fail to hold their adjustment. In a similar way the battery, coil, timer and contact points should be put in shape, rather with the idea of "tuning" the system for a severe test than of rendering it "as good as new."

In regard to the lubrication system, it is particularly important that all ducts and feed pipes be thoroughly cleaned for the reason that any impediment to the flow of oil is rendered of greater importance in winter than in summer, through the tendency of even a thin-bodied oil to thicken at low temperatures. Because it is not pleasant to make roadside repairs in cold or stormy weather, it also is a good plan to make sure that all unions in the oiling system are solid and show no signs of breaking away and that the pipes themselves have plenty of "slack" so that they will yield to warping in the frame without causing the unions to be strained. Also it is well to readjust the oil feeds to give a slightly increased flow, though that depends to some extent upon the grade of oil recommended by the manufacturer for winter use.

Beyond looking after the alignment of the shafts and making sure that the gear changing lever and its sub-connections are so adjusted as to cause the gears to mesh properly, the change gear should require little attention at this time. It should be thoroughly cleaned, however, and the case supplied with a grade of oil especially recommended by the manufacturer of the car or of a trusted oil producer for the mechanical and climatic conditions which are to be withstood. The same, in a general way, applies to the rear axle, if of the live type, save that that member should be inspected with extreme care to make sure that it does not sag, and the truss rods, which help to strengthen the housing, drawn up until they are carrying their full share of the load.

The propeller shaft and the linkage that serves to anchor the rear axle in place, however, require special attention. The universal joints must be inspected and any lost motion taken up, if suitable means of adjustment is provided. At all events, it is important to make sure that the parts are not worn sufficiently to endanger their safe working, while it is equally important that the joints be properly lubricated and covered with a leather or metal housing. The torsion bar should be firmly secured to the axle housing at the rear, and the cushion device, by which it is suspended in front, should be strongly attached to the frame and the springs observed to be of sufficient strength to keep it from bumping

with a noticeable shock except when a very severe jolt is encountered.

In the same connection it should be ascertained that the alignment of both front and rear axles is correct, as this has a most important bearing on tire wear—always an important item, but never more so than during the winter. The springs also require attention and should be jacked up sufficiently to permit a thick graphite grease to be spread between the leaves, the perch bolts afterward being drawn up tightly, to prevent slipping or lost motion, while the shackles and shackle bolts should be examined carefully for signs of excessive wear or flaws.

The steering gear in particular should receive attention. The gear itself should be free from lost motion, its casing thoroughly clean and filled with lubricant, and its attachment to the frame rendered absolutely secure. The connections should be examined to see that they are neither bent nor otherwise disarranged, while the joints must be adjusted to take up lost motion, thoroughly lubricated and protected from dirt by means of leather boots.

In looking after the wheels and rims, it is important to make sure that all flange bolts are drawn up tight, and that the spokes and felloes are examined to make sure that the dry weather of summer has not caused the wood to crack and so impair the strength of the wheel. The rims should be secured free of rust and, if of the demountable type, their locking devices examined to see that they are in proper order. Afterward it is well to go over the body and external fixtures, such as lamp brackets, fender and running board irons and top, wind shield and tire supports, taking up lost motion, replacing lost or damaged nuts and bolts and generally making sure that there is no chance for parts to work loose.

After the car has been overhauled in this way, the question of winter equipment must be gone into. And in this connection perhaps no problem is of greater importance than that of protecting the cooling system against the ravages of frost. And it can be stated authoritatively, though countless formulas for anti-freezing solutions have been suggested, and though more than one effective compound designed for the purpose is on the market in the form of a branded product, perhaps nothing can be more efficacious than a judicious mixture of glycerine and wood alcohol. By using equal parts of glycerine and alcohol to the extent of about 40 per cent. of the total contents of the cooling system practically perfect insurance against freezing at any temperature nearly down to zero is obtained, together with freedom from the danger of corroding the jackets or clogging the radiator passages with encrustations, which result from the use of some solution. With the occasional addition of small quantities of alcohol to the mixture.

this solution may be kept equally effective without complete renewal throughout the winter, as the glycerine does not evaporate with the water.

In connection with laying in the winter's supply of oil, of course it is wise to consult the maker of the car or his agent as to the advisability of changing to a thinner bodied oil for the engine than is used in summer. With certain types of oiling system, notably the self-contained pattern, in which the oil never leaves the engine casing and does not flow through external pipes, probably no change will be found necessary. With other systems, however, a lighter oil generally is required in winter. Some operators find it advisable also to employ a thinner grade of cup grease in winter than in summer, and this is particularly advisable if the car is to be run during very cold weather.

One additional precaution is necessary in connection with the temporary fall laying up. That is to lay in a good store of tires. It already has been indicated that frozen and muddy roads, snow and ice by no means are easy on the understandings of the machine. Therefore, it is well to have a good stock of spares on hand in advance. This is particularly important, as it is desirable to take advantage of favorable weather conditions whenever they present themselves during the winter, delays due to a lack of abundant equipment being particularly annoying on this account.

#### Illustrating the Extent of a Factory.

Few people who have not seen them scarcely can begin fully to realize the size and proportions to which some of the larger automobile factories have attained. Some of their extent may be obtained, however, from the fact that one watchman of the Rambler factory, for instance, in going his rounds for the night travels about eight miles and a half. Charles T. Jeffery, general manager of the Thomas B. Jeffery Co., says that if one started at one corner of the Rambler plant and walked around the buildings, returning to the same spot, he would walk a mile and a half, or a distance equivalent to 15 city blocks, figuring ten blocks to a mile. If he started at the point where the raw materials are received and made a tour of the plant, he would travel about two miles. Going around the factory would be equivalent to walking three times around the Rambler half mile testing track, or three and three-quarter times around a city square.

Incidentally, five new buildings are now being added to the Rambler plant, including the new power plant, and additions are constantly being made to the working force. The Rambler output for 1911 will again be limited to 2,500 cars. Large additions have been made during the past year to the machine shop, motor assembling department and inspection department. Every important part of the car, even including the finest

limousine bodies, are now made in the Kenosha plant.

#### Strength of Demand for Closed Cars.

Whether the experience this fall of the Pierce-Arrow Motor Car Co., of Buffalo, N. Y., in regard to enclosed cars is typical of the whole industry is a question, but it is a fact that its records show that the demand for enclosed cars is far in excess of that of any other year.

Periodically at the Pierce-Arrow headquarters percentages on body styles and colors are struck. By means of these the company is enabled to know at all times just what the trend of the buying public is in general and particularly toward its own cars. The figures so far this season show that the proportion of enclosed cars to the total output is a trifle more than 60 per cent. greater for the present season than it was for 1910 cars. This increase amounts to about ten cars in each hundred.

The demand for enclosed cars is heavier, of course, in the fall than at any other time of the year, but it is not expected that the figures will be altered to any material degree. One of the reasons for this belief is that of the enclosed cars ordered so far, the suburbans and broughams, or limousines, as they are popularly known, outnumber the landaus and landaulets in the proportion of more than three to one. Landaus and landaulets will be ordered in the spring if the experience of other seasons holds good, owing to the fact that they are ideal in spring and summer when they may be used in either open or closed form, according to weather conditions.

#### One Method of Removing Valves.

Although a number of different forms of valve removing tools are on the market, it is possible to make a fairly effective removing device by screwing a small stud into the wall of each cylinder immediately back of each of the valve stems, which can be used as a fulcrum upon which to rest the end of a screw driver when raising the spring in order to release the key which extends through the stem. In drilling the cylinder for the studs, of course the piston must be removed, and the inner wall afterward should be dressed down with a scraping tool to remove the burr raised by the drill. When it is objectionable to carry a more or less cumbersome remover in the tool kit, the device may be employed successfully; furthermore, it possesses the merit that it always is at hand and cannot be mislaid.

#### Here's First Truck Dealers' Association.

Out in Kansas City the commercial vehicle has assumed such prominence or promise that the Automobile Truck Dealers' Association has been organized. Its officers are: President, O. O. Vandenburg; secretary, M. V. Payne; treasurer, C. L. Rouze

## OPENINGS FOR AMERICAN CARS

**Mrs. Fisher Finds Them in Her Trip  
Around the World—Her Advice to  
American Makers.**

In addition to being a woman of means and some leisure, Mrs. Harriett Clark Fisher, who recently completed a tour of the world in a Locomobile, is also the owner and directing head of a large anvil and vise factory in Trenton, N. J., and therefore is no stranger to commercial problems. During her tour Mrs. Fisher's business eye was not wholly closed and the fact served to leave distinct impressions regarding the possibilities for the American automobile in foreign fields; and these impressions she has recorded in *American Industries*, the official organ of the National Association of Manufacturers, of which she is the only woman member. In her article she endeavors to arouse the American automobile manufacturers to greater efforts, promising rich rewards.

"Motor car manufacturers of the United States should wake up to the possibility of foreign trade," she says. "Abroad lie virgin fields for the industry. It is true that here and there American machines have to contend with prejudice, with the feeling that our cars will not stand up in competition. Part of this we brought on ourselves, as in Calcutta, where one line of cheap cars is said to have put us back years in winning this market.

"American automobiles are needed in England, in France, in India, South Africa and Japan. A golden opportunity lies in India. I would not be afraid to land four or five good cars there, and count on having the money for them in my pocket in a month. The people of India are fascinated with motors, from the highest priced down, and great sums are being spent for them. Ability to pay for automobiles need cause the American shipper no anxiety. The amount expended on the trappings of a single elephant would buy three or four cars, to say nothing of the maintenance of the beast.

"If the American manufacturer seriously wishes to increase his sales, let him go after this foreign business as if he meant it. He should look the ground over himself, or through a capable representative who can show his line properly.

"India with its perfect roads is a motoring paradise; a better buying class than its merchants cannot be found; for the smaller cars there is a great demand among English officers.

"Do not think there are no automobiles in India. There are many, but the American car shrinks into obscurity in its representation. Here is a single instance. His Highness the Maharajah of Gwalia has 32

machines—but of American make not one. I have had to tell people in various parts of the world who looked over my car, a 40 horsepower Locomobile, that it was a fair example of our output, though the United States makes more different types than the rest of the world combined; that the impression that we make only cheap cars is wrong; that one can get an American car for \$600, or for any price up to \$6,000—and just as good in design, material, construction and finish as may be procured anywhere.

"Foreign buyers are waiting for us to come to them, but in the meantime they are taking advantage of the propositions that France, Germany, Italy hold forth. Five hundred miles from Bombay, away in the jungle, we ran across a Fiat, belonging to an English officer touring with his wife over the model Indian roads. And this suggests a comparison of foreign highways and our own and their relation to how our machines will perform abroad. In the course of my world tour I found the roads delightful everywhere except in America. The approach to Tonopah, Nevada, over miles of tin cans and broken bottles, is a sample of the conditions a car may meet here. But the inferiority of our highways has had its use, for it has demanded of the American machine a durability that will carry it anywhere. Its generous margin of safety and strength enables it to meet the most trying and unusual conditions. The German, French and Italian cars, on the other hand, are fashioned for use in the most advantageous surroundings. When one motors in France it is as in a succession of beautiful parks, and the same is true in Italy, even in the remote villages.

"One consideration should always have the special attention of American manufacturers. In quoting prices, let them always be C. I. F.; that is, tell the prospective customer what the machine will cost laid down on the dock in his port. The buyer can scarcely be induced to figure freights, duties, unloading, etc., etc. This the manufacturer can do readily. If he disregards this condition he can thank himself for lost sales.

"The fact that the Government of Japan has appropriated a great sum for the purchase of machines to run between Yokohama, Tokio and Nikko gives some idea of the field for American automobiles there; in many places the motor will render the building of railways unnecessary. There are some machines in use, but they include the most venerable arks in existence—as, for instance, an old Belgian model with cylinders placed end to end.

"I see a great future for our automobiles when the makers realize the extent to which they may be sold abroad. Their merits need only to be given publicity. In the campaign for our latest great industry, the American tourist, such as myself, is aiding materially."

## CADILLAC MYSTERY IS SOLVED

**How It Did Not Seek a Factory Site—  
Cruel Letter Which Aroused Fond  
Hopes in All Directions.**

From one end of the United States to the other end, cities, towns and villages have been enjoying long-distance visions of a fine large automobile factory located and humming merrily in each respective "midst"—not one of those factories preceded by artful correspondence or by an even more artful promoter, but a real live factory with a big name and lots of fine machinery and with lots of cars bearing its name actually running on the road in all parts of the country, in other words the factory of the Cadillac Motor Car Co., now and since its beginning located in the city of Detroit, Mich.

The prospect of securing such a prize has caused the mayors and aldermen and the boards of trade and chambers of commerce of innumerable communities to stick their hair, pull down their vests and generally to "perk up" their persons, while "ye local editor" has forgotten the fine red apple which Si Simkins left on his desk, in the joy of turning journalistic handsprings and unfolding at great length, or less, the story of how the great Cadillac Motor Car Co. was "inquiring around" for a factory site right in Squash Hollow itself. It was not until such items began to appear in print in all directions, North, South, East and West, that anyone in the automobile trade even suspected that the Cadillac company was dissatisfied with its location in Detroit and purposed and proposed "pulling up stakes" and removing to such thriving places as Squash Hollow, Miss., or Maple Sap, Vt. None could guess the reason, and just as the wonderment was attaining growth, the mystery was solved. One of the local boards of trade bursting with pride and prunes supplied "ye local editor" with a copy of the Cadillac letter which had aroused so many fond hopes and brilliant prospects in so many widely separated parts of the country. This is the letter:

"Board of Trade:

"Gentlemen—If you have a booklet or any literature describing your city and vicinity and giving information with reference to the sources of wealth, population and activities in your territory, we should be glad to receive a copy. Thanking you in advance for any assistance you may render us, we are,

"Very truly yours,

"Cadillac Motor Car Co.,  
"E. C. Howard, Asst. Sales Mgr."

The Cadillac sales department merely was "on the job" seeking out those markets which hold promise of best returns for money and effort expended and in the seeking postage stamps had not been spared.

## "MIXED SYSEEM" IN NOVEL FORM

Thomas Transmission Combines Mechanical and Electrical Effects—Starts Engine and Lights the Lamps.

Another variable speed transmission system has been produced. The statement in itself is of no importance because inventors have been turning out variable speed transmissions at a prodigious rate practically ever since the first engine was put into a motor buggy. The particular interest which attaches to the design in question is that it is of the electrical variety, absolutely novel in form, both mechanically and electrically, and that it provides for the electric lighting of the car and the starting of the engine with a lighter and

diameters and are keyed to the same shafts, which are free to rotate. Up to this point it will be observed, the arrangement is closely similar to the reverse or low speed trains of a common spur planetary change gear. As in that type of gear, the planets are in mesh with two sun gears, which are keyed to two separate shafts. At this point the similarity ceases.

In the Thomas transmission system, the sun gears, F and G, are keyed to the telescopic shaft H and K. The inner shaft, H, is the propeller shaft proper and is coupled to the cardan member, which leads to the rear axle in the usual manner. It is provided with a crab claw clutch, indicated by Q in the illustration, connecting the outer and inner shafts, which is used in securing the direct drive and which also comes into play when it is desired to start the engine by electrical means. Upon this shaft, back of the coupling Q, is the armature of an

less expensive form of installation than commonly is employed in "mixed" systems, as the gasoline-electric combination ordinarily is designated.

In developing the system, its English inventor, a Mr. Thomas, has evolved a most ingenious application of the planetary gear principle. Such being the case, and to distinguish it from systems in which current derived from an electric dynamo, driven by the gasoline engine, is employed to drive one or more motors which are connected with the driving wheels, the new arrangement is termed a "mechanical electric transmission." In other words, the action at speeds below the maximum, which is a direct mechanical connection, involves a combination of both mechanical and electrical forces. The effect, strictly speaking, is that of applying an electrical brake to an ordinary planetary gear, thus enabling the motion of the floating member to be varied at will through a wide range, the maximum speed being obtained when it is brought to rest, and the car ceasing to be driven when the floating member is revolving at high speed.

The accompanying diagrammatic illustration of the arrangement shows the general simplicity of the construction involved. The drum J is keyed to the engine crank shaft and replaces the ordinary fly wheel. Within the drum are two pairs of planet pinions, A and D, which are of different

electrical machine CC, which is keyed in place. Upon the rear end of the outer shaft, K, is the armature, B, of a second electrical machine, BB. Both electrical machines are alike in that each may be used interchangeably as a motor or dynamo. They are connected through a single lever controller with suitable resistances and with a storage battery which is intended to supply current for lighting and starting the motor, and which also is used when it is desired to reverse the car.

In action the engine is run at constant speed regardless of whether the car is in motion, running at high or low speed, or at rest. When the pinions A and C are larger than the pinions D and F, respectively, the rotation of the drum causes the pinion F to revolve backward and the pinion G to revolve forward. The relative rates of rotation of the two pinions of course depends upon their relative resistance to motion. Thus the system may be said to be balanced about the mechanism enclosed in the drum exactly as the driving wheels are balanced over the mechanism of a spur differential.

When the car is at rest the pinion G will be held stationary by the resistance of the rear wheels to motion. By the same token the armature of the electrical machine CC will remain stationary. The result will be that the pinion F will rotate freely, carrying with it the outer shaft K and the arma-

ture of the electrical machine BB. When the controller is placed in the starting position, BB becomes a generator, feeding current to CC, which then acts as a motor. The result is two-fold. The loading of the dynamo, BB, tends to decrease the speed of the armature, and so of the pinion F, thus tending to cause the pinion G and the propeller shaft to turn. At the same time the current directed into the windings of the electric motor, CC, causes the armature to exert a large torque on the propeller shaft.

As the load on the shaft K causes the dynamo BB to continue to decrease in speed, the speed of the car increases until finally the armature B is brought to rest by electrical load upon it. At this point in the acceleration of the car, the electrical machine CC ceases to be a motor and begins to act as a generator, since further acceleration is impossible after the machine BB ceases to generate current owing to the stopping of its armature. As the car speed is further increased, the machine CC becomes a dynamo and the machine BB a motor. By a suitable arrangement of the connections, however, the machine BB now is driven in a direction opposite to that in which it has been turning. This has the effect of increasing the speed of the shaft K until both armatures are turning at the same rate of speed. At this instant the clutch Q is engaged, thus locking the outer and inner shafts together and eliminating the electrical end of the transmission system from action.

For obtaining the reverse, a second coupling, S, in the propeller shaft is disengaged and BB is used as a dynamo and CC as a motor, driven in the reverse direction. For starting the motor the clutch S is disengaged and the coupling Q engaged. The electrical machine BB may then be employed as a motor to turn the crank shaft, the necessary current being obtained from the storage battery.

The single controller lever works in a quadrant marked first "reverse," then "start engine," then "neutral," and afterward forward speeds from "1" to "9." A final top notch in the quadrant is marked "charge battery." The clutch is pedal controlled. Otherwise the entire handling of the machine is accomplished by means of the single controller lever, which is placed in the center of the car and operated by the driver's left hand.

It is claimed that the cost of the electrical and mechanical combination is sufficient to increase the first cost of any machine in which it is installed about \$250, as compared with its cost when equipped with an ordinary three-speed gearset. Considering the advantages gained in the way of simplicity of control, and the addition of the self-starting and lighting features—the latter, when made in the form of a separate installation with dynamo being by no means inexpensive—it is pointed out that the added cost is not exorbitant.

## FEW CHANGES IN 1911 PREMIER

Only Minor Improvements in New Models  
—Closed-Front Touring Car the  
Feature of the Line.

As is the case with so many other manufacturers, the Premier Motor Mfg. Co., of Indianapolis, Ind., has been unable to find room for more than insignificant refinement in the mechanical details of its product, and as a result its 1911 models, like those of other makers, differ from their predecessors chiefly in respect to body designs, the development of a closed-front touring car, in contradistinction to the Premier

elasticity to return to its proper alignment without cracking if subjected to a slight torsional strain. The bottom half of the crank case is of aluminum, and acts only as an oil retainer.

On the intake side of the motor is the float feed carburetter, and on the exhaust side the water pump and magneto, both being driven from the same shaft which drives the fan.

Lubrication is accomplished by means of a return circulating system with gear driven centrifugal pump. The flow of the oil may be observed from a sight feed glass on the dash.

The ignition will be the high tension Bosch dual system, the Premier low tension make and break system with Bosch mag-

the front and three-quarter elliptic on the rear.

The wheels are 36 x 4½ inches on all "4-40" models, except the roadsters, which are 36 x 4. The "6-60" are provided with 36 x 4½ inch on the front and 36 x 5 inch on the rear.

### The Gospel of Friction Transmission.

In upholding the gospel of the friction transmission the Cartercar Co., Pontiac, Mich., very wisely calls attention to the fact that it is the friction between the tire and the road that affords the ultimate means of propulsion for all types of car, that in cars which do not employ the friction disc method of transmitting the driving power absolute dependence is placed

PREMIER "CLUBMAN" CLOSED-FRONT ROADSTER

THE "4-40" CLOSED-FRONT TOURING CAR

torpedo body, being the most striking of the line. This, as heretofore, will be superimposed on two distinct chassis, one mounting a four cylinder, 40 horsepower engine, the other a six cylinder, 60 horsepower engine. In addition to the now popular closed-fronts, the Premier line of course includes the standard open types. They will be finished in a rich blue-black with panel lines and light striping. The wheels will be a special Premier gray, except on the limousines, where the running gear is the same blue-black finish as the body. The fenders are finished in black baked enamel and are of such proportions as to afford ample protection.

The motor cylinders are of close grained gray iron, cast in pairs, with valves on opposite sides, and the water jackets cast integral. The bore is 4½ inches and the stroke 5¼ inches. Aluminum cover plates cap the castings, facilitating the cleaning of the water spaces. The entire upper parts of the cylinders are water jacketed, this jacket extending one-half inch below the travel of the top of the piston. The greater part of the intake manifold is cast integral with the cylinders, thus heating the gases. Between the cylinder pairs is liberal room for long bearings, and the distance between the latter comparatively short. A feature of the Premier motor is the crank case, the engine base being made of a close grained semi-steel. This is well adapted to the maintenance of perfect alignment and the holding of screw threads for studs, and possesses sufficient

neto, or the low tension with Bosch magneto and jump spark with battery and coil. When the combined low and high tension are supplied a timer and four unit coil are used on the "4-40," and a distributor and a single unit coil are used on the "6-60." The low tension make and break system, of course, is the old Premier stand-by, and is, of course, retained.

The clutch is of the multiple disc type with 21 plates, having cork inserts, encased and running in oil. The transmission is of the selective sliding gear type, giving three speeds forward and one reverse. The gears are contained in an aluminum case. The power is transmitted to the rear axle by a shaft of liberal size, equipped with two universal joints packed in grease. The rear axle is internally ribbed and requires no external truss rod reinforcement.

The brakes have an effective surface of 526 square inches, and the drums are integral parts of the wheel hubs. The internal expanding members are of bronze and operated by the foot pedal, while the external contracting brakes are fiber lined steel bands, operated by a hand lever. All adjustments can be made from the outside, and two sets of equalizing bars ensure equal contact on each wheel.

The frame is of pressed steel, dropped at the rear, and narrowing slightly toward the front to assist turning in a short radius. The front axle is a solid, one-piece drop forging with the spring seats integral and entirely free from welds.

Semi-elliptic steel springs are used on

on friction developed between the members of the master clutch, that all cars are stopped by the friction of braking surfaces, and, further, that it is friction between tire and rail that causes all railroad trains to move, and friction between belts and pulleys that drives the wheels of the average factory. The disc form of automobile transmission, it is explained, is merely an extension of this universal principle one step farther than it otherwise is carried. The argument is set forth with graphic drawings in a little booklet which just has been issued and which also contains the specifications of the five styles of Cartercar—all of which, needless to add, are friction drive.

### Wherein Back-Fires and Back-Kicks Differ.

Back-fire is an expression very frequently misused, when a motor ignites prematurely and back kicks, but does not necessarily back fire. Back firing generally is caused by a very lean mixture. This burns slowly and ignites the next charge as soon as the valves open, an explosion resulting in the intake pipe or carburetter. Too rich a mixture will also burn slowly, but seldom back fire. A leaky valve, or one improperly timed, might cause it, as a flame can be blown through even a very small opening. Back kicking results when the spark is too far advanced and the motor is turning slowly, causing the charge to ignite before the piston has reached the center, and either checking or reversing the motion of the crank shaft.

**BUILT BY PITTSBURG PACKERS**

**Meat Men Pool Interests in Motor Truck  
—New Product Designed for  
Use on Hills.**

Recalling the historical adage about Mahomet coming to the mountain, it is related that a number of meat packers of Pittsburg some time ago experienced a desire to introduce the motor vehicle into their business, but failed of success for the reason that the market at that time did not afford a product that exactly suited their requirements. Hence—and the approach to the mountain is very literal when the

three-ton truck, as a matter of fact, is no less than 150 inches.

The motor, which is rated at 50 horsepower, is of the four cylinder, vertical pattern, water cooled, and mounted under the hood in front of the driver's seat. Its cylinder dimensions are  $5\frac{1}{4}$  by 6 inches and the cylinders are cast singly. It is provided with dual ignition, including the Remy magneto; Stromberg carburetter and the Hele-Shaw pattern of multiple disc clutch.

Final transmission of power to the rear wheels is by double side chain, the countershaft and distance rod construction being particularly heavy. The brakes also are of appropriate construction, the service members, which are of the contracting type,

THE NEW PACKERS THREE-TON MOTOR TRUCK

hills of Pittsburg are considered—some of them pooled their interests and produced a truck of their own. This bit of explanation serves to introduce the Packers motor truck, which has just been put on the market by the Packers Motor Truck Co., of Pittsburg. After more than a year of use, as it is claimed, it was decided to open a regular outlet for the machine, and stock models of one, two and three ton capacities speedily followed.

The design of the three types is practically the same, and follows rather conventional lines insofar as specifications are concerned. The accompanying picture shows the three ton model, which reveals no external peculiarities, about the only out of the ordinary feature that is visible being the side gates, which in addition to the rear entrance considerably facilitate loading. A point of especial excellence, which though not self-evident, is noteworthy, is that an extremely long wheel base is employed. The object of this, of course, is to reduce the overhang to its lowest possible terms, thus making a more uniform distribution of the weight on the chassis than is possible where the useful load is more nearly balanced over the rear axle. The standard length of base for the

being applied to drums at the extremities of the countershaft. The emergency brakes, which are actuated by a side lever, are of the internal expanding type and act directly on the rear wheels. Both front and rear wheels are of the artillery type, 36 inches in diameter, and shod with solid tires, the rear equipment being of the dual order. The front tires are of 5 inch size, while the rear ones are 4 inches in width. The chassis weighs 6,300 pounds. With the open body type the weight of the complete vehicle comes up to about 6,800 pounds.

**Effect of Turning Corners at High Speed.**

While it is required by law that automobiles shall be driven slowly in turning corners, the practice should be followed for a perfectly valid reason aside from that fact. Whenever a turn is taken at high speed, the centrifugal force due to the velocity of the machine, and tending to cause skidding, must be resisted by the tires. The consequence is that enormous strains are imposed upon the casings, which are very likely to cause rim cutting and which tend to produce abnormal wear just above the beads even though no immediate effect is noticed.

**CLEANLINESS IN THE GARAGE**

**Business Value of Careful Washing Indicated—How to Avoid Injury to Customers' Cars.**

Advice on the subject of car washing is usually received by garagemen about as gracefully as "hints on cleanliness in the home" by the average housewife. Nevertheless, it is a circumstance of no mean importance that many a motorist on tour is disgusted on pulling out of some country shop of a fair morning to discover little dabs of soap along the edges of the running boards, while close observation reveals the fact that the body panels are streaked with dirty and soapy water showing that they have been dried, and probably rubbed down, without being properly rinsed. It only requires a few experiences of this nature to spoil the appearance of even the most carefully varnished surfaces, while the ignorant or careless washer probably is directly responsible in most cases for the mummified appearance of so many cars of the cheaper grade that have seen only a season or so of use after being hastily turned out with limited coats of varnish.

The secret of good car washing, it is related by a man who ought to know, seeing that he is in the business, lies in the proper use of the soap quite as much as anything else. The soap should be dissolved in very hot water—and thoroughly dissolved too—the thick solution formed in this way afterward being stirred into the luke-warm wash water in the proper proportions. When this is done, and proper care taken not to rub grease collected from around the wheels into the polished surfaces, a good start has been made. Thereafter, it is quite as important to make sure that all the soapy water is rinsed off and the surfaces dried thoroughly before the car leaves the rack.

After all is said and done, old-time carriage washers are most successful in handling automobiles, once they have learned a few essentials concerning the work, like avoiding greasy sod pans when sponging off the car and refraining from playing the hose directly through the radiator and on the engine. That it is much easier to obtain ordinary "lumpers," who are anxious to become full fledged chauffeurs via the short and easy route of petty graft and patronage may account for the number of poor washers who are engaged and who, too frequently, are inclined to cover up their deficiencies by thinly coating poorly washed bodies with kerosene oil. If only the garagemen would bear it in mind that cleanliness in the garage, like cleanliness in the home, is next to successful achievement, it might be that fewer owners would have occasion to complain of the short-lived beauty of their cars.

## Concerning the Garaging of Commercial Cars

Despite hostile objections and more or less muttering on the part of the legitimate tradesmen whose perquisites were affected, several instances have been known in which a number of motorists successfully have carried out the plan of conducting co-operative garages for their mutual convenience and accommodation. Somewhat the same idea, though on a totally different scale, is being put into effect by operators of commercial vehicles in moderately large installations. Furthermore, there is reason to suppose that under some circumstances the plan is a good one and that considerable economies may be brought about by its application.

Generally speaking, when private motorists have clubbed together to open garages in company with a few of their friends, their sole object has been to rid themselves of what they called—or miscalled—the “robbery” practiced by professional garagemen and repairers. Under skilful management, enterprises of this nature have prospered to the extent of cutting out of the real expense the percentage that the garageman considered his rightful living wage. Sometimes the result has been as economical as anticipated. As often the gentlemen who expected vast economies to result have found that the robbery they fancied was being practiced was more imaginary than real.

Be that as it may, the motive back of the movement to establish co-operative garages among commercial motor vehicle operators is of an entirely different nature, though the ulterior object is the same. The principle involved is the broad one that the performance of any sort of undertaking on a wholesome plan results in a reduction of pro rata expense. Merchants who are accustomed to buying the entire output of a cotton mill in order to be able to throw print goods on their counters and undersell the retailer, who buys from the jobber, who buys from the manufacturer, are pretty apt to take a broad view of their delivery problem. They are apt to want to handle their motor trucks in quantities, buy their supplies and parts in as large lots as possible and to want to spread their maintenance costs over the largest possible area in order to reduce the unit cost.

If their own requirements are not sufficiently large to render the desired economy feasible, the natural tendency is for them to do one of two things. Either they will try to get their delivery work done by contract, or else they will seek some other merchant who is in a similar predicament

and try to arrange a co-operative method of car maintenance.

Sometimes the nucleus of the arrangement is an individual concern that, having solved the upkeep problem to its own evident satisfaction, is approached by another concern that is seeking a solution of the problem. Such a case recently was pointed out in New York City. In 1905 the firm of Aitken, Son & Co. purchased an equipment of five electric delivery wagons for its own use. Having looked over the ground pretty carefully, it had been determined that best results could be achieved only by retaining the cars under the firm's own management, and in consequence, a building was bought to house them properly and a competent manager hired to look after them.

Such was the evident success of the experiment that the heads of the neighboring concern of A. A. Vantine & Co. became interested and began an investigation. The result was that Vantine's equipment was purchased and later, under an arrangement private to the two companies, the second equipment was housed and cared for in the Aitken garage. Although both concerns are reticent about the actual details of their mutual experience, representatives of both are quoted as speaking in the highest terms of the arrangement both in regard to its economy and satisfaction in service.

Just here one point should not be overlooked. With this sort of equipment, requiring as small storage space as it does, considerable saving is effected by locating the garage as near as possible to the business center. With horse equipment, it frequently is necessary to maintain stables at some distance from the operating locality. This, of course, involves a considerable loss in “dead” mileage and also a loss of the time the equipment is on the road going to and from work. As being of an entirely different character and requiring for its proper upkeep and repair much less floor space per vehicle, the electric or gasoline equipment can be maintained within a relatively short distance of the store or warehouse at much less relative cost.

The general principle involved is that the maintenance within convenient radius of the business center of from one to five commercial cars may be expected to be unpleasantly high unless rare good judgment is exercised in overseeing it. Where the number of vehicles taken care of in a single establishment is greater than that, however, the expense per vehicle becomes propor-

tionately less as the number increases. Therefore the operator who has only a small equipment is forced to seek shelter in a public garage, thereby contributing to the profit of its owner, or else to undertake some sort of co-operative arrangement with another operator who is similarly situated.

Operators of large numbers of vehicles, of which R. H. Macy & Co. and the new establishment of Gimbel Bros., in New York, are prominent examples, of course, are in a position to carry, on their own garaging operations without reference to others. As time goes on there is no question that the number of such installations will increase. During the formative period, however, and always, so far as the small operator is concerned, the garage problem must continue to be more or less of a poser.

At present, insofar as the public garage is concerned, the operator of the commercial car is in a position to feel the influence of the pleasure car in this direction just as much as in every other one. Garagemen, as a rule, are subject to the demands and influence of the pleasure car owner; also, he is more or less biased because of the reputed ease with which real money can be pried out of his pockets. Consequently the garageman is influenced to improve his service in every way possible, to provide conveniences for chauffeurs and luxuries for patrons, to install all manner of handy contrivances for taking care of expensively appointed machines. But he is not particularly encouraged to look out for the wants of the commercial vehicle owner who expects his trucks to be on the road a stated number of hours every working day in the year, rain or shine, and who is more interested in keeping down charges than he is in helping pay a share on the insurance and taxes of an uptown “front” on the row.

Some day the dividing line will be drawn in this, as in other respects, between the two great divisions of the industry. In order to operate commercial vehicles successfully it is necessary that they shall have the best and most expert sort of care. Circumstances of both a business and mechanical nature render it possible to accomplish standard upkeep service at a reasonable figure only where wholesale operations are carried on. And the conclusion is plain to see.

Unless the small operators, of whom there always must be large numbers in any city or town, are afforded efficient garage service for commercial vehicles they will

have to resort to the co-operative plan of maintenance. It is too early in the history of the motor truck to determine whether or not this is altogether a wholesome tendency. But certain it is that the opportunity exists for the garage business, as an independent commercial undertaking, to be developed to meet this small but growing demand.

The inducement for the garageman to go into this field as a specialty is not great, to be sure, when compared to the "easy living" that is supposed to follow the acquisition of a few good customers, together with a lucrative agency and possibly a renting business on the side. But bearing in mind the annual increase of expense and decrease of profits in consequence of com-

## GASOLINE FOR COTTON PICKING

**Novel Agricultural Motor Solves Time-Honored Problem—Also Useful in Many Other Ways.**

If first reports from Texas of the first experiments conducted there are borne out by future developments the gasoline engine may be said to have solved the problem, or one of the problems, of the South, i. e., the quick and economical picking of cotton. Hundreds of inventors and near-inventors have undertaken the solution and tens of thousands of dollars have been fruitlessly spent for the same purpose, but on the

a cultivator or by a stalk cutter attachment. The motor may be used for anything else from running a saw-mill to a cotton gin or a feed cutter.

The owners assert that "when generally introduced it will multiply the potential energy of the Southern laborer by at least 25."

### Says Car Makers Have Cornered Hay.

According to the best of belief on the part of horse owners in and adjacent to Harlem, New York City, U. S. A., the automobile manufacturers are responsible for the skyscraping prices of hay, oats and other animal food. Timothy D. Gleason, who has large livery stable interests in that neighborhood, declared at a meeting, held

NOVEL AGRICULTURAL MOTOR IN USE AS STALK-CUTTER AND PLOW

petition, as well as the certainty of the long-continued and sustained growth of the commercial side of the industry, it would seem that as a sound business proposition the garaging of commercial cars should not be without its attractions to men of good judgment and ambition.

This much is certain, the users of motor vehicles for business purposes are governed in their management of them by rules of business first and economy always. The man or men who can devise ways of reducing the costs that other men experience are sure of all the business they can handle; and within reasonable limits, they are welcome to all they can make for themselves in the transaction.

### To Start Motor Without a Crank.

Sometimes the crank of a motor becomes broken or disabled, making it necessary to start the engine by some other process. A good method by which this may be done is to jack up one of the rear wheels of the car and engage the high gear, leaving the clutch in. Then turn the wheel forward rapidly, which can be done very easily. When the motor starts, throw out the clutch, shift the gear from high to neutral and lower the wheel to the ground. The car is then ready to start.

Caruth farm, near Dallas, Tex., there recently were tested three mechanical pickers produced by the Price-Campbell Co., which reports say more than made good in the presence of 500 astonished spectators. The motive power of the machine is a 30 horsepower gasoline engine.

The three cotton pickers gathered the opened cotton, doing no harm to the many unopened bolls, the squares just forming, or to the plant. The cotton is snatched from the bolls by a battery of rotating steel fingers or spindles, then carried upward and deposited into sacks at the rear of the machine, and it is claimed that the machines will pick an acre an hour, and get about 90 per cent. of the fiber which is ready to be gathered. A claim of 800 pounds of seed cotton an hour is made for them in fields where the cotton is well fruited, or where it would produce three-fourths of a bale to the acre. The machine is operated by one man, who simply guides it much as a chauffeur guides a car. The machine does the rest. It also does more than pick cotton, as the accompanying illustrations serve to show. When stripped of its picking device, a plowing attachment can be bolted to the frame, and good work done with the 30 horsepower motor. Then this plowing attachment can be replaced by

a few nights ago, at a rendezvous called Nolan's Hall, that the feed interests are controlled by automobile manufacturers, whose scheme is to compel horse owners to buy cars. He may have been stirred up by the recent Maxwell-Briscoe company's comparative test.

Gleason stated that fodder costs twice what it did 14 years ago, and is anxious to find out where the \$1.40 he pays for a hundred pounds of baled hay goes; for by his word the farmers' share of that amount is but 23 cents and the tie wire and advertising of the hay can hardly eat up the remaining \$1.17. He contributed other statistics to the effect that there are 175,000 horses in Greater New York and 45,000 horse owners. He put the up-keep of each animal at from 75 cents to \$1 a day.

An organization of protest was formed, with Gleason himself as president and treasurer.

### Claims Record Motoring Population.

The hamlet of Lakeview, in Lake county, Ore., 15 miles from the California line, has a population of 761, and yet it has 40 automobiles, many of which are big touring cars. It is said that the place has more automobiles for its size than any other town in the United States.

## Stray Sparks

Chicago insurance agents are protesting against the new schedule in rates adopted by the Automobile Insurance Association. The competition of the London Lloyds is assigned as the reason for most of the difficulties there. A committee therefore is at work on a new schedule which it is hoped will prove more satisfactory all around.

The latest indictment against the automobile is likely to "come out in the wash." From Boston the yarn is sent out that

Thieves recently broke into the garage of James Wainwright near Monmouth Beach, N. J., and escaped with an expensive, high powered automobile. The chauffeur, who was sleeping overhead with clear conscience and perfect digestion, heard nothing, although the windows of his room were wide open. Exactly the same thing was done a few nights afterward in Nutley, also in New Jersey, at the country place of William Sargent.

Alleging that he had been permanently injured by an automobile belonging to Louis R. Spear, of Boston, president of the American Automobile Association, a farmer of Webster, Mass., by the name of George H. Stone, last week obtained a verdict for \$5,150 from a United States district judge

had lost track of 35 years ago, read the story and a reunion resulted. They had been living only a few miles apart for several years.

It is not alone for the army and navy that automobiles are to be impressed for public service. Last week, during the rush of big fires in New York City, the police under the unusual conditions jumped upon the running boards of passing private touring cars and commanded the drivers to hasten to the conflagration. The same thing was done by extra fire and salvage men. Burglars, too, are keenly alive to the advantages of such emergency carrying service, only theirs would be away from rather than toward "a given point," to use geometrical phraseology.

### TWO OF THE PRIZE-WINNERS IN THE DAYTON, OHIO, EXPOSITION AUTOMOBILE PARADE

STODDARD-DAYTON CARS OF CONGRESSMAN JAMES M. COX AND JOHN H. MCGEE

Chinamen are being smuggled across the Canadian line in automobiles, dressed as society women. It is declared that disguised by goggles, veils and picture hats dozens of them have paid liberally for such means of entry.

An "automobile campaign echo breakfast," whatever that may be, was given a few days ago in Chicago by the Illinois Equal Suffrage Association at the LaSalle hotel. An echo is something that returns, just as an automobile brings you home—if it is of the right kind. This appears to be a large year for those that can "come back" and for some, too, that find they cannot do so.

One of the strangest suits on record was lost a few days ago in the county court at Omaha in the action brought by William R. Craig for damages following the nervous shock of an automobile collision. Strangely enough Craig was not in either car that collided nor did the accident result in fatality. He merely asked to be reimbursed for the mental strain that he suffered as a casual witness of the accident.

and jury, sitting in Littleton, Mass. Mr. Spear himself was not in the car at the time of the accident, but nevertheless was held responsible.

Owners and managers of tall business buildings in Greater New York are said to be having a hard time securing elevator men and, as usual, in looking about for the cause, the trouble is laid at the door of the automobile. The demand for chauffeurs is alleged to have deflected many of the former runners of lifts, besides well nigh cutting off the list of recruits. Accordingly several large office buildings have fallen back on Italians, many of whom can talk so little English that there is need of sending an interpreter along on each 'vator.

So many instances are reported in which deserting chauffeur husbands have been located by their wives through newspaper reports of automobile collisions that it is really worth while to give the pleasant side of the same picture. Andrew Freeborough, of Pittsburg, got into print a few days since through rescue work in connection with an automobile going over an embankment. His brother, Henry Freeborough, whom he

Middleboro, down Cape Cod way, in Massachusetts, is pluming itself over the fact that it is the banner automobile town in the Bay State, or at least it thinks it is, according to late returns. Although the town has scarcely 8,000 population, 80 cars are owned there, or slightly more than one to every 100 inhabitants. Furthermore the average showing is thought to be the highest in New England. The place is particularly proud over the fact that it has a gasoline fish cart which goes over its route so speedily that the winds wafted from it, even in warmest weather, are not odoriferous.

Action has been begun by the Hessian Automobile Club of Germany against a peasant Reichstag member who concluded a tirade against automobilists thusly: "I should like to recommend the following as an eleventh commandment for all cartmen: 'Go and get yourself a license for firearms, and then a thoroughly serviceable revolver, so that you can protect yourself when you are fallen upon by the modern vermin which renders the country roads unsafe and trifles with human life.'" The prosecution is on the charge of inciting to the

committal of crime. Taking exception to the word "vermin," a number of automobile clubs have sued him for malicious libel and defamation of character. He already has apologized profusely.

#### Hotel Keeper Suppress a Speed Trap.

Touring motorists have at last brought to book the city of Danbury, Conn., which was conducting a speed trap at the small triangular park where West street intersects Division street. Car owners were so indignant over the way they were being mulcted that they carefully avoided the place, which was possible without going far out of their way.

The Danbury hotel owners speedily began to notice a shrinkage in their receipts and found that their patronage was going to other towns. Accordingly they put up such a mighty plaint to Mayor Gilbert that he discontinued the trap in no time. The only question is, will it stay discontinued? Several months ago notices to motorists were sent through the trade press and other channels as to the proper course to be followed in passing the park. The police, however, insisted upon the turn being made in exactly the opposite direction from that given in the instructions. Among several of the victims fined the notion prevails that there was really no conflict in authority, the whole scheme being to squeeze easy money out of offending visitors.

#### The Chief, He Fixes 'Em, B'Gosh!

A drastic measure is being applied by the chief of police of Decatur, Ill., to automobile owners who do not have lamps on the rear of the machine, or on whose machines the rear number plate is not properly illuminated by the rays of the lamp, as required by state law. As soon as the chief hears of a car standing anywhere, on which conditions are contrary to the legal demands, a bicycle policeman is despatched with a long chain and lock, which he passes around the steering post and through the spokes of the front wheel and locks. The chain remains locked in this position until the owner has complied with law, and then, by heck! the chief is satisfied and indulges in a grin.

#### About Gates McGarragh's Garage at Goshen.

The town of Goshen, N. Y., last week narrowly missed acquiring a novelty in the garage line. A grain dealer who handles fertilizer as well as plaster, mixed his merchandise in delivering it, bringing about as unique an experiment as the cement model houses of Thomas A. Edison. The prospect grew out of the fact that Gates McGarragh, president of the Mechanics National Bank of New York, is building a garage in Goshen, for the exterior of which a patent plaster is being used. The supply ran short, so word was sent to the dealer to rush over a two-horse load in sacks.

After about half of the invoice had been stirred together and applied, the telephone rang sharply and a frantic voice inquired if any of "that plaster" had been used. "Half of it," was the contractor's answer. "Why, that wasn't plaster; it was fertilizer," shrieked the dealer. "I thought it didn't set very well," came the response.

#### New York Hotel Keepers Bid for Tourists.

Viewing with envious eyes the profitable patronage acquired by New England's shrewd bonifaces, a number of hotel owners of the central part of New York state have formed the "Empire Tours Association," with the purpose of diverting some of the trade toward their houses. They intend to erect guide posts and point out the undoubted natural beauties with which their part of the country is endowed. The officers chosen for the first year were: President, William E. Leffingwell, Watkins Glen; vice-president, J. D. Price, Coopers-town; second vice-president, Frederick W. Rockwell, Albany; secretary, Lorent Johnson, Watertown; treasurer, U. U. Kelly, Cooperstown.

#### Driver Who Was a Public Danger.

Careening from side to side on Third avenue, New York, and missing collision with the pillars of the "elevated" railroad by mere inches, on Monday last, an automobile belonging to and driven by Morris Weinstein, a drug salesman, brought up with a crash against a trolley car, damaging the latter and wrecking itself. When Weinstein was taken to the police station it was found that he was suffering from neurasthenia and was a victim of locomotor ataxia, which condition made it practically impossible for him to control his muscles. Despite the fact, he had purchased the automobile with a view of benefiting himself by outdoor life.

#### Provides Motor Cars for the Insane.

Although automobile ambulances have been in use in New York and other cities for several years, they heretofore have been confined to the conveyance of sick or injured persons. A few days ago, however, there was put into service the first automobile ambulance ever built for the exclusive handling of insane patients, and attached to Bellevue Hospital, New York. Previously insane patients were taken to Bellevue in police patrol wagons. Now the police will have nothing to do with the handling of such cases.

#### New Way to Get Food and Lodging.

In Rochester, N. Y., a new style of graft has come to light. Several days ago a stranger, who since has been identified as John C. Armbruster, of 25 Manhattan street, New York City, staggered into a hotel, covered with dirt and blotches of what seemed to be blood, gasping out that he had been hurt by an automobile. He

was carried to a room, washed, etc., and finally taken to a hospital, where he was kept for several days, living upon the fat of the land. Then someone discovered that he had been faking the accident, and an unsympathetic judge sent him to jail for six months for the "joke."

#### How a Kitten Wrecked a Motor Car.

That it is oftentimes dangerous to carry a pet animal unconfined in an automobile was demonstrated a few days ago by an accident at Long Branch, N. J., that completely wrecked the car of Mrs. Joseph McDermott, wife of the county clerk, and severely injured the three occupants. Mrs. McDermott was attempting to carry home a kitten that had been given her. The frightened cat fought so hard to escape that the chauffeur sought to lend assistance and took his hand off the steering wheel for an instant. That instant, however, was sufficient to bring the machine up against a post with a crash that threw everybody out.

#### When a Collision Becomes an Assault.

Thirty days in jail was the sentence meted out by New York's Court of Special Sessions to Philip Forsythe, a chauffeur, for assault in the third degree. On April 17th last Forsythe ran his automobile into a wagon driven by William McLaughlin, the latter sustaining injuries to his left arm and side. At Forsythe's trial last week the charge of assault was upheld because the chauffeur yelled at the driver of the wagon "to get out of his way, or he'd knock him out." It is this the first time a chauffeur has been found guilty of assault as the consequence of a collision and sent to jail for it.

#### Tragedy that Points to Obvious Moral.

Cranking the motor, with gears left in mesh and the emergency brake of which had been released by some boys "monkeying" with the car, caused the instant death of C. Wilder, a photographer of Prosser, Wash. The car jumped forward, knocked him down, rolled over him and then stopped. The wheels had passed over his neck and broken it. Many persons who were passing along at the time and who saw the man's feet protruding from beneath the car, thought he was at work making repairs. He lay for a long time without anyone coming to his assistance.

#### Novel Means of Exposing Delinquents.

One of the Chicago gas companies has a new idea for the utilization of the automobile. It has furnished its inspector with a gasoline vehicle painted bright red with brass rods, a gong and general appointment not unlike a fire patrol wagon. When the equipage dashes down the street to shut off a meter for nonpayment of a bill, everyone in the neighborhood will know of it as soon as if an ambulance, fire engine or trolley emergency wagon had been along.

Volume XXV.

No. 3

## TO BUILD AMERICAN CARS ABROAD

**Briscoe Sails to Establish a Factory in England—Moderate Priced Models to be Reproduced for Foreign Trade.**

When it was given out last week that Benjamin Briscoe, president of the United States Motor Co., would sail to Europe, chiefly on pleasure bent, it was not stated that much of the pleasure would be of the sort that comes of firmly planting his company's standard on foreign shores. For, as a matter of fact, the principal object of Mr. Briscoe's mission—he sailed yesterday on the Lusitania—is to establish an American automobile factory in Great Britain.

For some time the United States Motor Co. has been investigating foreign conditions, and finally reaching the conclusion that the demand for moderate priced cars, such as are included in the Maxwell, Brush, Sampson and Stoddard-Dayton lines, was sufficiently large to justify more than the appointment of agencies, Mr. Briscoe decided that the best way to meet the demand was by actually manufacturing the cars in the center of the demand. Accordingly, and before he returns, there will be organized in England a company for the purpose.

It probably will be styled the United Kingdom Motor Co. and will be located near London. Several sites have been considered, but the exact location of the plant will not be determined until Mr. Briscoe has personally inspected the various sites which are available for his purpose. Once this is settled, it is the intention of the United States Motor Co. to transfer its designs and duplicate tools to England, but it will purchase the necessary machinery in that country.

The foreign company at first will devote its principal attention to Great Britain, Germany and Russia, the plan being to establish branch houses in these several countries and later to "invade" all other of the important European countries.

Mr. Briscoe, of course, will spend most of his time in England, and also visit several of the automobile plants in France, studying the foreign conditions generally. He will be absent about five weeks. Mrs. Briscoe accompanies him.

## Bookkeeper Starts Bankruptcy Proceedings.

William P. Young, bookkeeper of the Indiana Auto Parts Co., Marion, Ind., has filed a petition in bankruptcy against his employers, asking that the company be placed in the hands of a receiver, and demanding \$50 damages for labor performed which he cannot collect. He furthermore utilized his knowledge of the company's affairs as shown in their books, and claimed that the corporation is insolvent, as it owes \$40,000 for labor, materials, supplies and for money borrowed, while its total assets are but \$30,000. Other creditors of the company are said to have become alarmed and to be preparing to take similar steps.

## Reo and Owen Amalgamation Pending.

Negotiations are pending whereby the Reo Motor Car Co., of Lansing, Mich., will take over the Owen Motor Car Co., of Detroit, but despite the fact that press despatches have stated that the deal had been consummated, F. R. Bump, sales manager of the Reo company, on Monday last told a Motor World man that any alleged confirmation which had been given out was not official. That the transaction is likely to be consummated, however, there is small doubt.

## Wood Sued for Selden Infringement.

Suit for alleged infringement of the Selden patent was filed on Monday last, 17th inst., against the W. A. Wood Automobile Mfg. Co., which recently was organized to produce gasoline cars in Kingston, N. Y., which town is in the Judicial Southern District of New York. Subpoena was served on Samuel S. Slater, who as director and counsel for the company gave written admission of service on behalf of the defendant company.

## VOTING TRUSTEES ARE SELECTED

**Wall Street Men Who Will Shape General Motors' Destinies—Preparing to Pay Bills and Consolidate Plants.**

Voting trustees will be the official designation of the Wall Street men who for the next five years will control the General Motors Co., in accordance with the terms of the \$15,000,000 loan which they advanced.

These trustees are: James N. Wallace, president of the Central Trust Co., of New York; Frederick Strauss, of J. & W. Seligman & Co., New York; James J. Starrow, of Lee, Higginson & Co., Boston; Anthony Brady, New York, and W. C. Durant, Flint, Mich., the last named being the head and front of the General Motors' organization.

The fact that the trustees had been selected was made known by a circular letter to the General Motors' stockholders, inviting them to exchange their shares for "voting trust certificates" and which, incidentally, indicated that the Wall Street interests involved are sufficiently powerful already to have arranged for the listing of the certificates on the New York Stock Exchange, into which lambs have been known to gambol. The circular letter in question, which is dated New York but which bore the Flint, Mich., postmark, is as follows:

"For the purpose of liquidating the indebtedness of and providing necessary working capital for the General Motors Co. and its constituent companies, an issue of \$15,000,000 of 6 per cent. five-year first lien gold notes has been sold to Messrs. J. & W. Seligman & Co., of New York, and Messrs. Lee, Higginson & Co., of Boston (issuing houses), with other prominent banking interests associated.

"The agreement with the bankers provides that during the life of the loan the financial affairs of the company shall be supervised by a 'voting trust' with a majority of the capital stock deposited with

the Central Trust Co., of New York, to insure such control.

"The agreement further provides that every stockholder of the General Motors Co. shall have the privilege of exchanging present holdings of preferred and common stock (either stamped or unstamped) for preferred and common 'voting trust' certificates, the time for exchange being limited to Oct. 20, 1910. The voting trust certificates will be listed on the New York stock exchange, thus protecting their negotiability and incidentally enhancing their market value. The present preferred and common stock certificates will not be listed on the exchange.

"The holders of voting trust certificates are entitled to all benefits and rights, including dividends, belonging to the certificates of stock deposited, except the right to vote thereon during the period that said loan continues outstanding."

Detroit has been the sole selling market of the stock while it has been unlisted, but listing in New York will of course transfer the activity to that city, and whether the lambs will digest it more freely than when the wand was waved in Detroit, where the quotations last week were 51 for common and 65 for preferred, remains to be seen.

According to the stories from Flint, the entire indebtedness of the General Motors Co. and all of its subsidiaries will be paid in full before the end of the present month. It is announced also that henceforth a "conservative policy" will be pursued and that "concentration in Flint" will be a part of that policy, which is taken to mean that all save the larger plants now located in other cities will be transferred to and be consolidated with the Buick company's property in Flint.

#### Bucyrus to Bring Forth a Car.

The Forth Motor Car Co., of which C. R. Forth and M. G. O'Brien, of Mansfield, O., are the moving spirits, has secured possession of a one-time steam shovel plant in Bucyrus, O., and is placing it in condition for the purposes of automobile manufacture. The car which will be produced is the design of Forth, who has had experience in the Packard, Overland and other factories, and is claimed to incorporate a number of innovations. It is stated that frames and other parts already have been ordered and that actual work in the Bucyrus plant will commence within ten days.

#### Price List of Lions is Revised.

Because of increased facilities which permit of a larger output the Lion Motor Car Co., of Detroit, has revised the price list of its Lion 40 horsepower cars as follows: Touring car, listed at \$1,700, reduced to \$1,500; four passenger baby tonneau, listed at \$1,700, reduced to \$1,475; two passenger roadster, listed at \$1,650, reduced to \$1,450. In each instance, the new price includes complete equipment.

## STANDARDIZATION IS STARTED

### First S. A. E. Committee Takes Up Its Task—Meets in Cleveland and Outlines Desirable Frame Standards.

The work of standardization to which the Society of Automobile Engineers has committed itself now has been fairly inaugurated, the first of the many subcommittees that are engaged in the task having met in Cleveland on Monday last and assumed its allotted burden. This subcommittee was the one entrusted with the standardization of frame sections. The members present were as follows: W. H. Van Dervoort, Moline Automobile Co.; James H. Foster, Hydraulic Pressed Steel Co.; L. R. Smith, A. O. Smith Co.; W. P. Kennedy, Studebaker Automobile Co.; Coker F. Clarkson, general manager Society of Automobile Engineers.

The current practice in frames for motor cars is marked by little uniformity in sizes and proportions of the sections, although it is apparent that a smaller number of sections would be sufficient and reduce the tool cost; increase the output of all presses by reducing change of tools; reduce the number of different sizes of stock required, and also the number of variations in the sizes of all parts fastened to automobile frames.

It was the sense of the Cleveland meeting that the frame as an element of automobile design should receive more attention in the initial stages of laying out a car model, with relation to the disposition of other elements of the machine, such as power equipment, transmission mechanism, springs, axles, body, etc. As an extreme case of putting the cart before the horse, a few designers have been known to order their motors, transmissions, bodies and other parts before giving the frames, to which they are to be attached, a thought.

The committee in its report will recommend the quality of steel to be used in frames, specifying the chemical composition, physical properties and heat-treatment desired. This is one of the two divisions of the subject of standard frame sections.

The other division is the design of frames generally, and it is believed that standardization can be very effective, without in any way throttling progress or the development of meritorious new styles of frames.

The matter of design will be subdivided somewhat as follows:

- Side bars—1. Main section; including (a) thicknesses of metal, (b) thickness relative to depth of section, (c) width of flange.
2. Standard front ends, of which there are said to be a thousand current designs of frame front ends.
3. Standard taper for rear end.
4. Uniform radii of curves and depth of

drop for drop frames and double-drop frames.

5. Main width of frame at rear end.

6. Offset of side rail to produce front end width. Proportion of length of offset to amount of offset.

Cross members—7. These are straight and curved. As to the former, matters to be considered are standard radius and length for integral gussets, which should preferably, as a matter of cost of production, be on the cross bars instead of on the side rails; as to the latter (curved cross bars), standard radii and amount of drop of front member. And in general harmony of design with relation to strength and weight of side bars.

Sub-frames—8. Dividing into (a) amount of drop, (b) width between engine bars and (c) taper of engine bars.

Diagrams will be produced showing ways of economizing on material to arrive at minimum waste without interfering with merit of design; amount and place of material that should remain after holes are drilled for assembling cars; preferred path for holes; advisable lips and lugs on cross members and outside fittings; spacing of rivets.

It is expected that a definite report covering these various items will be rendered within 30 days.

#### Making 3-in-One Oil in Canada.

The 3-in-One Oil Company of New York, whose well known lubricant now is in prime demand for magneto use, has established a branch factory in Canada, and hereafter will fill all Canadian orders from that plant. This move, of course, eliminates considerable red tape and delay and also will result in a considerable saving of customs duties.

#### Michigan General Motors Increases Capital.

The General Motors Co. of Michigan, an offshoot of the parent company of that name, has certified to an increase of capital stock from \$10,000 to \$100,000, "for the purpose of securing further capital for investments." The certificate names as the principal stockholders, W. J. Mead, W. C. Durant and Standish Backus.

#### Bretz Opens a Branch in Detroit.

The J. S. Bretz Co. has established a Western office and salesroom at 1215 Woodward avenue, Detroit, of which the company occupies the entire second floor. H. J. Porter and J. W. Hertzler, who represent the Bretz interests in the West, will make the new place their headquarters.

#### Mitchell Official Goes to Europe.

Henry Plow, assistant treasurer of the Mitchell-Lewis Motor Co., of Racine, Wis., sailed last week to Europe on a business trip. He will be absent about two months and will spend most of his time with the agency at Paris.

**ROTARY VALVE RAISES RUCTIONS**

**Much-Involved Case Involving Distributor  
for Two-Cycle Engines—Retracted  
Affidavit Figures Unpleasantly.**

Testimony was to have been taken at Sandusky, O., on Thursday last, 13th inst., under the direction of the Scientific Research Co., of New York, which is composed of A. Elliott Ranney, formerly the Elmore agent in that city, and associates, having as its purpose the investigation of the claims of Krebs & Bachle to have invented a "rotary distributor," embracing the shape and design of a rotary valve for two-cycle engines. The testimony, however, was not taken. The action was started by order of the United States patent office, issued May 17, 1910, under the "interference" provision of the patent law, and should have been closed on or before October 15th, 1910, in order to be valid under the six months limit clause.

When the attorneys for the Scientific Research company and the Elmore company reached Sandusky on October 13th, to be present at a conference set for that date, at which a number of witnesses living in Ohio were to be examined, the majority of these witnesses could not be found, nor could they be reached by telephone. The result of the remarkable elusiveness of the necessary witnesses was that this interference suit fell through. Immediately after the "meeting" in Sandusky Sigmund Herzog, of New York, attorney for the Scientific Research Co., received a communication from J. Asa Field, the chief witness, in which the latter asserts that he had been mistaken when he made affidavit to the effect that one George Holloway, formerly superintendent of the Elmore Mfg. Co., had made the drawings relating to the "rotary valve," and stating that these in reality were produced by one A. H. Dalzell, who at present is the Elmore agent in Rochester, N. Y. He admitted somewhat incautiously that he had been seen by the attorney for the Elmore company, and that the latter had convinced him of the error which he had made in his former affidavit. The letter, according to Herzog, will be used in an action to be brought against Field in the United States court.

The patent which is at the bottom of the whole matter was issued to Bachle and Krebs on March 3, 1908, and bears the number 880,958. It comprises a rotary distributor, and is quite specific in its claims. A very similar patent, No. 895,194, based on much broader lines, was granted to one Radcliffe on August 4, 1908. When Radcliffe learned of the infringement suit to be started against the Elmore company he at once signified his intention of proceeding

against the same company on his own account, for infringement of his patent. So that at present there is a promise of two different suits being started by two different people, based on two different patents, against the Elmore company for infringement of either one or the other of these patents.

The first results of "the meeting that failed" are the withdrawal of Sigmund Herzog, attorney of the plaintiff, from the patent case, and the probability of having the whole matter threshed out in the United States Criminal Court in the hearing of the charges brought by Herzog against J. Asa Field for his "erroneous" affidavit, which he afterwards had occasion to qualify considerably.

**Jury Decides Watt is Bankrupt.**

It required but 15 minutes for a jury in the United States District Court at Detroit last week to decide that the Watt Motor Car Co., of this city, was bankrupt, as alleged by petitioning creditors, among whom were several officers of the company. The rather unusual procedure of submitting such a case to a jury was due to the representation of the Watt company's president, M. J. Delaney, that it was solvent. He did not, however, take the stand to refute the statements of the vice-president and bookkeeper of the concern that its liabilities are \$14,020 and its assets but \$5,000 plus an interest in a plot of real estate. The Watt company is a typical example of the "mushrooms" to which the feverish automobile interest in Detroit gave growth. It built two cars and then went prospecting for money and a factory. It came near getting both in Lapeer, Mich., but the deal fell through and a debtor seized one of the two cars; a petition in bankruptcy followed in due course.

**Pioneer Brooklyn Dealer Dead.**

Isaac S. Remson, who died on Thursday last in Brooklyn, N. Y., was one of the first automobile agents in that borough, if, indeed, he was not the pioneer. He was about the earliest of wagon dealers to realize the future of the motor car and established an automobile department in connection with the wagon business of the Remsen Mfg. Co., now a stock concern, 28 years old, of which he was president. The Remsen company for years held the Brooklyn agency of the Locomobile.

**Witherbee Files a Personal Petition.**

Thos. S. Witherbee, residing at 526 West 111th street, New York, who has been engaged for many years in the manufacture of electrical goods, individually and as general manager of the Witherbee Manufacturing Co., and Thomas Battery Co., at No. 438 West 42d street, No. 1912 Broadway and No. 51 West 63d street, has filed a petition in bankruptcy. He places his liabilities at \$7,174 and has no assets.

**E-M-F MEN GO INTO MOTORCYCLES**

**Brownson Resigns His Offices and Others  
Join Him—Flanders Interested but  
Will Remain with E-M-F.**

R. M. Brownson, secretary and treasurer of the E-M-F Co., has resigned those offices to become president and general manager of the Pontiac Motorcycle Co., a \$600,000 organization which just has been formed in Pontiac, Mich. Max Wollering, former production manager of the same concern, also has relinquished that position to become identified with the motorcycle enterprise, of which E. LeRoy Pelletier, the E-M-F's famous publicity manager, is a stockholder, and in which he is to play an active part. Other stockholders in the Pontiac Motorcycle Co. are Dr. J. B. Book and Charles L. Palms, two of Detroit's most foremost capitalists, who also were heavily interested in the E-M-F Co. until its sale to the Studebaker interests.

The fact that so many well known men are going into the motorcycle industry has created a buzz of comment in the trade, and because that Brownson was the right-hand man of President Walter E. Flanders of the E-M-F Co., reports have been freely circulated that Mr. Flanders himself was to leave the E-M-F organization to take up the reins of the motorcycle enterprise. But while Mr. Flanders freely admits that he is a large stockholder in the Pontiac Motorcycle Co., he scouts the idea that he has any intention of fulfilling the rumors or predictions that have been made regarding his severance of relations with the E-M-F establishment. He states that he has invested in the new motorcycle company because the men who compose it have been very closely associated with him for several years, and because he has the utmost confidence in their ability.

"Regardless of previous accomplishments," he added, "I do not consider that my task in the automobile industry has yet been fulfilled. In fact, I feel that we have but just begun. The E-M-F Co. is today the third largest in the licensed association, and it is my ambition to make it first. My interest in the motorcycle business will not in any way demand my own time, and there is no truth in the reports to that effect which have been circulated by competitors of the E-M-F Co."

**Tire Holders in Infringement Suit.**

The Gilbert Mfg. Co., of New Haven, Conn., has brought suit in the United States Circuit Court at Hartford against the Post & Lester Co., alleging infringement of the Fredson E. Bowers patents on spare tire holders. The patents bear date December 3, 1907, and were assigned to the Gilbert company on December 15, 1909.

**The Week's Incorporations.**

Kalamazoo, Mich.—Aldrich Auto Co., under Michigan laws, with \$5,000 capital.

Lemmon, S. D.—Lemmon Auto Co., under South Dakota laws, with \$10,000 capital.

Sioux Falls, S. D.—Fawick Motor Car Co., under South Dakota laws, with \$150,000 capital.

Delphos, Ohio—Mueller Implement & Auto Co., under Ohio laws, with \$75,000 capital. Corporators—John Mueller and others.

Hamilton, Ohio—Central Motor Co., under Ohio laws, with \$20,000 capital. Corporators—D. H. De Armond, C. J. Jones and others.

Seattle, Wash.—Independent Auto & Supply Co., under Washington laws, with \$10,000 capital. Corporators—S. A. Neff, W. B. Neff.

Chicago, Ill.—Adams Brothers Co., under Illinois laws, with \$10,000 capital; to deal in automobiles. Corporators—C. R. Jones, W. D. Tuff, J. B. Deibler.

Indianapolis, Ind.—Keystone Auto Co., under Indiana laws, with \$5,000 capital; to deal in motor vehicles. Corporators—C. F. Redding, A. Amanna, Josie Redding.

Indianapolis, Ind.—Capital Auto Co., under Indiana laws, with \$5,000 capital; to deal in motor vehicles. Corporators—C. S. Grant, Samuel Glick, C. C. Pettijohn.

Chicago, Ill.—Premier Sales Co., under Illinois laws, with \$15,000 capital; to deal in automobiles. Corporators—Henry W. Wales, S. S. Gorham, Gilbert Noxon.

Charlotte, N. C.—Charlotte Motor Car Co., under North Carolina laws, with \$3,000 capital; to deal in motor vehicles. Corporators—A. Burwell, E. F. Stenerson and others.

Indianapolis, Ind.—Cadillac Automobile Co., under Indiana laws, with \$20,000 capital; to deal in automobiles. Corporators—E. W. Steinhart, W. M. Fisher, Frieda E. Werler.

Toledo, Ohio—Dusseau Fore & Rear Drive Auto Co., under Ohio laws, with \$100,000 capital; to manufacture newly patented automobile. Corporators—D. V. Dusseau and others.

Milwaukee, Wis.—Auto Supply Co., under Wisconsin laws, with \$20,000 capital; to deal in accessories and supplies. Corporators—Oscar F. Fishedick, J. D. Babcock, J. T. Drought.

Detroit, Mich.—Brown Wind Shield Co., under Michigan laws, with \$5,000 capital; to manufacture automobile wind shields. Corporators—Benson Brown, Edgar Murray, Floyd I. Benson.

Chicago, Ill.—Fred T. Seegar & Co., under Illinois laws, with \$2,500 capital; to conduct a garage and rental business. Corporators—William J. Lavery, Leon D. DeBost, George L. Cook.

Chicago, Ill.—Sherman Auto Co., under Illinois laws, with \$1,000 capital; to operate a garage and do general renting business. Corporators—Timothy D. Hurley, Otto Beer, Lee S. Lerosky.

Atlantic City, N. J.—Harris Automobile Co., under New Jersey laws, with \$60,000 capital; to deal in motor vehicles and accessories. Corporators—William B. Loudenlager, J. B. McDevitt and others.

Los Angeles, Cal.—Thomas-Mercer Motor Car Co., under California laws, with \$50,000 capital, \$500 of which is paid in; to deal in automobiles. Corporators—A. M. Young, A. J. Wilson, F. W. Force.

Detroit, Mich.—Day Automobile Co., under Michigan laws, with \$300,000 capital; to manufacture utility motor car. Corporators—Thomas W. Day, Hugh Jennings, Cameron F. Roberts, Wallace E. Brown.

Pekin, Ill.—Pekin Garage & Outing Co., under Illinois laws, with \$5,000 capital; to do general automobile and garage business. Corporators—Walter E. Green, Herman Kaemmerling, William R. Kaemmerling.

Philadelphia, Pa.—National Association of Automobile Owners, under Delaware laws, with \$100,000 capital. Corporators—J. E. Rice, Harrisburg, Pa.; H. C. Long, R. L. Van Dusen, Philadelphia, Pa.; F. H. Hoffecker, Wilmington, Del.

Oklahoma City, Okla.—Northwest Motor Co., under Oklahoma laws, with \$100,000 capital; to manufacture and deal in automobiles and automobile engines. Corporators—L. R. Weiss, Charles E. Sockler, Charles P. Wickmiller, Earl Worl.

Brooklyn, N. Y.—Powell Engine Corporation, under New York laws, with \$50,000 capital; to manufacture automobiles, machinery, engines, etc. Corporators—Luther P. Powell, Royston W. Powell, Chas. I. McLaughlin, all of Bensonhurst, L. I.

**Recent Losses by Fire.**

Grafton, N. D.—McKay Bros., garage and several automobiles burned. Loss, \$20,000, with only \$750 insurance.

Long Beach, Cal.—Pacific Garage; building and 20 automobiles destroyed. Loss, \$40,000. Gasolene tank on motorcycle exploded.

Pittsburg, Pa.—G. B. Gordon's garage on Forbes street; building damaged, one automobile wrecked; two men severely injured. Loss, \$6,000.

New York City, N. Y.—Dryer's Automobile & Carriage Warehouse, 221 West 37th street; top floor wrecked, 50 carriages burned, several automobiles damaged. Loss exceeding \$25,000.

Richmond, Va.—Richmond Motor Co.'s garage, 319 West Main street; building destroyed, ten automobiles burned. Loss, \$25,000. Caused by man stepping on match on floor while chauffeur filled gasolene tank near by.

**Changes Among Prominent Tradesmen.**

Ernest L. Smith has resigned the sales management of the Grant-Lees Machine Co., of Cleveland, to become Western representative of the R. I. V. Co., of New York. He will make Detroit his headquarters. As he previously was connected with the Standard and the Timken roller bearing companies, he is no stranger to his new duties.

Claude S. Briggs, former president of the Krit Motor Car Co., of Detroit, Mich., who recently sold his holdings in and retired from that company, has joined the Brush Runabout division of the United States Motor Co. He will be located in Detroit where he will assist President Frank Briscoe, of the Brush company, in the sales department.

R. L. DeLisser, brother of Vice-President Horace DeLisser, of the United States Motor Co., has joined the metropolitan staff of the United Motors New York Co. Previously DeLisser was with the Maxwell-Briscoe Motor Co., at Tarrytown, N. Y., and the Columbia Motor Car Co., at Hartford, Conn. He will have charge of the Columbia interests in New York.

Orlando Webber, one of the pioneers of the industry in the West and until recently manager of the Palmer-Singer branch in Chicago, finally has removed to the East and become sales manager of the Palmer & Singer Mfg. Co., with headquarters in New York. The berth in Chicago left vacant by his removal has been filled by the appointment of his brother, Charles Webber.

Carl Wallerich, who recently resigned the sales management of the Haynes Automobile Co., of Kokomo, Ind., to join the staff of the Willys-Overland Co., at Toledo, Ohio, has been appointed a district manager of the latter company. His territory embraces Indiana, Illinois, southern Michigan and southern Missouri, and includes the cities of Chicago, St. Louis, Detroit and Indianapolis.

Don C. McCord has been appointed sales manager of the Marion Motor Car Sales Co., of Indianapolis, which hereafter will market the Marion car, which previously was handled by the Willys-Overland factory organization. McCord for three years was the Overland factory representative on the Pacific coast. His chief assistant is William D. Myers, for some time assistant sales manager of the Overland company, with offices at Indianapolis. Their headquarters will be at the Marion factory in the latter city.

**Increases of Capital.**

Racine, Wis.—Racine Mfg. Co. increases capital from \$400,000 to \$600,000.

Detroit, Mich.—General Motors Co. of Michigan increases capital from \$10,000 to \$100,000.

IN THE RETAIL WORLD.

R. E. Donaldson, of Milford, Ia., has sold his garage to Unger & Bowman.

A new garage is being built at Corning, Ia. Henry Knolla will manage it.

Glencoe, Ill., is to have another garage. Sidney B. Cahn is building it at a cost of \$5,000.

George Brown, of Maxwell, Cal., has "seen the light" and is building a garage in that town.

The First Implement & Automobile Co. has been organized and has commenced business in Vinton, Ia.

G. J. Edwards, who conducted a garage in Appleton, Wis., has sold it to Henry Walter, of the same town.

John Holloway and Alva Bryant have purchased the Morrison Garage in La Fayette, Ind. It is located on Columbia street.

Jones & Brandes, of Hastings, Neb., have leased a space 132 x 44 feet in the business section of Grand Island, Neb. They will erect a garage thereon.

E. M. Taylor and T. E. Loope have purchased the Frogner Auto Garage, in Iola, Wi.; they will conduct it under the firm name of Loope & Taylor.

J. McLaren, Grand Rapids, Mich., has disposed of his automobile and accessory business to S. A. Dwight, who will continue it under his own name.

Charles McFarland, of Sioux Rapids, Ia., has traded his butcher shop for an up-to-date garage. J. H. Hamilton was the garageman who made the exchange.

Sherrill & Littlefield is the style of a new firm which just has engaged in the garage and renting business in Charlotte, S. C. They will also handle accessories.

The Frederick E. Murphy Automobile Co. is the style of a new concern which just has opened up at Third street and Third avenue south, Minneapolis, Minn. Mitchell cars will be featured.

The Automobile Repair Co., of 1103-1105 Pine street, St. Louis, Mo., has leased the Mitchell garage at 4953 Delmar boulevard. It will conduct it in connection with its automobile school.

The firm of Dickerson & Spauldings, dealers in automobiles and accessories in Grinnell, Ia., has been dissolved by mutual consent. Spaulding will continue the business in his own name.

S. B. Johnston and E. J. Hewling have formed a partnership and are building a garage at the corner of Grand avenue and 17th street, Des Moines, Ia. They will show the Packard line of cars.

The Ideal Motor Car Co. is the style of a new company which has opened a garage and salesroom in Hopkinsville, Ky. Sam Frankel, Will Kimmons and C. S. Jackson are the men behind the project.

Ellinwood, Kan., soon will have its third

garage. It is being erected in this little village and will be a cement structure, 75 x 50 feet, and will be occupied by Bert Hammer and Wallace Bummert.

Robert Crandell is erecting a two story garage in his home town, Oak Park, Ill., at the corner of North Boulevard and Oak Park avenue. The building will be 100 x 50 feet, of brick, with cement floors.

Hughson & Merton, Pacific coast handlers of the Ajax tires, have opened a store in Seattle, Wash. It is located at the corner of Pike street and Tenth avenue, in the heart of the city's automobile district.

The Bradford Auto-Garage Co., recently organized with a capital of \$10,000 under the laws of Vermont, has constructed a garage on land bordering on the Waits river, Bradford, Vt. Regal cars will be featured.

James L. Elliott and Fred W. Ulrich, of South Bethlehem, Pa., have formed a partnership and opened a garage on West Fourth street, near University place. The structure is of concrete and big enough to house 85 cars.

The Mich-Heinrich Co. is a new-comer on the Minneapolis automobile row. H. J. Mich and G. W. Heinrich are the members of the firm, which will handle Warren-Detroit cars in its salesrooms at 6-8-10 Tenth street south.

Work has been started on a new garage for the Lackawanna Auto Co., of Scranton, Pa. The structure, when completed, will be three stories high, 40 x 150 feet, of brick, and will cost \$25,000. It is located at 314-316 Adams avenue.

R. M. Owen & Co., distributors of the Reo and Premier cars, have opened a branch house at the corner of Halsey and Pearl streets, Newark, N. J. It is in charge of R. E. Ingersoll, formerly manager of the Owen store in New York.

Lucien H. McIntyre, president and director of the Rutland Garage Co., of Rutland, Vt., has severed his relations with the concern, transferring his stock to G. H. Grimm, another director. A complete re-organization of the firm will take place in a short time.

The Atlanta (Ga.) branch of the Hartford Rubber Works Co. has been removed to larger quarters at 19 Houston street. The change was made necessary by the increased business which A. W. Kirk, the manager of the branch, reports is likely to prove even larger next year.

The Atlas Machine Co., of Louisville, Ky., which formerly handled the Empire car, has relinquished the agency in favor of a new concern just formed in the town under the style the Empire Automobile Co. Quarters have been secured on Third avenue, north of Walnut street.

Durham Brothers, of Pine Bluff, Ark., have filed a petition in voluntary bankruptcy. Their liabilities are about \$5,000 and

assets about \$3,060. The step was made necessary as the result of an unsuccessful outside business venture by one member of the firm, in which considerable money was lost.

I. O. Kite, of Kansas City, Mo., has purchased an interest in his brothers' firm, Kite Bros., who have been conducting a garage in Ft. Scott, Kan. At the same time the business has been transferred to the new garage at the corner of Marmaton and Fenton avenues, which is 100 x 50 feet, of concrete blocks.

Incorporated with a capital of \$3,000, the Cairo Motor Co., of the Illinois city of the same name, has opened a garage and supply house at the corner of Sycamore street and Washington avenue, and has absorbed the Motor Car Co., of Cairo. C. L. Martin, who is one of the incorporators of the new concern, was part owner of the absorbed company.

Under the management of Edward E. Gerlinger, the Stoddard-Dayton Automobile Co. has been formed at Portland, Ore. Although Stoddard-Dayton cars will form the mainstay of the concern, other gasoline cars will be handled and a general garage business conducted. The headquarters of the concern are at 66 North Tenth street.

Joseph Greenburg and Max Rich, doing business as the Guarantee Auto Supply Co. at 65 Cortlandt street, New York, have been petitioned into bankruptcy by the Goodrich Co. and seven other creditors, whose claims aggregate \$400. Among other things, it is alleged that the firm had made preferential payments and that a city marshal had levied on their stock. Assets are estimated at \$500.

Ludwig Wolff, president of the Diebold Motor Car Co., of Canton, Ohio, on October 6th filed a deed of assignment in the name of the company, Attorney A. Talmage Snyder being named as the assignee. Later, Charles F. Weingartner, secretary of the company, filed a motion asserting the solvency of the company. The company's assets are given as not less than \$5,000, and it is now left for the court to decide whether the firm is solvent or not.

Five new garages are being built in Los Angeles, Cal., the largest of which is intended for the Maxwell-Briscoe Co.; it is located at the corner of Olive and 12th streets. The Doerr-Brown Co., which will feature Knox cars, is settling down on Olive street, near 12th, while J. D. Hooker is building a garage 53 x 120 feet at the corner of 12th and Flower streets. Still another structure is going up at 1408 South Grand avenue, where James J. Freeman and Mary S. McArthur expect to do a general renting business. Wesley Clark also established himself in that vicinity, having chosen the corner of Grand avenue and West Adams street for the location of his new garage.

## The Test of a Car

**W**HAT is the test of a car to-day—what does an owner need most unless he is a millionaire? Economy of operation—combined with reasonable size and reasonable speed. Judged by this touchstone, there is one car that suits every requirement—The White Gasoline Motor. It is a moderate size car—of moderate weight—moderate price, and above all, moderate in up-keep, having a four-cylinder, long-stroke engine, with power enough for every purpose. On this basis, and this basis only, White Gasoline Cars invite the inspection and comparison.

With regard to materials and method of manufacture, an unbiased expert—one of the leading men of the country—has said that it is impossible to build a car better than the methods now in vogue at the White Company's factory.

If you are interested in a car which combines this manufacturing excellence with a proper balancing of size and power, let us show you the car itself.

Many agencies now open for White Gasoline Cars and truck, also steam passenger cars. Demonstrators should be bought at once for early delivery.

NEW YORK, OCTOBER 20, 1910.

### Concerning the Transmission Problem.

Despite the wide recognition of the sliding pinion mechanism as the standard change gear arrangement there are many who still question the probability of its indefinite continuance as such. With the increasing adoption of motor vehicles for business purposes the importance of the question is considerably accentuated. A statement recently attributed to an engineer of repute is noteworthy in this connection. "In the operation of taxicabs," he is quoted as saying, "the greatest cost of repairs has been experienced with the change gears. In the hard and constant use to which taxicabs are subjected the gears are very frequently broken owing to the constant shifting of them necessary in the dense traffic through which the taxicabs must move."

With vehicles employed for pleasure only, experience, has demonstrated the superiority of the sliding gear system in certain respects, while the fact that it has

become identified with cars of the more luxurious and expensive variety doubtless has added to its prestige among the uninformed and has led to the impression that it is in all respects superior to other systems. As a matter of fact, it is not in all points more advantageous than other systems, and the objection that most frequently has been urged against its use is the one that militates most strongly against it when applied to taxicabs and other commercial vehicles. Regardless of its mechanical economy in other respects it is a great drawback to its success that a certain amount of skill is necessary in order to operate it successfully; furthermore, whenever it is not handled with the necessary amount of skill and judgment it is bound to develop an inordinately high rate of upkeep. In weighing the advantages of any system the power wagon user is bound to consider not only mechanical but also operating efficiencies. It may be better economy for him to utilize some device that is mechanically inefficient yet sufficiently simple in operation to enable him to employ low priced labor in handling it, for example, than it would be for him to employ a better class of mechanism and more expensive labor, or to use the same class of labor and then stand a higher rate of upkeep in replacing parts broken by careless handling. In other words, it might prove good economy in the long run to employ a form of change speed gear that uses more engine power than the conventional gear, but that would stand up under the severe usage of continual speed changes without requiring frequent and expensive repairs, or that was so constituted that its parts might be replaced at lower cost.

In this connection it is well to call attention to the fact that most excellent service is obtainable with light machines from the planetary type of change gear, and that in the spur form, it is not only economical to build but simple to operate and reasonably efficient when maintained in good condition. Another form of gear which is little used, relatively speaking, but which affords the ideal degree of simplicity in operation, is cheap to produce and cheap to maintain, is the friction disc drive. By many authorities it is believed that in some form of friction transmission will be found the ultimate solution of the automobile change gear problem. Still others pin their faith to the hydraulic system, by which functional simplicity is obtained at the ex-

pense of some added mechanical complication, though whether to the point of ultimate economy, remains to be demonstrated on a perfectly broad business basis. It constantly is becoming more strongly apparent that the transmission problem remains to be reduced to its ultimate solution.

While on the witness stand, President Gresser, of Queens Borough, New York City, whose administration is under investigation, sought to excuse himself and also the condition of Hoffman boulevard, by stating that that thoroughfare had been ruined by the 19,000 automobiles which he said used it en route to the scene of the Vanderbilt race. Of course, nowadays it is popular to blame everything on the automobile, but if all of Mr. Gresser's statements are as truthful as the one regarding Hoffman boulevard, George Washington's laurels are safe. The boulevard is a thoroughly disgraceful and discreditable piece of work, and if it was not a political job, as freely has been intimated, it bears all the earmarks of it. It was in abominable condition long before even an entry blank for the Vanderbilt race was printed, and if the president of Queens Borough does not know it, his sources of information are almost suspiciously lacking. In case he is found guilty, it would be a happy idea were part of his punishment be made to consist of about 24 laps over his "automobile ruined" boulevard. It is not short of a man-trap, and if the city of New York escapes payment for loss of life it may count itself lucky, with no thanks to Gresser.

In introducing a new model a British automobile manufacturer indicates with pride that during the two years a similar product has been on the market the number of such cars running on the road has reached "nearly 2,000." From which he concludes triumphantly, "Our experience, therefore, with such a vast number of users is very varied and it is from the experience of so many users that we have been able to embody in this 1911 chassis every known improvement that was required to ensure it being a perfect 'model de luxe' small car in every particular." With all due respect to the force of the argument, how much greater must be the advantage in the same respect of certain of the American "large producers" whose output in a year runs anywhere from two to five times as high on each of several different models.

**Accessory Makers Strong for Both Shows.**

Of the members of the Motor and Accessories Manufacturers, Inc., who have contracted for space in the Madison Square Garden show in New York, 146 will exhibit during the first or pleasure car week, and 114 during the second or commercial vehicle week. Of the members who will exhibit at Chicago, 121 will be in evidence during the first week and 97 during both weeks. These figures will do much to settle a lot of speculation regarding the comparative number of parts and accessory makers who would exhibit during the entire run of both shows, it being anticipated that relatively few of them would display their wares during the commercial car week. The M. A. M. will allot their space on Tuesday next, 25th inst.

**Jonz Elects and Prepares to Enlarge.**

Although the American Automobile Co. of Kansas City has acquired control of the Jonz Automobile Co., of Beatrice, Neb., whose plant it was reported would be removed to Kansas City, the Jonz company is preparing to erect a three-story addition, 46 x 140 feet, to its factory in Beatrice, a proceeding that does not suggest removal. At its annual meeting last week it also elected officers as follows: President, B. B. Bales; vice-president, C. Charles Jones; secretary, N. E. Jones; treasurer, H. K. Cole; assistant treasurer, C. R. Jones; general manager, L. A. Boli, Jr.

**Pittsburgh Dealers Elect Officers.**

At its annual meeting last week the Automobile Dealers' Association of Pittsburgh, Inc., elected the following officers for the ensuing year: President, W. N. Murray, president Standard Automobile Co.; vice-president, F. D. Saupp, president Hiland Automobile Co.; secretary, E. C. McCurdy, secretary McCurdy-May Co.; treasurer, G. P. Moore, general manager of Keystone Auto Co.

**Fined \$100 for Violating Injunction.**

Judge Ward, of the United States Circuit Court, in New York, last week imposed fines of \$100 each on Julian M. Pickney, president of the Auto Spring Repairs Co., and William R. Petz, for contempt of court in making and selling a spring repairer device in infringement of the patent issued to the Accessories Supply Co., and in violation of an injunction granted June 7, 1910. They paid the fine.

**Edsall Selected as Mora Trustee.**

At a meeting of the creditors of the bankrupt Mora Motor Car Co., Newark, N. Y., last week, Julius M. Edsall, of Buffalo, was selected as trustee in bankruptcy. His bond was fixed at \$50,000.

**Stuyvesant Excites an Illinois Town.**

The Stuyvesant Motor Car Co., of Cleveland, Ohio, which has a six cylinder car in

hand, has the little city of Rockford, Ill., "all worked up." F. E. Stiverson, president of the company, was in Rockford last week and after looking over several factory sites told the leading citizens that if encouraged to the extent of about \$75,000, a Stuyvesant factory, employing from 300 to 500 men, would locate "in their midst." Rockford now is engaged in trying to raise the cash.

**Enlargement of the Empire Plant.**

The Empire Tire Co. has completed several additions to its plant in Trenton, N. J., which were made necessary by its increased business. Among them is a three-story stock and shipping room, 40 x 80 feet; a third story, 40 x 70, on the main mill building; a second story, 40 x 100, on the office building, and also a six-car garage for the accommodation of the automobiles used by the headquarters staff.

**Iowa Dealer Killed on Race Track.**

J. Leon Meredith, President of the Meredith Automobile Co., of Mason City, Iowa, was killed during the racemeet at Des Moines last week. He was driving a Hudson car in one of the events and collided with a Reo driven by John Wallace, who was badly hurt but who will recover.

**Elkhart Seeking an Oklahoma Site?**

According to Oklahoma press reports, representatives of the Elkhart Motor Car Co., Elkhart, Ind., makers of the Sterling car, are in that part of the country seeking a site for a branch factory. They are said to be wavering between Oklahoma City and Muskogee.

**Overland's Chief Engineer Goes Abroad.**

Among the passengers on the Lusitania which sailed for Europe yesterday was W. H. Cameron, chief engineer of the Willys-Overland Co., who goes to visit the London show and also several continental factories. He will be absent a month or more.

**Michelin Erects Its Fourteenth Building.**

Still another building has been added to the Michelin Tire Co.'s already extensive plant at Milltown, N. J. The new structure—the fourteenth—which just has been completed is 54 x 212 feet and will be devoted wholly to the production of inner tubes.

**Havens Hopes to Produce "Sixes" for \$1250.**

The Havens Motor Car Co., which recently secured backing in Port Huron, Mich., hopes to begin operations there within 30 days. It plans to produce a six cylinder car listing at \$1,250.

**Huge Addition for Stoddard-Dayton.**

The Dayton Motor Car Co., Dayton, Ohio, has let contracts for a huge addition to the Stoddard-Dayton plant in that city. It will be a brick building 1,000 feet long by 80 feet wide.

**COMING EVENTS**

October 17-26, Atlanta, Ga.—Georgia Around State Tour.

October 21-22, Boston, Mass.—Boston "American" commercial vehicle contest.

October 21-25, Washington, D. C.—Second annual Washington "Post" tour to Richmond, Va., and return.

October 24, Lawrence, Mass.—Automobile races.

October 27-29, Dallas, Tex.—Dallas Automobile Club's race meet.

October 28-29, New York City—Commerce vehicle test, under auspices New York American.

October 29-30, Jersey City, N. J.—Reliability run of Automobile Club of Hudson County.

November 3-5, Atlanta, Ga.—Atlanta Automobile Association's fall meet on Speedway.

November 5, Los Angeles, Cal.—Los Angeles-Phoenix (Ariz.) desert road race.

November 5-6, New Orleans, La.—Automobile meet.

November 7-11, Chicago, Ill.—Reliability contest under auspices Chicago Motor Club.

November 10-13, San Antonio, Tex.—San Antonio Automobile Club's races at International Fair grounds.

November 12, Savannah, Ga.—International road race for the Grand Prize of the Automobile Club of America.

November 22-26, Lake Charles, La.—Louisiana Fair Association's race meet.

November 24, Redlands, Cal.—Mile High Hill Climb Association's contest.

November 24, Santa Monica, Cal.—Southern California Automobile Dealers' Association's annual road race; 200 miles.

November 24, Savannah, Ga.—Savannah Automobile Club's road race.

November 26-27, Los Angeles, Cal.—Motordrome races.

December 3-18, Paris, France—French Automobile Manufacturers' Salon in Grand Palais.

December 25-26, Los Angeles, Cal.—Races at Motordrome.

January 5-21, Detroit, Mich.—Detroit Automobile Dealers' Association's annual show in Wayne Pavilion.

January 7-14, New York City—Association of Licensed Automobile Manufacturers eleventh annual show in Madison Square Garden. Pleasure cars and accessories.

January 16-21, New York City—Association of Licensed Automobile Manufacturers eleventh annual show in Madison Square Garden. Second week devoted to commercial vehicles.

**EXCHANGE VIEWS ON ELECTRICS**

**Electric Vehicle Association of America  
Holds Its First Convention—Discusses  
Low Priced Product.**

Evidence of a demand, or fancied demand, for a light electric vehicle suitable for delivery and general utility purposes developed in connection with the first annual convention of the newly formed Electric Vehicle Association of America, held in New York City on Tuesday last, 18th inst., in connection with the electrical show in Madison Square Garden. It was asserted by representatives of the central station men that such a demand exists and that the demonstration and sale of electrics of larger capacities would be considerably expedited were machines of this class available.

Expressions of this view failed to elicit very cordial response from the automobile makers present, the latter explaining that they at least, had been unable to discover any very substantial leaning in this direction on the part of the buyer and also citing several reasons that would make it difficult to exploit such a machine successfully. A car to carry loads below 1,000 pounds, and selling for somewhere about \$750, was the type defined.

The object of the convention, like that of the association, was to promote the adoption and use of electric vehicles for business and pleasure purposes, and with that intent a full and comprehensively instructive program had been arranged. While the attendance of "outsiders" was not large, a majority of the 250 persons at the meeting being either electric vehicle men or those affiliated with other branches of the electrical industry, the result cannot fail to result beneficially to the interests involved quite as much through the interchange of ideas which took place as from the impulse toward well-directed publicity which the movement received.

The convention was directly in line with a well-shaped project for assembling the electric vehicle manufacturers and central station men, who deal in the electric current which is essential to the operation of the machines, and electric vehicle users, upon a common footing insofar as their mutual interests are concerned. Its immediate result was to show that there is opportunity for considerable adjustment of views before an absolute community of spirit is possible, though in unanimity of agreement as to the present strength and probable future development of the market for electrics unbounded enthusiasm was shown.

This spirit reached a climax when, in concluding an illustrated lecture in which nearly 100 views of electric cars were

shown, most of them commercial vehicles photographed under operating conditions, Day Baker, New England representative for the General Vehicle Co., caused to be thrown on the screen this sentiment, written in the cramped hand of the "Wizard," himself, and over his own signature:

"In 15 years more electric current will be sold for electric vehicles than for light.

"Thomas A. Edison."

President Wm. H. Blood, Jr., of Stone and Webster, Boston, Mass., presided over the meeting, and gave a particularly effective exposition of the purpose of the association in his opening address, in which he referred confidently to the broad expansion in use which the electric is destined to experience. The other speakers on the program and their subjects were as follows:

"Problems Involved in Advancing the Use of Electric Automobiles," W. P. Kennedy, New York; "Recent Electric Automobile Performances with the Edison Battery" (illustrated by stereopticon), Frank L. Dyer, Orange, N. J.; "The Responsibility of the Central Station to the Electric Vehicle Industry," Louis A. Ferguson, Chicago; "Various Applications of the Electric Vehicle" (illustrated by stereopticon), Day Baker, Boston; "The Electric Vehicle in Heavy Trucking Service," J. T. Hutchings, Rochester, N. Y.; "The Electric Vehicle Battery," Bruce Ford, Philadelphia; "The Proper and Practical Care of Electric Vehicle Batteries," S. C. Harris, New York; "A Central Station Campaign for Electric Vehicles," F. M. Tait, Dayton, O.; "Motor Vehicle Road Tests," (a) Philadelphia to Atlantic City, G. M. Graham, Philadelphia; (b) Proposed run under auspices New York American, Duncan Curry, New York; "A Large Modern Electric Garage," Charles L. Eidlitz, New York.

It was during the afternoon session, when the meeting was thrown open for the discussion of papers, that it first became apparent that the newly fledged association has considerable work cut out for it in the way of settling certain questions of supply, demand and administration. For, oddly enough, though the subjects of the set papers were alluded to in flattering terms, the gist of the discussion for the most part hinged about points that the speakers of the day had not touched upon or merely had mentioned in passing.

Before the discussion had progressed very far it developed that whereas the manufacturers are anxious to assist the central station men by suggesting how properly to sell and maintain electrics, the central station forces are equally willing to be helpful to the manufacturers in the way of suggesting things for them to do. At no time did the interchange of views reach the heat of debate, but just sufficient warmth was developed to bring out forcible and richly suggestive expressions of opinion. It was in this way that the mat-

ter of the light commercial electric came in for discussion.

It was R. M. Searle, of the Rochester Railway & Light Co., who introduced the subject, in connection with a bright and forcible series of suggestions, all of which revealed thorough familiarity with the electric vehicle in the field. In connection with the work of central stations, he explained in substance, it is desirable to use machines of less than 1,000 pounds capacity. Such a vehicle also could be used to advantage, he thought, in making demonstrations to prospective purchasers, even where an installation of heavier machines might be in contemplation; the light cars, as being handier, less expensive to operate and involving a smaller investment in demonstrating machinery, should prove useful in this field.

Later, after the manufacturers' side of the question had been presented from various angles, the same speaker arose to renew his plea for the little electric; citing various lines of business in which it would find a ready market, according to his views, such as that of florists, cigar merchants, and retailers in other light wares who, to strengthen and advertise their trade require light, cheap and quick delivery means. He further asserted that so strongly had the demand been felt in his own locality that his company had been forced to buy chassis and construct body equipments to suit their customers' needs.

The cause of the light electric also was championed by several other speakers, among them Arthur Williams, of the New York Edison Co., vice-president of the society, who besides quoting Mr. Edison as predicting a heavy demand for such machines in the future, fixed the price at \$750. Mr. Osgood, of Newark, speaking in the interests of the local public service corporation, revealed a new point of view when he referred to the facility with which users desiring light delivery vehicles can buy second-hand gasoline cars and convert them to commercial purposes. In fact, he indicated the hypothetical light electric as being in close competition with the remodeled gasoline pleasure car, the latter having a considerable advantage in point of economy, from the standpoint of the uneducated operator, because of its very low first cost. That the number of old gasoline cars available for conversion is very great and is destined to increase at an enormous rate, he also emphasized.

Speaking from the point of view of the car builder, who presumably has studied the market very closely and weighed its demands with exceeding care, Hayden Eames, of Cleveland, stated it as his opinion that instead of calling for vehicles of smaller capacity, the real tendency of the market is to call for machines of increased capacity. As the user becomes familiar with operating conditions and learns to handle his equipment economically, his ef-

fort is to concentrate as far as possible and to increase his loading unit.

In the opinion of W. P. Kennedy, installation expert for the Studebaker Automobile Co., most of the electric vehicle manufacturers already have too many different styles of chassis in the works. It is their desire to concentrate as far as possible, and the addition of new models, particularly light ones, when the indicated demand appears to be greater for the medium and heavier styles of car, would be both expensive and hazardous. Success with a light model could be obtained only upon the basis of immense outputs—a point that several other speakers brought out.

In the experience of the General Vehicle Co., as expressed by Mr. Boyd, no quantity market is visible for the small electric. He and others, among them Mr. Lund, of Chicago, also were doubtful of the practicability of such a vehicle from the engineering standpoint. The latter, in particular, was of the opinion that its operating cost would be likely to prove too high, relatively speaking, to warrant its introduction.

The mention of durability brought up the tire question, and incidentally elicited from one or two of the central station men inquiries as to the relative costs of solid and pneumatic tires. An effective answer was furnished by Louis A. Ferguson, of the Chicago Edison Co., who told of his experiences with tires on his 4,000 pound touring car, which, he thought, was a little heavier than the type of electric truck then under discussion.

Rapid mental calculation showed that in a given period his tire costs had averaged seven cents a mile. Edison service in Chicago had developed an average cost of 1.45 cents per mile for solid tires over a wide range of practice. Mr. Kennedy told of an average tire cost of less than one cent a mile with solids, in Studebaker experience.

Careful compilation of figures from a wide range of installations have shown, according to the same authority, that the cost of operation increases with the square of the speed. Thus, wherever practicable, it is now sought to reduce running schedules. The result is an immediate and striking saving in running expense.

Apropos of tire expense, Mr. Baker, of the General Vehicle Co., related an illuminating experience with one of his customers who had complained of high maintenance figures. Within an astonishingly short period seven tires had been discarded from the customer's installation. Investigation showed that the tires had not been traded in or sold, and further that they had never been to the repair shop. Upon examination it developed that several of the discarded tires were cut in one or two places, one or two had torn away from the base, and others were more or less used up; not one of the lot, however, was so far gone that it could not be repaired. In each case, as Mr. Baker was very careful to explain, not

the manufacturer himself—who is one of the largest and best known producers in the business—but one of his salesmen, after inspecting the damaged tread, had declared the tire ruined and promptly had sold a new one in its place.

The result was that the tire manufacturer was taken down into the customer's basement to view the exhibit; that he declared the tires worthy of preservation; and that he further agreed to see to it that the customer was better taken care of in the future. Later, however, as the speaker declared, the tire manufacturer turned to him laughingly and said:

"Be very careful, Baker; you are treading on dangerous ground there.

"We could go on filling up the holes in that man's tires and they would keep running forever. But you must remember we are not in the repair business. What we want is to sell new tires!"

Later Baker succeeded in arranging with two prominent tire concerns to handle the commercial vehicle end of their business on a maintenance contract basis instead of selling tires outright. The result, naturally, was much to the benefit of the user.

Someone was unfortunate enough to remark that it had been said the electric vehicle manufacturers were loth to place their products in one-car installations, preferring to work under the more advantageous conditions of larger equipment. This was indignantly denied by several contributors to the discussion; Mr. Kennedy declaring that in one case within his experience a customer by an initial investment of \$1,800, had displaced his horse equipment and effected a saving in his delivery costs of no less than \$1,000 a year.

Rather an original suggestion was that of Mr. Searle in regard to what he termed a "confession of weakness" on the part of the manufacturers when they admitted the utility of the electric was confined to use within city limits. Inability to climb bad hills was one popular objection that served to cut down the useful radius of electrics on this account. Instead of shortening the travel of the cars, his idea would be to string a trolley wire up any bad hills along well traveled lines, providing each vehicle with a "substitute" trolley pole, that could be put into action to furnish extra current to pull it up the hill, thereby relieving the battery from the extra drain and possibly affording it a "boost" as well.

After some discussion the New Jersey Public Service representative remarked that the trolley wire already was strung in the vicinity of Fort Lee hill, near New York, which was the particular example chosen by the previous speaker, and that suitable rails already were laid. If the electric vehicle users only would bring along a few electric trucks, he intimated with some asperity, beyond a doubt the Public Service would provide flat cars to carry them up the hill.

At the close of the morning session, the convention was entertained at a luncheon provided in the restaurant of the Garden by the New York Edison Co. The courtesy of the same company was evidenced later, when on leaving the hall at the close of the convention all those present were provided with complimentary tickets to the electrical show.

#### **"Export Expedition" to Girdle the Globe.**

Three globe girdlers are due to leave Detroit on or about November 1st, but unlike others their globe girdling will be more of a business undertaking than a sporting event. Their purpose is not merely to introduce and demonstrate and exploit the Hupmobile, but to open up the foreign markets for it. The trio are Joseph R. Drake and Thomas S. Hanlon, of the Hupp Motor Car Co., and Will B. Wreford, a former newspaper man. They will use the new 20 horsepower Hupmobile touring car, and will "travel light," with little baggage and few parts, the intention of the "export expedition" being to drive the car wherever possible. After reaching San Francisco the party will in turn visit Hawaii, Australia, China, India, South Africa and Continental Europe.

#### **Van Dyke Sets Up a Maintenance Plant.**

The Van Dyke Motor Car Co. of Detroit has established a garage and maintenance plant in Chicago at 2436 Cottage Grove avenue. It has a capacity for 200 Van Dyke wagons and trucks to which it will be wholly devoted, the maintenance system in vogue entailing not merely the usual washing but nightly inspection and adjustment. W. A. Rider is in charge of the establishment.

#### **Marble Proves that He is Innocent.**

George Marble, who was arrested in Kenosha, Wis., in connection with the stealing of parts from the Rambler factory, as told in last week's Motor World, has been vindicated. District Attorney R. V. Baker asked for the discharge of Marble and declared that closer investigation showed him to be innocent.

#### **April Dates Chosen for Montreal Show.**

April 1st to 8th have been selected as the dates for the Montreal (Can.) show, which will be held in the local Coliseum as heretofore. It will be managed by E. M. Wilcox, of Toronto, who also is in charge of the show that will be held in the latter city in February.

#### **The Speedometer that Dawson Used.**

Couch & Seeley, makers of the Cosgrain speedometer, have risen to object to the statement that the first four men in the Vanderbilt cup race used Warner autometers. They say that Joe Dawson, who finished second, employed a Cosgrain.

**OLDFIELD ENACTS A "BARNEY"**

**"Slips Out of Grandstand" at Readville and Performs Stunt on Track—Guileless Promoter "Signals" Vainly.**

Although the Bay State Automobile Association withdrew its support at the eleventh hour from the hastily arranged race meet at Leadville, Mass., that affair went through Friday afternoon, 14th inst., after a fashion. W. W. Fullerton, who has figured as a promoter at other points, was really the mainspring of the venture. When he found that the state association, disgusted over the tactics of Barney Oldfield and his prize ring affiliations, had decided not to use the sanction it had secured, Wellman got one on his own account.

In view of the fact that a good deal of money had been spent in advertising the meet, and hardship would be caused several of the contestants who were on the ground, the contest board of the American Automobile Association granted Wellman permission to hold the races, but only upon the express stipulation that Oldfield should not participate in any way. Barney, by the way, had been heavily advertised along with his big car. In spite of the agreement, without which no sanction could have been secured by Wellman, Oldfield "slipped out of the grandstand" after 5 p. m. and made two circuits of the track, paying no attention to the "signals" bidding him to leave the track. On the face of things, it would seem as if Oldfield violated the conditions of the sanction purely on his own responsibility, but the opinion obtains in many quarters that Wellman understood Oldfield's little game in advance and aided in carrying it out. Should it be proved that Wellman was a party to the collusion, instead of escaping with a small fine, which he could well afford to pay under the circumstances, the ostensible promoter is likely to be barred a long time, if not permanently, by the three A.'s. Encouraged, apparently, by the negative opposition of the A. A. A., Oldfield, since his stunt against a negro pugilist first was announced, bringing about his suspension, has gone about openly defying the national body, which, according to one of its officials, can be depended upon to bring up him and his staff with a swift jerk.

The Readville races were announced as being under the management of the Massachusetts Motor Racing Association, a name that seems to have been coined for the occasion. Oldfield made the circuit of the mile track in just 50 seconds, according to the stop watches of four reporters.

The principal event of the meet was the hour race, which went to Ben Kerscher, driving Oldfield's Knox stock car, who completed 51¾ miles. Kerscher took the

lead almost at the start and was not headed until the thirty-seventh mile, when a rear tire gave out. This gave J. L. Judd (Jackson) the lead, but the latter soon had tire trouble of its own and Kerscher regained first place and he never lost it again. Edward Beverly (Simplex) was second, a quarter of a mile behind, and A. W. Rogers (Simplex) was third with 47¼ miles; Judd (Jackson), fourth, with 39 miles, and G. W. Wells (Moon), fifth, with 33¼ miles. The first event was a five miles match race between Nelson Slater (Lancia), a Worcester amateur, and John Schuyler (Firestone-Columbus). Slater got a fine start, which easily landed him winner in 5:54.

Second on the bill was another five miles match race between S. P. White in a Cameron and G. H. Wells in a Moon. White won in 5:39, having a lead of three seconds. Two other amateur races had to be given up because of darkness. The summary:

One hour race—First, Ben Kerscher, Knox, 51¾ miles; second, Edward Beverly, Simplex, 51½ miles; third, A. W. Rogers, Simplex, 47¼ miles; fourth, J. L. Judd, Jackson, 39 miles; fifth, G. W. Wells, Moon, 33¼ miles.

Five miles, match race—Won by S. P. White, Cameron; second, G. W. Wells, Moon. Time, 5:39.

Five miles, match race—Won by Nelson Slater, Lancia; second, John Schuyler, Firestone-Columbus. Time, 5:54.

Mile time trial—Barney Oldfield, Blitzen Benz, 50 seconds (unofficial).

**Contest Board Denies Gorham's Protest.**

Although it did not appear in the stories of the affair, it seems that Sidney S. Gorham, one-time secretary of the American Automobile Association, attempted to enter six Premier cars in the recent interclub reliability run of the Chicago Automobile Club and the Chicago Athletic Association. The entries, however, were refused by the joint technical committee, because of the disqualification of the Premier cars in the Glidden tour. Mr. Gorham, who by the way, is legal counsel for the Premier company, promptly filed a protest, but the contest board of the three A.'s at its meeting last Wednesday, sustained the position taken by the committee.

**Splitdorf Offers Trophy for Hour Race.**

C. F. Splitdorf, who makes magnetos, and good ones, has presented the trophy for the one hour race which will constitute the chief feature of the Mount Vernon (N. Y.) Automobile Club's racemeet on the Empire City track, Saturday next, 22d inst. The prize, which is of special design, will be styled the "Splitdorf Magneto Trophy," and must be won three times to entitle the holder to permanent possession. A cash prize also goes with the trophy on each occasion. Saturday's program will be made up of seven events.

**OLDFIELD NOW IS AN "OUTLAW"**

**A. A. A. Casts Him Out, Bag, Baggage and Managers—He Prepares to Become a Real "Sporting Man."**

Barney Oldfield, his Benz and his baggage, and his whole kit and crew, have been outlawed and no longer can race or appear in any capacity whatsoever in any contest sanctioned by the American Automobile Association, or any of the organizations with which it is allied, which means that they no longer can be recognized or harbored by any club, promoter or track owner who desires to deal with automobiling or any other recognized sport.

The A. A. A. already had set down Oldfield, and his manager, "Bill" Pickens, for the part they played in arranging and heralding a "moving picture race" with Jack Johnson, the negro prize fighter, and as Oldfield, despite his suspension, "committed a flagrant violation of the rules at a sanctioned meeting at Readville, Mass., on October 15th, by intruding himself upon the track in his Benz racing car and without official start or timing, made several circuits of the track, in defiance of the warnings of official"—to quote the official language of the A. A. A. contest board—his disqualification was made indefinite at a meeting of that body held in New York yesterday. The 200 horsepower Benz car which he used also was similarly disqualified, as also was W. H. Pickens and J. Alex. Sloane, his managers, the latter of whom is declared to have participated in the offense at Readville.

Having cast his lot with negro pugilists, moving picture men, bookmakers and other sporting men, Oldfield, the "outlaw," is to become a "real sport" and has visions of prying the public purse wide open. "Lou" Housman, a Chicago "sporting man"—a term that covers many unusual occupations—is declared to be ready to take Oldfield to his bosom and make him the star, or one of the stars, of an aggregation of "sports" with which he will tour the country doing an alleged vaudeville stunt in an effort to induce the great green public to "loosen up." Oldfield, however, first wants to win his moving picture "race" with the negro prize fighter which was scheduled for today, but apparently his victory already is assured, as Housman, the Chicago "sport," is reported to have made offers to other "stars" of his kind which have been accepted. One of the officials of today's moving picture "race" was to be "Tim" Sullivan, the Bowery politician, who is something of a "sporting man" himself and with a reputation of knowing how to make people "loosen up." A blinding rainstorm starting early to-day prevented the race from being run as per schedule.

**"THROWN" TIRE CAUSES A TRAGEDY**

**Fatal Accident in Feature Event Cuts Short Texas Racemeet—Adair Takes Lion's Share of Trophies.**

What was admitted to have been the only "real event" in the three days racing at the fair grounds, Amarillo, Texas, was brought to an untimely end by an accident that caused the instant death of T. H. Skaggs, a driver, Wednesday, 12th inst. Skaggs, piloting a Simplex car owned by W. H. Bertrand, was going almost at the rate of 70 miles an hour when the machine threw a tire, gave a lurch, turned over and crushed the driver's skull. F. P. Pringle, Skaggs' mechanic, of Dallas, was also badly hurt. The same entry threw two other tires earlier in the race, but without serious results. When the car finally righted itself and came to a standstill every wheel had been broken and the steering post torn away. Skaggs' home was in Alabama. The remaining motor speed contests were called off. However, an hour later Thomas Benoist, a St. Louis aviator, was struck with such force by a propeller while adjusting his biplane, that his condition is critical.

Of the earlier race events Adair, National, won the 20 miles contest, with Day, E-M-F, second, and Reeves, E-M-F, third. Reeves, E-M-F, captured the ten miles race, Day, E-M-F, being second, and Myers, Rambler, third. Adair, National, also annexed the ten miles handicap, with Reeves, E-M-F, second. The summary:

Twenty miles—Won by Adair, National; second, Day, E-M-F; third, Myers, Rambler. Time, 19:22.

Ten miles—Won by Reeves, E-M-F; second, Day, E-M-F; third, Myers, Rambler. Time, 13:22.

Ten miles handicap—Won by Adair, National; second, Reeves, E-M-F. Time, 11:35.

**Runaway Races on Denver Speedway.**

What is characterized with delightful indefiniteness as a "new Western mark," was established last Saturday by Milburn McDonald in the ten miles race against a motorcycle at the Denver Motor Speedway. At that, however, McDonald, who is a youthful local light, did not even come anywhere near the world's record. His time was 8:48. He also distinguished himself by capturing the 50 miles match race. In the ten miles contest he drove practically with one arm, the other having early been rendered helpless when his elbow struck against an iron bar in one of the car plunges. The program was under the joint management of the Denver Motor Club and the Denver Motor Speedway Association, about 3,000 persons being in attend-

ance. McDonald, who is better known as "Red," drove a high powered Thomas car in the ten miles contest, but in the 50 miles race he handled a Reo, his time being 57:43. He made a runaway affair of it, leading J. H. McDuffee in a Chalmers by fully ten miles. In the ten miles race for cars selling at \$1,000 or less, Alkire, in the Ford, won by ten seconds from Swanborough in the Hupmobile, the former's time being 13:35. In the 30 miles handicap race based on piston displacement, Alkire in the Ford (allowance 1:10) won in the time of 38:53. McDuffee, Chalmers (scratch), was second in 40:45.

**Referee's Queer Ruling is Reversed.**

The contest board of the American Automobile Association at its meeting last Wednesday sustained the appeal of the Foster Motor Car Co., of Richmond, Va., against the wiping out of the 20 points penalization against the Speedwell car in the July endurance run conducted by the Richmond Times-Dispatch. The trophy, therefore, goes to the Buick No. 9, entered by the Foster company. The referee originally appointed was unable to go on the tour and the substitute who took his place had his collarbone broken early in the trip. A second substitute, S. T. Atkinson, was therefore appointed, and he continued to ride in the contesting Speedwell car as he had been doing before his appointment. In canceling a penalty which the technical committee assessed against the car, referee No. 3 returned a "sealed verdict" and refused to explain why the penalty could not stand. In seeking the restoration of the penalty the Foster company claimed that favoritism had been shown.

**Louisville Finally Makes Its Awards.**

After some two weeks delay caused by doubts or protests, the Louisville Automobile Club on Thursday last finally made the awards for its recent reliability and economy test. The Maxwell car, entered by the Marshall-Clark Motor Car Co., was given the prize for reliability, and the Cole, entered by the Southern Motor Sales Co., got the award for economy. But eight cars started in the contest, and but three finished, the smallness of the field leaving a bad taste in the mouth of the Kentucky organization which is inclined to charge that it was "thrown down" by the local trade after having been given assurances of ample support.

**Special Radiator Causes Disqualification.**

C. L. Taylor, Reo agent, who appealed from the award of the Kansas City Star Cup to O. W. Hiatt, driver and entrant of the Buick 17, on the ground that the latter was equipped with special radiator, has had his exceptions sustained by the contest board of the American Automobile Association. The prize therefore will go to the Reo.

**FAST AND SLOW SPORT AT SPOKANE**

**Wolverton and Alderson Account for the Speed Contests—Falk Takes Slow Stunt on High Gear.**

Vance Wolverton and H. C. Alderson, driving Chalmers cars, were the stars in the automobile races that brought to a close, last week, the Interstate Fair at Spokane, Wash. Wolverton captured the five miles stock car event for cars of 4 to 4½ inch bore, while Alderson took the five miles affair for cars of 3½ to 3¾ inch bore, also the two miles drop-and-pick-up-passenger race. Will Falk, in a Hudson, won the slow race. Alderson made the best time by covering five miles from a standing start in 6:38. The summary:

Five miles for stock cars, 3½ to 3¾ inch bore—First heat, Will Falk, Hudson, first; H. Hahn, Ford, second; time, 7:26. Second heat, H. C. Alderson, Chalmers, first; Stoner, Stoddard-Dayton, second; time, 6:38. Won by Alderson.

One-eighth mile slow race for high gear—Won by Will Falk, Hudson; second, Harry Bell, Pullman. Time, 40 seconds.

Two mile drop-and-pick-up-passenger race—First heat, Stenstrom, Chalmers, first; Harry Bell, Pullman, second; time, 3:50. Second heat, H. C. Alderson, Chalmers, first; H. Hahn, Ford, second; time, 3:41. Won by Alderson. Hahn made the best time but was disqualified.

Five miles for stock cars, 4 to 4½ inch bore—First heat, Vance Wolverton, Chalmers, first; D. Hahn, Oakland, second; time, 6:45. Second heat, Harry Bohr, Stoddard-Dayton, first; Bert La Rue, Pullman, second; time, 7:07. Won by Wolverton.

**Steering Knuckle Explanation Fails.**

The appeal by H. E. Frederickson, of Omaha to the contest board of the American Automobile Association on the penalization of one of his Chalmers cars in the recent Omaha endurance run has not been sustained. The protest arose over a loose steering knuckle. Frederickson contended that it was his habit in getting cars from the factory to receive them with the knuckle turned a bit. He did not explain how the knuckle on his other Chalmers happened to be tight. The decision of the committee was therefore sustained.

**Bragg Decides to Join the "Pros."**

Caleb S. Bragg, the Yale University amateur who has made his mark as an automobile driver, will join the cash-chasers. At his own request, the A. A. A. contest board has transferred him to the professional class. Chairman Butler declares that despite the popular notion that Bragg was a "shamateur," the contest board found him always above board.

**TRUCK HANDSOMER THAN CARS**

**Takes the Sweepstakes Prize in Cleveland's Centennial Parade—Pageant Was Five Miles in Extent.**

For once a gasoline truck was considered prettier than a whole row of spick and span, polished and "spruced up" pleasure cars—and that by a board of judges that ought to know a good looking car when it sees

WHITE TRUCK THAT WON SWEEPSTAKES IN CLEVELAND PARADE

one. It was in Cleveland that this happened—in a parade in that Ohio city when three White gasoline trucks carried off prizes for beauty, for uniqueness of decoration and, best of all, the sweepstake prize.

The occasion for this distribution of prizes was the Centennial celebration held at Cleveland on Tuesday, October 11th inst., during which the Cleveland Automobile Club pulled off one of the best parades seen this season. Despite the short time given to preparations, a line of cars five miles long passed along the 18 miles route from Wade Park to Rock river. Carefully judging each car as it went by, the judges awarded the sweepstake prize to the White gasoline truck shown in the picture. It consisted of a huge float, covered with flowers, from which rose a standard White gasoline touring car, filled with a bevy of girls and handsomely decorated with flowers.

Another prize for beauty of decorations and general handsome appearance fell to the lot of White trucks when the Euclid Park bus was adjudged worthy of it. And that mere beauty should not carry away all the honors, and utility have its share, too, a third prize for uniqueness of decoration and cleverness of arrangement was awarded to the Diamond Rubber Co. for its interesting exhibit on a White truck, on which the various steps made in the manufacture of automobile tires were demonstrated.

Cleveland being a center of considerable

automobile manufacture it goes without saying that the other cars made in that city were also conspicuous in the parade.

**"Interchangeability" that Led to Arrest.**

Interchangeability of parts is being widely advertised as a "good thing," but two Oklahoma motorists at present are without their cars, Levi M. Bowman is under arrest and the courts are trying to bring light into the muddle—all because said Bowman, who conducts an automobile repair shop and

garage in Lawton, Okla., is said to have done a little juggling with the parts belonging to the two cars. The unusual sit-

ANOTHER PRIZE-WINNING WHITE TRUCK IN CLEVELAND PAGEANT

uation arose from the fact that Dr. A. R. Hughes sent his car to Bowman's garage for repairs. At the same time there stood in the garage another car of the same make and model, and Bowman is alleged to have taken parts from the doctor's car and put them into the other one. He was arrested on a warrant charging him with grand larceny and Dr. Hughes had the other car placed into custody for the time being pending a decision of the courts.

**NEW VERDICT FROM SCOTLAND**

**Violation of Speed Law Not an Offense Unless "Wickedly Committed"—Sheriff Himself so Rules.**

Scotland, the land which originated the famous "Guilty but not proven" verdict, has come the front again with another judicial decision which is likely to make the world of motorists "take notice." A Scotch sheriff has decided that exceeding the speed limit is a "very questionable offense," and unless "wickedly committed" one that does not deserve punishment. The opinion was rendered in the case of a Scotch artillery officer who was haled before the sheriff's court for violating the speed ordinances, and who explained that to the best of his belief he traveled only at the legally permitted speed of ten miles an hour. As the police evidence showed him to have gone a measured quarter mile in 54 seconds, he would have been fined in any country that had automobile laws forbidding such "speed." But the Scotch sheriff dismissed the case, pointing out that the law of Scotland required that a man should not be convicted of a crime unless he acted "wickedly, wilfully, and feloniously." He sympathized with accused, because he was satisfied in the belief that he was unconscious of committing any legal wrong; and he thought it was contrary to

the moral principle of the law of Scotland to convict any man of an offense unless he knew he was doing wrong. That was ground upon which he might acquit accused, but it was ground which he probably would have to contest in the High Court of Justiciary, where the question might be raised as to whether it was not part of the law of Scotland that a man was not to be found guilty unless he had done an act fully, wickedly and feloniously.

## Twenty-Seven Hundred Points to Save a Human Life

"Honk!" "Honk!" "Honk!" "Honk!" A woman's scream, a cloud of dust and then—CRASH! Twenty-seven hundred points lost, two lives risked—but one life SAVED—a WOMAN'S life. It happened in the recent MUNSEY HISTORIC TOUR, in a little New England village. Down the road thundered LaMar in his powerful machine—the Great Western 40. For ten miles the road ran along a creek, until it reached a small narrow bridge crossing the creek. At this point it was necessary to make a sharp turn—one of the many dangerous turns usually found in the country. The Bridge was entirely obstructed from view until LaMar was almost upon it. He couldn't see the lone horse and carriage on the bridge until it was too late. What could he do—not a hundredth part of a second could be lost. There was only one course open—and that practically meant suicide. But LaMar's mind was made up. With wonderful coolness and a nerve like steel he did the unexpected—what one man in a thousand would have thought of in such a horrible crisis. He crashed into the side of the bridge with a force that made the earth tremble, and threatened the collapse of the structure. He risked his own life and the certainty of winning the contests—but SAVED a life. It was an awful bump—but the almost infallible Great Western 40 was righted and finished with the leaders. Such is the character of the man, LaMar—and the durability of the car—the Great Western 40.

## The Blazed Trail

From coast to coast—everywhere in the civilized world—the Great Western 40 has left a glorious trail—a trail five years long, blazed with almost impossible achievements. Its past has been great. Its FUTURE will be GREATER. Every car—from the first one built—has been a credit to its makers.

The remarkable performance of this wonderful new car started men to thinking—men who already owned cars—men who EXPECTED to, and men who were EXPERTS. They never saw such service from a car costing less than \$4,000 or \$5,000. They wondered how we could sell the Great Western 40 for \$1,600. (This is possible only by breaking all traditions—basing price on cost of manufacture, plus selling cost, plus a fair profit.)

Soon it became the favorite. Men who owned \$5,000 cars sold them and bought the Great Western 40 at \$1,600. They KNEW that they would get the same service—perhaps better—and that the cost of up-keep would be less. Men who intended to buy higher priced cars ridiculed the idea and bought the Great Western 40 instead. They, too, had seen the advantages. And they could save \$3,000 or more.

It was no longer necessary to pay \$5,000 for a big powerful car—for the service that such high priced cars would give. Over \$1,600 was too much. Thousands of men had changed their minds. For in the Great Western 40 they get the utmost. Then men who wanted to invest only \$1,000 or so in a car saw the folly of such a movement. They recognized the wisdom of adding a few hundred, and getting the utmost—a big powerful \$5,000 car for \$1,600.

It wasn't long before the Great Western 40 was the people's idol. It became a BUSINESS car, as well as a pleasure car. Merchants used it, doctors used it, solicitors, real estate and insurance men—men in every business—owned Great Western 40's. Their cars gave them unheard of satisfaction. For five years it was the popular car—and STILL is the car most talked about.

Records that we have kept show the Great Western 40 enduring the most abusive tests. Standing up under drivers who never consider a car—giving almost impossible service to farmers in country, and doing everything asked by the experienced critical man in town. Over rough, hilly country roads, fields and swamps, where no car but one built like the Great Western 40 could ever stand up.

Through congested traffic, where quick action is essential. Here the Great Western 40, though a massive car,

# Great Western 40

**Semi-Torpedo**  
**\$1650**

slips in and out of tight places, when less responsive cars must wait. All this with never a balk—seldom a mishap. If any car is trouble-proof, it is the Great Western 40. No man ever cursed it—no man ever kicked at its cost of upkeep. For not even the lightest of cars surpass it in economy of maintenance.

Its only expense—and that is low—is for oil and gasoline. Twenty-one miles on a gallon of gasoline is nothing for the Great Western 40.

Your tire expense—so far below the average—is hardly worth recording. This great economy is due to the car's wonderful lightness, special springs, general construction, steady motor, ease of operation, absence of vibration.

So now you can see that the scares you have had from discontented owners of expensive cars were not meant for the Great Western 40.

## See What It Has Done

The greatest proof of all this is its wonderful record—its horrible trial in the Glidden Tour. 2,851 miles of awful, torturous, muck and rock, through deep swamps, desert sands, up steep, rocky winding hills, past the wrecks of cars that failed to endure this awful gruelling—cars costing almost TREBLE its price.

Through these 2,851 miles of misery—without even a delay or break-down. And it finished in Chicago with the leaders—cars costing as high as \$5,000. Such is its power of endurance, of superiority.

It won with ease the Pittsburg Hill Climb. And then the Chancellor and Lyons perpetual Trophy, in the rocky, unbearable California Mountains. Thus it added further to its glories. It proved itself the ALL-PURPOSE car. Able to go where many cars fear to tread—and come back. Able to climb the worst hills and mountains, or give you the road care of your life. These great feats—these victories over cars of great cost—amount to just one thing: SERVICE—GREAT WESTERN 40 SERVICE. It is a service that the car is giving to its thousands of owners every day—all over the world. In all its past—its five years of triumphs—the Great Western 40 has been wonderful.

But its future will be better. We have done many things to insure THAT.

## What 1911 Offers

The 1911 line includes a varied assortment of body types that ought to meet the requirements of any prospective buyer, regardless of his profession, business or pleasure. The touring car has the same general lines as the 1910 model, with some general refinements in detail finish. The wheels are now painted cream, setting off to greater advantage the pleasing lines of the deep coach blue body.

One of the new types shown is a Demi Tonneau with a combination Roadster, equipment furnished without additional charge. This Demi Tonneau is intended for four passengers, but it is very roomy, and has the advantage over the average small tonneau of having plenty of room between the back of the front seat and the tonneau seat.

The body is fitted with a hooded dash, and when converted into a roaster makes a very fine touring car. This combination car is also painted a deep coach blue and equipped with cream wheels.

These body types are all mounted on the same chassis. We are devoting our entire time to the building of this 40 H. P. machine. The finishing details are changed on the various models so that they present varied styles. But by building only one model chassis we are able to turn out a much finer product than where different chasses are built, and at the same time make a lower list price than would otherwise be possible.

One of the very popular types illustrated here is the four-door Semi Torpedo car that has neither the extreme lines of the torpeda nor the unprotected driver's seat. This model, which lists at \$1,650, is a beautiful royal purple, while the trimmings of the body and dash are in circassian walnut. The sides of the body are high and very luxuriously upholstered.

One of the novel features of this body is the compartment between the front seats where the driver can handily keep small articles or memorandum books that are frequently used. The radiator is painted to match the body and the tubes are aluminized, making in all a very pleasing effect.

For the admirers of the Full Torpedo effect we have produced a Full Fledged Torpedo type body listing at \$1,750. This car is of a very handsome lines and is intended for a four passenger torpedo, although the tonneau is

# Great Western FORTY

## Demi Tonneau \$1600

Two automobiles at the price of one. Both bodies go with the car at \$1600

very roomy. The body is fitted with invisible hardware and the doors are equipped with locks and keys so that a person leaving the car standing for any length of time may keep the doors locked against intruders.

This model is equipped with a Prest-O-Lite tank in addition to the regular equipment, and has 35x4 inch tires.

Mechanically there was very little to improve upon. The records of the 1910 Great Western 40 have so helped to impress the fact that the strength of constructions and sturdibility of the chassis are entirely satisfactory that few changes in mechanism could be suggested.

The wheel base has been lengthened to 114 inches, which is considered ideal for this type of car. The 1911 motor is again of the long stroke type of construction, the bore being  $4\frac{1}{4}$  inches and the stroke 5 inches. The cylinders are cast separately with intergral water jackets.

The motor has been improved in appearance by polishing the aluminum parts and by enameling the cylinders. A Schebler carburetor and a Remy magneto, both of which have been used on Great Western cars in previous seasons, are on opposite sides of the motor. The five-bearing type of crank shaft is being continued, for with  $14\frac{1}{2}$  inches of bearing surface a broken crank shaft has never been heard of in a Great Western 40.

The piston is of the convex head type which not only strengthens the construction, but reduces the expansion, at the same time increasing the compression. This type of piston prevents oil from collecting on the piston heads, and helps to do away with an accumulation of carbon. Oil grooves are provided at the bottom of the pistons to distribute oil to the cylinder walls. In addition to the five-bearing crank shaft feature the strength of construction maintained throughout the car is shown in the design of the crank case. It is of I-beam sections through which steel studs run, one end of each bolting through the cylinder base and the other end through the crank shaft cap. The bearings used throughout the crank shaft are nickel babbitt die cast.

The cam shaft is a solid forging with the cams intergral, and can be removed from the front of the motor without disturbing the balance of the parts. The intake valve is on the side, and the exhaust valve in the head of the

motor, where the exhaust gases are discharged very quickly so that the intake gases go into the cylinder without crossing the burnt exhaust gases. As the exhaust gases expand in their rush toward the muffler the expansion is taken care of by the enlargement of the exhaust manifold which is four times greater in area at the muffler pipe end than at the exhaust port of the cylinder.

A vent pipe has been designed that releases the crank case compression, but through which oil cannot possibly be blown all over the motor, as with straight vent pipes. Layers are placed across the vent pipes on the inside, but lying first on one side and then on the other so that the compression is relieved and oil can be poured in through the pipe when desired.

The lubrication system is contained in the bottom of the crank case. The oil level is fixed at the factory before shipment, so that the driver has nothing to adjust or worry about. The oil is pumped from the oil reservoir in the bottom of the case to a sub-bottom in the lower half of the crank case where the oil maintains a constant level with two holes, through which it returns to the oil reservoir.

# Great Western FORTY

**Torpedo**  
**\$1750**

The radiator is of standard construction, except that the water spaces do not come in contact with the frame. Thus leaks are avoided. This radiator is a little larger than the motor is supposed to require, so that all over-heating troubles are absolutely avoided. A centrifugal pump is used on the 1911 chassis.

The transmission is again of the selective type, with three speeds forward and reverse. But improvement in the past year has been made in the gears. The teeth are made for strength, and are liberally designed so as to stand abuse. A cone clutch is again used, covered with raybestos, with six engaging springs placed underneath the lining. This clutch operates very easily by a foot pedal and works so smoothly that it is being continued without change.

The steering gear is of the worm and sector type, with the spark and throttle levers above the steering wheel. On the Torpedo and Semi Torpedo models a dished aluminum spider is used with a laminated wheel. But the Touring Car and Demi Tonneau types have a brass spider with an ebony wheel. The front springs are semi-elliptic while the rear springs are three-quarter elliptic, and are now fitted with rubber bumpers throughout. An I-beam drop forged front axle with 11 inches road clearance is used. The rear axle is of the semi-floating type, the same as used in 1910 with success. A very substantial yoke slides on the housing of the propellor shaft, allowing for the variations in the position of the shaft on unequal roads.

The control set is conveniently placed just outside of the frame on all types except the Full Torpedo, in which model it is on the inside of the body. An emergency brake lever operates an internal brake, and the foot lever operates the external brake. These brakes are of very liberal dimensions and will hold the car on any hill.

All unnecessary parts have been eliminated and the design of the various bodies is not marred by clumsy attachments or exposed brake rods. A pressed steel drop frame is used with a sub-frame supporting the motor, transmission and clutch. The frame is narrowed in front. Thus the car can be turned on an ordinary street. These models are made in both the standard 56½ inch tread, and the 60 inch tread for southern use.

**Simplicity--Durability** Simplicity of construction and refinement of design make the Great Western 40 almost troubleproof. The motor is so responsive, so quiet, so steady. The absence of vibration is most conspicuous. Each cylinder is ground to watch-like accuracy, and it RUNS so, under any load, on any road, in any weather. Each part is made with one point in view: DURABILITY. And we are certain of getting this. For we make our own motors. Back of each is sixteen years of experience in making good gasoline motors up to 500 horsepower. And we have the facilities—and the skilled mechanics, to help.

Rated at 40, the Great Western 40 actually develops a full 40. But better than that it TRANSMITS that full 40. Power generated, but not transmitted, means power lost. Yet actual test of many cars prove conclusively power losses of from 10 to 20 per cent. Thus, you see, in the Great Western 40 you have an ample reserve of power for emergency. You can have all the power you need, WHEN you need it. And all the speed you want, WHEN you want it—60 miles an hour if you choose.

## Quiet Beauty -- Luxurious Comfort

Note the graceful, pleasing design of the Great Western 40. Its appearance, though dashing, is conservative, refined. A car fit to travel in the most select company—a car to make its owner justly proud. In the Great Western 40 you get something CLAIMED by EVERY car, but sorrowfully missing many: COMFORT.

The luxurious leather upholstery over finely tempered steel springs afford all the comfort of a Pullman. The 34 inch tires take you over the bumps and humps of the roughest roads with perfect comfort.

And the 114 inch wheel base—increased 2 inches from last year—adds further to the comfort of the Great Western 40.

If you buy a Great Western 40 you will have much to be glad for. All the service of a \$5,000 car for \$1,600—at a far lower cost of up keep. You'll have freedom from trouble and worry. For the dependability of the Great Western 40 abolishes all chance of ever being stalled on the road—10 miles from nowhere—away from help and repair shops.

You can be sure that you'll get where you're HEADED for, and BACK again, safely.

No car—at ANY price—affords a better investment than the Great Western 40. Now send for complete specifications, and learn about the car that set the motor world agasp—the all-purpose car—the car that NEVER LAYS DOWN.

USE THE COUPON—It's for your convenience.

## ELECTRICS IN TOURING TESTS

**Extended Trials of Edison Battery Reveal  
Its Advantages for Heavy Mileage—  
"Climb to the Clouds."**

It is probable that the history of the automobile industry holds no record of a "pathfinding trip" more significant in its true meaning than that recently completed by two electric vehicles in covering the 1,000 miles route of the so-called ideal tour through New England. Although its promoters have not applied that designation to it, it actually was of the nature of a pathfinding expedition in the sense that,

ELECTRICS READY FOR THE "CLIMB TO THE CLOUDS"

besides demonstrating the perfectly obvious fact that it is possible to make such a trip in an electric car, it served to locate suitable charging points where the service necessary for such an undertaking can be obtained. In consequence of this exploit, it is confidently hoped that within a year or two the use of electrics for touring over charted ways no longer will be considered extraordinary, but will become decidedly popular with certain classes of motorists.

The tour, which was taken by the two cars, running in opposite directions, was the culmination of an extended series of tests devised to demonstrate the practicability of the electric for use as a true family car for general purposes, and also to demonstrate the advantages of the new Edison battery. The entire undertaking formed the subject of an illustrated lecture delivered by Frank L. Dyer, of the Edison Battery Co., before the Electric Vehicle Association of America, at its first annual convention in New York this week. These runs, totaling a mileage of more than 3,200 in the aggregate, have occupied the whole summer and covered a wide range of territory.

"These trips," said Mr. Dyer, "constitute the work that has been done so far in

showing the public that the electric is a car of unsurpassed utility and of great convenience. They were taken without the slightest hardship, but on the contrary the young men who actually achieved the performances enjoyed their experiences. Even now a repetition of any one of them can be safely undertaken by any properly equipped electric car, but in the future no doubt the opportunities for charging will be improved. While to many these performances of electric automobiles may be in the nature of a revelation, further trips are in contemplation that will be even more remarkable."

Summarizing briefly the entire campaign, many of the details of which have not been published hitherto, Mr. Dyer continued:

"The routes embraced many of the suburban towns of New Jersey, Long Island, and Staten Island. In laying out these runs the ordinary good automobile routes were chosen irrespective of grades, the idea being to cover the same roads that would naturally be used by any other type of vehicle. Each trip called for the accomplishment of from 85 to 100 miles to be made on a single charge of the battery. In every case, after the return over the scheduled route, the vehicle was run to a standstill to entirely exhaust the battery and determine the excess mileage still retained in the car, thereby indicating the safe margin after each trip. . . .

"These day tours were open to any manufacturer who was in position to use the Edison battery. The S. R. Bailey Company, of Amesbury, Mass., and the Anderson Carriage Company, of Detroit, Mich., were the first to enter. . . . The battery equipment of the Bailey and Detroit cars is 40 cells, each of the Edison A-6 type, the normal charging rate of which is 45 amperes at 75 volts for 7½ hours. . . . The cars were weighed with their load, showing 2,357 pounds for the Bailey and 2,448 pounds for the Detroit. . . . Strict care was taken that the pressure in tires should re-

main constant, so as to obtain true odometer readings, and all tire troubles were carefully noted.

"The first run was made by the Detroit. Starting from New York at 7:28 a. m., the car proceeded to South Ferry to St. George, Staten Island, thence by way of the Richmond turnpike and Old Stone road through Tottenville, back over the Amboy road through Richmond to the Elizabethport ferry. From Elizabethport the route continued through Elizabeth, thence by way of Norris avenue to Union, thence by Irvington avenue to Orange, thence through Bloomfield to Hackensack; from there to Fort Lee and Undercliff, across the ferry at 130th street, down Riverside drive to the starting point, which was reached at 5:02 p. m. Taking out the time for lunch and delays at the three ferries, the running time was six hours and 58 minutes, the distance being 84 miles, giving an average speed of 12.07 miles per hour. This is certainly a fair average when we consider the numerous stretches of freshly tarred roads that were encountered and the fact that on the northern portion of the run, towards its end, the grades were quite stiff, often as high as 2 per cent. Excess mileage being run off in New York showed a safety surplus of 18 miles, making a total of 102 miles for the day on a single charge.

"The second run was made with the Bailey car, starting from 40th street to the 23d street ferry, thence to Jersey City. From there the car proceeded across the meadows, the road at that time being under construction and in bad condition; through Newark to Montclair, up the Valley road to Great Notch, over some exceedingly stiff grades to Little Falls, along the Pompton turnpike to Mountain View and Pompton. This as any one who has been over this section of the country knows, is a beautiful run, affording occasional views of the Passaic river winding through its tunnel of over-hanging trees. The route continued to Pompton river and lake, and the quaint, now almost unused, Morris canal; thence to Butler and return, thence with some stiff grades over Preakness mountain to Haledon, through Arcola to Hackensack to Fort Lee and Undercliff, ferry across the Hudson, and Riverside Drive to the starting point. The total mileage was 76 miles, and the time, omitting stops, was five hours and six minutes, giving an average speed of 13.19 miles per hour. Excess mileage being run off in New York, showed a surplus of 40 miles, making a total for the day of 116 miles, on a single charge. Some parts of this particular run may be spoken of as almost mountainous, grades of 10 per cent. being frequently met."

Three other runs made by the same cars resulted in mileages and average speeds as follows: 122¼ miles, at 12.38 miles per hour; 139½ miles, at 13.71 miles per hour; 113 miles, at 12.47 miles per hour.

"To demonstrate the dependability and reliability of a single battery charge," Mr. Dyer goes on to say, "the Detroit driver was facetiously given the role of a sick woman (his name was Darling) under the doctor's orders to spend at least an hour and a half per day for a week in her electric in Central Park, but unfortunately whose credit at the garage was low, so that she was able to pay for only a single 7½ hours charge at the normal rate. In this test no water was given the batteries, and for the seven days the charging socket was sealed. For seven successive days from one and one-half to two hours each day the car was run in the park, and showed at the end of that time an odometer reading of 120 miles, at an average speed of 12.32 miles per hour. The cost of the current consumed was \$1.42 or 21 cents per day for a trifle over 18 miles.

"Another interesting test was in connection with Fort George Hill, the Mecca of all 'hill climbers' in and around New York; the Bailey car was given the task of finding out how many times she could make the ascent. The hill is 2,238 feet in length, and, according to the Engineering Department of New York, the grade is 11 per cent., the road bed being a fair granite block. The car was started from a standstill at the foot of the grade each time, and made 21 successive trips up the hill, on a single charge of the battery. This particular performance means a climb of almost one mile into the air in eight miles, to say nothing of coming up grade for nine miles from the garage to reach the hill. . . .

"It was next thought feasible to take a week's tour, representing perhaps the maximum leisure a busy man might be able to secure, and which he might desire to pass in a pleasant, profitable and economical way. After a little correspondence regarding charging stations in Pennsylvania, it was decided to circle the state of New Jersey, making night charging stops at Asbury Park, Atlantic City, Philadelphia, Bethlehem, Port Jervis and Newburg. The roads in New Jersey were in good shape, but those in Pennsylvania were bad, and the grades were heavy and full of short waterbreaks. The daily runs by the two cars, taking the roads by and large as they came, varied between a minimum of 94 miles, in every case on a single charge. The total mileage was 489.

"The success encountered on this particular trip was so pronounced that it was then decided to attempt the 'Ideal Tour' of approximately 1,000 miles. . . .

"The Bailey and Detroit cars, with their crews of two men each, equipped with baggage and necessary touring outfit of tools and tires, left New York City on Saturday, September 17th last, and arrived at Waterbury, Conn., their first stopping place, the same night, both in good form, one car having taken the Hudson river route and the other that along the Sound.

"After recharging their batteries at Waterbury on Saturday night, the cars parted, the Bailey making her next stop at Pittsfield, Mass., and the Detroit proceeding to Boston by way of Hartford, Springfield and Worcester. The third night saw the Bailey car at Manchester, Vermont, where she was confronted by one of the extreme tests of the trip—the passage over Peru mountain with its rough roads and heavy grades. The owners of large gasoline cars laughed at the Bailey crew, when they were told what was to be attempted, saying that the feat was absolutely impossible. Nevertheless, the car went over in fine shape and reached Springfield the next evening. A short delay was experienced here in charging due to lack of water power at the Central Station.

"Meanwhile the Detroit car was spinning along the Massachusetts and Maine coasts, through Portsmouth and Portland on to Poland Springs, . . . the Bailey going through Claremont, New Hampshire, and Newport, past Sunapee lake, and making her night stop at Plymouth and again recharging. The Detroit at this time was plowing through heavy sand from Poland Springs, en route to Bretton Woods, to gain which she had the climb through Crawford Notch and over Tug-o'-War Hill—the Waterloo of many big cars.

"Both cars met at Hotel Bretton Woods, Mount Washington, a trifle behind the regular schedule, due solely to delays in charging, for it must be realized that on this maiden trip through the localities where electric cars were practically unknown, some of the charging facilities were decidedly crude.

"At Bretton Woods a pleasant diversion from the original schedule was decided upon, no less than an attempt to climb to the summit of Mount Washington by the wagon road. The cars were therefore driven to Jackson, the nearest charging point, and thence to Glen, the base of the actual climb. Due to unavoidable delays and heavy weather, it was necessary to spend the night at the 'Half Way House,' and continue the climb next morning. . . .

"The actual summit of the mountain was not reached, owing to the presence of sleet, hail and a heavy gale, which made it impossible, but the cars were not turned back until they had ascended nearly 6,000 feet and were within one mile of the top. . . . The return through a blinding rain and wind storm that swept the mountain and made the road almost undiscernible was a trip never to be forgotten by the two drivers.

"From Bretton Woods the two cars continued over the prescribed route without mishap and substantially on schedule. The Bailey odometer showed a total mileage of 1,017.99 miles, the actual running time was 86 hours and 31 minutes, and the average speed for the entire trip was 11.77 miles per hour. The Detroit made a total of

1,017.73 miles in 89 hours and 25 minutes, with an average speed of 11.35 miles per hour."

#### How to Clear the Running Board.

In refitting used cars it is a very good plan to clear the running board of encumbrances, as is being done by a number of manufacturers in turning out their new models. With rare exceptions it is possible to arrange a mounting for the gas tank under the body; either in the rear, or inside the frame between the gear box and one of the side members. The tool and battery boxes are not so easily disposed of, but by utilizing to the best possible advantage the space under both the front and rear seats it generally is possible to get them out of sight, without rendering access to them at all difficult. The clearing of the running boards possess the double advantage that it improves the appearance of the machine and that it leaves ample room for carrying a number of suit cases.

#### To Keep Motor Truck Engines Cool.

Operators who have had experience chiefly with cars of the pleasure type should bear in mind that certain peculiarities inherent to its work render the cooling of a motor truck engine considerably more difficult. The main difficulty in connection with the cooling of a commercial vehicle engine is that owing to the relatively high speed of the motor and slow speed of the car the natural circulation of air over the radiating surfaces is considerably reduced. Therefore, it is extremely important to make sure that the fan driving belt or gearing is in good condition at all times, and also to see that the circulating system is free from deposits and the pump in working order.

#### Value of Recording Tire Mileage.

Motorists who take the small amount of trouble necessary to keep an accurate odometer record of the mileage of each of their tires will find themselves well repaid in the end. By observing the exact amount of service rendered by each shoe a standard soon is developed by which the performance of new equipment may be judged, while any sudden deficiency in the case of one or two wheels, may be taken as an immediate indication that something is wrong with the mechanism or that the wheels are out of line.

#### Why Locking Ring Should be Secure.

In replacing tires on quick detachable rims which are of the variety in which the removable flange is secured by a locking ring, care should be taken to see that both the flange and ring are properly in place before the type is inflated. If this is not done, there is considerable risk that the attachment may not be made positive, in consequence of which there is danger of "throwing" the ring with some little risk of injury to passing traffic.

**OVERLAND'S TWO NEW OFFERINGS**

**Toledo Company Produces a \$900 Touring Car and a \$775 Runabout—Characteristics of the New-Comers.**

Although preliminary announcements of the Willys-Overland Co., Toledo, O., had indicated that its new line consisted of no less than 13 different models, the existence of still another model, a fourteenth, known as model 47, is revealed unostentatiously by an advance catalog which just has been issued. This new-comer is a touring car listed at \$900, although its specifications place it in the class with machines which often are

light delivery wagon with 25 horsepower motor and built in either open express or closed delivery styles; "38," which is a light four passenger touring car equipped with the Overland pattern of planetary change gear, pedal controlled; "40," a 40 horsepower runabout which may be arranged for two, three or four passengers and which has three-quarter elliptic springs in the rear to ensure comfortable riding over even the worst of roads; "42," a 40 horsepower touring car with selective change gear, 112 inch wheel base and 34 by 4 inch tires; and model "41," which is similar to the last named model, save for its lighter general construction, some differences in body design, and that it is equipped with the planetary style of change gear.

SALES-MANAGER G. W. BENNETT IN THE NEW \$775 OVERLAND

sold at a considerably higher figure. It has the 20 horsepower motor which is employed in model "46," but its wheel base is longer than that of the torpedo runabout, being 102 inches, and it is equipped with 32 by 3½ inch tires.

The other striking Overland innovation is the popular priced model 45, listed at but \$775. It is a runabout of 20 horsepower. In the accompanying illustration the car is shown with Sales Manager George W. Bennett seated behind the steering wheel. In the range of 20 horsepower runabouts in which its general specifications place it, it is distinguished by its full-elliptic rear spring suspension, which renders it suitable for use over rough roads as well as city and suburban boulevards, and its large capacity gasoline tank, which likewise fits it for touring purposes. Its wheel base is 96 inches and it is equipped with planetary change gear, multiple disc clutch and the Remy magneto. It is shod with 32 by 3 inch tires, the 32 by 3½ inch size being furnished, when required, as an option.

The new Overland product, considered as a whole, includes the perpetuation of five styles of car that have been built during 1910. They are models "37," which is a

Of the new models, "46," "50" and "53" are torpedo runabouts, while "54" is a torpedo runabout of very nobby proportions. "46" differs from the "45" model already mentioned, principally in the matter of its body design, the chassis being practically the same. Model "49" is a revision of the continued model "38," having the 25 horsepower motor, 102 inch wheel base and full elliptic rear springs. Unlike the older model, however, it has the sliding pinion form of change speed gear.

An option as to the open or closed-front style of touring body is afforded in the case of the new model "51," which is a 30 horsepower five passenger touring car having the selective transmission and 110 inch wheel base, three-quarter elliptic rear springs, selective transmission, and the Bosch "two independent systems" ignition arrangement which employs eight spark plugs and allows complete independence between the magneto and battery, the three large models have the 40 horsepower motor, 34 by 4 inch tires and are the most elaborate cars in the line in their respective classes. In the order named they are a standard touring car for five passengers, a torpedo runabout seating two, and a tor-

pedo touring car for four passengers.

The complete line thus musters two commercial vehicles, six runabouts, one of which is adaptable for two to four passengers; three touring cars for four passengers and four for five passengers, making 15 in all, or 14, if the two styles of commercial body adapted to the same chassis be counted as a single model. Three models are of 20 horsepower, three of 25, two of 30 and six of 40. Except in the case of the three large models mentioned above, ignition universally is effected by means of the dual system with the Remy magneto as standard equipment. Engine lubrication is effected by a force-feed oiler driven by the cam shaft, except in the case of models "40," "41," "42," "52," "53" and "54," these motors being equipped with a self-contained oiling system located in the crank case.

#### To Handle German Steels in America.

The Becker Steel Co. of America has been incorporated under the laws of the state of New York to handle, in the United States, the products of Stahlwerk Becker, A. G., Willich, Germany. The plant of Stahlwerk Becker has one of the most modern equipments in the world for producing high grade steels of all descriptions, particularly alloy steels of difficult fusibility, as all steels are electrically melted in Paul Girod furnaces. George B. Norcross is general manager of the American company. Offices and warehouses already have been established in New York and Detroit, and the company contemplates locating similar establishments in all of the principal industrial centers of the United States, so that shipments can be made promptly from the large and well assorted stocks which will be carried. All types of alloy steels used in the construction of automobiles are supplied and are furnished promptly in either bars or forgings.

#### Stock Offer to Stimulate Co-Operation.

As an earnest of his belief in the policy of co-operation, President Benjamin Briscoe, of the United States Motor Co., has caused to be set aside \$1,000,000 worth of its 7 per cent. cumulative stock, which is offered to the company's employees, with participation in proportionate distribution of a block of common stock aggregating \$250,000, thus enabling all its employees to become stockholders in the concern. Any one in its employ, including its agents, will be privileged to subscribe. President Briscoe's plan is to sell the preferred stock on the instalment plan, turning over to a board of trustees all stock subscribed for by an employee, which trustees will hold until the same is fully paid for. The employee shall have the privilege on and after August 1, 1911, to continue his payments or withdraw all he has paid in plus 4 per cent. interest per annum. In order to induce him to continue investing, a bonus of 25 per cent. in common stock will be given to stock-holding employees.

# Profits of a Metropolitan Motor Bus Line

The possibilities and actualities of motor bus transportation are well illustrated by the annual report of the Fifth Avenue Coach Co., of New York, which just has become public property, and the growth of which has been so quiet as scarcely to be realized by the average resident of the big city, despite the conspicuous figure which the big, double-deck buses present on the public streets. These buses have entirely replaced the smaller horse-drawn coaches which previously were employed and, as was the case with the latter vehicles, they ply Fifth avenue, Riverside drive and St. Nicholas avenue, which practically are the only chief thoroughfares on which the trolley car has not yet encroached. The company's report covers the fiscal year ending June 30, 1910, and apart from the marked increase of the buses' popularity which it discloses, it is remarkable as indicating that

not one of the 61 vehicles employed had to be withdrawn from active service during the 12 months.

Although the equipment of the company did not experience any increase in point of number of cars employed, it carried fully 74 per cent. more people than in the 12 months preceding, the figures for the two years being 6,305,165 and 3,009,294 respectively. Of these 6,305,165 passengers carried, 5,755,221 were adults paying ten cents per ride, while 549,954 were children who paid five cents each. For depreciation the company charged off one-third of the purchase price of the buses, amounting to \$112,583.28, while for depreciation of the tire equipment \$55,125.76 were allowed, or over 10 per cent. more than the entire capital of the company. With its gross receipts in fares fixed at \$603,019.80, the income per bus mile amounts to 45.67 cents,

and as the transportation expenses for the 1,320,432 miles figured up to \$247,020.33, the expenses per bus mile amounted to 18.71 cents, not including depreciation of equipment, maintenance of buildings, etc.

The increased popularity of the motor buses was responsible for the great increase of the surplus of the company. Although the corporation is capitalized at only \$50,000, it was able to put \$27,879.77 in the surplus capital, or more than 50 per cent. Another example of its economical management is hidden in the item "office furniture and fixtures," which has remained at the modest sum of \$263.90, an increase of but \$28.50 over that of the preceding year. At the same time the cash capital in hand is in excess of the total capital stock outstanding, a condition of affairs which is highly creditable to the management of the company. The report in detail:

## Operating Statement.

	1910	Year's increase or (*) Decrease
Number of omnibuses (exclusive of two non-revenue cars).....	61	
Number of round trips made during year...	153,609	56,679
Number of bus hours during year.....	177,832	65,736
Number of bus miles (including 39,768 "idle" miles).....	1,320,432	524,057
Number of passengers carried at 10 cents...	5,755,221	2,332,507
Number of passengers carried at 5 cents....	549,954	363,364
(Queensboro Bridge discontinued September 20, 1909.)		
Total amount of fares (45.67 cents per bus mile).....	\$603,019.80	\$251,418.90
Revenue from livery service.....	13,053.19	5,268.62
Advertising.....	14,232.12	4,232.12
Miscellaneous.....	20.00	*.01
Total revenue from operation.....	\$630,325.11	\$260,919.63
Maintenance, building and fixtures.....	\$4,288.91	*\$13.18
Tires (Depreciation of tires in 1909).....	55,125.76	27,768.44
Maintenance, equipment.....	74,923.28	39,417.99
Depreciation, vehicle equipment (a).....	112,583.28	46,989.64
Conducting transportation.....	247,020.33	108,009.90
Damages and injuries (b).....	18,085.71	15,033.36
General expenses.....	20,746.37	4,406.96
Discount on material and supplies. Cr. (c).....	1,606.31	1,606.31
Total operating expenses.....	\$531,167.33	\$240,006.80
Taxes.....	\$34,059.29	\$14,230.22
Income from operation.....	\$65,098.49	\$6,682.61
Non-operating income (interest).....	725.06	*145.71
Gross income applicable to corporate properties.....	65,823.55	6,536.90
Income deductions—Interest on advances..	36,714.76	*532.14
Net income for year.....	29,108.79	7,069.04
Deduct profit and loss adjustment.....	\$1,229.02	*\$2,128.84
Net increase of surplus.....	\$27,879.77	\$9,197.88

(a) Depreciation is charged at the rate of one-third of the cost of omnibus equipment (on an assumed life of 3 years for buses), to create a reserve for replacement. No buses were withdrawn from service within the year.

(b) The charge to expense for damages and injuries is the equivalent of three cents per bus mile, but the actual payments during the year were \$4,570.35 (including \$1,937.21 on account of

Assets.		
Cash.....	\$50,477.09	\$13,261.24

Accrued interest, wages, and other unfunded debts.....	9,262.05	*189.13
Reserve for injury and damage claims (including other reserve of \$531.83 in 1910)	37,894.72	35,957.51
Capital stock.....	50,000.00	
Total liabilities.....	\$697,399.37	*\$96,717.64

Employees—On June 30, 1910: Conductors, 72; drivers, 70; others, 99; total, 241. Total salaries and wages, \$181,509.76. Included herein are 28 officers and clerks of the New York Transportation Co., who perform service for the Fifth Avenue Coach Co., and a portion of whose salaries are charged to it.

Accidents—Killed, 3; injured, 25.

previous years). This reserve was begun June 1, 1909. After paying the amount mentioned, the balance in the reserve was \$37,362.89. At the beginning of the year there were 13 claims and 17 suits for damages on account of personal injury; at the close of the year there were 10 claims and 13 suits.

(c) Reported under non-operating income, here deducted from expense.

**HUPP BRINGS OUT A LARGER CAR**

**It's a Full-Size Touring Model Listing at But \$900— Two New Bodies for the Popular "Little Hupp."**

Having originated the small runabout of striking appearance, which made such a quick "hit"—the "little Hupp," as it is familiarly termed—the Hupp Motor Car Co., of Detroit, Mich., now have launched a larger model, a full-size four passenger touring car, listing at but \$900, which is certain to command attention.

This car is equipped with the Hupp 4 cylinder, 20 horsepower motor. The cylin-

crank case extension, thus forming a unit power plant. The gears run in oil, the one universal joint at the rear of the transmission being enclosed in a dustproof case and lubricated by oil which flows from the crank case. The car is driven by a shaft which turns within a steel tube, this tube taking all of the torsional strain. The differential housing is well ribbed. Hyatt roller bearings are used on the outer ends of the axle. The foot and emergency brakes are both internal expanding and have a non-burning lining. The front axle is an I-beam section drop forging, with integral spring seats, and the springs are semi-elliptical in front and of a patented cross spring construction in the rear. Oil cups are attached to all spring bolts. The wheels are

THE NEW 20 HORSEPOWER \$900 HUPMOBILE TOURING CAR

ders are  $3\frac{1}{4}$  by  $3\frac{3}{8}$  and are cast in pairs, having the valves on the left side with adjusting nuts on the valve stems; the spark plugs are placed over the inlets. The crank shaft bearings are of Parsons white bronze. The pistons have three rings. Every moving part except the flywheel and valve stems is enclosed in oil tight and dust proof housings. Lubrication is accomplished by the splash system, the flow of oil being governed automatically by a positive and simple adjustment on the oil reservoir interconnected with the accelerator control rod. The reservoir is attached to the side of the cylinders. The ignition is jump spark, the principal current being furnished by a Bosch high tension magneto. The spark is fixed, eliminating the control lever generally used. The cooling system consists of a Mercedes type of radiator with vertical tubes and straight fins, in connection with the thermo-syphon system of circulation. The clutch is of the multiple disc type in which ten plates are used, enclosed and running in oil. An improvement in the clutch this year is that tension adjusting plugs are used on the clutch springs.

The wheel base is 110 inches. The frame is pressed channel steel and has four cross members. Selective sliding gear transmission is used, giving two speeds forward and one reverse, the gears being contained in the

30 by 3 inches in front and 31 by  $3\frac{1}{2}$  inches in the rear. Two pedals constitute the clutch and service brake control, while the emergency brakes are operated by a hand lever at the driver's right. The gear shifting lever is conveniently placed at the side. The throttle lever is mounted on the steering column under the wheel, and interconnected with a foot accelerator pedal. Steering is done by means of a 15-inch wheel operating through a rack and pinion type of gear.

The Hupp company will not only continue to produce the "little Hupp" in runabout form, but will also supply it with torpedo and coupe bodies.

**Putting Soaps to the "Litmus Test."**

Rather a fanciful, but no less exact, way of investigating the properties of any soap that is recommended for automobile washing is to apply to it the chemist's "litmus test." A strong solution of the soap is prepared and into it are dipped bits of red and blue litmus paper, such as may be obtained from any druggist. If the soap is either acid or alkaline in its properties, the colors of the test papers will be changed, according to circumstances. As both acids and alkalis are calculated to injure the varnish of the car, a strong soapsuds which responds readily to such a test may be considered unsafe to use.

**"LAG" OF THE BATTERY SYSTEM**

**Why Engine Speeds Up when Shifted to Magneto—"Averaging the Advance" Cause of Popular Supposition.**

Frequently when changing over from battery to magneto ignition it is observed that the speed of the engine increases, and the effect commonly is ascribed to the more rapid ignition resulting from the greater intensity of spark which the magneto is supposed to produce. Generally speaking, however, such is not the case, the effect being due rather to the more accurate timing of the magneto and to the more nearly absolute synchronism of the sparks in various cylinders which it ensures. Even admitting that it is much easier to secure synchronism in sparking with the magneto than with the battery, it may be said that in most instances the increased engine speed observed in such occasions results not from any structural or functional advantage on the part of the magneto but from lack of skill on the part of the operator in not adjusting the battery spark to the best timing point.

As is generally understood by those who have made a close study of the subject, a certain very minute period of time is required to accomplish the "saturation", of the windings of either a spark coil or a magneto armature. In the case of the coil, however, it frequently happens that this period is greater than it is in the ordinary magneto, while a further element of delay results from the inertia of the vibrators. These effects combine to cause a delay in response after the primary contact is made at the timer; and that delay may be compensated for by the skilled driver by advancing the spark almost to the point at which the explosive impulses will occur before the pistons begin to descend, and so cause the engine to knock.

Still another cause of possible lag on the part of the battery system is that with improper adjustment the response of the various vibrators will vary. Wear on the contact points, pitting of their surfaces, differences in the temper of the springs and faulty contacts at the different points in the timer afford other opportunities for irregular sparking. And irregular sparking involves delayed ignition in one or more cylinders, with a possibility that when the spark is advanced to its maximum the more advanced sparks may cause very slight back pressures in the affected cylinders and so cut down the effective turning moment of the engine.

Where but a single coil is used with a high tension distributor in addition to the primary timer, of course, the difficulty due to irregularities in the setting of a number of vibrators is eliminated. But this system

also possesses certain possibilities of irregular action if the timer and distributor are not kept up to their full efficiency.

The average automobile driver is not accustomed to "following" the acceleration of his motor any too closely by advancing the spark as the speed increases. As a matter of fact, very many drivers adopt two or three arbitrary positions for the spark lever and shift it from one to another as the speed of the engine varies, without taking the trouble to maintain an accurate adjustment at all times. It is this habit of "averaging the advance," so to speak, that may be held to account in most instances for the popular supposition that the magneto spark is the more effective of the two; that is, supposing that both magneto and battery systems are properly adapted to the engine and that they are in equally good condition.

Perhaps a more general reason for the noticeable speeding up of the engine at the instant the spark is shifted arises from the fact that the battery is very commonly used at the present time for starting on the spark, and for little else. Under such circumstances it is customary to throw over the controlling switch almost immediately after the engine has taken up its cycle on the battery spark. That being the case, it is evident that during the brief instant the battery system has been in use the timer has not been advanced, although the engine, running without load, has increased in speed up to the full limit of its retarded spark. The magneto, on the other hand, its timing being to a large extent automatic, gives a much earlier spark. Thus the effect in such cases is much the same as though the switch had not been touched, but instead the timing lever had been suddenly yanked part way around on its sector. If, incidentally, the batteries happen to be a trifle weak or the vibrators dusty from disuse, the effect will be rendered all the more noticeable.

#### Lubrication that Saves Gearsets.

One portion of the average gearset that frequently receives far less careful attention than it deserves is the thimble bearing at the forward end of the driven shaft. Because of its nature this bearing is difficult to inspect without dismantling the entire transmission, while it is equally difficult to lubricate, especially when not of the anti-friction variety. To prevent the bearing from cutting and so causing the shaft to get out of line and disturb the alignment of the gears, it is important that the ducts through which it is lubricated be kept clean at all times and that a proper amount of oil be fed to it. Unless this precaution is taken the cutting of the bearing and the surrounding bushing, which is likely to ensue, is apt to shorten the life of the entire gearset by not a few hundred of miles. Its effect, of course, first becomes noticeable when the gears fail to mesh properly.

## PHOTOGRAPHING FACTORY PARTS

**Not the Simple Process Generally Supposed to Be the Case—Apparatus That Is Necessary.**

Few people who view photographs of collections of automobile parts and the like have any idea of the complicated work which is necessary before the actual "picture-taking" is commenced. As it naturally is extremely difficult to get perfect light and correct grouping of parts and tools, if the articles are suspended vertically, or fastened upon a vertically placed board, inventive genius has produced ap-

pliances which render this difficult proceeding quite easy and simple.

In the accompanying picture is shown the solution of the problem as carried out in the E-M-F Co.'s factory in Detroit, Mich. A high scaffold has been erected upon the top of which a camera is fastened in such a way that its "eye" points vertically downward. The height of the structure being invariable, it therefore is possible to obtain by careful experimentation a focus arrangement which renders every article in the picture as sharp and clear as the art of modern photography permits. Once such a focus is fixed it may be measured and noted down for future reference, giving in advance perfect assurance of the picture's "coming out well." The groups of parts and tools to be photographed are placed on a tray covered with white cloth; each part is numbered and a clerk jots down the names as the tray is being "snapped."

A great advantage of this style of pho-

tographing is the almost complete absence of disturbing shadows which may be obtained thereby. Choosing a day of diffused light, an object looked at from above presents no shadow at all, while the same object viewed from the horizontal has shadows below each raised portion. The same result may be obtained by throwing powerful artificial light directly horizontally upon a vertically hung board, but there the fastenings of the various objects always are more or less in evidence. When the tools or parts are delicate and thin such interference is often very disturbing.

Another novelty in the photographic establishment of the E-M-F Co., but one which is not shown in the picture, is the "snapping" of a complete chassis. This usually is done with the assistance of a block and tackle which lifts the car bodily off the floor into a "look pleasant" attitude of perpendicularity.

The scene depicted was occasioned by a recent revision of the parts catalogs, a bridge contiguous to the company's photograph gallery being employed for the operations.

#### The Lean Spark and the Fat One.

There is a general tendency to term an insufficient spark a lean spark, but not always with due reason. A thin spark, giving but little heat will cause a loss of power to a motor, not because it does not ignite the mixtures, but because the different cylinders frequently miss. The idea is also prevalent that a thin spark requires more gas than a fatter or hotter spark, but as the mixture either explodes or does not explode, the size or heat of the spark has nothing to do with the explosion force of the gas. The function of the spark is to ignite a minute part of the gas, the rapidity with which this combustion takes place depending entirely upon the gas itself and not at all upon the spark. A hot fat spark, however, is the best one, and simply because it is more liable to explode poor mixtures with more regularity.

#### Purposes Served by Talcum Powder.

That the French chalk or talcum powder dusted between the inner tube of a tire and its casing is intended to act as a lubricant between the adjacent surfaces generally is understood. But that it also serves a useful purpose in preventing the tire from heating unduly perhaps is not so widely appreciated. As a matter of fact, however, this is the case. For unless provision is made to cause the surfaces of the tube and casing to work together smoothly the friction created by the great pressure to which they are subjected will tend to generate a very considerable amount of heat. This heat, of course, added to that caused by the churning of the compressed air in the tube, sometimes may cause the air to expand sufficiently to overstrain the tube and result in a blow-out.

**VELIE WITH DETACHABLE DOORS**

**Moline Manufacturers Permit Owners to Consult Their Convenience—Engine and Ignition are Improved.**

While the line of 1911 Velie cars, specifications of which just have been issued by the Velie Motor Vehicle Co., Moline, Ill., will include examples of the new closed-front type, these models will be unusual in that the front doors will be detachable. This feature will appeal to many buyers who will desire to remove the front doors

five passenger landaulet, semi enclosed; a limousine and a coupe. The landaulet seats five passengers in the rear compartment, as does also the limousine. The bodies of the latter two cars are interchangeable with that of the touring car.

All trimmings on these 1911 bodies are of heavy nickel instead of brass, although brass may be had if so ordered. The standard combinations of color are Velie blue with fine white line stripe, with Velie gray wheels, magenta lake striped in 20th century red with gear to match; Velie gray throughout with one-fourth inch stripe of white edged with fine line of black or Velie red throughout.

Lubrication is accomplished by means of a gear pump located on the bottom of the oil reservoir. All moving parts and bearings being provided with compression cups or spring oilers. The clutch is of the dry disc type with three engaging plates, but cork inserts have been added to the center disc and the throwout yoke is provided with an internal oil groove to allow more generous lubrication. Slight changes also have been made in the starting crank and in the valve for controlling the admission of the gasoline.

The Brown-Lipe selective sliding gear transmission is used, with three speeds forward and one reverse, and mounted on Tim-

VELIE TOURING CAR WITH CLOSED FRONT

THE NEW SEMI-RACING ROADSTER

during the warm days of summer, but who may have use for them when the wind and chill of winter makes them desirable. The design of the car makes it appear equally well with or without the doors.

The new models which have been added to the Velie line are a five passenger touring car with detachable front doors, a four passenger close coupled car with detachable

The Velie motor as heretofore is of the L type, of four cylinders,  $4\frac{1}{2}$  by  $5\frac{1}{4}$  inches, cast in pairs. The crank shaft is offset three-eighths of an inch. The principal change effected in the engine is that the mushroom style of tappet has been discarded for a new tappet of roller design and of heavy construction. A cam of somewhat different design replaces the old one.

ken short series roller bearings. The front axle is an I-beam section drop forged from solid ingot on Timken roller bearings. The rear axle is the Timken full floating with pressed steel housing and double radius rod construction, and the differential is a Brown-Lipe bevel gear on Timken roller bearings. The gears in the transmission are  $3\frac{1}{2}$  per cent. nickel steel, and those in

TOURING CAR WITH OPEN-FRONT BODY

NEW VELIE THREE PASSENGER ROADSTER

front doors, and a two passenger roadster of the semi-racing type, with low seats, rakish steering column, and an oblong gasoline tank mounted behind the seats. This latter model is designed specially for speed and is capable of at least 65 miles an hour. The older models are a five passenger touring car; a two, three or four passenger roadster; a four passenger toy tonneau; a

The result of this change is a more quietly running motor, which the company claims to be practically noiseless without the sacrifice of any power. The ignition system has been changed on the secondary or battery side, the Atwater-Kent uni-sparker replacing the 4-unit coil and commutator. The principal current, however, is supplied as heretofore by a Splitdorf magneto.

the differential are chrome nickel steel. In front the springs are semi-elliptic, 38 by 2 inches, and in the rear three-quarters scroll, 46 by 2 inches. The foot brakes are double contracting, and the hand, or emergency, are double expanding. The wheel base of all models is 115 inches, and the wheels, 34 by 4 inches, are provided with Hartford quick-detachable rims.

## SINS OF THE "EXPERT DRIVER"

His Species Blamed for Not a Few Existing Evils—Some of the Damage that He Does.

Perhaps one of the most exasperating pests in automobilism is that big little man—the "expert driver." In speaking of him, says a contemporary, we do not think of the painstaking mechanic who by dint of study and experience gained in actual practice familiarizes himself with motor cars until he is able to obtain from his charge the maximum service with a minimum necessity for repair and adjustment. Him we would call the expert motorist—but we have in mind the fellow who is an expert "driver" and nothing else. It is almost needless to say that since the exhibition of stunts in driving is apt to prove an expensive habit the expert driver rarely is found among the owners. Usually he has graduated from the washstand in a garage, while sometimes he is a specimen of the so-called natural-born mechanic, a species that neither modern mechanical progress nor scientific learning seems to have been able to exterminate.

It is the expert driver who is largely responsible for the animosity of the mere pedestrian against the motorist; it is he who scares elderly ladies into hysterics by bearing down upon them with a rush, only to clap on his brakes with a bang and bring his car to a stop half an inch from the pedestrian's shin.

Not infrequently the expert driver is a real expert as far as his exhibitions pass without the infliction of harm on others or on himself, but in every case he is a costly acquisition. If you want to watch him, stand in front of a busy garage for a little while and you will have ample opportunity to observe his doings. He will come out of the garage at full tilt, clear the opposite curb by ripping the steering wheel around with all his might, and disappear around the next corner in similar fashion. When he returns he will tear down the block at a speed of fifty miles an hour, throw on the brakes some eight or ten feet from the stopping point and bring the car to a stop almost within its own length—which of course looks very clever—to the driver—and costs money for repairs and excessive deterioration—to the owner.

This sort of driver is the one to whom an open muffler is music in the ears; who imagines himself a miniature Oldfield who could have beaten every record had he been given the chance.

As to climbing a hill on high gear every time, trust to your expert driver to do it. Very often he will do it, too, even if the motor should knock its own head off—in utter oblivion of the fact that low gear

ratios are made just for hill climbing. If you don't drive your car yourself, beware of the expert driver, or at least nip his ambitions early in the proceedings.

### De Palma's Daring Stunt on Cycle Track.

Ralph De Palma made three laps over the Clifton (N. J.) Stadium bicycle track last Sunday, with his "Cyclone" Fiat, a performance that crowded quite a few thrills into 43¾ seconds. The distance was half a mile. De Palma intended to go the mile, but the track managers became frightened and ordered him to stop. The Stadium is only one-sixth of a mile in circumference, being banked 45 degrees at the turns. Racing drivers have long contended that a car could not be driven over it at high speed without accident, while a slow pace was dangerous because of the steep banking. DePalma went six laps by way of trial—the track vibrating a good deal. The shaking, however, was as nothing to that which followed, when he opened wide. The boards, too, appeared to have rattled loose as he passed. The car skidded twice when it was near the top of the turns, which caused the management to end the experiment. DePalma complained of nausea as he ended. At times he said the front wheels were in the air. It is doubtful if another test of the sort will be permitted by the track owners.

### "Society Tourists" Elect Their Governors.

One of the oddest automobile organizations to be found the world over is the Motor Car Touring Society of New York, which held its annual dinner, last week, at the Harvard Club. The dinner table was decorated with miniature automobiles and aeroplanes, while the walls of the rooms were hung with automobile pictures. The seal of the society has been reproduced by most of the members for stick pins. A cunning little run will be held to Belmont Park, during the aviation meet, and next month a dreadfully long tour to Tuxedo, 30 mile away, will be undertaken. The governors chosen for the year at last week's meeting were A. Eugene Gallatin, Percy R. Pyne, 2d, Orme Wilson, Malcolm D. Sloane and Francis L. V. Hoppin.

### Baseball Player Will Surprise Mother.

The baseball season having ended, Tris Speaker, who played for the Boston American League team, started on Monday last for his home in Hubbard, Tex., 2,000 miles away. Unlike other players who are homeward bound, Speaker is making the journey in an automobile, a Velie, and is carrying a "message," sealed in a baseball, from the mayor of Boston to the governor of Texas. According to the story, Speaker will surprise his mother by making her a present of the Velie when he arrives in Hubbard—and if Mrs. Speaker does not read the newspapers she really may be very much surprised.

## CITY'S RIGHTS ARE CHALLENGED

Old Question of Municipality vs. State Arises in Indiana—Revocation of Licenses Involved.

The old quarrel between the administration officials of city and state, over their respective rights and privileges again has broken out, this time in Indiana. The question of whether or not the magistrate sitting in a municipal court has the right to revoke an automobile driver's license, which is issued by the state, has stirred up something of a howdy-do in Indianapolis, and Judge Remster, of the Circuit Court, is hearing arguments in a test case which at present is before him. Attorney Gaylord R. Hawkins, arguing on a demurrer before Judge Remster, said that the city ordinance which grants such power and authority is contrary to the laws of Indiana—that full control of speed limit and the regulation of automobiles and automobile drivers are vested in the state.

Judge Remster took the case under advisement and in the meantime Merle N. A. Walker, city attorney, will prepare a brief on the question and submit it to the court. The case probably will be decided during the present week.

Albert Ferguson, colored, driver for William M. Jillson, was arrested July 21st, and on a plea of guilty to speeding a machine, was fined \$10 and costs in police court. Judge Collins revoked his license. No appeal was taken in this case but fine and costs were paid. The driver prepared to "take his medicine," bitter as it was, and sought new fields of labor.

Later it was decided to make a test case out of it and Gaylord R. Hawkins was driven to police headquarters September 24th by Ferguson, where the driver was arrested for driving without a license. Entering a plea of not guilty he was tried and fined \$1 and costs. The case was appealed to the circuit court.

In the demurrer upon which Mr. Hawkins argued, it is alleged there is no power vested in the board of public safety to grant licenses; that the state has taken control of the regulation of speed; that the ordinance passed by the common council is void because it violates Sec. 23 of the bill of rights in granting privilege and immunity to one citizen in preference to others, as the board of safety determines to whom the licenses shall be granted; that the city has no power to punish for violations as it is in the province of the state; that there is no provision in the charter of Indianapolis which grants the right of the council to revoke licenses held by owners and drivers of automobiles and that the council has no power to vest the police judge with such power.

## Demonstrations; Helpful and Other Kinds

How few salesmen or drivers are capable of making good demonstration—one that induces first, confidence, and then enthusiasm and finally brings the "prospect" up to the buying point!

Many a sale is lost by a poor—a badly managed—demonstration. The ideal salesman is the one who makes his own demonstration instead of entrusting the customer for this critical test to a chauffeur, declares E. LeRoy Pelletier in the Co-Operator.

Only he who possesses the happy faculty of talking tactfully can make a thoroughly satisfactory demonstration. He can "suit the action to the word—the word to the action," in such a way that the car becomes a thing of life rather than a mere machine, seeming to obey his thought almost before the command is given.

Have you ever noticed how tense are your nerves when you watch an animal trainer putting his pets through their paces?

"Fido! roll over," he commands, and you wonder if Fido will roll over or sit up, instead.

The strain is as hard on you as on the trainer—more so, for by previous experience he knows the propensities of the brute.

I had an experience with a chauffeur-demonstrator once that always makes me recall a balky trick dog or a sulky trained seal.

I was unfamiliar with this particular car, so let a driver from the garage take the wheel. I sat in the tonneau with the "prospect." As we started out I asked him to note the smoothness with which the gears meshed—and my voice was drowned in a grating, crashing noise that made us both think the entire transmission had gone to smithereens. Catching another breath and trying to look cheerful, I called his attention to the smoothness of the clutch—when the driver bawled out "This infernal clutch is slipping—it's no good, anyway."

The sale had gone glimmering, of course, but I still smiled a set smile and as we approached a grade—less than two per cent.—the prospect asked, "How is she on hills?" "Great," I answered blithely, and just then the motor began to labor, then to buck and then the driver shifted back to second, "Cylinder full of carbon," he announced. It wasn't that—it was simply a bad carburettor adjustment which any salesman-driver would have seen to before starting. I bought the prospect a dinner to cover my chagrin—and directed him to my "dearest enemy" from whom he bought a car.

The trouble with most drivers—and all

mechanics—is that they are more solicitous of your opinion of them as a driver than of the performance of the car.

"If I had a magneto on this 'old boat,' I'd show you," said one the other day. "But the car isn't sold with a magneto," I replied, hoping to shut his trap. Vain hope!

"Naw! and there's a lot of other things it needs, too—only those wise guys up at the factory won't listen to some one what knows. I told them—" and you just couldn't keep him still.

In the course of a very good ride he told all the weaknesses of the car—or what he in the fullness of his ignorance considered faults—and convinced the prospect that the only reason he didn't win the Vanderbilt Cup race was because the house wouldn't give him a mount.

Now you are not selling drivers—cars is your line.

The object of a demonstration is not to show what a skilful driver you are—nobody gives a hang about that except the boss, and he knows and pays you for it.

What the customer wants to know is not what an expert like you can do with the car but what an inexperienced man like himself can get out of it. The more expert you are, the less recommendation for the car—can't you see that?

But the greatest weakness of the demonstration entrusted to a mere driver, instead of being made by the salesman himself, lies in the fact, patent to all good salesmen—that there's only one "psychological moment" in the entire course of a negotiation deal.

How often have you sent a prospective customer out with a driver feeling sure only a satisfactory ride was necessary to close the sale.

The driver came back alone. Oh yes, Mr. Jones was delighted with the ride—and his wife just raved over it—but—well, he said he would drop in tomorrow. Next time you saw Jones he was riding in another demonstrator's car, and a week later you learned he bought a rival machine.

Now there had been a psychological moment during that ride—a time when, flushed with enthusiasm, Jones would have said, "We'll take the car," and he would have stuck to it, once committed, even if the salesman hadn't sense enough to pull up at the first cafe or road house and draw up a contract, get his earnest money while the delighted lady sipped a cool lemonade.

But the driver did not know it. More than likely, having pleased them with some simple stunt he felt so elated he attempted

something almost impossible—and "fell down."

More sales are lost by demonstrations that frighten the customer than in any other way. The average driver prides himself on being able to burn up the road—forgetting that any fool can open the throttle and hold the car in the road at any speed, whereas it requires real skill to give the passengers a comfortable, satisfying, pleasurable ride. It is safe to say that any driver who violates the speed laws is a poor demonstrator. No man enjoys a fast ride in a car he is not accustomed to or with a driver he doesn't know. And it is not due to his cowardice, either. The man who is the most daring driver when holding the wheel himself is the most nervous when sitting in a car driven by another. Your own experience will tell you that.

Any car made nowadays will go fast enough to satisfy any but a speed maniac—the task is to prove that it will afford a comfortable ride over any road, a safe one in crowded traffic.

"When any man drives so fast that I begin to watch the car and the road I cease to enjoy motoring," remarked a lady in the writer's hearing. She had told the whole story. Nine out of ten people prefer loafing along at a fifteen or twenty mile pace, enjoying the scenery, breathing clear air and sitting restfully, to scorching over a dusty road and tiring every muscle by the effort to remain in the seat.

The demonstrator who realizes this will seldom bring back an excuse when he should bring a check.

The writer had a couple of hours to spend between trains in a Western town, not long ago. I improved the time by calling on our dealer there. He greeted us more cordially than such a busy man could afford to do, and insisted on showing us as much of the town as could be encompassed in the two hours I had at my disposal.

Followed a model demonstration—the one that inspired this article:

Leisurely he went about starting the motor. Didn't let it race and roar. Gently drove out of the garage—didn't drop in the clutch and make the curb at a jump. Didn't give us a crick in the neck when he engaged the high and clutch—it was as sweet as an electric.

Instead of making for the boulevard he drove leisurely down and through the most congested part of the city over mad pieces of pavement and trolley tracks where the bricks had worn away leaving a six inch chasm each side. Our man didn't mention

it; talked entertainingly of other things; but you marveled at the easy way the car glided over those bad spots. You couldn't help anticipating a jolt and were pleasantly surprised when you didn't get one.

He didn't try to drive pell-mell through the crowded street—it was 5:30 p. m.—or even to keep his high in all the time; on occasion he dropped back to second, even first. Always he conceded to pedestrians the right of way, and one realized that a man can drive a motor car and still be a gentleman—a fact some pedestrians have good cause to doubt.

Don't you know that shocks or inconvenience imposed on others takes half the pleasure and zest out of an automobile ride? I always feel as if every one not so fortunate as to own a car is entitled to sympathy and the lucky fellow in one can never be courteous enough to make up for this longing void in his less fortunate brother's heart. Our friend seemed to feel that way—he was getting so much pleasure out of that car he felt generous toward all the world and he asked for only enough road space to skip on unobtrusively.

One didn't notice that the speed had gradually accelerated as the "business section" was left behind, for our demonstrator was saying: "There, in that big house with the gray stone corners lives Booth Tarkington; here is the home of J. Whitcomb Riley; that modest looking house is where President Harrison lived and died. Isn't that a fine place? It is the home of Ed. Van Camp—the baked-beans man. Millionaire? Oh yes. Isn't it strange how one man will see an opportunity in such a commonplace commodity"—etc., etc.

You didn't realize that you were going along at a clip—twenty miles an hour perhaps—but sub-consciously you were saying: "Isn't it wonderful what a lot of ground one can cover in an hour with an automobile? Why! We've driven clear around this big, beautiful city."

Turning a corner all at once we saw the open country before us and the most inviting stretch of road, perhaps a mile straight-away. Gradually the driver opened her up. It was beautiful the way she gathered speed, making you hold tight to your hat, yet impressing you all the time that she still had lots of reserve power. 30, 40, 45, 48, 49,—it increases slowly when you get up there—50 miles the speedometer registered by the time we had used up our stretch of road. No, he didn't jam the brakes to stop, nor even close the throttle quickly. Measuring the distance with admirable accuracy he slowed down gradually without a jerk or a jar on the passengers or a strain on the car or the tires.

Turning about, did he again open her up for the return trip? Not at all. He was too wise to incur an anti-climax—too clever a salesman to spoil that first impression by a repetition of the stunt. He left you with a feeling that the car would go a mile a

minute or more—but he didn't try to prove it. Slowly we retraced our way and turned into the boulevard which winds gracefully along the river side.

He talked little of the car—none of his driving. But when he did speak—when he did call attention to the flexibility of the motor, the simplicity of control, the certainty of the brakes, he suited the action to the word—and you can bet your life he knew to an ounce just what she would do—to a hair's breadth how she would respond to throttle or brake. Any one with his hands on the wheel can feel that—and he can fool the best driver in the car who hasn't. That's where the salesman-demonstrator has the advantage of his fellows who can talk but not drive.

Is it any wonder such men can sell cars—know no hard times? Why! when we got back I was so infatuated with that car I'd have bought it on the spot if I thought the house would stand for the item in the expense account.

#### When Chauffeurs Want a Night Off.

The ways of the "Heathen Chinee" long since have ceased to be peculiar, for the modern chauffeur can teach him a few dark tricks such as even he never dreamed of. Instances of deep dyed duplicity multiply as the methods of lusty members of that calling are brought to mind. But for elements of both novelty and simplicity excelling such crude jests as result in mysteriously "leaking" tire valves and fuel tank drain cocks that "work" open unexpectedly, the recent experience of a New York business man may be taken as breaking the record.

As the "subject" relates the incident, he left town one morning to visit a friend living some 40 miles or so out in the country. Just after luncheon the chauffeur appeared on the scene with a mildly apologetic air. Somehow, he explained, the tail lamp had been lost off the car in coming out from the garage. That, of course, would necessitate returning before dark, instead of in the cool of the evening, as had been planned.

"It just happened that at this moment there flashed across my mind a remembrance of a somewhat similar incident of the not too dim and distant past that made me hesitate before replying," said the motorist in telling the story afterward. "It had happened then that my number plate had dropped off. There was no accounting for its loss at the time, but later, when it was discovered under the carpet on the tonneau floor, I began to see a great light.

"With this circumstance in mind, therefore, I waited a moment, as if in deep thought. Then, as if on inspiration, I exclaimed, 'I'll tell you what we'll do! We'll stay right here all night and go back in the morning with a clear day before us.'

"The chauffeur did not answer for a moment, but his face was something of a study as he turned away. I had a feeling

that I should see him again before long, and I was not mistaken. Not over a half hour later he came tramping up the drive, dusty and triumphant, carrying the tail lamp that had been 'lost.' He had found it in a clump of bushes by the roadside a couple of miles back, he said, and his face glowed with virtuous pride as he exhibited the reward of his search.

"By way of recompense, as something seemed to be expected of me, I murmured a few words about trying to get off even earlier than originally had been planned. But somehow," he concluded with a sly twinkle, "it was almost ten o'clock at night before we finally got on the road, despite my very best efforts to hurry away."

#### Why Oklahoma Objects to Horn Tooting.

Out Oklahoma way they still grade automobiles as cattle of a more or less objectionable class. The Guthrie Capital says: "We have been requested to touch lightly upon the subject of the automobile. We would rather do that than have the automobile touch lightly or any other way upon us. The busy streets of this city have always been hard enough to navigate, heaven knows, but nowadays with the automobile added to the trolley cars, pedestrianism has degenerated into a mere succession of frenzied leaps and stops, akin to that of a startled fawn. Shakespeare, who was ahead of date said: 'No man means evil, but the devil, and we shall know him by his horns.' This eternal horn blowing is a nerve destroying crime. The smaller the car, the bigger the volume of its horn. To hear one of these little sheetiron washboilers, with a one horsepower engine, a 12 horsepower horn and a 20-mule driver, coming down the street, you'd suppose that Gabriel with his trump, had broken loose at last, and when you look up expecting to see a trump you see nothing but a two-spot. There ought to be an ordinance passed putting 'such cattle' out of business."

#### Game Without Guns or Ammunition.

The possibilities of the motor car as an adjunct of the fall hunting season are just beginning to be realized. A month ago news despatches from Bangor, Me., told how a bear had been impaled upon the starting crank of a touring car while on a woodland journey. Two weeks later a New Jersey bull charged upon a car of gory hue and ended as dressed beef. Last week at Port Jervis, N. Y., a party of New Yorkers ran into a flock of partridges and furnished all hands with a game dinner. Anson B. Cole, of 63 Wall street, Manhattan, who ate some of the birds, vouches for the authenticity of the story. He says two partridges, confused by the bright searchlights, broke the wind shield, landing dead in his lap. Unfortunately, the feathers had to be picked off, and no toast nor tea came along with them. Two others landed in the rear of the car, one bird for each passenger.

## 1911 Cars Now Ready

Rambler  
Sixty-five

**T**HE 1911 Rambler is now ready and orders are being taken for early deliveries of all styles. The line includes landaulets, coupes, limousines, town cars, roadsters, toy tonneaus and five and seven-passenger touring cars with detachable fore doors. Details and construction alike for all: two sizes, forty-five and thirty-four horsepower. Forty-inch wheels on all seven-passenger open cars, thirty-six-inch wheels on all others. Seven-eighths elliptic springs and shock absorbers produce gratifying comfort. The offset crank shaft and straight-line drive enable you to travel through sand and up grades on high gear as slowly as ten miles an hour. That there is no need to rush the hard pulls is one of the charms of driving a Rambler.

*You may have a copy of the special  
number of the Rambler Magazine  
if you make request immediately*

## Stray Sparks

No nice green grass is to be allowed to grow under the feet of the Quaker City Motor Club in preparing for the next Fairmount Park races. It has been decided to ask for a sanction for October 14, 1911.

Tony Ocklinda, a Nebraska farmer, has a genuine home-made automobile. He surprised residents of Hastings by driving his creation into town a few days since. The body was taken from a spring wagon, and the wheels from a binder, while the steering mechanism was a brake wheel from a freight car.

A veteran Brooklyn (N. Y.) automobile dealer was out on Bedford avenue a couple of Sundays ago, wheeling his newest "kid" in a 1911 perambulator. Several children rounded a corner just ahead of him and through force of habit, it is declared, he reached to the side of the go-cart, feeling for the horn bulb.

Although Dr. O. C. Jackson, a Jamaica, L. I., veterinarian, has discarded the horse as a carrier in favor of a motor car, he still persists in carrying a long whip on the vehicle. Whether the goad is carried as a reminder of old times or is still used for application to towing animals is a question that keeps hundreds of people guessing.

Friends of Scott Mylott, mechanic with Al. Mitchell in one of the Chadwick cars at the recent Fairmount Park, Philadelphia, collected \$18 to put flowers on his grave when they heard he had been killed. A few hours after they learned he was alive, which cheered them so much that they insisted he should have the posies anyhow.

Georgia's new law requiring state registration of all motor vehicles has brought some disappointment in its train. It was generally supposed that there were between 7,500 and 10,000 cars in the state, but the registration figures prove that there are only 3,800 in use. Of the larger cities, Savannah has the greatest number, 701. Atlanta has 600.

Customs authorities in their attempt to catch smugglers are resorting to all sorts of odd and unwarranted schemes. A few days ago an automobile was almost torn apart at Boston, when it arrived on a Cunard liner, simply because it was guessed that the upholstery or mechanism concealed dutiable goods. Nothing was found, however. The car belonged to Mrs. H. N. Slater, who as a mill owner is one of the wealthiest women in the world.

Circular letters have been sent to labor organizations throughout the United States and Canada asking for subscriptions to finance the recently-incorporated Columbus Motor Transportation Co. to compete with

the Columbus Railway and Light Co. The scheme is to increase to 50 in number the 12 large passenger trucks that have been paralleling several of the car lines since the traction strike began in that Ohio city last spring, and with which the strikers hope to put the traction magnates out of business.

Bleeding Kansas has had another wound since the Jewell county superintendent of instruction made his report. Jewell is a leading agricultural section, but the super-

### Compression Release in New Form.

The difficulty of starting gasoline motors under compression has been responsible for many alleged remedies in almost as many forms, the most recent addition to the number, an English release valve, which is here illustrated, somewhat varying from the usual procedure. The main feature of the

Fig. 1.

Fig. 2.

device is a valve, A, adapted to make a tight joint at either of the two seatings, B and C. When the cock is opened and the motor turned over by hand the valve is lifted into the position shown in Fig. 1, and the compression reduced from four to six pounds per square inch, making it easy to crank even a very large motor. When a charge explodes the rush of compressed gas overcomes the pressure of the spring around the valve step below the cap, and causes the valve to be forced against the upper seating, thus preventing all further escape of gas. The valve is non-operative during the admission stroke, so there is no reduction in the volume of the charge drawn in, nor any weakening of the suction on the needle valve of the carburetter. When the engine is started the cocks are closed and the release valve is entirely out of action.

intendent states that several schools have been closed because scholars are lacking and calls attention to the startling decrease in the number of children. He sums up the indictment this wise: "American farmers are living on land worth \$100 an acre, selling dollar wheat and spending much of their time riding in automobiles, leaving the task of raising families to foreigners."

One of the planks of the Chicago Social-

istic party calls for government control of automobiles and automobile riders. The "demand" of the framers is "that street crossings shall become highways for the common people who have been shuttled lightning-like by death bearing machines; that mufflers shall be kept closed and that the rackets and accidents caused by automobiles shall cease." Other sections in the epoch-making platform demand the feeding of school children and insurance against illness, invalidity, loss of employment and old age.

Two home-made highwaymen, of the Long Island brand, last week made a clumsy failure in trying to hold up a party of motorists between Sayville and Bayport. The capital of the bandits consisted of a supply of old wire nails and tacks with which the roads were strewn, two revolvers and a couple of masks. The victim marked for a hold-up was D. P. Hamilton, Manhattan, who had a crew of women folks aboard. The nails got in their work all right, but as Hamilton had a loaded revolver in his overcoat pocket, he soon had the drop on the offenders.

Attachment papers were served last week at Ponca City, Oklahoma, on the Auburn car, which is being used as a pathfinder for a reliability run in and about Kansas which is to be conducted by a Kansas magazine. The passengers, upon reaching Ponca, saw a man gesticulating wildly to them. Naturally they supposed it was a welcome from a hotel proprietor, or somebody of that ilk, but he proved nothing of the sort. Instead, he was a sheriff. The trouble arose over an old agency contract between the Ponca Automobile Co. and the Arnold Motor Car Co. of Wichita, which owned the pathfinder. As the vehicle was locked up, another car had to be secured in order that more paths might be found.

### Halting Near Tracks Causes Death.

In a peculiar accident in which Seele H. Ellis, a wealthy resident of Brooklyn, N. Y., lost his life, occurred on Saturday last, October 15th, at New York avenue and Rockaway turnpike, L. I. Ellis had punctured the left rear tire and stopped in the street, quite close to the trolley tracks, to fix it, but before he was finished with the repairing a trolley car came along and crushed him against his automobile. The running board of the street car struck him in the side, breaking a rib and bruising him frightfully. He also suffered a severe wound on the head and was picked up unconscious, his death taking place soon after his removal to the Jamaica hospital. The motorman of the car has been arrested, although he is said to have been innocent of the death, the darkness preventing his seeing the bent figure at the side of the stalled automobile until it was too late. It is unknown what caused Ellis to halt his car so near the tracks instead of at the side.

New York, U. S. A., Thursday, October 27, 1910.

No. 4

## TIRE PRICES ARE COMING DOWN

**Manufacturers so Notify their Larger Customers—Reduction Due December 1st and will Average 15 Per Cent.**

The long-looked for reduction in the price of tires at last is in sight. It will come to pass on December 1st and will average about 15 per cent. The Diamond and the Fisk rubber companies were first to announce that the price of their product will be lowered on the date stated; they gave notice to this effect to all of their larger customers during the current week.

The forthcoming reductions are made possible by the easier tone that now prevails in the crude rubber market both here and abroad. In London, the price of the crude article declined with almost startling abruptness during the present week, dropping 14 cents within three days; there the best grades rule at from \$1.38 to \$1.40 per pound. In New York, practically the same prices prevail, Up-river fine Para, being quoted at \$1.40 for deliveries up to January 1st, although spot purchases brought \$1.45.

The skyrocket rise in the price of rubber which from 69 cents in February, 1908, attained its height this summer when \$2.86 per pound was reached, has been one of the industrial sensations. The fall has been gradual and several times has been more apparent than real, some of the tire manufacturers complaining that immediately they sought to purchase in any considerable quantities the prices promptly would stiffen and move upward.

### Claire Barnes Heads Selling Company.

Claire L. Barnes & Co. were incorporated this week with full paid capital of \$30,000, a move which means that Claire L. Barnes, one of the best known and best liked men in the trade, is establishing himself in business on his own account. He will be president and general manager of

the new undertaking, which will handle the entire output and be the sole representative of the Billings & Spencer Co., of Hartford, Conn., and the E. B. Van Wagner Mfg. Co., of Syracuse, N. Y. The former are classed as the largest producers of drop forgings and tools in this country, while the latter operate the largest die casting Plant. Barnes is negotiating with several other reputable companies, but the two named are sufficiently strong to assure the success of the new selling organization, which will have its general offices in Chicago with branches in New York and Detroit, and possibly in several other cities. Until arrangements are completed in Chicago, Barnes & Co. will make their headquarters at their Detroit office, 732 Penobscot building. Barnes himself is thoroughly versed in the business in which he has engaged, having resigned the secretaryship of the Detroit Steel Products Co. about two and a half years ago to become general sales manager of the Billings & Spencer Co., of which he remains an official. He also will become an official of the Van Wagner company. Handling only unquestioned products and being direct factory representatives, Barnes & Co. are more than ordinary sales agents and are in position to render the sort of service that counts when service is required.

### Silent Sioux Going to Sioux Falls.

Although it cannot be identified as one of the going industries of Milwaukee, Wis., according to reports from Sioux Falls, S. D., the Silent Sioux Automobile Mfg. Co., of Milwaukee, has obtained South Dakota backing and will remove its plant to Sioux Falls within the next 30 days and produce at least 500 cars for next year's market. Allen R. Fellows and George R. Burnside are named as the Silent Sioux who effected the necessary arrangements, which included obtaining possession of a 20 acre factory site on which stand a disused woolen mill and other buildings. It is stated also that the Luverne Automobile Co., of Luverne, Minn., probably will be consolidated with the Silent Sioux.

## EXTRAVAGANT CLAIMS EXPENSIVE

**Court Holds They Entitle Dissatisfied Purchasers to Damages—Hard-fought Case Involving Imported Car.**

On Saturday last, 22d inst., judgment for \$8,452 in favor of Edward T. Bedford was entered in New York against the Hol-Tan Co., of that city. The judgment represents the result of a hard-fought suit involving some issues common to every day merchandising and others peculiar to the sale of automobiles and is, therefore, of significance to the entire trade.

It appears that in 1906 Bedford, the plaintiff, who is identified with the Standard Oil interests, purchased from the Hol-Tan Co. a 50 horsepower Fiat chassis, of which the defendants then were but no longer are the American importers. He paid \$10,500 for it, the sale being made by E. R. Hollander, the then vice-president of the Hol-Tan Co., who, Bedford testified, made great claims for the Fiat, asserting that it was better, faster and more powerful than any other car of its class, and that it would require no more attention or expense than the car then owned by Bedford.

In his complaint Bedford alleged that it was by these representations that he was induced to make the purchase, which fell so far short of expectations and representations that he demanded the return of his money. When this demand was refused, Bedford notified the Hol-Tan Co. that he would sell the chassis and offered that company an opportunity to buy it. The offer was declined and Bedford sold the Fiat for \$3,000 in August, 1907, and entered suit for \$7,500, which amount is the difference between what he had paid for the chassis and what he sold it for. Justice Greenbaum in Part XVIII of the New York Supreme Court appointed Frederick T. Wait a referee to hear the case.

Bedford alleged that the car was not well made nor of good material, that it did not

develop the power claimed, that it would not run smoothly or climb hills, and was continuously out of order and in the custody of defendants for repairs, the defendants failing to remedy the defects. He further claimed its cost of up-keep and for repairs was much greater than for his old car. The Hol-Tan Co. entered a general denial. Its claim is that such representations as were made at the time of sale were those incident to the usual guarantee, and that misuse and neglect or unskilful attention were the causes of the unsatisfactory service.

In the trial before the referee both sides produced expert witnesses, but the referee found Bedford's claims "correct and justified." Among other things, he held that claims made in effecting a sale which afterward are found to be extravagant or unwarranted entitle the purchaser to damages; also that though the plaintiff's retention of the chassis for a time could be considered an acceptance, his right to recover damages survives such acceptance. Justice Greenbaum approved the findings of the referee and gave judgment for the plaintiff for the full amount, plus interest and costs which brought the total sum to \$8,452.

Before the report was confirmed, however, an unusual situation developed. Referee Wait died and it was alleged that the signature attached to his report was not his own and that he had been too ill to sign a document of any kind. Handwriting experts were brought into the case, but the report was confirmed, as stated. The Hol-Tan Co., however, declares that it will appeal to the higher court.

#### **Increases Capital; Divides 30 Per Cent.**

At the annual meeting of the Imperial Automobile Co., of Jackson, Mich., last week, a 30 per cent. dividend was declared and the capital stock of the company increased from \$150,000 to \$450,000. Of the new issue, \$150,000 is represented by 8 per cent. preferred shares. The company produced 500 cars during the past season, and with a factory addition which has been completed, expects to about triple its output for the 1911 demand. The officers and directors elected at last week's meeting are as follows: B. M. DeLamater, president; H. S. Reynolds, vice-president; T. A. Campbell, secretary and treasurer. Directors: W. S. Kessler, Winthrop Withington, E. W. Barber, W. R. Smith, F. Tiffany, T. E. Barkworth, Jackson, Mich.; F. E. Davis, La Crosse, Wis.; M. H. Davis, Minneapolis, Minn.

#### **Anderson Holds Its Annual Meeting.**

At its annual meeting in Detroit on Friday last the Anderson Carriage Co., makers of the Detroit electric, elected the following officers for the ensuing year: W. C. Anderson, president; C. A. Newcomb, vice-president; F. E. Price, second vice-president and secretary; W. M. Locque, treasurer;

G. D. Fairgrieve, assistant treasurer and manager of sales; W. P. McFarlane, factory superintendent; G. M. Bacon, electrical engineer. The new building in which the company will build its motors is rapidly nearing completion, and as soon as completed the force of officers and workmen from the Elwell-Parker Electric Co., of Cleveland, will be transferred to Detroit.

#### **Body Builder in Financial Troubles.**

Sumner Healy, a builder of carriages and automobile bodies at Mount Vernon, N. Y., has filed a petition in bankruptcy, with liabilities of \$20,054 and no assets. Among the claims are one for \$15,571 by Robert F. Schwarzenbach for money loaned, and one for \$2,000 by John A. Joachim, being the damages demanded in a suit for assault and battery, begun in the city court on July 9th.

#### **Fire Destroys 32 Diamond Cars.**

Fire during the night of the 18th inst. practically destroyed 32 partly finished cars and for a while threatened the factory of the Diamond Automobile Co. at South Bend, Ind. The paint shop, in which the flames originated, was burned to the ground, but the remainder of the plant was saved. The total loss is estimated at \$50,000; partly covered by insurance.

#### **Selden Suit Brought Against Bergdoll.**

Suit under Selden patent was filed last week against the Louis J. Bergdoll Motor Co., in the United States Circuit Court for the District of New Jersey, service having been made on the defendant. The Bergdoll company is known through its sales organization in Philadelphia and recently commenced the manufacture of the Bergdoll "30."

#### **London Firm Gets Krit for Canada.**

W. J. Reid & Son, London, Ont., have been given the Canadian agency for the Krit car. The appointment was the result of a visit paid to London by President Piggins and Secretary Kanter of the Krit company.

#### **Gramm Company to Remove to Lima.**

On November 1st the main offices of the Gramm Motor Car Co. will be removed from Bowling Green, O., to Lima, O.; the latter has been under construction for some time and is ready for occupancy.

#### **Fields Leaves for Pacific Coast.**

H. E. Fields, vice-president of the Hartford Rubber Works Co., left this week for one of his periodical visits to the Pacific Coast. He will be absent six or seven weeks.

#### **Detroit-Dearborn Admits Bankruptcy.**

After seeking extensions for several months, the Detroit-Dearborn Motor Car Co. of Detroit finally has been forced into the hands of a receiver, the Detroit Trust

Co. having been appointed to serve in that capacity. Creditors who refused to grant extensions first filed an involuntary petition in bankruptcy, and the company quickly acknowledged its insolvency by filing a voluntary petition. The concern was organized last year, and although it cut no figure in the industry and produced only a few cars, it managed to accumulate liabilities of \$117,000. The assets are not stated.

#### **Company Formed to Make Cumbuck Truck.**

To manufacture a 1,000 pounds delivery truck listing at \$1,000, the Cumbuck Motor Co. has been formed in Detroit with \$100,000 capital stock and temporarily is located at 224 First avenue. R. A. Bailey is president and treasurer of the company, R. O. Cumbuck, vice-president and manager, and W. S. Bailey, secretary. The truck, which will be styled the Cumbuck, will employ a two-cycle engine, planetary transmission, thermo-syphon cooling and steering post on the left hand.

#### **Smithson Would Make Co-Operative Tires.**

H. A. Smithson, of Los Angeles, Cal., has a great scheme for the production of tires, although it is not exactly a new one. He wants to produce them on the co-operative plan and thus make the big tire companies sorry they are alive. The scheme, however, has not advanced beyond the point of addressing letters to boards of trade and chambers of commerce of various Western cities in an endeavor to secure their assistance and "co-operation."

#### **Webb Fire Apparatus is Reorganized.**

The Webb Motor Fire Apparatus Co., of St. Louis, Mo., has been reorganized under the laws of Delaware, in which state it has been incorporated with \$1,500,000 capital stock. A. C. Webb remains president and general manager of the company. D. B. Blossom is vice-president and A. R. Force secretary.

#### **Philadelphia Jobber Gets More Room.**

The Manufacturers' Supply Co., of Philadelphia, Pa., which has been figuring increasingly in the jobbing trade, has removed from 418 Arch street to the corner of Juniper and Cherry streets, where about 20,000 feet of "elbow room" has been obtained.

#### **To Produce Trimmings in Pontiac.**

The Pontiac Auto and Accessories Co. has commenced business in the Michigan city of that name. It will manufacture body trimmings and several specialties. Frank Jacques is the prime mover in the project.

#### **Regal Adds a \$900 Touring Car.**

The Regal Motor Car Co., of Detroit, has added a \$900 touring car to its line. It mounts a four cylinder 20-25 horsepower engine and incorporates most of the Regal's well-known characteristics.

**ROGERS'S UNIKA HITS THE TRAIL**

**Pneumatic Tire Again in Danger—Capitalists Offer Large Lumps, but Unika Prefers the Public's Money!**

Once more the pneumatic tire is in danger of being "put out of business" and the tire magnates in danger of being reduced to penury and woe. Their old enemy, the spring wheel, again is on their trail. The pneumatic tire and the tire magnates have foiled that persistent enemy many times and oft during the past 20 years, but never has it failed to return to the attack in some new guise and wearing a new name.

On the present occasion, it is wearing the name Rogers Unika wheel, and L. L. Rogers, of Boston, Mass., is its inventor and sponsor. Quite a few people in the automobile industry have met Mr. Rogers and are not wholly unfamiliar with his wheel, the essential feature of which is a hub composed of spiral springs "guaranteed against manufacturing defects for five years and having a modulus of elasticity of fourteen million (14,000,000) times compression." Rogers was in Detroit only a few weeks ago, where he talked of his wheel and of J. Pierpont Morgan's control of the automobile industry.

Apparently his visit to that center of automobile manufacture did not prove exactly what he anticipated, for he returned to dear old Boston and now instead of trying to induce motor car manufacturers to use his invention he means to give the great public an opportunity to share the riches that will flow from his Unika. The Rogers Unika Wheel Co., Inc., already is in being. Rodgers himself is its treasurer and Noah B. Smith is its president. It also has a "fiscal agent" who has an office in Boston and the fiscal agent is carrying half-page advertisements in the Boston papers which tell "how fortunes are made." Just now the best way is to subscribe for Rogers Unika stock; its par value is \$10 per share but those who avoid the rush can buy it for \$5, and the ad. absolutely assures investors that the stock "will soon sell for five to ten times par," which is "going some" in the way of assurances, even of those having "a modulus of elasticity."

The Rogers Unika is peculiarly situated. It does not need much—merely "a factory and tools and machinery and working capital;" and Rogers Unika could get all of these incidentals right away quick—just like that! For—again to quote the ad: "We can get hundreds of thousands from capitalists, any hour, any day." But Rogers Unika spu-r-r-rns these "hundreds of thousands." The coin of no capitalist will pave the way to Unika glory, for "it would mean giving up the control of our company. Under no conditions will we do this. We

therefore give the public an opportunity to join us."

"If you knew our business as we know it," further declares the Rogers Unika ad, "if you knew our opportunity as we know it, you would be amazed; if we told you all, you would be forced to doubt us. Come to our office and let us show you, or send for literature, and we will send you proof that the world is our field."

Well may the tire barons prepare to reduce their prices and to shiver in their shoes!

**Importers Show in Hotel Ball Room.**

The New York importers who have made plans for a show of their own have engaged the big ball room of the Hotel Astor, New York, for the purpose. This "parlor" exhibition is scheduled for January 2-7, thereby conflicting with the "independent" show at Grand Central Palace. So far only nine importers have engaged space, of which 12,000 feet is available, but Paul Lacroix, of the Renault firm, who is one of the committee in charge of the arrangements, expects to round up 15 makes of foreign cars by the time the show is due. According to the press agents the exhibitors in the Hotel Astor intend to cater to the "exclusive" motoring public, and an admission fee of \$1 is expected to do its share toward obtaining such exclusiveness.

**Prospecting for an "A" Factory Site.**

The "A" Automobile Mfg. Co. is the rather unusual style of a concern made up of San Francisco men, which is "prospecting" for a factory site on the Pacific Coast. T. A. Cooke, its treasurer, recently visited Sacramento, Cal., for the purpose, and after critically inspecting the ground near a brick yard "practically assured" the Sacramentons who escorted him that an "automobile factory employing several hundred men will be built in the near future." Cooke talked of a plant costing \$200,000 that will have an output of nearly 5,000 cars annually. In addition to Cooke, the officers of the "A" company are E. C. Collins, president; J. H. Graham, vice-president, and C. E. Gibbs, secretary.

**Gramm Sets Aside a Big Surplus.**

Declaring that its gross business for the year just closed amounted to five times that of the previous fiscal period, the Gramm Motor Car Co., of Bowling Green, Ohio, has disbursed its regular dividend and placed the sum of \$140,000 to the credit of the surplus account. The recent annual election of officers resulted in the re-election of E. L. White, president; B. A. Gramm, vice-president and general manager; and F. E. Lamb, secretary. W. T. Agerteer was elected treasurer. He is secretary and treasurer also of the Lima Locomotive & Machine Works, of which Mr. White is president. The number of directors was reduced from nine to five.

**G & J NAME IN A "BARGAIN SALE"**

**It Was Adroitly Used but G & J Company Hales User to Court—Price Cutters Employ Familiar Tactics.**

The Guarantee Tire & Rubber Co., of Indianapolis, Ind., has learned that there is at least one trade name or symbol that it cannot trifle with—the symbol "G & J" as applied to tires.

The so-called Guarantee concern is one of the kind that apparently does not lack what may be termed nimble-wittedness when it comes to driving a bargain or when disposing of "bargains." Recently it drove a "bargain" in tires and of course it desired to turn over the money quickly. Accordingly it advertised the tires at a sliding scale of cut prices, but as the prices of themselves evidently were not considered sufficient to "turn the trick" the symbol "G & J" was carried into the advertisement in a more or less adroit fashion.

"We offer 3,000 new 1910 G & J style Clincher and Quick Detachable Clincher Casings and Tubes," was the way the ad. read, the initials "G & J" being brought out in large, spread-eagle type and separate and apart from the remainder of the matter, an illustration of what might appear to be a G & J tire being employed to add point to the suggestion that the tires advertised were G & J tires, despite the statement made in very, very much smaller type that "the tires we offer represent the product of several well known manufacturers."

Like all "philanthropists" of its class, the Guarantee Tire & Rubber Co. never, never would deceive or seek to deceive a generous public. For if it is read as it should be read does not the advertisement plainly say "G & J style clincher casings and tubes" and not "G & J casings and tubes?" Lots of other smart people have employed the same style of advertising. The G & J Tire Co., however, is one of those that not only does not hold such "smartness" at its face value, but does not mean that its trade name shall be taken in vain or used to convey false or misleading impressions to the public. As the result of these leanings, the G & J company has instituted action against the Guarantee Tire & Rubber Co. for illegal use of its trade name and the outcome cannot fail to be of benefit to trade and public alike, and it probably will serve to put something of a damper on advertising of this sort.

**To Enlarge Maxwell's Western Plant.**

The Maxwell-Briscoe-Newby Co., of New Castle, Ind., has certified to a change of name to the United States Motor New-castle Co. Its plant, incidentally, is to be increased by the erection of a large addition, 160 x 280 feet.

## THE WEEK'S INCORPORATIONS.

Sioux Falls, S. D.—E-M-F Sioux Falls Co., under South Dakota laws, with \$25,000 capital; to deal in automobiles.

Butler, Pa.—Atwell Auto Co., under Pennsylvania laws, with \$25,000 capital; to deal in automobiles and conduct a garage.

Cleveland, Ohio—Militaire Auto Co., under Ohio laws, with \$300,000 capital. Corporators—M. L. Thomas, G. A. Gaston and others.

Detroit, Mich.—Cumback Motor Co., under Michigan laws, with \$1,000 capital. Corporators—A. A. Bailey, W. S. Bailey, R. O. Cumback.

Dallas, Tex.—Goodyear Tire & Rubber Co. of Texas, under Texas laws, with \$10,000 capital. Corporators—C. H. Gray, H. C. Waite, G. W. Rogers.

Wilmington, Del.—Blair, Scofield & Co., under Delaware laws, with \$100,000 capital; to manufacture and deal in automobiles, motor trucks and other motor vehicles.

Cape Girardeau, Mo.—Southwest Missouri Motor Car Co., under Missouri laws, with \$15,000 capital. Corporators—E. M. Rowe, J. W. Phillips, George McBride.

Cleveland, Ohio—Blue Blaze Spark Plug Co., under Ohio laws, with \$1,000 capital. Corporators—A. J. Hudson, A. R. Bullock, G. T. Bullock, A. F. Kivis, Nora Bresnan.

Los Angeles, Cal.—Owen Auto & Taxicab Co., under California laws, with \$25,000 capital, \$300 of which has been paid in. Corporators—C. H. Owen, J. W. Owen, A. W. Owen.

Minneapolis, Minn.—Auto Appliance Co., under Minnesota laws, with \$100,000 capital. Corporators—O. M. Bergstrom, S. E. Eastlund, M. L. Burkhardt, J. N. Smith, all of Minneapolis.

Cleveland, Ohio—Cleveland Aplco Sales Co., under Ohio laws, with \$10,000 capital; to deal in automobiles. Corporators—W. C. Phelps, E. Albright, P. D. Metzger, P. C. Stoller, D. C. Stewart.

Celina, Ohio—Wildam Cron Sons Co., under Ohio laws, with \$35,000 capital; to manufacture wagons, automobiles. Corporators—John A. Cron, Flora C. Schele, F. J. Cron, A. W. Cron.

Los Angeles, Cal.—McCarthy-Parker Automobile Co., under California laws, with \$15,000 capital, of which \$30 has been paid in. Corporators—Walter J. McCarthy, O. K. Parker, F. L. Mitchell.

Buffalo, N. Y.—Mitchell Automobile Co., under New York laws, with \$23,000 capital, of which \$5,000 has been paid in. Corporators—Alphonse Karl, John J. Gibson, Jacob F. Kramer, all of Buffalo, N. Y.

Oradell, N. J.—Wortendyke Garage Co., under New Jersey laws, with \$3,000 capital; to deal in automobile supplies and conduct a garage. Corporators—Stella D. Wortendyke, John S. Wortendyke, Victor A. Hart.

St. Louis, Mo.—Washington Automobile Co., under Missouri laws, with \$10,000 capital; to do general automobile business. Corporators—Anthony Celler, Adolph Simon, Charles J. Schneider, Arthur Sonntag.

Babylon, N. Y.—E-Z-Way Motor Grease Co., under New York laws, with \$100,000 capital; to manufacture and deal in greases and oils. Corporators—W. E. Dunn, C. F. Hilke, F. J. Cullingworth, of New York City.

Chicago, Ill.—Clark Delivery Car Co., under Illinois laws, with \$5,000 capital; to manufacture and deal in automobile delivery cars and supplies. Corporators—Albert C. Clark, Almon W. Bulkeley, Joseph F. Gillen.

Memphis, Tenn.—Hazen Automobile Co., under Tennessee laws, with \$25,000 capital; to deal in merchandise, specifically in automobiles. Corporators—Fay E. Hazen, A. N. Hattom, H. D. Goff, J. M. Goff, H. H. Bonner.

Hopkinsville, Ky.—Ideal Motor Car Co., under Kentucky laws, with \$10,000 capital; to deal in automobiles and other vehicles, and maintain a garage. Corporators—Sam Frankel, William Kimmons, Charles S. Jackson.

Detroit, Mich.—Bennett Axle & Transmission Co., under Michigan laws, with \$150,000 capital; to manufacture automobile axles and transmission gears. Corporators—Frank E. Humphrey, Charles Gleason and others.

New York City, N. Y.—J. W. Buckley Rubber Co., under New York laws, with \$40,000 capital; to manufacture and deal in all kinds of rubber goods. Corporators—J. W. Buckley, J. H. Buckley, E. H. Deane, all of Brooklyn, N. Y.

Brooklyn, N. Y.—Globe Anti-Friction Roller Bearing Co., under New York laws, with \$50,000 capital; to manufacture machinery and appliances, roller bearings, etc. Corporators—J. Newman, W. M. Bretow, A. Wentz, all of Brooklyn.

Syracuse, N. Y.—James Auto Co., under New York laws, with \$25,000 capital; to deal in accessories and supplies, to manufacture, sell and rent automobiles. Corporators—F. H. Plumb, F. E. Welch, W. D. Andrews, Syracuse, N. Y.

Jersey City, N. J.—United Motors South Bend Co., under New Jersey laws, with \$2,000 capital and a main office in Jersey City; to manufacture and deal in automobiles and accessories. Corporators—H. O. Coughlan, L. H. Guenther, John R. Turner.

Norristown, Pa.—Modern Auto Supply Co., under Delaware laws, with \$35,000 capital; to manufacture and deal in automobile accessories and supplies. Corporators—Walter C. Atkinson, J. Malsby White, Henry S. Goetz, all of Norristown, Pa.

Dayton, Ohio—Montgomery County Auto Co., under Ohio laws, with \$15,000 capital;

to deal in motor vehicles and maintain a renting service. Corporators—Howard G. Wiley, Sylvester A. Long, A. M. Keplinger, Charles E. Foreman, P. M. Keplinger.

Detroit, Mich.—Michigan Bolt & Nut Works, under Michigan laws, with \$300,000 capital; to manufacture tools, bolts and other parts for automobiles and machinery. Corporators—Sarah Bacon Hill, Edward Y. Swift, Levi L. Barnour, Hester McLean, and the estate of Edward D. Gilbert.

St. Louis, Mo.—Superior Motor Sales Co., under Missouri laws, with \$75,000 capital; to manufacture and deal in automobiles. Corporators—Oliver L. Garrison, Oliver L. Garrison, Jr., of St. Louis, and Murray M. Baker, of Peoria, Ill., with equal amounts of shares.

Detroit, Mich.—Nederlander Auto Sales Co., under Michigan laws, with \$10,000 capital, \$6,000 of which has been paid in; to deal in motor vehicles. The company is a reorganization of the Nederlander Auto Co., chartered a month ago in Detroit with \$5,000 capital. Corporators—A. Simon, Julius Cassel, Charles Simon, H. Nederlander.

New York City, N. Y.—Lovelace-Thompson Aeroplane & Motor Works, under New York laws, with \$100,000 capital; to manufacture automobiles, automobile engines, motors and aeroplanes. Corporators—R. L. Offett, N. A. Egbert, of New York City; M. Ogg, of Jersey City, N. J.

Richmond, Va.—Chesterfield Motor Car Co., under Virginia laws, with \$15,000 maximum and \$2,000 minimum capital; to maintain a garage and repair shop, to deal in automobile and to operate sight-seeing cars. Corporators—William E. Nichols, F. E. Nichols, B. G. Hathaway, all of Richmond, Va.

## Recent Losses by Fire.

Atlanta, Ga.—D. M. Stanford's garage and one runabout destroyed. Fired by incendiary.

Grand Rapids, Mich.—J. M. Weeks's garage and one automobile burned. Loss, \$2,000; partly insured.

Springville, N. Y.—Prinz & Schneider; garage and one runabout destroyed. Total loss, \$10,000; garage loss, \$4,000, covered by insurance.

Dobbs Ferry, N. Y.—Frederick Smith's garage on Cedar street; building and ten automobiles destroyed. Proprietor fatally injured. Loss, \$50,000.

## Increases of Capital.

Detroit, Mich.—Auto Equipment Co. increases capital from \$50,000 to \$75,000.

Jackson, Mich.—Imperial Automobile Co., increases capital from \$150,000 to \$450,000.

Kansas City, Mo.—Stafford Motor Car Co. increases capital from \$100,000 to \$400,000.

## IN THE RETAIL WORLD.

Henry Spencer and Clifford Britton are building a new garage in Howell, Mich.

Wharton, Tex., has a new garage "in its midst." G. D. Hearhart, formerly of Houston, Tex., is its manager.

The Tower Motor Co., of Adams, Mass., has invaded North Adams. It is building a garage on West Main street.

Theodore Tollack has opened a garage and repair shop in Black River Falls, Wis. Overland cars will be featured.

Work has commenced on a brick garage in New Haven, Conn., which will cost \$10,000. S. A. Lewis is building it.

A new garage has been opened at Granger, Tex. Barney Benefel and Sam Martin are the men behind the enterprise.

Harold Brown and G. B. Davey have formed a partnership and will sell supplies and accessories in Stevens Point, Wis.

Work has commenced on the new S. A. M. garage at 256-262 George street, New Brunswick, N. J. It will be 53 x 110 feet.

The Doerr-Brown Co., has opened up at the corner of Olive and 12th streets, San Francisco, Cal. It is handling the Knox car.

The Correja Motor Car Co., of New York City, has opened a branch in Newark, N. J. It is located at Branford place and Treat place.

The Auto Supply Co., of Milwaukee, Wis., recently organized with O. F. Fishedick as president, has opened an accessory store at 127 Second street.

Incorporated under the laws of Missouri, the Cole Motor Car Co. has opened up at 4123-25 Olive street, St. Louis, Mo. H. M. Payne is the manager.

The Kansas City (Mo.) branches of the Rapid and Reliance Truck companies have consolidated and opened a new garage at 1420 Woodland avenue.

Under the style O'Donnell & Wickers a new firm has started in business on Tenth street south, Minneapolis, Minn. They are handling Bergdoll cars.

Work is progressing on a garage which is being built by George Schaas on Eighth street, Fargo, N. D. It will cost, when completed, about \$7,000.

N. L. Rush, of Boston, Mass., has opened a salesroom and garage in that city, where he will display Kline cars. They are located in the Motor Mart.

J. D. Knowlton is the owner of a new garage which has been opened in Waterloo, Wis. It is located on Madison street, and will house Overland cars.

C. H. Geist is building a garage at the northeast corner of 64th street and Drexel avenue, Philadelphia, Pa. It will be two stories high and cost \$5,500.

Julian B. Miles is building a modern fire-proof garage at the corner of South Clin-

ton and Taylor streets, Syracuse, N. Y. It will cost when completed \$10,000.

Work has been started on a new garage at 104-106 West Church street, Elmira, N. Y., where Oakland cars will be sold. Harry E. Richardson is the man in charge.

Wilcox trucks will be the chief stock-in-trade of a new concern just formed in Boston, Mass., under the style the Wilcox Motor Truck Co. Frank S. Corlew is the manager.

Capitalized with \$10,000, the Washington Automobile Co. has been formed in St. Louis, Mo., to operate a garage at 526-528 De Baliviere avenue. It will be managed by Adolf Simon.

The little village of Davis, in Yolo county, Cal., soon will have its first garage. Theodore Schmeiser is building one which will be 50 x 80 feet, of brick and concrete, and will cost about \$2,000.

The Fidelity Motor Car Co. has been organized in Cleveland, Ohio, with E. H. Sykes as manager. Moline cars will be featured in the salesrooms which are located at 2364 Euclid avenue.

Chartered under the laws of South Carolina with a capital of \$10,000, the Roddey Automobile Co. has begun business in Columbia, S. C. J. B. Roddey and J. J. Cain are the men in control.

Dr. A. F. O'Leary, Michael D. Russell and John Grimes have formed a partnership under the style the Star Garage Co., and opened a garage in Waterbury, Conn. It is located on South Main street.

McIndoes, Vt., is decidedly progressive, for although it has but a handful of inhabitants a garage capable of holding 20 cars is being built there. J. H. Stuart is the genius responsible for the venture.

George Brown, who conducted a machine shop on Oak and Nevada streets, Maxwell, Cal., has sold his business to A. J. Recker and has purchased property on Oak street, where he will build a modern garage.

Styling themselves the Economy Auto Supply Co., Theodore Kaplan and E. Elin, of Newark, N. J., have opened an accessory store at 268 Halsey street. Kaplan formerly was with the Empire Auto Supply Co.

With the intention of selling American cars, made by the Jonz Auto Co., a new concern has been incorporated at Glenwood, Ia., under the style the Glenwood-Jonz Auto Co. The company has a capital of \$15,000.

The Lowe-Howard Co. is the style of a new firm which has opened salesrooms in Boston, Mass., where it will display Krit cars. The veteran George H. Lowe, Frank Howard and George E. Tufts are the members of the firm.

Howard G. Wiley, formerly a partner in the People's Motor Car Co., Dayton, O., has formed the Montgomery County Auto Co., in the same town, with a capital of

\$15,000. Salesrooms have been opened at 27 East Second street, where E-M-F cars will be shown.

Buick cars are to form the mainstay of a new firm which just has been organized at Jacksonville, Fla., under the style the Jacksonville Buick Agency. J. H. Spencer, J. A. McRae, Jr., and D. H. McMillan are the men behind the venture.

With a floor space of 100 x 100 feet, the new garage erected for A. C. Burton & Co., at the corner of La Branch and Texas avenues, Houston, Tex., is one of the largest garages in the South. It is two stories in height and will house Chalmers and Hudson cars.

Oscar M. Swedburg, of Holdrege, Neb., who recently purchased the Danielson Garage, has sold his entire stock to C. Engstrom, owner of the Hanson Garage, on West avenue. Engstrom will merge the two stocks and conduct the business from the West avenue garage.

Lindsley & Tryon, Pawtucket, R. I., have been petitioned into bankruptcy. At the creditors' meeting before the referee, Lindsley, the senior partner of the firm, was unable to explain what had become of \$500 drawn from the firm's account at the bank, or why there were missing pages in the firm's books.

Permits have been granted the Canadian Overland Co., of which G. R. Rastall is the managing director, for the erection of a new garage in Regina, Sask., at Albert street and Victoria avenue. The structure will be of brick, 50 x 125 feet, with concrete floor and plate glass front, and will be steam heated and electrically lighted and in all other respects thoroughly up to date.

Bernard C. Bowen has been appointed receiver of the Special Motor Vehicle Co., of Cincinnati, Ohio, by order of Judge Warner, of the Ohio Insolvency Court, Harry C. Strieker, a creditor of the concern, having petitioned the company into bankruptcy, alleging \$4,833.55 due him. The company has been operating as a garage and repair shop at Eighth street and Broadway since 1902, but the property recently was condemned to make way for a viaduct. The concern found it impossible to obtain suitable quarters and was placed in financial straits. Its assets are estimated at \$3,500.

## Snutsel Sails to Spread Splitdorfs.

Paul F. Snutsel sailed on Saturday last for an extended visit to Europe in the interests of C. F. Splitdorf, of New York. He will attend both the London and the Paris shows, at the latter of which he will have charge of the exhibit of Splitdorf magnetos. Thereafter he will visit the automobile manufacturers of France, Germany and Italy with a view of extending the use of the Splitdorf magneto, which has a much greater sale abroad than the average American fancies is the case.

## A Woman's Town Car

**M**OST women have felt compelled to drive electric cars—especially in the Winter—because no gasoline car was designed for a woman to drive. The White Company, as usual, alive to the situation, has brought out such a car—the inside driven coupe. In this coupe all the objections of former coupes have been overcome. It has a door on either side and the driver's seat folds up to make entrance easy from either side. At last, there is a properly designed coupe car seating from three to four persons besides the driver.

## The White Coupe

The White Coupe is an elegant, aristocratic looking town car with a snugness all its own and an ability to thread its way in and out of the crowded city streets enjoyed by no other car. The details of equipment, such as upholstery, electric lights and the little accessories are all of the finest imported materials—the best that money can buy. In fact, nothing has been overlooked that could contribute to a woman's satisfaction in a car which is so particularly designed for her personal use.

**Accidents that Can be Avoided.**

It is one of the peculiarities of human anatomy that when a man bends over he projects in two directions. The incident of a character in one of Cooper's Leather-Stocking Tales, who was wounded so that he could not sit down, while endeavoring to peer around a tree, behind which he had taken refuge, aptly illustrates the point. An up-to-date and no less suggestive illustration may be found along almost any narrow highway that is much frequented by motorists, if it be sought either where the road is rough or at about the hour of the gloaming.

Within the past few weeks a number of serious casualties have been reported in which the injured was struck by a passing car as he stooped beside his machine while lighting the lamps or replacing a tire. The plain truth of the matter is that too many motorists are either too ignorant of anatomical principles or too careless of their own safety to be properly watchful of pass-

ing traffic while they are engaged on the left side of their machines. That in many instances they are, also heedless in not laying up their cars outside the path of other vehicles also is true, though it frequently happens that on narrow roads this is impossible. The continuance or suppression of accidents of this nature may be termed largely a personal matter with the individual motorist; yet it is one of those personal matters in which an attitude of rigid scrupulousness may accomplish a great deal in relieving the apprehension of the timid and reducing the percentage of risk.

**Evidences of Trade Reconstruction.**

One of the most promising signs of the times is the careful and systematic method that is being employed in developing the various markets of the automobile industry. Until within a relatively short period the market for cars and accessories was largely self-inductive; so, too, were the demands for garage and repair facilities, and likewise the dependent requirements for supplies, components and materials, manufactured and raw. But the intensity of competition increases very rapidly as the number of competitors multiplies and as the requirements of the markets converge toward set standards; when conditions are such as to make it appear, no matter whether justly or otherwise, that the supply is about to outrun the demand, competition reaches a fever heat.

Some such condition as this has bred at the present time a series of such shrewdly planned and sagely directed long-distance development schemes as the automobile business of the past never could have known. And it is a fortunate circumstance that increasing competition is being met in many quarters in this thoughtful manner. For no manufacturer, jobber, dealer or garageman, whether alone or working in conjunction with others, is going to adventure his time and money in a constructive merchandising plan unless his better judgment tells him it carries fair prospects of success. Insofar as this tendency exists, therefore, it indicates freedom from purely speculative effort.

By all odds the most striking and conspicuous of such projects is the co-operative undertaking of the electric vehicle manufacturers and central station men practically to rebuild the market for electric automobiles. Not only does the plan include improvements in charging facilities and in

systems for vehicle inspection and maintenance, but it postulates the service of the central station men as practical advertising agents and salesmen for the electric vehicle itself as well as of the particular form of energy upon which its activities depend.

The principle is much the same as that which has led gas companies to instal cooking ranges at low cost to the consumer, or that has produced any one of a hundred other indirect methods of market stimulation.

Nor is the sudden energizing of the electric end of the producing industry the only illustration of the trend toward business construction. The Society of Automobile Engineers has undertaken the prodigious task of reducing parts and material specifications to an economic basis. In this it is receiving the assistance not only of the components producers, but of the automobile manufacturers, whose support is none the less hearty though rendered indirectly through the offices of their engineers. Where the constructive element in the industry is not openly organized it is still progressing toward unity of effort, from the supervision of automobile contest matters through all the ramifications of a very complex business upward and inward to the organized treatment of the delicate subject of credit information.

The growing stability of the industry is further evidenced in the independent efforts of individual manufacturers, whether in moving-picture and lecture campaigns, in the establishment of service depots and branch assembling factories, or in the cultivation of foreign fields, in addition to the development of direct markets. In the manufacture and sale, as in the use, of automobiles the bloom of novelty has been pretty well rubbed off. The outcome of the inevitable test of time must depend on the grip that is now being developed and on the combined strength and elasticity of sound organization.

**Opportunities Offered by the Electric.**

In connection with the exploitation of the electric automobile by the joint efforts of its manufacturers and the producers of charging current it must not be lost sight of that the garageman who is wideawake has an opportunity to render the movement considerable assistance besides reaping some little personal profit. While the suggestion is directed mainly at those

whose establishments are located in cities where the electric already has gained a considerable foothold, it also may be heeded by others whose locations are such that good roads, live business interests and a reasonably prosperous population afford conditions suitable for the introduction of machines possessing the peculiar economies of the electric. The ability to subscribe for dependable charging service is not necessarily essential in such instances, because many an isolated garage has a repair shop equipment to which a charging outfit could be added with reasonable expectation of profit, once the demand was assured.

Speaking in general terms, however, there is no reason why the housing and care of electrics should not be made a source of considerable revenue if properly undertaken. To do so it is necessary, first of all, to acquire a thorough understanding of the storage battery and to prepare to give the customer not simply the sort of service which will yield him a maximum of economy from his machine, but also to afford him that educational instruction which the peculiar, though elementary, requirements of the system demand. Where it is possible to do so, a competent battery man should be engaged for that work exclusively, and he should be charged with the oversight of all outfits under his care, not merely when they happen to be brought in for repairs, but on a basis of frequent and regular inspection. Given proper battery service, the remaining details of electric vehicle upkeep are readily mastered and easily and economically performed.

Even where the customer prefers to charge his batteries at home, the services of the garageman need not be entirely dispensed with. If he chooses to arrange for regular inspection of the battery and of the vehicle mechanism on a contract basis, he may thereby secure a constant though small income, while insuring for himself all repair work that may be required, as well as the perquisites of the annual overhauling and painting job. Not only this, but in many instances the owner who has an electric at some time may become the owner of a gasoline car; many motorists at present own vehicles of both types and will continue to do so as long as both exhibit equally desirable and independent characteristics. If such an owner already has been made a secure customer through service rendered with one type of machine,

## COMING EVENTS

October 28-29, New York City—New York "American's" motor truck contest.

October 29-30, Jersey City, N. J.—Reliability run of Automobile Club of Hudson County.

November 3-5, Atlanta, Ga.—Atlanta Automobile Association's fall meet on Speedway.

November 4-6, Kansas City, Mo.—Race meet under auspices Kansas City automobile dealers.

November 5, Los Angeles, Cal.—Los Angeles-Phoenix (Ariz.) desert road race.

November 5-6, New Orleans, La.—Automobile meet.

November 7-11, Chicago, Ill.—Reliability contest under auspices of Chicago Motor Club.

November 8, Yonkers, N. Y.—Mount Vernon Automobile Club's racemeet at Empire track.

November 10-13, San Antonio, Tex.—San Antonio Automobile Club's races at International Fair grounds.

November 11, Savannah, Ga.—Savannah Automobile Club's light-car road race.

November 12, Savannah, Ga.—International road race for the Grand Prize of the Automobile Club of America.

November 22-26, Lake Charles, La.—Louisiana Fair Association's race meet.

November 24, Redlands, Cal.—Mile High Hill Climb Association's contest.

November 24, Santa Monica, Cal.—Southern California Automobile Dealers' Association's annual road race; 200 miles.

November 24, New Orleans, La.—Race-meet under auspices of New Orleans Automobile Club.

November 26-27, Los Angeles, Cal.—Motordrome races.

he almost surely will remain so when he increases his equipment.

In addition to an active campaign in promoting the sale and use of electrics, the central station people are making preparations to inaugurate thorough systems of battery maintenance. In some instances this movement may represent an encroachment on business that the garageman might secure were he so disposed; in others it merely represents an opportunity for him to enter into a constructive alliance with live and well guarded commercial interests with which it will do him no harm to cooperate. The present campaign promises large results: so much of those results as

December 3-18, Paris, France—French Automobile Manufacturers' Salon in Grand Palais.

December 25-26, Los Angeles, Cal.—Twenty-four hours race at Motordrome.

December 31-January 7, New York City—"Independent" automobile show in Grand Central Palace.

January 2-7, New York City—Importers' automobile show in Hotel Astor.

January 15-21, Detroit, Mich.—Detroit Automobile Dealers' Association's annual show in Wayne Pavilion.

January 7-14, New York City—Association of Licensed Automobile Manufacturers eleventh annual show in Madison Square Garden. Pleasure cars and accessories.

January 16-21, New York City—Association of Licensed Automobile Manufacturers eleventh annual show in Madison Square Garden. Second week devoted to commercial vehicles.

January 16-22, Detroit, Mich.—Detroit Automobile Dealers' Association's annual show in Wayne Pavilion.

January 28-February 4, Chicago, Ill.—National Association of Automobile Manufacturers' tenth annual national show in Coliseum. Pleasure cars and accessories only.

February 6-11, Chicago, Ill.—National Association of Automobile Manufacturers' tenth national show in Coliseum. Second week devoted to pleasure and commercial cars, motorcycles and accessories.

February 25-March 4, Toronto Canada—Annual show under auspices of Ontario Motor League.

March 4-11, Boston, Mass.—Boston Automobile Dealers' Association's annual show in Mechanics building.

March 15-18, Louisville, Ky.—Louisville Automobile Dealers' Association's annual show in First Regiment Armory.

April 1-8, Montreal, Can.—Annual show in Coliseum.

the garageman can divert to his own uses by affording his support to the movement are rightfully his for the seeking.

Now that the bond market is improving and bankers having gone into the automobile business are peddling securities in that line, some one is unkind enough to suggest that there will be less said about motor cars as the root of all extravagances and the mainspring of economic evil.

The difference between reputable control of sport and the other kind never was better illustrated than by the Oldfield-Johnson hoax.

## HEARST STARTS HIS TRUCK TESTS

Thirty-Seven Vehicles Demonstrate Their Ability to Run—Substantial Evidence that "Test" Served Its Purpose.

The Boston American held its motor truck contest, which consisted of an endurance run to Newburyport and return, on Friday and Saturday, 21st and 22d inst. This was the first of the Hon. Will-

iam Randolph Hearst's great series of truck contests, which is to be continued in other cities where his newspapers are printed. During the two days of the contest, and the day after, the Boston American was generously studded with advertisements of motor trucks; it is fair to assume, therefore, that the affair served its purpose and

to penalties based on road troubles which the official observers were able to detect during the run, the final scores will be figured around the total weight carried and the cost of the gasoline and oil consumed in covering the 125 miles or so of the course.

From 47 entries the list simmered down to 37 actual starters, 30 of which completed the two days' performance without serious difficulties. The seven delinquents were reported to have dropped out from "tire,

two Frayer-Millers, and two Johnsons. Class E, five tons—Sampson, Morgan, Mack, two Reliances.

In the private owners' division were entries from the following firms: Henry Siegel Co., Smith Bros., U. S. Column Co., John Wanamaker, J. S. Nelson, George Backus, William Mahoney, Abbott-Miller, Eastern Avenue Garage and the Treat Hardware Co.

The trucks were weighed light on Friday, and again with their rated loads, early

FIVE-TON RELIANCE WITH ITS LOAD OF LUMBER

FRAYER-MILLER CARRYING A LIGHT LOAD

iam Randolph Hearst's great series of truck contests, which is to be continued in other cities where his newspapers are printed. During the two days of the contest, and the day after, the Boston American was generously studded with advertisements of motor trucks; it is fair to assume, therefore, that the affair served its purpose and

valve, oil and other troubles." Six of the survivors were penalized for tardiness at controls.

All the competing vehicles, like the five official cars, were of the gasoline persuasion; no electric vehicles were entered. The following cars started in their respective classifications:

on Saturday morning. After the weighing-in at Haymarket Square, they were driven to the Cottage Farm Bridge, where the tanks were filled and sealed, and where the official launching of the contest took place. Mayor Fitzgerald, of Boston, of course, presided at these ceremonies, and in the pregnant moment before giving the final

TWO OF THE "BIG FELLOWS"—THE GARFORD AND THE SAMPSON TRUCKS

was a complete success. Apparently they still are figuring over the results, however, for little real information is obtainable as to the outcome.

The contest was modeled somewhat after the lines of the recent endurance run from Philadelphia to Atlantic City, which was promoted by another newspaper with a patriotic name. That is to say, in addition

Class A, 1,000 pounds and under—Three Metz's, Hart-Kraft, Warren-Detroit, Reliance, I. H. C.

Class B, 1,001 to 2,999 pounds—Two Rapids, Atterbury, Franklin, Wilcox, Gramm, two McIntyres, two Autocars.

Class C, 3,000 to 5,999 pounds—Two Garfords, Alco, Frayer-Miller, Victor.

Class D, 6,000 to 7,999 pounds—Knox,

word, amidst a thick hush, he spoke as follows:

"The Boston American is always anticipating the needs of the times and it is blazing the pathway for others to follow."

He concluded his remarks with this sentiment:

"As mayor of the city I am glad to be here."

Starting at half-minute intervals, the trucks followed the outward route to Newburyport by way of Lowell, Lawrence and Haverhill, making a total of 61 miles. Controls were established at each of the cities. Three of the contesting vehicles fell by the wayside.

The five-ton Reliance, entered by the Reliance Motor Truck Co., skidded in the soft sand as it was entering the town of Billerica before reaching the first check, and pitched into the gutter, injured beyond the possibility of immediate repair. One of the Johnson trucks in the class D division skidded on the car tracks in Lawrence, struck a telephone pole and was put out with two smashed front wheels and springs.

subsequently being compensated for by taking on an equal weight of water. Before the start of the return journey a change in the schedule allowed the class E trucks was announced. They had been given an average allowance of six miles an hour on the outward trip. On the return this was increased to eight miles an hour, as the first day's work had showed the big machines capable of better speed than was called for.

The route back to Boston was by way of Ipswich, West Gloucester, Manchester, Beverley, Salem, Lynn, Malden, Somerville and Cambridge to the Longwood avenue bridge. Checking stations were established at West Gloucester and Lynn.

LINING UP THE VEHICLES—McINTYRE TRUCK IN FOREGROUND

The third car to meet with disaster was the little sister of the big Reliance, that was running in the class for light vehicles. It was retired at Haverhill; its inability being laid to a bolt being lost from one of the cylinders.

The name Reliance again was beclouded when the second of the two entries of that make in the E class failed to appear on time at the end of the day. When it did come in, four minutes late, its crew declared its tardiness to be due to a "frozen bearing" occasioned by lack of oil. The amusing part of it was that the official load of the vehicle consisted in part of one ton of perfectly good lubricant in barrels.

The scene at Newburyport was further enlivened by the miring of the big Sampson truck, which made a deep, soft bed for itself in being manoeuvred about the night stopping place. One of the Gramm trucks came to the rescue and pulled it back to solid ground.

After being recharged with fuel and oil, the cars again were weighed on the second day. Incidentally, the fuel supply had been brought along as cargo for the five-ton Morgan truck; the lightening of its load

The day's casualties included the loss of one each of the Metz and McIntyre entries and the penalization of the two remaining Metztes.

Considerable interest was added to the performance of three of the trucks by reason of the fact that they had come considerable distances over the road before starting. The Garford, entered by the W. A. Buxton Machine Co., had come in from Worcester, about 40 miles; the Autocar, entered by John Wanamaker, had been driven from Philadelphia; while the new Victor had been brought over the road from Buffalo.

Many of the trucks carried useful loads, thereby affording their entrants some return in advertising for the loss of their time and the cost of the trip. The conditions were supposed to correspond with those of actual practice, and when the final scores are announced they will, no doubt, be proclaimed as eminently practical.

#### Sheds New Light on the Tire Problem.

Despite the relatively high outlay of the average motorist for his tires it is probable that the comparative expense of maintain-

ing the ordinary automobile wheel with its tires and the common buggy wheel seldom is compared on a basis of actual miles covered. Whereas the iron wagon tire seldom gives trouble, the wheel on which it is mounted usually requires attention at least once a year, sometimes oftener. The result is that considering the small mileage of the buggy, the comparative cost of its wheel and tire up-keep is much higher than commonly is supposed. In the case of the automobile, on the other hand, practically the entire up-keep expense falls on the tire and, with its higher initial cost, that device naturally is credited with far less serviceability than it actually yields, when distance, loads and speeds are duly taken into account.

#### Deadening Vibration in Repair Shops.

In equipping garages in which the repair shop is located on an upper floor, great care should be taken to prevent noise and vibration from being transmitted to the lower portions of the building. To a considerable extent this may be done by arranging suitable cushioned mountings for benches, anvils and machine tools. Pieces of sheet rubber may be used for the purpose, or even sawdust or sand packing. In the latter case, the filling material may be placed in a small box in which is placed a flat board or plate, upon which the part to be supported is permitted to rest, the filler afterward being placed around the part and tamped into place. When vibration is taken care of in this way and due care is exercised to keep doors leading to stairways and elevator wells closed as much as possible, very little difficulty will be experienced.

#### Enables Traveling Men to Deliver Goods.

Traveling salesmen long ago began to see the advantages of the automobile for their own transportation needs, but it remained for the Pacific Cereal Co., of San Francisco, Cal., to improve upon the plan of furnishing cars for traveling men by putting on the road a light truck equipped to carry a small line of goods in addition to samples. The machine used is an Autocar truck, and besides carrying a very complete line of samples, its capacity is sufficient to enable the firm's representative to make stock deliveries in small quantities to take care of the majority of emergency and rush orders.

#### Carburettor Screws that Work Loose.

In carburetors of the type in which the float valve construction depends upon a lever fulcrumed upon a small machine screw, there is some chance of disarrangement through the backing out of the screw in consequence of poor fitting or excessive vibration. To counteract this tendency such screws should be lightly peened or riveted over, to retain them in fixed adjustment.

**OLDFIELD-JOHNSON RACE A FARCE**

**Proves to be a Black and Tan Picture Stunt  
Five Thousand "Easy Marks" Pay  
to Be Humbugged.**

Something like 25,000 people were missing from the Sheepshead Bay (N. Y.) horse track on Tuesday lost, 25th inst., when, after two postponements, the Barney Oldfield-Jack Johnson "race" was "pulled off," to use the pugilistic term that aptly fits the case. The wise promoters of the stunt had given out that a crowd of 30,000 was expected, but despite some clever publicity work only about 5,000 "easy marks" put in

in the second heat he gave the camera a better picture by "cutting it fine" and finishing only a few yards ahead. The track is more than a mile around, but no one took the trouble to verify the distance the men drove, and if anyone cares to believe the combination of one signal flag waved by Oldfield's manager, another waved by a prize fight promoter and a watch held by a horse race man, he will believe that Oldfield covered the five miles the first time in 4:44, and the second time in 5:14½. He will also believe that Oldfield, the "outlaw," drove an exhibition mile in his big Benz, also outlawed, in 44¾ seconds.

Oldfield's manager, "Bill" Pickens, also outlawed, was master of ceremonies. He arranged the setting for the dice-throwing,

OLDFIELD, HIS NEGRO PAL AND SOME OF THEIR SET

an appearance and paid \$2 for witnessing the biggest hoax that has been perpetrated on the public during a considerable period.

The miserable affair was exactly what the Motor World alone stated it would be, i. e., a "moving picture race." Both the white "outlaw" and the black pugilist were under contract to moving picture concerns and it could not well have been anything else. Before the "race" started the negro fighter kicked over the camera of a moving picture man who had not paid for the privilege of being present, and then the black and tan principals went through a lot of motions that may look genuine to greenhorns when the pictures are thrown on screens. Oldfield and Johnson shook hands and then shook dice for the choice of position, the moving picture gents inviting the crowd onto the track in order to add "life" to the scene.

After a fake start, for the benefit of the picture machine, the "race" was run in two five miles heats. Oldfield drove a Knox and the darky a Thomas. In the first heat the white man ran away from his "rival,"

and when Oldfield drew up after his "brilliant victory" he provided another picture with which the public will be humbugged.

"Everybody come out here and give the champion a big reception," he yelled to the spectators, several hundred of whom responded to the invitation. "Now lift him on your shoulders and carry him around and the rest of youse laugh and wave your hats," was the next command; and there were enough of the "easy marks," plus some hired men, to do even this bidding.

Having "conquered" the conquerer of Jeffries, Oldfield will now become an "actor" just like Johnson. He will go on the stage at any rate, and do a home trainer stunt on a vaudeville circuit. It has not yet been made known which set of moving pictures will be used during his act—whether the set taken during Tuesday's burlesque "race" or a set which is reported to have been taken several days before when Oldfield and Johnson are said to have engaged in a "close and thrilling race," while following in the wake of a moving picture machine mounted in a touring car.

**GEORGIA'S AROUND STATE AFFAIR**

**Lasted Ten Days and Awakened the Countryside—Free and Easy Competition  
but Method of Scoring a Puzzle.**

They've been marching through Georgia again. They started on October 17th and they finished the march last night. "They" were the parties contained in automobiles who were rounded up by three of Georgia's leading newspapers and, of course, they themselves did not call it a march. The affair was the "Around-the-State tour."

The Georgia newspapers are rather strong on affairs of the sort. Apparently whenever they desire to "start something," or when time is hanging heavily on their hands, they promote an automobile function of some kind into which the element of competition also enters; it entered into the tour which ended in Atlanta last night, but just where it entered and where it came out is more or less of a puzzle.

There was a referee—that's sure. He was the Honorable John M. Holden, Speaker of the Georgia House of Representatives. It also is certain that the tourists signed a book recording their arrival, and the time of their arrival each night, and in due course it is presumed that the Honorable Mr. Holden will examine the book and make known the results.

On the face of the returns, however, it appears that the only penalties which were imposed were penalties of 50 points each, which were tacked on to two cars which committed the grievous offense of passing other cars on the road, but at the time it was explained that if the offense was not repeated the penalties would be remitted.

As a tour pure and simple, however, the affair was quite "some pumpkins." Simultaneously, on the 17th, parties of tourists started from Atlanta, Macon, Albany, Bainbridge, Valdosta, Waycross and Augusta, the largest crowd, of course, being from Atlanta, where the most prominent of the promoting newspapers is located. These several groups chased each other, so to speak, around an irregular circle indicated by a line drawn from Atlanta through Griffin, Barnesville, Macon, Fort Valley, Ellaville, Albany, Moultrie, Pelham, Bainbridge, Thomasville, Valdosta, Douglas, Waycross, Reidsville, Savannah, Statesboro, Waynesboro, Augusta, Washington, Athens, Winder and back to Atlanta.

Touring through that part or any other part of Georgia is not exactly what may be termed a dream. While there are quite a few good miles of road in the Cracker State, there are many, many more miles that would insult the words "good" or even "half good" were they applied to them. The tourists encountered all sorts. They had a lovely time on the good roads; they had

## THE MOTOR WORLD

### ONLY NINE WENT TO RICHMOND

And None Returned with Perfect Score—  
Newspapers' "Endurance Tour" Falls  
to Arouse Much Interest.

a wholly different kind of a time on the others, some of which are closely related to bogs. Not a few of the cars sank up to their hubs in the mud, and there was frequent cause for the exercise of brotherly love which is marked by a towrope and a helping hand.

The newspapers involved, however, made airy trifles of such troubles and created such a general hurrah that the tour appears to have been "one grand sweet song." Certainly it excited even more interest than a circus. Every town on the route turned out en masse and extended what in the vernacular is termed "the glad hand," when nothing more substantial was extended.

The names of the drivers of the cars appears to have mattered little. The names of the owners or entrants and of the occupants were of more importance. There was one young woman, however, who drove a car, Miss Regina Rambo, of Marietta, who handled the steering wheel of a Columbia, and her name was mentioned many times and oft. She appears to have been the heroine of the tour and when she was not pelted with flowers she was presented with bouquets of them.

Not a few of the cars were entered by the local boards of trade and chambers of commerce which thrive in Georgia, and in addition to sampling the diversified roads they scattered advertising matter booming their respective neighborhoods.

Taken as a whole, however, it was a great affair—in Georgia—and when the referee figures out the score and accompanies it by the necessary diagram, its worth as a competition will be made so plain that all may see.

The Atlanta party, which was by far the largest of the tour, was as follows:

Ohio, Ohio Motor Car Co.; Columbia, Maxwell-Briscoe Southern Co.; Primo, Primo Motor Co.; Primo, R. E. Henderson; Franklin, W. D. Alexander; Columbia, Southern Ruralist; White Steamer, Edwin P. Ansley; Overland, St. Elmo Massengale; White Star, Atlanta Motor Car Co.; Selden, Southern Bell Telephone Co.; Cole "30," Long Henderson Motor Co.; Hudson, Atlanta Gas Light Co.; White (gasolene), Atlanta Journal; Everitt "20," Phil Cook; Abbott-Detroit, Abbott Motor Co.; Firestone-Columbus, Columbus Buggy Co.; Overland, Overland Southern Motor Co.; Mitchell, Georgia Auto Exchange, of Columbus; Overland, Baughman Auto Co.; Haynes, Mrs. John Keiley; National, Dolph Walker; Olds Special, Z. W. Oglesby; Buick, George W. Deen; Brush, Georgia Motor Car Co.; Overland, B. R. Beck; E-M-F, Dr. H. L. Rudolph; Pullman, Atlanta Constitution; Hupmobile, Georgia Auto Exchange; Hupmobile, M. R. Flourney; Ames, Ames Motor Co.; Case "30," J. I. Case Threshing Machine Co.; Thomas Flyer, Charles O. Duvall; Maxwell, Athens Chamber of Commerce; E-M-F, Winder Board of Trade; Cadillac, Hall Miller.

Apparently the Washington (D. C.) trade is beginning to grow weary of newspaper-promoted "reliability contests" and "endurance tours." At any rate the Washington Post's affair, denominated an "endurance tour," which ended on Tuesday last, 26th inst., was a peewee event; it attracted only nine entries, representing but five makes of cars. The route was from Washington to Richmond, Va., and return, about 500 miles. The contest started Friday, the 21st. The first night was spent in Staunton, Va., the second night and all of Sunday in Richmond, and Monday night in Warrenton, 65 miles from the capital.

The starters were as follows: Harry Walls, Maxwell; Bert Robinson, Maxwell; Howard Wagner, Columbia; Gary Carter, Washington; M. E. Arrison, Washington; Griffin Halstead, Washington; Irving Barber, Parry; Stanley Mortimer, Buick; Ward Angle, Buick.

None of the cars finished with a perfect score. Gary Carter, however, came near to one. He had a clean record until the last day, when he stalled the motor of his Washington car, of which he is the manufacturer, and thereby lost one point. Walls, in the Maxwell, was the runner-up. On the third day, he, too, had stalled his engine while fording a stream and also got water in his carburetter, which stop and difficulty cost him three points. The fight, such as it was, was between these two men, Carter and Walls, and unless their positions are upset by the technical examination, which was interfered with by rain, their standing is one, two.

Four of the nine cars were penalized on the first day. Halstead's Washington dropped into a hole near Purcellsville, Va., and broke a front axle; another one was telephoned for and the damage was repaired and the car rejoined the party the next day, although out of the contest, its accident having cost 925 points. Arrison stalled his engine in avoiding a collision with Halstead, when the latter dropped into the Virginia mudhole, and thereby lost one point. Both Buicks also were debited, Mortimer 14 points and Angle one point, for time spent in adjusting their sight feeds.

On the second day a heavy rain rendered a portion of the road almost impassable, only Carter and Walls negotiating it without penalty. Mortimer's Buick got stuck in the mud and lost 50 points. He was the heaviest sufferer; the other Buick lost eight points. Going into Richmond that night, W. D. West, the referee, was thrown from the Parry car, in which he was a passenger,

and narrowly escaped being killed when the car ran into a fence in the dark. Barber, the driver, had suffered a blow-out and was making up lost time when the accident occurred. None suffered more than bruises, however, and broken headlights and a bent axle was the only damage the car sustained.

Leaving Richmond on Monday, the cars headed for home via Louisa, Gordonville and Orange. The chief incident of the day was Walls' fall from the perfect score class when he stalled his motor in mid-stream. Halstead (Washington) and Robertson (Maxwell) also stalled their engines, the former doing it three times; such stops entailed debits of one point for each. Wagner in the Columbia was the heaviest loser. He dropped 21 points for working on his transmission due to inability to get it out of low gear.

On the last day, the short run of 65 miles into Washington spoiled the only remaining clean score—that of Garry Carter, who, as previously stated, stalled his engine.

### Frisco Forms Racing Association.

Somewhat on the lines of the Motor Cups Holding Association, which is responsible for the Vanderbilt and other races over the Long Island Motor Parkway, a racing association has been formed in San Francisco, Cal. Its purpose is to perpetuate the Portola road race or another big road race on January 1, 1911, over a course to be decided later, but which probably will be over the Haywards boulevard in Alameda county. The officers elected at the meeting were: William M. Klinger, president; A. J. Smith, vice-president; E. T. Sterling, secretary-treasurer; Frank Carroll, assistant secretary-treasurer, and Max Rosenfeld, chairman of the board of governors.

The local dealers who took an active part in the formation of the automobile racing association were as follows: B. H. Pratt, Fisk Rubber Co.; John J. Doyle, Pope-Hartford; George E. Hoyt, Fireman's Fund; E. N. Merguire, Fisk Rubber Co.; A. D. Nichols, Weinstock-Nichols Co.; John W. Swan, representing Leon T. Shettler; R. C. Kennedy and A. D. Whitehead, Marmon; W. M. Klinger, Fireman's Fund; F. J. Linz, Maxwell and Columbia; Dick Ferris, promoter; Max Rosenfeld, Apperson; W. H. Middleton, Alco; T. W. White, Warren-Detroit; F. G. Bierlein; A. J. Smith, Elmore; E. T. Sterling, secretary San Francisco Motor Club; J. A. Marsh, Pierce Arrow, president Auto Dealers' Association; J. O. Stewart; A. E. Morrison, Cadillac; C. S. Bougher and Harry Michener, Simplex; C. S. Richardson, Knox; Frank E. Carroll, Monogram Oil; Ivan L. de Jongh; E. P. Cooper, Alco; R. K. Roberts, Buick; F. G. Becker, Oakland; H. A. Bubb, Medford, Oregon; George P. Moore, Monogram Oil; R. F. Harrington; W. C. Morris, Autocar; Hazlitt L. Pelton, Stewart Speedometer.

**NEW S. G. V. SUCCEEDS OLD ACME**

**The One Bears Small Resemblance to the Other—Newcomer Full of Good Features.**

Old companies have brought out new cars, but usually they have attached the old name to their new product. When, however, the Acme Motor Car Co., of Reading, Pa., decided to reconstruct its line, it not only evolved an entirely new car but it applied a new designation to it. The Acme company's models no longer are termed "Acme," but "S. G. V.," which initials stand for the names of the officials responsible for

hardware, are of special design to match and add to the general appearance of the inside the body. All fittings, which usually are brass finished, such as the steering

FRONT VIEW S. G. V. MOTOR

the new car, viz.: Messrs. Sternberg, Graham and Vantine. Work on the S. G. V. was commenced more than a year ago, the best practices both at home and abroad being drawn on in the effort to attain the highest possible standard. The months of study and preparation were followed by months of road tests, and these factors combined with an output limited to 300 cars, have resulted, the manufacturers confidently assert, in a model that places the S. G. V. in the "select" class. It is founded on a single chassis having a wheel base of 116 inches, which with the several body designs affords a two passenger, four passenger close-coupled car, a five passenger touring car and a five or six passenger limousine or landaulet.

In working out the details of finish and equipment of the car great pains have been taken. Curved mud guards webbed to the frame by aprons between the running boards and body, protect the occupants of the car, and all moving parts are amply protected by the use of a long sod pan underneath. The bodies are built of sheet aluminum throughout with ash frame. All equipment, such as lamps, horn and body

THE NEW S. G. V. FOUR-PASSENGER CLOSE-COUPLED TOURING CAR  
SIX-PASSENGER LIMOUSINE MOUNTED ON SAME CHASSIS  
THE FIVE-PASSENGER S. G. V. TOURING-MODEL

car. One original feature is the method of mounting the horn tube, which is placed wheel and levers, are covered with hard rubber. All lamps may be enameled to con-

form to the color scheme of the body, or to suit any individual taste. The dash is of Circassian walnut, and with the exception of a small meter, indicating oil pressure in the lubrication system, is clean. The foot and toe boards are of cast aluminum. On the right side is the tire bracket and holder, integral, and arranged so that when not in use it may be folded down against the body of the car.

The S. G. V. motor is rated at 25 horsepower, and is of 4 cylinder form, with cylinders cast en bloc. The dimensions are  $3\frac{3}{4}$  by  $3\frac{3}{8}$  inches, with integral inlet manifold. The water jackets are exceptionally large, and as water is circulated around the valve stem guides it insures cool valves. The

ing, so that the motor is practically proof against the smoking evil.

For the ignition a Bosch magneto with fixed spark is used, eliminating the usual spark lever in the wheel, the spark advance being obtained as the motion increases in speed. Cooling is accomplished by means of a cellular radiator and a centrifugal pump.

The frame is of cold pressed chrome nickel steel, heat treated after each pressing operation. Both the upper and lower flanges of the channel section are very wide, and the frame is raised over the rear axle, giving low center of gravity, but allowing plenty of road and spring clearance. The frame narrows toward the front, allowing

of which are drop-forged. All four wheels are 34 inches in diameter, shod with 4 inch tires on demountable rims. They are of second growth hickory and the spokes are short and heavy. The springs are manufactured by the French maker, Lemoine, the front ones being semi-elliptical, 35 inches between centers, and the rear ones three-quarter elliptical, 44 inches in length. The control is by means of clutch and service brake pedals, with the levers for gear shifting and emergency brake located conveniently at one side. The engine is regulated by a finger disc on the steering wheel and by an accelerator pedal. The steering gear is of the worm and gear type. The wheel is of aluminum covered

LEFT AND RIGHT SIDES OF THE NEW S. G. V. 25-HORSEPOWER HIGH-SPEED MOTOR

pistons are finished by grinding and are very light in weight. The pistons have three rings, one of which is an oil ring. The wrist pins are secured in the bosses by two set screws, jam nuts and cotter pins. The connecting rods are of I-section vanadium steel drop forged, and the bearings are Forest bronze boxes with Fabrig metal inserts. The crank shaft is cut from a solid nickel steel billet, properly treated, and the bearings are of the same metal as those in the connecting rods. The bottom part of the crank case acts merely as an oil reservoir. The fly wheel is a steel casting and has fan spokes, eliminating the need for any other fan. The center of the fly wheel forms a housing for a multiple disc clutch.

Lubrication is obtained by means of a gear pump, driven from the rear end of the cam shaft. This pump draws the oil from the lower crank case and forces it to the main crank shaft bearings through integral passages in the case, through ducts in the crank shaft to the connecting rod bearing, then through a tube to the wrist pin bearing. A specially designed safety valve and by-pass keep the oil at constant pressure. The system is so arranged that it is thoroughly insured against over-feed-

ing the motor and transmission to be mounted upon it, thus doing away with the sub frame. This also permits the car to turn in a much shorter space.

The clutch, which is mounted in the fly wheel, is of the multiple disc type, having 36 steel discs running in oil. The clutch shaft which transmits the torque is mounted on ball bearings.

The transmission is of the selective type, giving four speeds ahead and one reverse, direct on fourth speed. All gears are of nickel steel. The service brake drum is attached to the direct drive shaft. The rear axle is of the semi-floating type, and runs on annular bearings. The differential is of the four bevel pinion pattern. The standard gear ratios are relatively low for normal car speeds, an arrangement which is made possible by the high speed of the motor.

In addition to the service brake acting on the driving shaft, which consists of two shoes controlled by a differential screw mechanism, two other brakes serve for emergency purposes. They are of the expanding type, operating in rear wheel drums under control of the side lever. The front axle is a channel section form of chrome nickel steel, heat treated, the ends

with hard rubber and contains at its center a short circuiting button for cutting out the ignition.

#### Denmark Now Offers Better Opportunities.

Many regulations favoring motorists have been passed recently in Denmark; public roads formerly inaccessible to automobiles have been opened up and a more liberal policy has been inaugurated, which should mean increased sales of motor vehicles in Denmark, writes Consul-General Wallace C. Bond, of Copenhagen, in a report to the Department of Commerce and Labor. At present practically all automobiles used in the country are imported, as there is only one factory in the kingdom, a very small concern, which turns out delivery cars chiefly. There should be a good market here for small runabouts, to be used by professional men, which would cost not over \$750, and a good opportunity presents itself for the building up of a substantial trade in delivery cars and motor trucks. There is a limited market for the larger and more expensive touring cars. The machines in general use here are from 10 to 20 horsepower. The import duty on automobiles is very low, viz., 2.68 cents per 2.2 pounds.

**NEW WAVERLEY HAS SWELL FRONT**

**Which Lends It Distinction—Other Models Have New Lamps, Fenders and Equipment—Mechanism Unchanged.**

It is somewhat remarkable how quickly a point of stability was reached in the design of electric vehicles. Gasolene cars now have reached a point where such of them as are produced by reputable and cautious manufacturers require very few changes in successive models, but this has been true of the electric for several years. The power plant of the Waverley line, for example, at present is in its third year of

been changed. The maximum speed is 25 miles an hour, and the mileage capacity per charge has been made adjustable according to the requirements of the owner; if more than 100 miles per charge is required, the Waverley Co. is prepared to furnish Edison battery equipment, at additional expense.

In the case of model "75-C," the second of the two four-passenger brougham offerings, considerable improvement in appearance and serviceability has been effected by the adoption of a new form of spring suspension. Such is the nature of the new arrangement that the frame sill is brought two inches below the tops of the full elliptical springs. By lengthening the forward fenders somewhat and adopting new style lamps the car's appearance is altered.

**CAUSES FOR POOR COMPRESSION**

**Faults, Small in Themselves, to Which Large Losses of Power May be Due—Indications and Remedies.**

When a car is taken to the repair shop for examination as to the cause of loss in power, the man who does the repairing frequently finds this loss of power to be due to "poor compression."

It is assumed, of course, that every motorist knows what is meant by compression, i. e., the drawing into the cylinder of a charge of gaseous mixture by a stroke of the piston in its downward travel, and the

IMPROVED WAVERLY BROUGHAM "75-C"

NEW MODEL "81"

VICTORIA PHAETON MODEL "76"

manufacture, and since its introduction it has undergone practically no change.

In announcing its new line the Waverley Co., Indianapolis, Ind., has disclosed but one strictly new model. This is a four-passenger brougham, known as model "81," resembling in many ways model "75," produced last year, but differing from it in several important respects. Thus the body is built in a single piece, three inches wider, the front has swelled side panels with rounded quarter set with French plate glass, and the general effect of the car is roomier and more luxurious. This effect is heightened by sundry improvements in appointment, such as the installation of two toilet cases, a flower vase, umbrella holder and shaft driven odometer.

Next to this car in point of newness is the Waverley roadster, which was introduced last year in a tentative form, but which has since been altered in several points. It is designated as model "78," and it is made in exact semblance to a gasolene roadster, possessing the same praiseworthy qualities of long wheel base, easy suspension and comfortable seating. The body is very low hung and is provided with a rear rumble seat. The total length of the vehicle has been increased to 114½ inches, the wheel base having been increased to 96 inches. The shape of the cape top also has

Practically the same changes as have been applied to the second brougham have been adopted in the remaining models of the line. They include the coupe, model "70-C;" Victoria-Phaeton, "76;" and the Stanhope, model "74." In the case of the runabout, model "69," however, a continuous fender has been substituted for the separate wheel guards previously used.

The mechanical equipment includes the original pattern of shaft drive with herringbone gears that was developed by the Waverley engineers two years ago, and which consists of a flexible shaft transmission between two pairs of herringbone reduction gears; the knife-blade contact form of controller and such protective arrangements as are necessary to provide against starting the car inadvertently or except on the low speed connection, and to prevent reversing with the power on.

In the matter of prices the new model "81" stands at the head of the list, its cost being \$2,600. Contrary to erroneous announcements, the list quotations on the other models have not been advanced, but stand at \$2,400 for model "75-C;" \$2,150 for model "7-C," as a two passenger coupe with 32 cells of battery; \$1,850 for the Victoria-Phaeton, model "76," with 32 cells of battery, and \$1,700 for the roadster, model "78."

compression of it by the next upward stroke into a space approximately one-fourth of the cylinder's cubic capacity, ready for its ignition and expulsion during the two succeeding strokes of the piston. This compression naturally gives the gases greater rebounding, expansive or explosive properties when ignited by the electric spark. It is in this manner that the power of the engine stroke is produced. It follows to a great extent that the power of the engine depends largely upon the extent to which the gases taken into the cylinder are compressed—that is, upon compression—though the number of revolutions which the crank shaft makes per minute also varies the power.

Indications of poor compression are the loss of speed, inability of a car to climb grades as easily as before or a decrease in the amount of resistance to the starting crank. Loss of compression is often due to bad valve seatings. The exhaust valve is liable to give more trouble in this respect than the inlet valve, as it has more work to do and has to withstand a great amount of heat subjected to it by the outrushing exhaust gases at the completion of each power stroke.

Leaky pistons are exceedingly wasteful of power. In closed base motors, such as the two cycle or in multiple cylinder types,

it is not always easy to determine where or what is the cause of the trouble. Ill fitting rings, scored cylinder walls, scratched piston walls or rings stuck to the cylinder by carbon will cause leaks past the piston. If these are allowed to go unrepaired for a time, much more serious damage results, often necessitating reboring and fitting of new piston and rings. These leaks not only allow the escape of the expansive gas, but also cause the oil to dry up along the overheated parts of escape.

Leaks caused by poorly fitted piston rings may be found by the presence of a dark colored section along their circumference. A perfectly fitting ring will always appear bright and smooth in its entire circumference. Those that are bright only in spots touch the cylinder only at those places. Therefore either the cylinder bore is not true or the rings are not perfectly round. It is obvious that a ring cut larger in diameter than the piston, having a section cut out, and then pressed together—there are such rings made—is not a perfect circle, but somewhat elliptical, and the ring will touch the cylinder only near the cut. Such ring construction is decidedly injurious and will wear the cylinder walls unevenly. After rings are cut they should be so clamped together as to allow their centering again in a lathe and being returned to a true circle.

Explosive force is sometimes lost because of the inaccurate boring of a cylinder. By the dulling of the tool as it cuts from one end, it may leave the end when the cut is finished smaller than the other. Consequently the piston and rings will not fit each end of the cylinder.

Next to imperfectly fitting rings or unequal cylinder diameter, a ring clogged or "stuck" from a poor quality of lubricating oil, or from the too free use of oil, will give the most trouble. The burnt carbon adheres to the rings, causing them to stick tight in their grooves and become incapable of pressing against the cylinder walls. Kerosene injected into the cylinder sometimes will cut away this carbon, but often it is necessary to remove the piston and rings and thoroughly clean them by first saturating with kerosene and then scraping them. The grooves in the piston should be cleaned before replacing.

Loss of power might result also from the presence of a sand or blow hole in the piston casting, and from punctures made by pieces of loosened metal such as piston ring pins or spark plug points.

#### Why Shock Absorbers Require Inspection.

Shock absorbers should be inspected occasionally to see that the fixtures by which they are secured to the frame and axle, respectively, have neither loosened nor bent, and that the connecting members have not been worked out of shape. If the device is incorrectly mounted it is liable to work improperly, thus interfering with the free movement of the springs.

#### Franklin Produces a Special Speed Car.

Having decided to produce a limited number of special speed cars, the H. H. Franklin Mfg. Co., of Syracuse, N. Y., already has delivered the first one to Ralph C. Hamlin, of Los Angeles, Cal.

The new car, as shown by the accompanying illustration, is a two-passenger, turtle-back torpedo-phaeton with high doors and flush sides. The motor used is a four-cylinder Franklin, air-cooled, with four-inch stroke and bore. Its construction, of course, is the exclusive pattern in which air, under induced draught, is circulated through "chimneys" surrounding the cylinders. The tire equipment, in accord with Franklin practice, is large, both

700 miles before the shoe was discarded, and that upon a 3,500-pound car. Used in a new and unfractured casing, it is claimed that the life of the shoe would be increased by about 40 per cent.; the incidental effect of the reinforcement being to add to the resilience of the equipment.

#### Duryea Speaks for Side Starters.

"The Motor World's account of the tragedy caused by cranking with the clutch engaged seems to point to several 'obvious morals,'" writes the veteran Charles F. Duryea. "It is well to say that one should be sure the gears are not in mesh before cranking, but it is well known that everybody forgets sometime or other, and it

THE FIRST OF THE FRANKLIN SPECIAL SPEED CARS

front and rear tires being 34 by 4½ inches in size, giving a wide margin of safety in the capacity of the tires over the load put on them. This car weighs but 1,900 pounds. It has a wheel base of 115½ inches.

#### Thermoid Brings Out Tire Reinforcement.

An old leather bootleg, hacked into shape with a penknife, is the primitive form of repair patch for a blown-out tire casing. Through successive stages, the prepared and vulcanized patch has progressed, under the influence of experience, until the present time. Developed from the simple patch, but elongated sufficiently to extend around the entire casing, the Thermoid Rubber Co., of Trenton, N. J., has just produced a new style of tire reinforcement, which is calculated to prolong the life of a tattered casing by many miles and, incidentally, to eliminate the bootleg for all time.

The reinforcing strip, which is shaped to fit the interior of the casing, is composed of a continuous fabric envelope into which an elastic rubber solution is inserted by a secret process, as it is explained, prior to vulcanizing. Tests with the reinforcement in one case, when applied to a casing in which there were no less than three holes, sufficiently large to admit a man's head, revealed an extra service of no less than

seems rather severe that the penalty of this forgetfulness should be a run-over.

"I would like to suggest that the remedy is a simple one and that it would be quickly supplied if buyers insisted, viz., to crank from the side. The control levers are at the side of the car. The throttle and spark controls are there. The sight of a man chasing back and forth from front to side is not an impressive one, but it often is seen when the car is at all refractory about starting. And there are other reasons. Cars are or should be stopped with the right side to the curb. This lets the passengers out on the clean curb instead of out in the muddy street. Ninety-five per cent. of our streets and roads are not good. The street sprinkler keeps even the good ones too wet for clean feet. And every year as the cars get lighter and more capable they are used in bad weather more and more.

"It thus will be seen that the side is the place for the starting crank. The driver is at the side before entering and he can crank without chasing around in front and getting his feet muddy as well as getting away from his car control. The early rigs had the starting crank on the side and those who have used them know how much more convenient they were than the now common front position."

## PROOF AGAINST ALL CLIMATES

**Stewart & Clark Make Ingenious Provision  
for Changes of Temperature—Its  
Effect on Speedometer.**

For the purpose of compensating errors due to differences in atmospheric temperature, the Stewart & Clark Manufacturing Co., Chicago, has installed a new element in its so-called multi-polar speedometer which results in increasing the accuracy of the instrument by a considerable amount. As was described by the Motor World in its issue of May 26, 1910, the effect of variations in temperature upon speed indicating devices which depend upon the magnetic principle results from a change in the electrical resistance of the non-magnetic or stator element. As the electrical resistance of this part varies, its response to the "drag" of the magnetic or rotor element is proportionately affected. The compensating arrangement which has been introduced in the Stewart instruments is calculated to offset this effect by altering the position of the relatively stationary element by a very slight amount and thereby influencing the drag of the magnet in the opposite sense.

In the accompanying illustration the instrument is shown partly in section and partly in shadow to indicate the relative position and effect of the new compensating device. The essential organs of the instrument are the driving shaft E which causes the rotor R to turn by means of the bevel gearing F, and the stator K, which is in the form of an inverted aluminum cup which covers the top of the magnetic ring D and surrounds its periphery in the annular space between the magnet and the protecting shell Q, which revolves as a unit with the magnet. A prolongation of the shaft J, upon which the cup is mounted, carries a pointer that swings over the dial P. In ordinary operation, as probably is pretty generally understood, the rotation of the magnet has the effect of generating electric currents in the body of the cup, thereby causing it to rotate through a very small angle against the resistance of the spring N.

The compensating device depends for its action upon the expansion and contraction of the outer casing of the instrument. A lever system, shown in phantom at S, is mounted in a heavy frame in the base of the instrument in such a manner that the contraction of the case A-B, when cooled, will move the levers and raise the lower bearing I, in which is mounted the shaft J of the aluminum cup K. This causes the cup to be slightly displaced in the field of the magnet D and has the effect of diminishing the drag of the magnet by a very slight amount.

As the effect of cooling the cup is to decrease its resistance and thereby to increase the flow of current, however, the displacement of the cup merely tends to correct a tendency that otherwise would result in a reading higher than that corresponding to the exact speed. Thus as the case expands and contracts with changes in temperature, the very minute upward and downward movement imparted to the stator in consequence has the effect of compensating for the effect of the same temperature changes on the cup, and so renders the indications of the instrument essentially correct.

Following the adoption of the compensating device in the 1911 Stewart models,

NEW STEWART COMPENSATING DEVICE

the Stewart instruments were subjected to a test similar in its nature to that by which the magnetic type of speedometer originally was shown to give erroneous readings under extreme temperature variations. The instruments to be tested were encased in wooden boxes, which, in turn, were enclosed in larger boxes, the latter being adapted to be filled with ice and salt, to obtain a cooling mixture; or with hot water, to raise the temperature of the instruments. The driving shafts, which were passed into the boxes through tubes, were geared to a shaft driven by a variable speed friction transmission, not unlike that employed in certain motor cars. The actual speed of the shafts was obtained by means of an electrical contact breaker which served to commutate an alternating current and thus to permit the speed to be ascertained by the use of a frequency meter. As a check, an ordinary revolution counter and watch are employed.

Three Stewart instruments, each equipped with the temperature compensating device were tested by this means, and also three instruments of another make, not compensated for temperature variations, but which, in the original test made last spring, had shown the same sort of error as the Stewart, though in smaller magnitude. The six instruments were tested in pairs at tem-

peratures ranging from 17.6 to 131 degrees Fahr., and the speeds which they indicated compared with the actual speeds calculated from the frequency meter indications.

In the case of the three compensated instruments the average errors were 5.9, 5.9 and 4.3 per cent. out of the way respectively. The average errors in the case of the uncompensated instruments were, respectively, 17.5, 23.0 and 28.2 per cent. The actual variations in miles per hour of the readings ranged from .3 to 3.7 in the least accurate; while in the uncompensated device the greatest range of error was from 2.8 to 13.3 miles per hour.

## "Duralumin" for the American Market.

Persistent efforts to develop an aluminum alloy possessing sufficient strength and elasticity to render it in any way comparable with the heavier metals have been rewarded in the new metal "Duralumin," a German product for which great hopes are entertained. After having been favorably received abroad, the introduction of the metal to the American market has been undertaken by the firm of Marburg Brothers, of New York City.

It is a magnesium aluminum alloy, and while its specifications are not declared, it is said to be of about 90 per cent. aluminum with small additions of other metals, mainly magnesium and copper. From the fact that some of the ingredients are heavier and others lighter than aluminum it follows that the resulting weight is practically the same as that of aluminum itself. Its appearance also is much the same, but it has the advantage of retaining its luster unaffected by the atmosphere; it also resists the corrosive influence of salt water, which is one of the claims that has led to its experimental adoption in marine construction.

Varying with the mixture and treatment its ultimate strength is said to run from 50,000 to 85,000 pounds per square inch. Soft plates of about 1/4 inch thickness are quoted as having the following properties.

Alloy No. 1—Specific gravity, 2.77; elastic limit, 26,000 lbs. per sq. in.; ultimate strength, 50,000 lbs. per sq. in.; elongation, 21 per cent.; contraction, 34 per cent.

Alloy No. 2—Specific gravity, 2.84; elastic limit, 36,000 lbs. per sq. in.; ultimate strength, 65,000 lbs. per sq. in.; elongation, 18 per cent.; contraction, 26 per cent.

By rolling, the No. 2 alloy can be made to show the following characteristics:

Elastic limit, 74,000 lbs. per sq. in.; ultimate strength, 85,000 lbs. per sq. in.; elongation, 3 per cent.; contraction, 10 per cent.

It is thus to be compared roughly with low carbon steel when annealed, the properties of the two metals being much the same both before and after rolling. At the same time its weight is only about one-third as great. Duralumin can be rolled cold or warm and also can be forged or drawn. It melts at 1,200 degrees Fahr.

## IMPROVING THE LEAD BATTERY

Lecturer Forecasts Appearance of a New Type—Explains Distinction Between "Acid" and "Alkali" Types.

Although it is not generally known, the Electric Storage Battery Co., of Philadelphia, Pa., manufacturer of the well-known Exide batteries, for some time has been developing a new and very radical type of plate construction which is calculated greatly to prolong the life of the battery, also eliminating the necessity for frequent cleaning in order to remove deposits of sediment. That the Storage Battery company is about to place such a battery on the market was revealed by Bruce Ford, who is connected with the company, in the course of a paper read before the Electric Vehicle Association of America, at its first annual convention in New York City last week. The Ford paper also has the merit of presenting a clear and concise explanation of the fundamental distinction between the acid and alkaline battery types, of which the ordinary lead cell and the new Edison battery, respectively, are familiar examples.

"Although primary batteries have been used to a small extent experimentally as the motive power of electric vehicles, the storage battery is the recognized standard for this purpose," said Mr. Ford. "Storage batteries may be divided into two classes according to their electrolytes; first, that having an acid solution; second, that having an alkaline solution. Neutral salt solutions although employed to a large extent in primary batteries never have been used successfully in storage batteries. Where alkaline solutions have been employed the electrolyte has invariably been a solution of caustic potash. The electrodes used with the alkaline solution have been various metals and oxides, such as copper, silver, nickel or cobalt in the positive pole electrode, and zinc, cadmium or iron, in the negative pole electrode. In some batteries of this class metals are permitted to go into solution, although such batteries are not now being commercially exploited, and the alkali batteries of today are constructed with insoluble materials in both electrodes. The Edison and Jungner batteries are the most familiar examples of this type.

"In the acid battery, although various solutions have been proposed and tried, dilute sulphuric acid is the recognized commercial standard for the electrolyte. Soluble electrodes, although at one time consistently exploited, have been abandoned in favor of insoluble electrodes, and the recognized standard material in both positive and negative plates is now lead. The lead cell is the oldest commercial form of storage battery, dating back to 1860. Although

the principles involved in the lead-sulphuric acid battery are the same as when it was originally brought out, yet the methods and results obtained have been the outcome of exhaustive experiments, some of which are still in progress, while many new experimental lines are being continually developed. The lead-sulphuric acid battery has characteristics of high and uniform individual cell voltage on discharge combined with low internal resistance and high watt-hour efficiency which render this type of cell peculiarly adapted to the needs of electric vehicle propulsion where high currents are required for acceleration, hill climbing and bursts of speed.

"The nickel-alkali-iron battery, on the other hand, has a high capacity per unit of weight which makes it attractive where an abnormal amount of mileage is required per charge. The manufacturers of this battery also claim a very long life. The battery is new in commercial operation, and therefore no definite commercial figures have been obtained as yet to substantiate this claim. High internal resistance and high initial cost are among its disadvantages.

"In the present standard type of lead cell the capacity per pound can be varied within certain limits by furnishing plates of different thicknesses. A thicker plate has a longer life in number of cycles of charge and discharge than a thin plate, but its capacity per pound on each discharge is not so great. The makers of the Exide battery have developed commercially several thicknesses of which three will be described as being representative. The standard Exide battery has a positive plate 7-32-inch thick and gives a capacity initially of about  $8\frac{1}{2}$  watt hours per pound of complete cell at its five-hour discharge rate, and this capacity will increase to about  $10\frac{1}{2}$  watt-hours in service.

"The Hycap Exide has a positive plate of 3-16-inch thickness will give initially about  $9\frac{1}{4}$  watt-hours per pound and will work up in service to about 12 watt-hours per pound of complete cell at the five-hour rate of discharge. The thin plate battery has a positive 9-64-inch thick, will give initially about 10 watt-hours per pound, and will work up in service to about  $13\frac{1}{4}$  watt-hours per pound of complete cell at the five-hour rate of discharge. There are, of course, more plates per pound of thin plate battery than of thick plate battery. Experience has demonstrated that with a given weight of battery where about the same percentage of the full capacity of the battery can be utilized on each discharge, the life in miles of the thin plate batteries is about the same as that of batteries equipped with the thicker plates. In other words, the extra mileage obtainable on each discharge practically compensates for the reduced number of discharges obtainable during the life of the batteries having the thinner plates.

"Experiments have shown that the lead

battery is capable of considerable further development to produce higher capacity per unit of weight, and also to produce plates of considerably longer life. In both the lead and the nickel types of batteries the action which governs the life is largely mechanical. In the respective processes of charging and discharging the battery, the active material of the positive pole plates becomes alternately oxidized and deoxidized. This alternate action causes a molecular disturbance which would eventually cause the active material to lose its coherence unless artificially maintained. In the lead battery it has generally been the practice to permit the active material to become gradually disintegrated and washed out from the surface, and to allow a reserve in the quantity of active material sufficient to produce a commercially satisfactory life. To the carrying around of this reserve active material in the lead battery is largely due its greater weight per unit of capacity than that of the alkali battery whose active material is maintained mechanically to restrict its molecular disintegration.

"For many years experiments have been carried on in this country and abroad to determine what could be done toward preventing the disintegration and washing away of the lead active material. To a Frenchman belongs the credit of having invented the only practical method so far found to actually accomplish this result. The fact was thereby established that by holding the active material in its place the life of the plate can be prolonged with excellent capacity to an almost indefinite period. The mechanical details of construction employed for this purpose were complicated and expensive, and this battery up to the present time has never been exploited to any considerable commercial extent. Recognizing, however, the value of the principle involved, the Electric Storage Battery Company, makers of the Exide battery, several years ago secured the American patent rights to this type of cell, and since then have been carrying on a course of experiments with most encouraging results, so that when they put this battery on the market, which will be within a very short time, it will be with every confidence in its future. In its present form, this battery will give initially in the neighborhood of  $9\frac{1}{2}$  watt-hours per pound, increasing in use to somewhat over 13, with a life of from two to three times that of the standard lead battery, and during its life the necessity for cleaning the battery of sediment will be eliminated. In the course of the years of experimenting with this battery various means of still further increasing the capacity per unit of weight of the lead cell have been opened up, so that a wonderful future may be predicted not only for the new battery, but for the lead battery as a whole, of which this new battery is only one form."

## TESTING NEW MODELS ON THE ROAD

**How One Company Gets the Best Work Out of Its Testers—Makes Payments on Mileage Basis.**

Paying road testers on a mileage basis, instead of giving them the usual day's wage for their work is a method adopted by one well-known American automobile manufacturer much to his own advantage as well as to that of the employees affected. The idea reveals appreciation of the psychological as well as the business aspects of the work. For while, to the average motorist, the mere occupation of driving a brand new car mile after mile with nothing in the world to do but keep the machine going and pile up as much mileage as conditions will permit might be considered an ideal occupation, it must be remembered that, to the road tester, it is "work." Also it must be borne in mind that road testing must be carried out regardless of highway and weather conditions and independent of the inclinations of the driver.

Thus it happens that occasionally, when it is desired to put a car through an endurance or "breakdown" test, the personal equation of the tester is found to have a considerable bearing on the result; the time required to complete a trial of this nature frequently has been known to drag out to such an extent as to interfere with production at the factory, for example, or to delay the turning over of cars at the prescribed rate. To obviate this difficulty the concern in question, the Locomobile Co. of America, of Bridgeport, Conn., has resorted to the expedient of paying the testers on a basis of distance actually covered on the road, instead of allowing them the regular rate of payment on the day and hourly scale.

"Testing out a model car is a long, slow, tedious operation where there is no incentive to drive for mileage other than that presented by a nice day with fine roads and the desire for a long trip," says Superintendent E. F. Russell, in explaining the merits of the system. "Something always happens; there are always reasons why the mileage is short and why, in some cases, no mileage is made for the entire day. Reasons usually are ones that it is hard to argue against—all of which is aggravated by bad weather. Models are usually born during the bad weather of early spring, when the most comfortable thing for the driver to do is to tinker with them around the garage and then spend a few hours on the road.

"All of these troubles disappear, including the car troubles, when the driver has a chance to run his rate from \$3 to \$5, \$6 or even \$7 a day. It is magical the way

the thing works out. The one idea of the driver under per mile basis is to get moving as soon as possible after daylight and to run to the limit of his time.

"When this method of driver and payment is adopted, however, it must be for a breakdown test of the model. It is neither advisable nor wise to adopt this method for

### The Limousine Lamp from Amesbury.

In addition to their standard headlights and side lamps, Gray & Davis, of Amesbury, Mass., have heard the call for those

special and distinctive designs that have come to be considered a necessary part of the limousine's equipment. The response to the call is shown by the accompanying illustration. That the new lamp is both richly ornamented and highly useful and that it will add "class" to any limousine to which it may be applied its appearance makes evident.

the ordinary testing of cars, as in the latter the driver's chief concern should be the adjustments, which have as much to do with proper running at slow speeds as they have with proper action at high speeds.

"Another prime requisite in testing out a model car is continuous hard service, with no let up. A test that is continuous for a given number of miles, say, 25,000, running the car a greater distance by the usual method of fairly easy day runs. Again in a prescribed course or courses which include all kinds of roads from fine stretches for speed to heavy hill and bad sand stretches for strains is best for such a test. Prescribed courses are necessary; otherwise the driver adopts the smoothest stretch he can find, with the idea of accomplishing mileage only.

"A good way to run a test is to have a relay of three drivers, working eight hours per day, payment to be made by the premium plan; which is based on a given number of miles for a day's work."

## MEN WHO WILL MOULD STANDARDS

**Make-up of the S. A. E. Committees on Standardization—New Work that Has Been Apportioned.**

In putting into effect its important undertaking of rearranging and organizing the standards of automobile design, the standards committee of the Society of Automobile Engineers has divided the work into 15 sections, each of which constitutes practically an independent problem in itself and is under consideration by a sub-division of the committee. Henry Souther, of Hartford, Conn., is chairman of the divisions generally, while A. L. Riker, of the Locomobile Co. of America, is acting in an advisory capacity to the extent that his time permits. Howard E. Coffin, president of the society, is member ex-officio of all the divisions, and exercises general oversight of the work. The headquarters of the committee is the New York office of the society, 1451 Broadway, Coker F. Clarkson being secretary of all the divisions.

The sub-committee on frame sections, which met in Cleveland this week, is composed of the following members: W. H. Van Dervoort, Moline Automobile Co.; James H. Foster, Hydraulic Pressed Steel Co.; L. R. Smith, A. O. Smith Co.; W. P. Kennedy, Studebaker Automobile Co.; J. G. Perrin, Lozier Motor Co. The other sub-committees are composed of the following members:

Aluminum and copper alloys—E. E. Allyn, Allyn Brass and Foundry Co.; J. J. Aull, Lunkenheimer Co.; G. W. Dunham, Chalmers Motor Co.; T. J. Fay, The Automobile; R. S. Fretz, Light Manufacturing and Foundry Co.; G. M. Holley, Holley Bros. Co.; S. P. Wetherill, Jr., Wetherill Finished Castings Co.

Bearings—H. W. Alden, Timken-Detroit Axle Co.; W. A. Frederick, Continental Motor Mfg. Co.; David Ferguson, Pierce-Arrow Motor Car Co.; Henry Hess, Hess-Bright Mfg. Co.; D. F. Graham, New Departure Mfg. Co.; Elwood Haynes, Haynes Automobile Co.; W. P. Kennedy, Studebaker Automobile Co.; Howard Marmon, Nordyke & Marmon Co.; A. P. Sloan, Jr., Hyatt Roller Bearing Co.; S. P. Wetherill, Jr., Wetherill Finished Castings Co.

Broaches and broached holes, both square and splined—Alex. T. Brown, Brown-Lipe-Chapin Co.; C. E. Davis, Warner Gear Co.; F. L. Eberhardt, Gould & Eberhardt; G. E. Merryweather, Motch & Merryweather Machinery Co.; C. W. Spicer, Spicer Mfg. Co.

Carburetors—G. G. Behn, Hudson Motor Car Co.; George M. Holley, Holley Brothers Co.; H. P. Maxim; Howard Marmon, Nordyke & Marmon Co.; J. G. Sterling, F. B. Stearns Co.

Constants for certain metals for gears—

G. W. Sargent, Crucible Steel Company of America; J. M. Mack, Mack Brothers Motor Car Co.; W. H. Van Dervoort, Moline Automobile Co.; C. H. Taylor, Hudson Motor Car Co.

Iron and steel—W. P. Barba, Midvale Steel Co.; E. L. French, Crucible Steel Company of America; Elwood Haynes, Haynes Automobile Co.; Arthur Holmes, H. H. Franklin Mfg. Co.; S. V. Hunnings, American Locomotive Co.; Russell Huff, Packard Motor Car Co.; M. T. Lothrop, Halcomb Steel Co.; George L. Norris, American Vanadium Co.; Thomas Prosser, Thomas Prosser & Son.

Lock washers—Charles T. Jeffery, Thomas B. Jeffery & Co.; A. C. Bergmann, Simplex Automobile Co.

Nomenclature—P. M. Heldt, Horseless Age; A. L. McMurtry, Automobile Club of America; C. H. Taylor, Hudson Motor Car Co.; A. H. Whiting.

Records of gasoline motor characteristics—H. G. Chatain, General Electric Company; B. D. Gray, American Locomotive Co.; E. T. Birdsall; Alex. Churchward.

Seamless steel tubes—H. W. Alden, Timken-Detroit Axle Co.; J. J. Dunn, Shelby Steel Tube Co.; W. S. Gorton, Standard Welding Co.; C. B. Reddig, Columbia Motor Car Co.; W. H. Staring, Peerless Motor Car Co.; W. H. Tuthill, Tuthill Spring Co.; H. S. White, Detroit Seamless Steel Tubes Co.

Springs, shackle bolts and spring fittings—A. C. Bergmann, Simplex Automobile Co.; George S. Case, Lamson & Sessions Co.; Christian Girl, Perfection Spring Co.; L. D. Hubbell, Pope Mfg. Co.; Charles T. Jeffery, Thomas B. Jeffery & Co.; W. H. Tuthill, Tuthill Spring Co.; G. A. Weidely, Premier Motor Mfg. Co.

Sheet metals—F. C. Burkhardt, The Crosby Co.; J. H. Foster, Hydraulic Pressed Steel Co.; C. E. Lozier, Columbia Steel Co.; Robert Skemp, American Sheet & Tin Plate Co.; L. R. Smith, A. O. Smith Co.; C. E. Whitney, Whitney Mfg. Co.

Tire efficiency—F. J. Newman, Woods Motor Vehicle Co.; H. F. Cuntz; David Ferguson, Pierce-Arrow Motor Car Co.; H. W. Alden, Timken-Detroit Axle Co.; Bruce Ford, Electric Storage Battery Co.

Wood wheel dimensions and fastenings for solid tires—J. M. Mack, Mack Brothers Motor Car Co.; W. P. Kennedy, Studebaker Automobile Co.

#### New York Owners in a Garage Project.

The Independent Owners' Garage Co., which recently was organized for the purpose of establishing a private club garage on the west side of New York City, has leased the property of Charles A. Miller, located at 326-328 West 70th street. The plans provide for altering the stables now on the plot into a five-story structure, of concrete, brick and limestone, at a cost of \$30,000. The company is said to have nearly one hundred members.

## TRI-CAR FROM THOMPSONVILLE

**It is Practically a Reproduction of a German Model—Incorporates Some Old Ideas and Some New Ones.**

When, several months since, the Bushnell Press Co., of Thompsonville, Conn., disposed of its cotton press interests and made known that it would engage in the manufacture of automobiles, no intimation was given of the manner of machine which it would produce until this week. As the accompanying illustration shows, it is a small three-wheel conveyance, blending both automobile and motorcycle ideas. It is

THE TRI-CAR FROM THOMPSONVILLE IN COMMERCIAL FORM

styled the Maxim tri-car, the name Maxim springing not from the well-known and inventive family of that name but from one of the two men responsible for the Bushnell creation, Maxim Karminski; his collaborator was Charles Peters. Both are foreigners and the machine itself is described as virtually a reproduction of one made in Germany.

In respect to the mounting of the motor and the carburetter employed the tri-car is productive of almost forgotten recollections. The very earliest motor bicycles, those of 12 years ago, carried the motors on the front forks and were driven by belts running on a pulley rim secured to the front wheel; and surface carburetters, such as are employed on the Maxim tri-car, were characteristics of the motor tricycles that preceded the bicycles. Their recrudescence at this time is rather startling.

The motor is of the two cylinder four cycle, air-cooled type, having automatic inlets. The aluminum crank case in two vertical sections also forms the base, which is fastened to a platform over the spring forks. A two-speed planetary type of transmission supplants the fly wheel. A Bosch magneto supplies the ignition. The planetary transmission control is through a horizontal lever carried within a steel

tube  $1\frac{1}{2}$  inches in diameter, which serves as a steering member. It is quite ingenious. By moving the lever to the right the gear is thrown into high speed and locked in position by a lever. Neutral is obtained by moving the lever back to center, and the speed of the engine is kept down by means of a little lever on the left side of the gear which controls the magneto. To turn this lever to the left throws in the low gear. Power is transmitted from a small sprocket on the transmission shaft to a larger one, secured on the front wheel hub, through a roller chain. The motor, transmission and all driving mechanism are contained in a single unit, and placed over the front wheel. Chain slack is taken up by a sprocket idler fitted with a spring device also pro-

viding for road shocks. Lubrication is accomplished by the splash system. The surface carburetter is carried within the gasoline tank and the feed is by pressure through flexible tubing to the motor.

This tri-car has a tubular frame of bridge construction, the side members being arched over the rear axle. The latter will be changed in construction soon from a solid piece of chrome nickel steel, which it is at present, to tubular steel. On each rear wheel hub is a brake actuated by a foot pedal.

The springs are two in number, semi-elliptic, 32 by  $1\frac{1}{4}$  inches. The wheels are 28 by  $2\frac{1}{2}$  inches, fitted with clincher tires. Chassis are equipped with either a box type of delivery body or with passenger equipment, the price of the former being \$325 and of the latter \$375.

#### How Rusted Nuts May be Removed.

To remove a nut which has become rusted in place, first saturate the bolt-end and the surface around the base with kerosene. After several hours of "soaking" in this way, hold a hammer or wrench firmly against one of the flats and strike the opposite one several smart blows. This will tend to break the scale in the inner threads which the oil has not reached.

**STREET CARS FOR SMALL TOWNS**

**Enterprising Georgians Show How a Touring Car Can Fill the Bill—Clarksville's Successful Experiment.**

Clarksville is not much more than a dot on the map of the state of Georgia, but it possesses several enterprising citizens who realized the adaptability of the automobile and who did not hesitate to make use of it in a manner that "points a moral" to other small towns of Georgia and of all other states.

Although Clarksville is a little place, the railway station is more than a mile re-

baggage and express matter conveyed by the flat car. The charge is five cents per passenger and 25 cents per trunk. The "street car" makes ten trips daily between town and depot and has been in operation several months.

**Burn Garbage to Charge Electric.**

After considerable experimenting in Hamburg, Germany, with an electric motor cart for collecting garbage, writes Consul-General Robert P. Skinner, the authorities have proposed to purchase a number of others, so that within a few years horses will be eliminated entirely in the handling of garbage. The power for charging the storage batteries of the cars is indirectly supplied by the city's incinerating furnaces.

CLARKSVILLE'S "STREET CAR LINE" READY FOR DUTY

moved from "Main street," and the walking is none too good. Accordingly an automobile was pressed into service to make the trip from town to station several times each day, but the number of passengers who presented themselves for transportation was far greater than the capacity of the gasoline car, and yet not large enough to justify any very considerable expenditure. The idea of a street car line was suggested, but the cost of trolley cars and equipment and power plant was out of the question. But the Clarksville Street Car Co. was organized, nevertheless. It was constructed around a pair of steel rails and the 25 horsepower Mitchell touring car, shown by the accompanying illustration. The "additional rolling stock" consists of two trailers, one a light truck for freight and the other a kind of omnibus for passengers. All of the cars, like the Mitchell, are, of course, fitted with flanged railway wheels of the standard type.

As many as 40 passengers have been carried on one trip, to say nothing of the mail,

Mr. Skinner thinks these municipal incinerating furnaces in Hamburg can be studied profitably by American municipalities.

There are 36 of these furnaces, which all burn continuously, except when they require cleaning. No commercial fuel is required after the fires are once started, and therefore the coal consumption is insignificant. The slag is removed in small iron carts and cooled by water, then broken up into three sizes by a slag breaker. An electro-magnet is in operation in connection with the slag breakers, which removes all pieces of iron, if such are contained, after the refuse has passed through the furnaces. The scrap iron is sold at auction, and the slag itself is in great demand for road dressing, drainage foundation of roads, concrete mixing, paving block bed for slag brick. The garbage incinerating furnaces also furnish power to operate the cranes, slag breakers, lighting plant, and the dynamos which generate the electricity for charging the accumulators of an electric motor launch.

**DISTRICT OF COLUMBIA A STATE**

**In the Legal Sense, at Least—Virginia Justice so Decides and Motorists Gain a Point.**

What is perfectly obvious to most people, but seems to require considerable thought when referred to the judiciary—namely, that the word "state" when applied to the various commonwealths forming the United States includes ipso facto the "territories" and the District of Columbia—has been judicially affirmed by Justice E. F. Thompson, of Virginia, at least so far as the Virginia automobile law is concerned. This law permits motorists from other states to use the Virginia roads for two periods of seven days each in the year without taking out a Virginia license.

The decision was made in a test case brought by LeRoy Mark, a Washington (D. C.) automobile insurance man, who motored to the Alexandria county courthouse on Tuesday, October 18th. Immediately upon his arrival he was arrested for entering Virginia without having complied with the laws, he having no machine license.

At the time the law went into effect, June 15, 1910, it was decided the clause exempting a resident of a state for a period of seven days did not apply to the District of Columbia, as it was not a state.

Mark was taken before Justice Thompson, and his two lawyers brought to the attention of the court Article 1 of Section 5 of Pollard's Code of the State of Virginia which reads: "The word 'State,' when applied to a part of the United States, shall be construed to extend and include the District of Columbia and the several territories so called, and the words 'United States' shall be construed to include the said District and territories." They further pointed out the Virginia law regulating automobiles expressly stated any one who had complied with the laws of his own state and displayed his identification number, together with the initial letter or letters of that state, was entitled to the use of the highways for two periods of seven consecutive days in each calendar year.

Justice Thompson's decision is not final, for an appeal has been noted by the Commonwealth Attorney of Virginia, in order that the matter may be brought to the attention of the attorney general.

**Rain Postpones Mount Vernon's Meet.**

Rain on Saturday last caused the postponement of the Mount Vernon Automobile Club's racemeet on the Empire City track, Yonkers, N. Y. It will be run on Election day, November 8th, a meet on the nearby White Plains track being scheduled for next Saturday, thereby preventing an earlier date.

### TALL TASK FOR A TOURING CAR

**Abbott-Detroit Undertakes to Complete  
100,000 Miles—Fine Start Already Made  
—Will Visit Whole Country.**

Tall travel to the extent of a round 100,000 miles is the demonstration to which the Abbott Motor Co. has committed one of its cars, dubbed the "Bull Dog." The car, driven by Roy McClary, is shown in the ac-

Detroit will be sent away on a long trip, including Chicago, Buffalo, Portland, Me., New York, Philadelphia, Washington and through the Southern states. On this part of the long journey Montague Roberts will be at the steering wheel. It is the intention of the makers to keep the car running until the 100,000 miles have been covered, when it will be taken apart in the presence of a committee of expert mechanics and every part examined as to wear and a thorough report made.

to earning a goodly sum towards the upkeep of the car, made trips from Paris to the provinces and seaports, returning usually with as full a load as he went. As is but natural, prices for simple transportation soared to a height never before reached in France. Owners of "rubber-neck" coaches capable of going a few hundred miles without serious trouble reaped a rich harvest. The fare for a single person from Paris to Boulogne was \$40; to Calais, \$50; to Brussels, \$70; Dieppe, \$40;

STRENUOUS GOING IN THE ROCKY MOUNTAINS ENCOUNTERED BY THE ABBOTT-DETROIT 100,000 MILES CAR

companying illustration in a Western setting, and is expected to go east, west, north and south in the hunt for mileage. Up to the present it has covered 13,900 miles, most of them in the mountain districts of Colorado and in the prairie states of the Middle West. Although handicapped by particularly bad weather, the car has succeeded in rolling up an average of 150 miles per day, up hill and down dale, through sand and gumbo, rain and storm, and, it is asserted, without repairs, adjustments or replacements of any kind.

As soon as it has reached Detroit, to which city it now is headed, the Abbott-

Detroit, during the first 10,000 miles, part of which it reeled off during the endurance run of the Kansas City Star, the car ran into a bed of quicksand in a creek which it was fording. The motor was entirely submerged, and it required the assistance of several horses and six men to pull it out of the quicksand, after twelve hours of work.

#### Strike that Proved Automobile's Harvest.

Mail advices just received from France give some idea of the enormous demand put upon automobiles during the recent short-lived railway strike. Practically every owner of a motor car who was not averse

Lille, \$60. Although these prices were the averages, occasionally much higher rates were obtained. One party of three, desiring to travel to Boulogne-sur-Mer, a distance of about 130 miles, had to pay \$240. The taxicabs made small fortunes, prices varying from \$15 for a trip to Versailles to \$30 for a round trip to Enghien or to St. Germain. Luxurious limousines, touring cars, phaetons, etc., were drawn up along the boulevards with big signs on them "Paris-Boulogne," "Paris-Dieppe," etc., and seldom had to wait long to be filled to their carrying capacity. A single trip to Brussels netted the owner \$400.

# The Massachusetts Idea of Road Improvement

Modern highway builders have come to regard the automobile not as an enemy to good roads, but as a cause from which have arisen new and serious conditions that constantly require to be met. The importance of the system of state construction and supervision of certain highways here requires emphasis, because, as Harold Parker, chairman of the Massachusetts highway commission, explained in the course of a paper read before the recent National Good Roads Convention at St. Louis, a tendency is observed for the cities and towns to follow the example set by state authorities in road building, and also, to some extent, to borrow their methods. The same authority also draws a parallel between the state highway systems of the United States and the government maintenance systems of Europe.

"The analogy between state roads and the government roads of Europe is close," said Mr. Parker. "The department of roads and bridges in France, which has had control of all the government roads for a great number of years, has demonstrated the wisdom of the organization of departments or boards to determine not only what roads are essential to the well-being of the state, but how to build these roads most economically and to maintain them effectively.

"The system which has been applied to the roads of France, and in a lesser degree in the other European countries, has had very much to do with the gradual development in this country of roads built under the control of the state government. . . . Any doubt as to the wisdom of states using their credit for the development of their road systems has long departed in Massachusetts. We consider that the building of good roads, and their care after they are built, is the best investment that the state of Massachusetts has ever made.

With a view to indicating the extent to which the influence of the automobile has been manifest not only in bringing about the improvement of the roads but in altering the methods of building and maintaining them, he goes on to present these fundamental facts:

"First: That the automobile has more gravely affected the question of good roads than any other one influence within my knowledge. The bicycle first gave an impetus to a slumbering desire, but the automobile put into practical effect the longings only partially aroused. It is true this came at a time when the people were very ready to receive the suggestion, because it was generally felt by all classes of people living in the country that their road sys-

tems must be improved; and that the automobile more seriously affected the well-being of an improved road more than anything else.

"Second: Wherever the automobile was a common factor the old water-bound macadam road showed the effects thereof at an early stage, and if the road was not immediately cared for its destruction was assured; and the cost of maintaining roads built under what was considered a few years ago as the only means of building them through the country became so great that it was practically prohibitive.

"This has caused the road-builders all over the world to devise ways and means of saving what they had spent so much money to obtain. They were almost in despair, because unless the roads were paved with wood, stone or brick, they were torn to pieces by the automobiles almost as soon as they were completed. It was felt that the macadam road was doomed, and nobody knew how to save it. The best road engineers in the world put their minds to a solution of this question.

"In Europe, tar and asphalt have been tried in different ways for several years, but only with indifferent results. In this country, in addition to tar and asphalt, asphaltic oil has been put to the test. The oil-producing companies have worked in conjunction with the roadbuilders in producing oils which, after exhaustive trials, have been demonstrated as most useful, so that many millions of gallons of different grades of asphaltic oil are used on the roads of the United States every year, with the prospect of vastly increasing amounts being required, as their effectiveness becomes more apparent.

"In Massachusetts our first experiment with residuum oil was tried on the sands of Cape Cod six years ago, where nothing was used except the natural sands and heated oil; and it may interest you to know that the road is as good today as the day it was built, and it requires little, if any, expenditure for maintenance.

"A vast number of experiments have been tried by us in the use of tar, asphalt and asphaltic oil. In fact, no known product has been overlooked in our endeavor to discover something which would prevent the materials of the road from being disintegrated by the wheels of automobiles.

"In England, the cost of maintaining roads since the advent of the automobile has increased from 48 to 70 per cent. In France, and in Europe generally, the ratio is about the same.

"In this country, a fair comparison of the

cost cannot be made, because our methods of building and maintaining roads have never been so well classified as to enable us to reach a satisfactory comparison.

"We realize here that in many cases the best built macadam roads have lasted but a few months under constant automobile use, so that our experience accords in the main with that of foreign countries.

"Our experience also indicates that the theory of macadam road construction need not necessarily be reversed or reformed, but that it should be modified in such a way that the tractive force of automobile wheels shall not tear apart its ingredients.

"The old doctrine is that the macadam road as originally built by Macadam gave not only endurance to the road, but gave resiliency to it also. Therefore, the old method should be retained, if possible.

"It is with this view that our experiments have been carried on. We found that it was necessary for us to secure a material which would make a new surface on top of the macadam road, and thus prevent the destructive action of the wheels, or else find some binder which might be incorporated into the top course of the macadam road, so as to prevent its disintegration.

"On old macadam roads the application of a new thin wearing surface to preserve the road has now become general practice in many localities, our common form being a thin surface formed by a light application of oil and sand, fine gravel, or stone screenings.

"This method of road preservation is now very extensively used on the state roads of Massachusetts with excellent results. Experience shows that if a suitable residuum asphaltic oil, one that is rich in asphalt, is used, a single application of about one-half gallon to the square yard will last from one to three years, its durability varying with the amount and character of traffic. Better results are obtained by two applications of one-fourth gallon each than by one application of one-half gallon.

"This method of preservation being so economical, many miles of ordinary water-bound macadam road have been built in the last three years with the surface finished with a wearing coat of oil and screenings, the additional expense over ordinary macadam, being only about eight cents per square yard.

"Another and possibly a more permanent method of constructing road to stand modern traffic, is to incorporate in the top layer of stone a sufficient amount of asphaltic material to fill all the voids, and bind the upper course.

"In the construction of roads under this method, the first course of stone is laid, the voids filled with screenings or sand, and the whole thoroughly compacted, as in the case of the ordinary macadam road. On the top of this course is spread the second or wearing course.

"The voids may be filled by either the penetration or mixing method. Under the penetration method the second course is laid and rolled lightly, after which heavy asphaltic oil is applied, preferably by means of spraying machines, using sufficient quantity to fill all the voids but not to flush the surface.

"Stone screenings or coarse sand are then applied over the whole, and thoroughly compacted. The thickness of this course is ordinarily about two inches and requires about two gallons to the square yard of surface.

"Under the mixing method, the second course of stone is first coated with the bituminous material, and is then spread to such depth that it will be about two inches thick after rolling.

"The additional cost of a road constructed by the penetration method is about fourteen cents, and by the mixing method about twenty cents per square yard above the cost of the ordinary water-bound macadam road, both of these estimates being based on the use of a heavy residuum oil.

"In cases where the traffic is extremely varied and heavy loads are transported, it is preferable to use a nearly pure asphalt, in which case the additional cost is about twenty-five cents per square yard.

"The above methods are also used for resurfacing old macadam roads, the method of procedure being practically the same as in constructing new roads. If the old road is worn badly and contains irregular holes, the low places or holes are patched with stone alone, or with stone and oil combined, tamped or rolled into place after which the new top course is placed.

"Another method of resurfacing worn out macadam roads is to mix heavy asphaltic oil and gravel, then spreading the mixture on the road to such depth that it will be about two inches in thickness after rolling. This method has been used in Massachusetts with the greatest success, and some roads that were treated by this method two years ago show absolutely no change at the present time, and are in perfect condition.

"In connection with this gravel and oil treatment it may be well to mention the fact that it has been found in Massachusetts that where traffic is not excessively heavy, a mixture of sand with heavy asphaltic oil makes as economical and efficient road surface in localities where sand or sandy gravel prevail, and stone is difficult to obtain.

"Another method adopted in Massachusetts for surface construction is to place about five inches of sandy gravel on the roads, and compact the same as much as

possible, and then apply heavy asphaltic oil, using about three-fourths of a gallon to the square yard, covering it with just sufficient sandy gravel to take up the surplus oil. The oil furnishes the binder that is lacking in the sandy gravel, and the completed road presents a smooth, hard surface that is hardly distinguishable from a surface composed of stone and oil."

#### Making Old Shoes Save New Ones.

Fore some time it has been the occasional practice of motorists who desire to effect striking economy with their tires to resort to the expedient of applying an old shoe outside the regular tire and casing. Considerable difficulty has been experienced

in working the plan, however, due to the tendency of the extra shoe—the overshoe, so to speak—to creep. To obviate this tendency and render the application of the double shoe plan reasonably easy, a foreign inventor has just produced a special clamping device which bridges the fellow and grasps the bead of the outer casing, which it thus binds firmly to the regular tire. So effective is the gripping power of the device, that it is claimed to prevent all creeping, thereby eliminating unnecessary wear between the outer and inner shoes.

As the accompanying illustration indicates, each of the several clamps which are used consists of two claw-like arms hinged to a connecting link. The link is tapped and provided with a tightening screw which bears a plate on the inside of the rim. When the claw arms are tightened they hold down the outer cover to the inner cover, and all lateral spread of the cover or arms is prevented by an additional bridge which bears against the arms.

The advantage claimed for the use of two shoes instead of one is that it provides a protecting buffer outside the main tread, so that any tears or cuts derived from running over snow and ice or over frozen roads are less likely to cause a fracture of the inner tube than ordinarily would be the case, while the life of the inner shoe also is materially prolonged. It also is believed that when touring over muddy roads the extra width of tread thus secured is advantageous in preventing the wheels from

sinking deeply into soft spots. The common way of affixing the extra shoe hitherto has been to strip off the bead and punch holes through the sides, afterward lacing the cover thus formed by means of wire passed around the main casing and the fellow.

#### Packard Produces Illuminating Cable.

Having made a big mark in the production of a cable that is highly successful for ignition purposes, the Packard Electric Co., of Warren, Ohio, naturally has taken up the manufacture of lighting cables to meet the growing demand made by the system of electric illumination of automobiles which is becoming so popular. The cable is made up in either single or duplex conductor styles. The makers claim for this cable that it will permanently withstand the action of dirt, moisture, vibration and more or less oil and heat, though not so much as the ignition cable. They are of large carrying capacity, but at the same time as small in outside dimensions as possible. The insulation consists of one layer of high grade rubber. The single conductors are protected by a single braid of fine glazed thread in colors, striped spiral each way and saturated with flexible enamel. The core is No. 30 tinned soft drawn copper wire.

#### To Assist American Cars in Brazil.

In a report advising that American manufacturers circulate their advertising matter in Rio de Janeiro, J. J. Schechta, the American vice-consul general, adds that "Rio de Janeiro has not proven a very successful field for American automobiles, owing to the lack of facilities for repairing them. European machines are said to get better attention than do American automobiles in the garages, but of late there seems to be a tendency toward better disposition in this particular. In any case, such manufacturers as may be planning later to establish themselves in Brazil could not take a more simple and effective means of initiating their campaign than with a thorough-going canvass of the present owners of motor cars in Rio de Janeiro."

#### Tire With a Phenomenal Record.

St. Louis has been responsible for some tall achievements, but if there ever was anything taller than the tire records reported by the White Garage Co., of that city, it has been lost to sight. The record—and it easily must be a world's record—is that of a Diamond tire used on a front wheel of the company's White steamer. Until recently retired from service, the tire not only had covered nearly 18,000 miles but never had been inflated or removed from the rim for any purpose, it still contained the air pumped into it when it left the White factory in Cleveland. The other three Diamond tires on the car had averaged 12,000 miles.

## Campaigning to Extend the Electric's Use

Although in the past the electric vehicle industry suffered considerably through the indifference of the central station men, upon whom the user is dependent for charging current, that condition no longer prevails. Quite to the contrary, some of the more wideawake members of the profession are taking special means, not simply to encourage electric vehicle owners to employ their vehicles under advantageous conditions, but to stimulate the market by offering various encouragements to present and prospective owners of electrics. In this respect, the central station men are gradually coming up to the standards that they have set in other lines of activity, where they have earned for themselves the name of extraordinarily persuasive merchants.

Considerable light was thrown on this method of promoting the use of the electric at the convention of the Electric Vehicle Association of America, held in New York last week, in the course of a paper read by Frank M. Tait, of Dayton, O., in which various methods which have been employed in the course of central station campaigns were discussed. Almost every town or city, with an electric current supply available, has had some experience with the electric pleasure automobile, and in many of these places vehicles reposing in the scrap heap, as Mr. Tait explained. In some of the towns where the central station is alive to its opportunities, many such relics have been overhauled, fitted with new bearings, motors and batteries, and at present are doing good work. The return of these vehicles to useful occupation constitutes a saving of capital which, though small in the case of one individual, is of considerable magnitude when taken in the aggregate. He continued:

"The early difficulty with the successful working out of the electric pleasure vehicle, as a dependable piece of apparatus, was the lack of proper care for the battery and the low mileage from excessive friction losses, etc. The battery, a few years ago, was the most shamefully handled piece of apparatus, and it was common practice to find the men directly responsible for the working out of these batteries with very meager knowledge or skill in handling same. Lead burning, in those days, was done chiefly by means of a soldering iron. Improper notions were entertained as to the mileage that a car might be expected to traverse under given conditions, often resulting in a completely discharged battery with the electric far from home and charging facilities. Repetition of these experi-

ences and the frequent necessity for paying for battery renewals, soon caused many users of the early electric pleasure car to abandon them, and these early experiences have made the later day introduction of electric vehicles difficult.

"A plan that is very successfully followed in bringing the electric vehicle to the favorable notice of the ladies, to whom it particularly appeals, is to have the manufacturers' demonstrators or the Central Station's vehicle man keep on the lookout for the various afternoon bridge whist and other small gatherings that are scheduled in the town or city, and knowing the families interested well enough, and having the correct sort of demonstrator, offer to call at their homes and deliver several of the ladies in the electric victoria or coupe to the house where the function is being held, and later call for them and return them to their homes. Only a few ladies can be handled in this way by one demonstrator, but where a number of vehicle salesmen are on the ground, it is often possible to take the majority of the ladies to the party. Of course, as little reference as possible is made to the ladies about the demonstration feature on the trial trip, and this is reserved for a few days later, when another is made to make more of a business demonstration, etc."

"One Central Station has a regular system of inspection in vogue, and while it does not maintain a garage for electric pleasure vehicles, it does have its vehicle man carefully overlook every electric vehicle in the city regularly, not less than once a month, although three electric garages are supposed to do the work properly and satisfactorily to the individual users and to the satisfaction of the Central Station Company.

"The treatment heretofore outlined, and with constant vigilance on the part of the Central Station vehicle man, has resulted in placing 85 electric pleasure vehicles on the streets of Dayton, Ohio, within the past two years, and the number is rapidly increasing. These cars are divided among all the well-known reputable types of electric automobiles, and the various electric vehicle and battery manufacturers have been most cordial in their feelings toward the Central Station and in their active co-operation towards the introduction of the various vehicles.

"The electric truck proposition must be handled in a somewhat different manner from the pleasure rig, and it seems to be necessary for the Central Station, at least in the beginning, in order to succeed to go

into the electric truck garage business.

"To properly attempt to sell electric trucks and assist in their adoption in any territory, the Central Station must first have an electric truck or two of its own. It is difficult to understand how any Central Station can expect to have many electric trucks on its streets, with their batteries fed from its circuits, until this has been done. Trying to sell electric trucks, without having at least one electric wagon of its own, corresponds to those Central Stations that sell electric current for lighting and would have their display rooms and business offices lighted with kerosene or candles.

"A plan to interest possible purchasers of electric trucks is to tabulate a list of the various stores, express companies, etc., that have to do with the delivery of goods, drayage, etc., by offering to loan a truck and a competent driver to go over their routes, now covered by the horse and wagon deliveries, and allow their delivery men to check in the business done against the electric truck's record of the cost of doing it. This showing will always be in favor of the electric truck, unless the work to be done is the sort that belongs to the gasoline trucks, like long and continuous hauls into the country, etc.

"These trial propositions can be worked successfully with department stores, grocery stores, express companies, drayage concerns, laundry companies, delivery companies, butchers, bakers, etc., etc. Careful records should always be kept of the weight carried, stops made, and all the vital data necessary to prove the superiority of the electric truck over the horse-drawn vehicle, as well as the gasoline truck, in many lines of delivery work. All electric vehicles should have careful records kept, daily, of their entire mechanical and electrical performance, and these record blanks are easily obtainable from vehicle and battery manufacturers, as well as Central Stations operating electric vehicle departments."

Referring to a 1,000 pound truck that has proved useful in the work of the central station itself, owing to its special equipment of linemen's paraphernalia and an electric searchlight, he continued:

"The projector contains a high candle-power tungsten lamp, and is arranged to focus in any direction. It was designed to facilitate locating and repairing trouble on the overhead lines at night, and the beam of light on the 50-foot pole shows how well and safely the lineman can attend to his repair work, even on a dark or stormy night.

"There are many uses to which this truck, with its searchlight, may be put. This wagon is on the streets almost continually, day and night. In the daytime it is used to install services and meters, and at night its battery is removed and a freshly charged one substituted, and the wagon goes on with the night trouble work, etc.

"In connection with the sale and introduction of electric trucks, it may be well to point out that mistakes have been made by various enthusiastic but misguided electric truck salesmen, who have endeavored to sell electric trucks for work and at speeds and under conditions that the trucks are not fitted for, and this is a matter that should be carefully followed by every central station company endeavoring to build up an electric business.

"Some time ago an electric vehicle man thought to help along the sale of a one-thousand-pound wagon by urging the proposed buyer to visit a neighboring city and see the truck demonstrated. Instead of having a truck of modern design and high efficiency available for the trail, an old model was used and a complete failure made of the demonstration, because the purchaser had been led to believe, by the vehicle man of the central station, that a modern truck would do the work properly and satisfactorily. If a modern truck had been used for the demonstration, the sale would surely have been consummated.

"While pushing the campaign for more electric vehicles, the builders will do well to consider the design and supply of a small electric wagon from five hundred to seven hundred and fifty pounds capacity, which would come between a pleasure vehicle and a one-thousand-pound truck, that could be made and furnished to the average central station for a much lower price than the present one-thousand-pound truck. There is an eager demand for a large number of these "small service" wagons that would fill the wants of the average central station for its trouble and repair departments.

"This type of wagon would be the proper thing for a small central station to start its electric vehicle campaign with, and enable it to practice the use of the electric vehicle and help to sell trucks in its territory.

"The gasoline vehicle builders have arisen to this need for a small delivery wagon, at a reasonable first cost and large numbers of these gasoline delivery wagons, suitable for the use of the butcher, baker, laundry, grocer, and similar people, are rapidly being introduced, at this time, into the territories supplied with electric current by the central stations in this country.

"At present, the central stations are entirely helpless to combat the introduction of these small gasoline delivery wagons, as the only electric vehicle now available for the purpose is the one-thousand-pound electric wagon which has a first cost of 65 per cent. more than the average gasoline delivery wagon above noted."

### Why Engine Power Sometimes Fluctuates.

Engines which exert almost full power at high speeds often show a tendency to lay down on low speed or when climbing a hill, and though this lack of power is usually found to be due to lack of compression, the reason for it is not so generally understood. The duration of compression at high speed is so slight that not a very large part of the charge is able to escape, while at a low speed the effects of poor compression are quickly noticed. Under the latter conditions a relatively large time elapses between the beginning of compression and the ignition of the charge, as well as between the ignition and the exhaust, with the result that the power fails when most needed.

### To Make a Home-Made Number Plate.

It is a curious fact that despite the universal application of number plates to mo-

tor cars no standard method of mounting them has been adopted universally. The result is that, particularly in the case of the rear number plates, a wide variety of positions are chosen, while each time a new car is purchased it becomes necessary again to solve the problem of mounting its number in such a way as to satisfy the legal requirements and also in as convenient a manner as possible. Few if any of the brackets designed for the purpose, and which are attached to the lamp bracket, serve the purpose. Frequently they do not permit the number plate to be set level and, as often, the first number is concealed or practically concealed by the lamp itself and the number plate is constantly a-shiver when the car is in motion.

The accompanying illustration shows an inexpensive and home-made solution of all these shortcomings. This device merely consists of two angle-irons, or other metal bent to shape, the number plate is secured to the longer or projecting arm by means of rivets or stove bolts, while the shorter arm is fastened to the underside of the body overhung by wood screws. The advantages of the arrangement are that it permits the plate to be mounted either above or below the body line—since the angles may be turned either up or down in

making the attachment—that it may be installed without drilling the frame, that it permits the number plate to be placed in either a high or a low position, that it is cheap to construct, and that it is not protected by patent. If desired, of course, the attachment may be applied to the overhang of the rear seat, instead of between the rear of the body and the frame, thus bringing the number nearly on a level with the rear mud guards.

### To Avoid Chain-Driven Magneto Trouble.

In cars in which the magneto or pump equipments are driven by sprocket and chain transmission that arrangement must be watched with extreme care to prevent it from giving trouble. In the case of the magneto in particular, any derangement is liable to give considerable trouble unless the proper setting of the parts has been studied in advance. Both sprockets should be marked with a prick punch when properly assembled, so that the "spot" on each sprocket will line up with a straight-edge placed from center to center of the two shafts. When this has been done a broken chain can be replaced without delay in adjusting the armature to secure the proper timing. A more common difficulty with this form of transmission arises from the stretching of the links, which tends to upset the timing of the magneto, while in the case of either magneto or pump, it is liable to interrupt the service by jumping the sprockets. This can be prevented only by constant watchfulness in maintaining proper tension.

### How Pierce Provides for Employees.

The trends of thoroughly modern factory construction and equipment are well illustrated by the conveniences provided for the workmen in the addition to the Pierce-Arrow plant at Buffalo. When it is completed there will be available 3,042 full-length lockers and 766 porcelain individual wash bowls, each provided with hot and cold water faucets, soap and separate towels. These are located in what is styled the administration building, and in order that the workmen may make use of them without inconvenience during inclement weather, the building is connected with the factory by several concrete tunnels. The big dining hall which was one of the features of the Pierce-Arrow plant and which seated 900 workmen, is being so enlarged that it will have a capacity for 1,700 men. During the winter evenings an organization of employees uses the hall for dances, concerts and similar affairs.

### How to Remove a Rusted Screw.

When rusty screws become refractory they usually can be removed by applying to their heads a red hot piece of iron or other metal. When the screw itself becomes hot it can be dislodged with a screw driver in the ordinary manner.

## ROTHS RESURRECT OLD PATENTS

Indiana Inventors Bring Three of Them to Bear in Suits Against Four Big Manufacturers—Points Involved.

With less than two years life left in the patents, Gilson W. Roth and Charles C. Roth, of Indianapolis, Ind., have convinced themselves, or someone has convinced them, that three patents which they own are possessed of sweetness which should not be wasted on the desert air. Accordingly, the Roths have selected four of the shining lights of the automobile industry and instituted suits for alleged infringement against them in the United States Circuit Court at Indianapolis.

The four concerns that are charged with infringement are the Willys-Overland Co., the United States Motor Newcastle Co., the Premier Motor Mfg. Co. and the Buick Motor Co. The patents involved, all of which were issued in 1895, are No. 539,923, May 28; No. 549,213, November 5 and No. 552,263, December 31.

Two of the patents—the first two—apply to four cylinder horizontal opposed engines, of which type few ever were used, but the specifications and claims are such that the Roths apparently believe that they cover mechanical details common to the present type of four cylinder vertical motors. As nearly as can be comprehended from the complaints, patent No. 539,923 is supposed to control four cylinder engines employing a single cam shaft, the Roth invention relating to a horizontal four cylinder engine, but one having a vertical and common cam shaft located between the cylinders. Patent No. 549,213 applies to a similar engine having two ignition circuits, one circuit for each pair of cylinders, and a single cam for closing the circuit and supplementing means for igniting the engine when at rest. The idea apparently prevails that this patent controls the ignition of four cylinder motors. The third patent, No. 552,263, relates to a generator for gas engines having a

specific arrangement for controlling the gas as it enters the mixing valve and also for controlling the admission of air and for cutting off the electrical circuit when the gas valve is closed.

### Reo Takes Owen and Rechristens Car.

The Owen Motor Car Co., of Detroit, formally has been absorbed by the Reo Motor Car Co., of Lansing, Mich., and henceforth the Owen car, which is to be rechristened the "R-O," will be built in Lansing, where it will occupy a part of the new Reo truck plant. While the amalgamation entailed an exchange of Owen shares for Reo shares, the basis of exchange has not been permitted to become public. Ralph R. Owen, the president of the Owen company and the designer of its car, who is a brother of Ray M. Owen, the Reo distributor, and F. R. Bump, sales manager of the Reo company, both have joined the Reo organization.

### Miller Gets Pacific Coast Berth.

Harry C. Miller, for many years a conspicuous member of the B. F. Goodrich Co.'s staff, first in Detroit and later in New York, has been appointed general Pacific Coast representative of that company and will leave for San Francisco in time to assume the duties on December 1st. For years the Goodrich company has been represented on the Coast by the Gorham Rubber Co., but on December 1st its contract expires and the Goodrich company itself thereafter will handle the Pacific Coast business. It is its intention to establish both wholesale and retail stores in San Francisco and Los Angeles and two other branches in the Pacific Northwest. Miller himself will make his headquarters at San Francisco, but will circulate between the various Pacific branches.

### Selden License for Morgan Trucks.

The R. L. Morgan Co., of Worcester, Mass., has been granted a license under the Selden patent. It applies only to motor trucks in the manufacture of which the company has been engaged for several years.

## FORD BRINGS DOWN ITS PRICES

Reductions Are Substantial and Apply With and Without Equipment—Reasons Given for the Move.

Quite unexpected, the Ford Motor Co., of Detroit, this week announced a reduction in the price of its productions for 1911—the Model T touring car from \$950 to \$780 and the Model T roadster from \$900 to \$680; and while the company will continue its policy of equipping the cars complete with top, wind shield, gas lamps, generator, etc., it has departed from the beaten path by naming prices on both models without such equipment, in which form the touring car lists at \$700 and the roadster at \$600.

"The reasons for these reductions," said Commercial Manager N. A. Hawkins, "are told in a few words. We are in a position to do business on a small profit. Our great new Highland Park plant is now completed and we have facilities for easily making 30,000 completed Model T cars in a year. This factory has already established a record of 285 finished cars in one day. Our equipment is so perfect that we will be able to build these cars with the aid of only 4000 men.

"Our factory is built to profit from quantity production. It occupies the greater part of 60 acres of ground and was built at a cost of two million and a half dollars. The main building of four stories in height possesses over one-half million square feet of floor space. We are going to make the Ford Model T indefinitely. All the necessary experiments have been made and paid for. Our big, new factory is fully paid for from the profits of previous years. We have no bond issues to pay off; there are no mortgages upon our property and we have contracted no loans. We have absolutely no indebtedness and our policy of purchasing in large quantities the entire output of steel mills, equipment, factories, etc., permits us to command the lowest prices in the market for materials. It

is all simply the result of specialization, organization and equipment, and a factory built with one purpose—that of building the Model T Ford.

"We have 49,600 Ford owners to-day. This is more than any other automobile company in existence. We have orders for next year's business which tend to make us very optimistic regarding the automobile industry in 1911. Our business for 1910 totalled \$19,000,000."

The Ford company, which was one of the first to organize an "Owner Service," will emphasize this department of its organization more than ever during the coming year. It has established two big assembling plants, one in Kansas City and another in Long Island City, for the purpose of extending service to eastern and far western owners of Ford cars. At the factory one entire floor in the main building is devoted to the parts department and here are complete stocks of parts of every car which the Ford company has manufactured since its organization in 1903. The company demands that each of its dealers also carry a complete stock of repair parts. At each of the branches—of which there are over a score—the parts' stocks are practically as complete as that at the Detroit factory.

The Ford Motor Co. at the present time holds a unique distinction in the automobile industry, in that it has maintained its personnel and management unchanged since the first day of its organization in June, 1903.

#### Dissatisfied Buyer Gets Jury's Verdict.

Following a trial by jury, judgment has been entered in the United States District Court at Salt Lake City, for \$1,876.23 against the Columbus Buggy Co., of Columbus, Ohio, and in favor of Mrs. M. E. Smith, of the Utah city. In some details the case was unusual. It grew out of a gift of a Columbus electric car made to Mrs. Smith by her son, who is a member of the State Senate. When it reached Salt Lake City, one tray of the battery was found to be old and useless and the car was shipped back to its makers and a return of the purchase price demanded. When the demand was refused, suit was instituted. The jury's verdict was for the cost of the car, \$1,650, plus interest, \$226.23, from February 1, 1909.

#### Californians Seek to Lessen Shocks.

The Bow Shock Absorber Spring Co., of Los Angeles, Cal., which has existed as a co-partnership, has incorporated with a view of enlarging its sphere. N. Luxemburger is its president and T. F. Rockwell, secretary and treasurer. The device which it manufactures is a spring of the archer's bow type. It is built up of leaves placed to reverse of the usual practice, the large leaf being on the out or under side, a centrally hinged truss rod serving to limit the range of action and to check the rebound.

## WALL STREET SELECTS ITS MAN

**James J. Storrow to be Controller of General Motors—Delay in Completing Details Defers Payment of Bills.**

Although it was expected that all the details connected with the General Motors Co.'s \$15,000,000 loan would be so well in hand that the company's obligations would be paid before the close of October, the ramifications were too diverse to permit it and Monday next now has been set as the next most probable date for the mailing of the welcome checks to the expectant creditors. Tardiness in receiving the report of the Buick Motor Co. is said to have been a contributing factor in the delay.

Meanwhile there have been meetings of the directors of the various sub-companies involved in the transactions and W. C. Durant, the wandwaver of the General Motors Co. and James J. Storrow, of Lee, Higginson & Co., who represents the Wall street interests that advanced the money, have been running to and fro between New York and Michigan. In addition to holding the stock and mortgages on all the big company's property, Wall street's control apparently is to be very real and very earnest. Storrow, who was elected one of the voting trustees, is said to have been selected as controller of the entire General Motors' establishment, and is to be represented by a controller in each of the sub-companies.

#### Million Dollar Merger on in Canada.

According to reports from Canada, the Baynes Carriage Co., Ltd., of Hamilton, and the American Road Machine Co., of Canada, Ltd., located at Goderich, Ontario, soon will be merged under the name of the Acme Motor Carriage Machinery Co., Ltd., with a capital of \$1,000,000 for the purpose of manufacturing motor cars of the touring, taxicab and commercial type. The main office of the new corporation will be at Hamilton, where the bodies will be made and other parts assembled. Several Detroit automobile manufacturers are said to be interested in the project, but inquiry has failed to disclose their identity.

The American company at Goderich is a branch of the American Road Machine Co., of Kennet Square, Pa., which absorbed the Good Roads Machinery Co., of Hamilton, about two years ago.

#### United States Takes Maintenance Company.

The Motor Car Maintenance Co., which has been conducting a general repair business in New York City, formally has become attached to the United States Motor Co., having been reorganized which officials of the latter company dominating its directorate and having located in its big

building at Broadway and Sixty-first street, where its equipment has been greatly enlarged. Its new officers are as follows: F. D. Dorman, secretary of the United States Motor Co., president; J. D. Clay, vice-president and general superintendent; J. W. Wellington, vice-president of the United States Motor Co., treasurer; W. R. DeVoe of the United States Motor Co., secretary and F. W. Darnstaedt, assistant superintendent. These men in conjunction with Vice-President Horace DeLisser of the United States Motor Co. constitute the board of directors. The Maintenance company will continue its general repair business on an enlarged scale and will also handle Grabowsky commercial vehicles in New York, New Jersey and Connecticut, to which F. J. Toner, manager, particularly will devote himself.

#### Evans Buys Factory for New Motor.

The Evans Motor Car and Parts Mfg. Co. has purchased a factory at 50-51 Harper avenue, Detroit, Mich., which is to be utilized for the manufacture of a 32 horsepower four cylinder engine designed by R. H. Evans, secretary and treasurer of the company, the simplicity and compactness of which is a striking feature. It has 103 fewer parts than the usual four cylinder motor, weighs only about half as much, is only about half the size and will be sold at a considerably lessened price. The Evans company purposes supplying the engine to the trade in addition to using it in cars of its own production. One of the motors has been in use for nearly two years and it was its behavior during that period that induced the company to begin the manufacture of the four-cylinder engines on a commercial scale.

#### Hydrocarbon for Tire Manufacture.

The Protecto Hydrocarbon Co. has been organized in Denver, Col., with capital stock of \$100,000, for the purpose of "converting hydrocarbons into waterproof materials and compounds necessary in the manufacture of automobile tires and other similar rubber goods." Among the men interested in the project are former Governor James H. Peabody, president; A. B. Frenzel, Thomas Keely, J. Grattan O'Bryan and A. L. Kintner. Offices have been opened in the First National Bank building, Denver, with Kintner as manager. A site is now being sought for a factory which probably will be located in the West.

#### Lozier Buys Land in Long Island City.

The Lozier Motor Co. has purchased a plot of six lots at Thompson avenue and Hulst street, Long Island City—which is a part of New York City—on which will be erected a fireproof building, 100 x 150 feet. The site is in the same vicinity as that in which the Ford and Packard companies recently erected immense "service buildings."

**MATHESON SEES CLEAR SAILING**

**Receivership Soon to be Ended—Selling Company to be Enlarged and to Take Over the Factory.**

The Matheson Motor Car Co., of Wilkes-Barre, Pa., is almost out of its troubles, which is to say the receivership which has existed since last July is about to be ended. As a result of a number of conferences, arrangements have been effected whereby the Matheson Automobile Co., the selling organization of which C. W. Matheson himself was the head, will take over the entire business and operate the factory as well as the sales department.

The Matheson Automobile Co. did not become involved in the embarrassment of its sister company and is increasing its capital stock to \$2,650,000 in order to provide for the new order of things. The receivers of the Motor Car Co., already have petitioned the Circuit Court of Luzerne County, Pa., for authority to make the transfer, and there is no doubt that it will be granted and that the Matheson business which always has been a high grade business, soon will be on smooth sailing once more.

During the receivership, operations of the factory at Wilkes-Barre necessarily have been curtailed, but once the pending arrangement is consummated, the plant will resume work with a full force on the production of the six cylinder car which was but just making its mark when the trouble came to a head. C. W. Matheson states that contracts are in hand amounting to several hundred thousands of dollars and that deliveries already are being made of the 1911 model.

**Maxwell Enlarges its Auburn Factory.**

The Maxwell-Briscoe Motor Co. has added two new buildings, one 370 x 85 feet, the other 100 by 50 feet, to its plant at Auburn, R. I. The enlargement will permit the Maxwell company to manufacture there every part that goes into such of its cars as are built in the Auburn factory.

**More Money Put into the Moon.**

The Moon Motor Car Co., of St. Louis, Mo., has increased its capital stock from \$175,000 to \$300,000 and has declared a 10 per cent. cash dividend and a 54 per cent. stock dividend. The latter was returned to the treasury to apply toward the increased capitalization.

**Jury Gives Big Verdict Against Garage.**

Damages amounting to \$16,500, and costs totaling \$107.68, were awarded to Mary Madden in a suit against the Bilbro Auto Co., which operates the Pyramid Garage at 36 West 62d street, New York City. In

the trial before Supreme Court Judge Platzeck and a jury, October 24-25, Mary Madden testified that her husband, Walter Madden, had driven his automobile into the garage and upon the elevator in the rear of the building; that this elevator started suddenly upward before the automobile had come to a complete stop; that the automobile slipped backward and that Walter Madden was caught between the car and the next floor, and was crushed to death. She therefore asked for damages of \$25,000. Examination during the trial proved that the employe running the elevator had been careless, that he was of immature age, and that therefore the Bilbro Auto Co. was responsible for the death of Walter Madden. The jury granted Mrs. Madden \$16,500 damages.

**Another Stanley Car Appears in Detroit.**

The Stanley Motor Car Co. is the title of the most recent addition to the Detroit trade. It has located temporarily at 318 Howard street, where it will begin the production of the Stanley "30" and "40," which will be listed at \$1,450 and \$2,000 respectively. The officers of the new company are G. S. Murdock, president; A. A. Savoie, secretary and treasurer, and F. E. Gibbard, general manager. Unlike the New England car of the same name, the Detroit Stanley will be a gasolene car.

**To Produce Spark Plugs in Detroit.**

With the mayor of Detroit, Philip Breitmayer, as its president, the Wolverine Motor Supplies Co. has been organized in Detroit, Mich., to manufacture the Detroit spark plug, the invention of Theodore L. Beguhn. The other officers of the company are Frank W. Kanter, vice-president, and Frederick A. Van Fleet, secretary and treasurer. George W. Simpson, who also is a stockholder, will manage the factory, which has been established at 1221 Woodward avenue.

**M. A. M. Fix Date for Annual Banquet.**

The Motor and Accessory Manufacturers, Inc., have set Friday, January 13th, as the date for their annual banquet. It will be held at the Waldorf-Astoria and as usual will be one of the big social functions of the New York show season.

**Baker Joins the Credit Association.**

F. A. Baker & Co., of New York, have been elected to membership in the Automobile Trade Credit Association. The firm, an old-established one in the cycle jobbing trade, recently added automobile accessories to its stock.

**Buick Brings Out a \$550 Model.**

The Buick Motor Co. has added a \$550 runabout to its line. It employs a two cylinder motor, 4½ x 4 inches, rated at 14 horsepower, and has 30-inch wheels and a wheel base of 79 inches.

**M. A. M. TOUCH HIGH WATER MARK**

**Large Accession of New Members Makes Roll of 220 Names—Twenty-four Applicants Elected.**

The membership of the Motor and Accessory Manufacturers, Inc., reached high-water mark on Thursday last, 27th inst., when the board of directors passed favorably on 24 applicants, thus bringing up the roll to 220 members. The new members elected were as follows: Apple Electric Co., Dayton, Ohio; Borne-Scrymser Co., New York City; Carpenter Steel Co., Reading, Pa.; Chicago Telephone Supply Co., Elkhart, Ind.; Covert Motor Vehicle Co., Lockport, N. Y.; Crucible Steel Co. of America, Pittsburg, Pa.; Dover Stamping & Mfg. Co., Cambridge, Mass.; Eisemann Magneto Co., New York City; Ferry Machine & Foundry Co., Cleveland, Ohio; Frost Gear & Machine Co., Jackson, Mich.; Johnson & Co., Isaac G., New York City; Kellogg Mfg. Co., Rochester, N. Y.; Miller Rubber Co., Akron, Ohio; Newark Rivet Works, Newark, N. J.; Reichenbach Laboratories Co., Chicago, Ill.; Russell Motor Axle Co., No. Detroit, Mich.; Schrader's Son, Inc. A., New York City; Spacke Machine Co., F. W., Indianapolis, Ind.; Standard Thermometer Co., Boston, Mass.; Stein Double Cushion Tire Co., Akron, Ohio; Stevens Mfg. Co., Rome, N. Y.; White & Bagley Co., Worcester, Mass.; Willard Storage Battery Co., Cleveland, Ohio; Young, O. W., Newark, N. J.

**Goodrich Gets Judgment Against Moto-Bloc.**

Judgment by default for \$1,911 was entered in the City Court of New York on Tuesday last, 1st inst., in favor of the B. F. Goodrich Co. against the Moto-Bloc Import Co., of New York, of which Leon D. Kaufman is president and general manager. The sum represents the value of goods furnished, \$1,892.04, plus interest and costs. Although Kaufman did not appear to defend the action, his affidavit acknowledged the debt, but disputed a credit item of \$14.80 which appeared in the account. Kaufman is the man who dealt in cut-price tires and who, claiming that his supply had been cut off, appealed to the courts to help him "smoke out" an alleged combination in restraint of trade.

**Oakland to Hold an Outdoor Show.**

Oakland, Cal., is to inaugurate the 1911 show season. This—Oakland's "first offense"—will be held out of doors in Idora Park, and will be opened in November. It is being promoted by the Oakland Automobile Association, and will be managed by George E. Middletown, although F. K. Mott, mayor of Oakland, figures as chairman of the show committee.

**THE WEEK'S INCORPORATIONS.**

Beatrice, Neb.—Glenwood-Jonz Auto Co., under Nebraska laws, with \$15,000 capital; to deal in automobiles.

Des Moines, Ia.—Ryan Motors Co., under Iowa laws, with \$5,000 capital. Corporators—William A. Ryan, L. A. Ryan.

Lima, Ohio.—Maus Auto Co., under Ohio laws, with \$5,000 capital; to deal in automobiles. Corporators—H. P. Maus and others.

Cleveland, Ohio.—The Owners Garage Co., under Ohio laws, with \$15,000 capital; to operate a garage. Corporators—Frank H. Ginn and others.

Kansas City, Mo.—Auto Car Sales Co., under Missouri laws, with \$5,000 capital; to deal in automobiles. Corporators—N. Rhodes, R. Ridgell, J. M. Reed.

Chicago, Ill.—Henry Motor Car Sales Co., under Illinois laws, with \$25,000 capital; to manufacture and deal in automobiles and other motor vehicles.

Louisville, Ky.—Electric Vehicle Co., under Kentucky laws, with \$10,000 capital; to deal in automobiles. Corporators—H. B. Hewitt, P. E. Allison, E. M. Drummond.

Brockton, Mass.—Pickard Bros. Motor Car Co., under Massachusetts laws, with \$150,000 capital. President—E. J. Pickard, B. I. Pickard, of Brockton; to deal in motor vehicles.

Sardis, Ohio.—Mt. Olivet, Sardis and Maysville Automobile Hack Line, under Ohio laws, with \$1,500; to operate a motor vehicle line. Corporators—W. S., J. M., J. A. Wheatley.

Newark, N. J.—Cook's Garage & Renting Co., under New Jersey laws, with \$25,000 capital; to conduct automobile garage. Corporators—J. T. Cook, G. L. T. Gibb, C. M. Cook, all of Newark.

Newark, N. J.—Cook's Garage & Renting Co., under New Jersey laws, with \$25,000 capital; to conduct an automobile garage. Corporators—J. Thomas Cook, George L. T. Gibb, Carrie M. Cook.

Boston, Mass.—Columbia Tire & Top Co., under Massachusetts laws, with \$35,000 capital; to deal in motor vehicles. Corporators—F. F. Wentworth, Dover, N. H.; R. A. Brine, Brookline, Mass.

Philadelphia, Pa.—Mack Motor Truck Co., under Delaware laws, with \$50,000 capital. Corporators—J. J. Smith, Baltimore, Md.; H. C. Yarrow, Jr., G. A. Yarrow, W. K. Yarrow, of Philadelphia.

Camden, N. J.—Mid-West Motor Supply Co., under New Jersey laws, with \$100,000 capital; to manufacture automobiles, motors, etc. Corporators—F. R. Hansell, William F. Eidell, John A. McPeak.

Chicago, Ill.—Townsend-Comstock Co., under Illinois laws, with \$25,000 capital; to manufacture automobiles and other motor

vehicles. Corporators—L. E. Townsley, S. E. Comstock, Edward F. Comstock.

Chicago, Ill.—Typhoon Signal Co., under Illinois laws, with \$5,000 capital; to manufacture automobile, marine, railway and other signals. Corporators—Theodore Weise, R. P. Hartenstein, C. F. Lower.

New England Engine & Supply Co., under Massachusetts laws, with \$50,000 capital; to manufacture and deal in gas engines and motors. Corporators—J. N. Shoemaker, M. W. Carsley, Winthrop, Mass.

Camden, N. J.—Mid-West Motor Supply Co., under New Jersey laws, with \$100,000 capital; to manufacture automobiles and motor vehicles. Corporators—F. R. Hansell, William F. Eidell, John A. McPeak.

Indianapolis, Ind.—Marion Sales Co., under Indiana laws, with \$10,000 capital; to deal in automobiles, motors and motor vehicles. Corporators—James E. Kepperly, E. A. Brown, J. O. Vanier, all of Indianapolis.

Kokomo, Ind.—Kokomo Junior Tire Co., under Indiana laws, with \$10,000 capital; to manufacture rubber tires for automobiles, bicycles and motorcycles. Corporators—A. L. Sprangle, J. C. Dewees, J. E. Palethorpe.

Cleveland, Ohio.—Sharp Spark Plug Co., under Ohio laws, with \$10,000 capital; to manufacture spark plugs for internal combustion engines. Corporators—J. F. Johnson, John Sharp, William Sharp, W. W. Turney.

Camden, N. J.—Low Speed Turbine Co., under New Jersey laws, with \$100,000 capital; to manufacture automobiles, airships, motorcycles, etc. Corporators—J. A. McPeak, H. L. Reese, J. H. Gaul, all of Camden, N. J.

Asbury Park, N. J.—Barnes Automobile Fender Co., under New Jersey laws, with \$250,000 capital; to manufacture automobile fenders. Corporators—W. D. B. Barnes, M. F. Thomas, W. H. Bechtel, all of Asbury Park, N. J.

Detroit, Mich.—Breeze-Detroit Carburetter Co., under Michigan laws, with \$50,000 capital; to manufacture and deal in carburetters. Corporators—George A. Breeze, of Detroit; William B. Lasher, of Bridgeport, and others.

New York City, N. Y.—Cross-Magill Motor Truck Co., under New York laws, with \$100,000 capital; to manufacture motors, motor vehicles, engines, etc. Corporators—C. J. Cross, W. F. Magill, P. S. Tilden, all of New York City.

Brooklyn, N. Y.—Institute Motor Supply Co., under New York laws, with \$10,000 capital; to supply automobiles, aeroplanes and motor boats with accessories. Corporators—James H. Whaley, Isaac A. Cary, both of Brooklyn.

San Antonio, Tex.—Thomas B. Jeffery Co., under Texas laws, with \$20,000 capital;

to deal in automobiles. Corporators—Charles T. Jeffery, G. M. Berry, of Kenosha, Wis.; Ira J. Kinnett, George B. Talieffer, of San Antonio.

New York City, N. Y.—Draper-Latham Magneto Co., under New York laws, with \$500,000 capital; to manufacture magnetos and other electric devices. Corporators—G. O. Draper, C. J. Dannenbaum, A. C. Day, all of New York City.

Syracuse, N. Y.—Onondaga Taxicab Co., under New York laws, with \$25,000 capital; to manufacture and sell automobiles, motor trucks and other power vehicles. Corporators—J. J. McCarthy, J. H. Coolican, R. P. Byrne, all of Syracuse.

Bangor, Me.—Penobscot Motor Co., under Maine laws, with \$100,000 capital, of which nothing has been paid in; to manufacture and sell automobiles, motors, engines, motor boats and aeroplanes. Corporators—Fred D. Oliver, J. S. Howe, both of Bangor, Me.

New York City, N. Y.—Gett Mfg. Co., under New York laws, with \$200,000 capital; to manufacture ball bearings, magnetos, machinery, motors, engines, motor vehicles, etc. Corporators—L. B. Gleason, F. B. Von Teuber, New York City; A. G. Schultz, Albany, N. Y.

Dover, Del.—International Automobile & Engine Co., under Delaware laws, with \$10,000,000 capital; to manufacture automobiles, airships, motorcycles and motor boats. Corporators—William D. Yarnall, of Yeadon, Pa.; Elwood H. James, of Sharon Hill, Pa., and S. C. Seymour, of Camden, N. J.

Wheeling, W. Va.—Hearne Motor Co., under West Virginia laws, with \$20,000 capital, \$2,000 of which has been paid in; to manufacture and deal in automobiles and fire engines. Corporators—Julian G. Hearne, Thomas McK. Hearne, S. A. Williams, all of Wheeling, and Leech K. Craft, of Elm Grove, W. Va.

**Increases of Capital.**

Cleveland, Ohio.—Toledo Carburetter Co. from \$1,000 to \$75,000.

Petoskey, Mich.—Northern Automobile Co. from \$2,500 to \$5,000.

Detroit, Mich.—Warren Motor Car Co. from \$100,000 to \$300,000.

St. Louis, Mo.—Moon Motor Car Co. from \$162,500 to \$300,000.

Lewistown, Mont.—Lewistown Automobile Co. from \$5,000 to \$10,000.

St. Louis, Mo.—Phoenix Auto Supply Co., from \$20,000 to \$50,000, full paid.

**Recent Losses by Fire.**

Chicago, Ill.—Colonial Garage, 826 East 39th street, damaged; loss, \$2,000.

Faulkton, S. D.—C. E. Warner's garage and twelve automobiles destroyed; loss, \$25,000.

## IN THE RETAIL WORLD.

Bruce C. Edenton has "opened up" in Jackson, Tenn. He is handling the Thomas Flyer.

Work has been started on a new garage in Mohawk street, Buffalo, N. Y. Allen E. Klopp is building it.

Ed Van Loo, of Waupun, Wis., has purchased the garage of Putnam Bros., and will conduct it in his own name.

The E. A. Perkins Co., which operated a garage and repair shop at 379 Main street, Winsted, Conn., has sold out to the Heady Garage Co.

The Auto Tire & Supply Co. is the style of a new concern which has been formed in Wichita, Kans. It will locate on South Lawrence avenue.

S. A. Lewis, of New Haven, is building a garage on Crescent place, in Bridgeport, Conn. The structure is 50 x 130 feet, of brick with concrete floors.

S. A. Phillipi, a constable of the Eighth ward, Reading, Pa., has gone into the automobile business. He will show Demot cars at 7 North Seventh street.

The American Motor Sales Co. has commenced business in Erie, Pa., with the Thomas Flyer agency. Northeastern Pennsylvania will form its field of sale.

New salesrooms have been opened by the Ross Motor Co., in Mobile, Ala., at 103 South Conception street. They are under the management of C. W. Short.

The Lackawanna Vulcanizing Co., of Scranton, Pa., has taken over the Central City Garage at 223 Wyoming avenue. It will occupy the whole building.

The Imperial Motor Car Co. has been formed in Nashville, Tenn., to handle Packard cars. J. S. Frazer is president of the concern, which will be located at 1518-1522 Broadway.

Work is progressing rapidly on a new garage which is being built on West Main street, Worcester, Mass., for the Ware Auto Co. It will be 50 x 80 feet, two stories high, of concrete blocks.

Ground has been broken for a new garage for the Fawkes Auto Co., Minneapolis, Minn. The building is 50 x 150 feet, with two stories and basement, and will house the Marmon line of cars.

William Richter, who, in partnership with Claude Simmons, owned the Motor Mart Garage on Douglas avenue, Freeport, Ill., has purchased the interest of his partner and will continue the business under his own name.

What is hailed as the most commodious garage in Southern California is now ready for business in San Diego. It is situated at the corner of Seventeenth and C streets, 100 x 100 feet, of brick and concrete, and will house Buick and Premier cars. F. B. Naylor is the manager.

Work is progressing rapidly on the new building for the Fawkes Auto Co., at Hennepin and Erie streets, Minneapolis, Minn. The structure is two stories high, of solid concrete, and will be ready on January 15, 1911.

Errett M. Lemon and Fred G. Serena, of Wheeling, W. Va., have purchased the American Auto Tire Repair Shop at 1609 Chapline street. Serena formerly was connected with the B. F. Perkins garage in the same city.

A four-story garage to cost \$150,000 is being built on Market street, near 20th street, Philadelphia, Pa., by the Douredoure estate. Several prominent automobile companies have signed leases for parts of the big building.

The stable of Timothy Sheahan at Land's End, Mass., is being converted into a garage. It will be of brick with concrete floor, and will accommodate at least fifteen cars. Sheahan will transfer his livery business to a rear building.

Under the style the Peerless Motor Car Co., a company has been formed in Brooklyn, N. Y., to handle the Peerless line of cars. E. T. Bloxman is manager of the company, which has its headquarters at 1384-1386 Bedford avenue.

Patterson & Thomas, Plattsmouth, Neb., have discontinued their business and sold their stock at auction. Thomas expects to open a salesroom and garage in Long Beach, Cal., while Patterson probably will go into some other kind of business.

Under the style the Clay Motor Car Co., a new concern has opened its doors in Philadelphia, Pa., with George S. Clay as president and general manager. Its headquarters are at 447 North Broad street, where Franklin cars are to be featured.

N. L. Biever, who has been with the Maxwell company for six years, has been given the agency for New Haven county, and has opened a salesroom at 1079 Chapel street, New Haven, Conn., under the style the Biever Motor Car Co. He will handle the Maxwell line exclusively.

Frank H. Stevens has been appointed receiver for the Massachusetts Automobile Co., Boston, Mass., which filed a petition in bankruptcy on October 29th with assets of \$3,128 and liabilities of \$19,445, nearly all of which liabilities are unsecured. His bond has been fixed at \$1,500.

Work was started last week on the new garage for Kemp Brothers, at 1518-1520 Hennepin avenue, Minneapolis, Minn. The new building will be two stories high, 44 x 125 feet, and will serve as headquarters for the Brush runabout and the Alden-Sampson trucks. The garage will be ready for business February 1st and is to cost \$18,000.

J. A. Cramer, the agent for Mitchell and Stoddard-Dayton cars in Buffalo, N. Y., has transferred the Mitchell agency to the

Mitchell Automobile Co., at North and Main streets, which recently was formed for the purpose and in which he is a stockholder. He will continue to show the Stoddard-Dayton line at his garage at 737-741 Main street.

With a capital of \$75,000, the Superior Motor Sales Co. has been formed in St. Louis, Mo., to take over the Stoddard-Dayton agency from M. M. Baker & Co. Its salesrooms are located at 2007 Locust street. Murray M. Baker, who has the state agency for Illinois, is the president of the new company, while O. L. Garrison, Jr., is the general manager.

F. W. Vogler and Norman DeVaux, formerly managers of the Northwest Buick Co., in Portland, Ore., have formed a partnership with Fred A. Bennett, of the F. A. Bennett Automobile Co., under the style the Northwest Automobile Co., with headquarters at the corner of Lounsedale and Alder streets. The company will handle Reo and Apperson cars exclusively.

## Changes Among Prominent Tradersmen.

C. F. Rouze, who has had wide experience as general agent of the Acme Harvesting Machine Co. in Kansas City and who more recently managed a large motor truck business in that city, has been appointed general manager of the Western branch of the commercial vehicle department of the United States Motor Co. He will make his headquarters in Kansas City.

George E. Daniels, for the last two years manager of the Buick Motor Co.'s Philadelphia branch, has been appointed general manager of the Oakland Motor Car Co., of Pontiac, Mich., which, like the Buick company, is a part of the General Motors' organization. Phillip S. Russell, of Detroit, succeeds to the vacancy in Philadelphia caused by Daniel's transfer.

A. H. Doolittle has been appointed publicity manager and assistant advertising manager of the Knox Automobile Co., Springfield, Mass. In addition to acquaintance with publicity methods, he not only possesses the knowledge that comes of a Cornell course of mechanical engineering, but also that born of practical experience in driving a car and of actual work in the Pope, Electric Vehicle and Knox shops.

W. A. Merriam has been appointed Eastern manager of the Warner Auto-Meter Co., with headquarters at the company's New England branch, 925 Boylston street, Boston. After December 1st, the Warner advertising department also will be located at that address and will be in charge of Merriam, who resigned the management of the merchandizing and sales aid departments of Lord & Thomas, the big advertising agency in Chicago, to join the Warner establishment. As previously he had experience as both sales and advertising manager for two large concerns, he will be no stranger to his new duties.

## WHOSE JUDGMENT WILL YOU TAKE?

**W**HOSE judgment will you take when selecting a car for your personal use? Do you understand mechanics—does a gear cut from heat-treated chrome nickel steel look any different to you than one from malleable iron?—could you tell the difference? Does length of stroke or size of cylinders mean anything to you, unless backed by the performance of the cars in the hands of owners? In the long run doesn't it really mean that you must trust someone? And wouldn't you better trust to the trained minds of our organization—to our engineers who have been studying these problems for years? Isn't the stability of a manufacturer of importance to you—don't you need to know that he is going to be in business and make the guarantee of his car good—don't you need to know his Dun and Bradstreet ratings?

The White Company has been building machines for service for fifty years or more—they have been building automobiles that endure for over ten years, and some of the first models may still be seen doing yoeman's service on the streets.

When we tell you that our gasoline models are the best we know how to build—that they will run more economically for you—that they will do all the things you expect of them, or of any car, regardless of price—isn't it fair to presume that we have tested the proposition and know something of what we speak? We are building cars for continuous service, and whether they be gasoline or steam driven we are striving to produce the best. The performance of our cars in the hands of owners everywhere is your assurance that we have accomplished the result for which we have striven.

Let us send you literature which tells the intimate details;  
or better yet, let us demonstrate the cars themselves.

### Motor Trucks as Display Advertisements.

It has frequently been pointed out that the use of motor vehicles by business houses in itself constitutes a useful advertisement. Indeed, in the past when the shortcomings of the motor truck and light delivery wagon were pronounced, the argument used to be offered as an offset to the high operating expenses that so frequently were experienced. At present that phase of commercial vehicle operation is far less valuable than formerly, though it still may be reckoned an asset by the persuasive automobile salesman. That the motor truck is superior as an advertising medium to the horse-drawn equipment, not intrinsically but because of its more rapid circulation, recently has been brought to notice by an authority who regards the matter in this light.

Considering the sides of the motor truck as an advertising medium in itself, he contrasts the advantage derivable from the wise employment of its 80 to 200 square feet

of surface as compared with that of the horse-drawn vehicle. With a day's run of 60 to 80 miles, he thinks the display should be in reading distance of at least 100,000 persons. "If we admit equal publicity to advertising in street cars and subways in reading distance of perhaps 5,000 persons at one dollar per square foot, we have an advertisement worth from \$80 to \$200 per day," he concludes. On the same basis, with its daily mileage of 20 to 30, the horse-drawn wagon passes with reading distance of from 30,000 to 40,000 persons, with a corresponding diminution in its advertising value.

It is by no means to be urged upon the commercial vehicle salesman that he seek to encourage the sale of motor trucks and delivery wagons on the strength of the increased "circulation" which they afford the owner's card painted on the sides. But it is important that this phase of motor vehicle employment, like all others, be gone into thoroughly and its full bearing on ultimate utility considered. There are certain classes of business in which the value of street display has an important influence on the volume of sales. Where such happens to be the case, of course, the motor vehicle man must be prepared to indicate the advantages to be derived from the wise use of wagon advertisements and to be prepared to advise the customer effectively.

### Expensiveness of "Inventive" Chauffeurs.

That ancient and honorable expression, which so often has been made to serve as a justification for high prices, "it is cheapest in the end," should be qualified before it is applied to the case of the professional chauffeur. It should be amended by adding—"provided he is not permitted to exercise his mechanical ingenuity in 'improving' the machine." Regardless of the wage question the chauffeur who is continually tinkering with the car is very expensive.

The question is never more pertinent than during those seasons when time hangs heavily on his hands or when much overhauling is being done and when, if he be inventively inclined, the alternative tendencies of the paid driver are apt to be in evidence. Supplementing the owner's personal pride in his mechanical sensibilities and his desire to acquire the satisfaction of individual initiative and achievement, the result is apt to be a loss of the true status of the automobile as a stock car. Which raises a question as to the real merit of the stock

car as a personal possession as contrasted with a car having few or many special qualifications.

As far as the average motorist is concerned, it must be remembered that in deciding whether the chauffeur's criticisms of the design are to be heeded to the extent of permitting him to modify the construction of the car in any material respect, the wisdom of the driver is pitted against that of the engineering department which the manufacturer maintains at tremendous annual expense for the express purpose of deciding just such questions. Occasionally the individual motorist may be so fortunate as to secure at chauffeur's wages an inventive genius who is capable of suggesting real improvements over an existing design. Such improvements sometimes may be of the sort which the manufacturer might not find it economical to install on a regular stock car. But in most cases they are apt not to be of the nature of genuine betterments, considered in the long run.

The whole point of the stock car principle is that it not only permits the producer to turn out a good product at a relatively low cost to the buyer, but that it permits him to go on taking care of the owner indefinitely. The whole theory of the service department rests upon the supposition that there will be a constant demand for replacements; with this in view the manufacturer lays his plans to produce quantities of surplus parts, which he is forced to carry in the form of a non-paying investment for an indefinite period. In departing in any material respect from standard specifications, the owner deprives himself of the benefits of such standardization, thereby placing himself in the same position he would occupy had the car been built to order.

The secret is out! It was plain to all that something ponderous must have dropped on the rubber market to flatten the price of the crude gum, but not until last week did it become known that the drop was that of our good old friend, The Automobile. It says so itself. It printed an article regarding the situation, the "rubber barons" of London, brave men that they are, read it and bingo! it was all over with them. It was so heavy that it squashed them flat and then the price of rubber came tumbling down. It is to be hoped that the trade and public realize the great debt of gratitude which, according to its own testimony, is due our valuable contemporary.

## SAVING MINNEAPOLIS MOTORISTS

**"Owners' Association" Rushes to Their Rescue—Bail, Lawyers and Tow Rope Always in Readiness.**

Minneapolis, which is in Minnesota, has become possessed of one of those Automobile Owners' Associations which paint beautiful pictures for the benefit of men who own motor cars and seek to rescue them from the clutches of dealers and repairmen who charge the market prices for supplies and labor. The officers of the Minneapolis association are: F. M. Cartwright, president; Chas. N. Acker, vice-president; Ernest Malmberg, secretary; Thos. D. Schall, treasurer; A. C. Raymond, general manager.

In addition to the usual sale of supplies and making repairs at "attractive prices," the Minneapolis organization proposes to carry on "rescue work" on the high road. It will have a "life line" always in readiness. This form of rescue is thus dealt with in the association's list of "members' privileges."

1. In case of accident or breakdown, from any cause whatsoever, all that will be necessary for a member to do in such emergency will be to seek the nearest telephone and notify, any hour, day or night, the offices of the association, stating the nature and location of accident, when a wrecking car will immediately be dispatched in charge of a competent chauffeur, mechanic or other help. The owner's car will be repaired at the place of accident, if it is within the bounds of possibility to do such work in reasonable time. Failing which the car will be towed to the association's garage, or, if desired, to that of the owner. The charge for such services will be free for the first hour; subsequently a nominal charge of \$3.00 per hour will be made. The radius within which such cars will be fetched and assistance rendered is anywhere within 10 miles of Minneapolis. Outside of such radius a small extra charge will be made, which will include the service of all engaged in repair work, and the actual repair work done, but not the cost of materials used.

2. Should an owner be arrested for exceeding the speed limit, or for the breach of any road rule, it will be only necessary for the member to report by telephone his predicament to the offices of the association when bail will be immediately furnished in his behalf. An attorney will also be placed at his disposal for defense. The first appearance of such attorney will be free of charge. Subsequent services will be paid by the member, but at a rate considerably less than usually charged.

3. Should the car of an owner be under repair, or in any way temporarily out of commission, the association will rent him

## COMING EVENTS

November 3-5, Atlanta, Ga.—Atlanta Automobile Association's fall meet on Speedway.

November 4-6, Kansas City, Mo.—Race meet under auspices Kansas City automobile dealers.

November 5, Los Angeles, Cal.—Los Angeles-Phoenix (Ariz.) desert road race.

November 5-6, New Orleans, La.—Automobile meet.

November 7-11, Chicago, Ill.—Reliability contest under auspices of Chicago Motor Club.

November 8, Yonkers, N. Y.—Mount Vernon Automobile Club's racemeet at Empire track.

November 10-13, San Antonio, Tex.—San Antonio Automobile Club's races at International Fair grounds.

November 11, Savannah, Ga.—Savannah Automobile Club's light-car road race.

November 12, Savannah, Ga.—International road race for the Grand Prize of the Automobile Club of America.

November 22-26, Lake Charles, La.—Louisiana Fair Association's race meet.

November 24, Redlands, Cal.—Mile High Hill Climb Association's contest.

November 24, Santa Monica, Cal.—Southern California Automobile Dealers' Association's annual road race; 200 miles.

November 24, New Orleans, La.—Race-meet under auspices of New Orleans Automobile Club.

November 26-27, Los Angeles, Cal.—Motordrome races.

December 3-18, Paris, France—French Automobile Manufacturers' Salon in Grand Palais.

December 25-26, Los Angeles, Cal.—Twenty-four hours race at Motordrome.

December 31-January 7, New York City—"Independent" automobile show in Grand Central Palace.

January 2-7, New York City—Importers' automobile show in Hotel Astor.

January 15-21, Detroit, Mich.—Detroit Automobile Dealers' Association's annual show in Wayne Pavilion.

January 7-14, New York City—Association of Licensed Automobile Manufacturers eleventh annual show in Madison Square Garden. Pleasure cars and accessories.

January 16-21, New York City—Association of Licensed Automobile Manufacturers eleventh annual show in Madison Square Garden. Second week devoted to commercial vehicles.

January 16-22, Detroit, Mich.—Detroit Automobile Dealers' Association's annual show in Wayne Pavilion.

January 28-February 4, Chicago, Ill.—National Association of Automobile Manufacturers' tenth annual national show in Coliseum. Pleasure cars and accessories only.

February 6-11, Chicago, Ill.—National Association of Automobile Manufacturers' tenth national show in Coliseum. Second week devoted to pleasure and commercial cars, motorcycles and accessories.

February 25-March 4, Toronto Canada—Annual show under auspices of Ontario Motor League.

March 4-11, Boston, Mass.—Boston Automobile Dealers' Association's annual show in Mechanics building.

March 15-18, Louisville, Ky.—Louisville Automobile Dealers' Association's annual show in First Regiment Armory.

April 1-8, Montreal, Can.—Annual show in Coliseum.

another at the uniform rate of \$3.00 per hour. The same privilege will be extended to those members who, through accident, are compelled to abandon their own cars and being desirous to continue their journey would otherwise have to pay a high price for a machine from some outside source. In case of accident and another car being required, the same will be despatched on receipt of phone message, to the point of breakdown, provided the same is within the 10-mile radius.

### Where Automobile Figures in Fatality List.

Statistics prepared by the United States Government concerning the number of fatal accidents during 1909 show that the motor car is practically at the bottom of the list, which follows: Railroads, 6,659; burns, 3,992; horse-drawn vehicles, 2,152; mines and quarries, 1,997; poisonous gases, 1,837; other poisons, 1,779; electric cars (trolleys), 1,723; sunstroke, 816; automobiles, 632; freezing,

251; lightning, 150; homicides, 1409. Putting it in another light, automobiles caused but 2.8 per cent. of the accidents of 1909 as against 9.6 per cent. for the horses.

### Rowe has a "High Score" Tire Record.

C. W. Rowe, of Watsonville, Cal., is another motorist who has entered the "high score" class of tire users. He reports that one of the four Diamond tires on his Garford car purchased in June, 1907, lasted 18,000 miles and another 16,000 miles. The St. Louis record of 18,000 miles without reinflation, however, remains untouched.

### More Motor Cars for Mail Service.

Finding the work of the automobile in the postal service highly satisfactory, Postmaster General Hitchcock has signed an order for seven additional automobiles to be used in Cleveland and Indianapolis. The buying of these cars had been recommended by the postmasters of the respective cities.

**MR. HEARST HOLDS BACK AWARDS**

**Wants Results of His New York "Test" for His Sunday Edition—How the Affair Shaped Up.**

Chapter II—the New York chapter—of the Hearst motor truck stunts was distinguished in two ways; first by the great variety of commercial vehicles that it called forth, whereby it was rendered useful as

WHEN A "LITTLE FELLOW" PASSED A BIG ONE—A GENERAL ELECTRIC AND A MONITOR

affording a broad contrast of types, and second by reason of the generous patronage afforded it by the electric vehicle people, both manufacturers and owners. From Mr. Hearst's own peculiar point of view, however, it is likely that the contest may not have been considered as successful as the Boston run, for the reason that, although there were more entries, there were fewer advertisements obtainable in the editions of the paper carrying accounts of the undertaking.

The contest was run on Friday and Saturday of last week, 28th and 29th ult., but no one who depended upon any except the Hearst newspapers for his information, or who did not happen to cross the trail of the contest, would have known it as none of the other New York papers mentioned the affair. It was split up into 16 divisions, which means that 16 first prizes are coming to as many contestants when the final results are announced. Under some circumstances the decision might have been expected even before now—the results of the corresponding and simultaneous contest in Chicago were published on Monday—but it has been stated that the ampere-hour meters, which were used in computing the scores of the electrics, have been sent to a laboratory to be calibrated, so that the final announcement cannot be expected before next Sunday.

Fifty-seven trucks were entered in the various classes, but only 49 actually started. Of this number but 27 escaped with clean road scores. Fourteen of the clean score division were gasoline propelled and 13 were electrics. The final results depend

upon the relative amounts of gasoline and oil consumed per ton mile and the number of kilowatts of energy used from the batteries of the electrics; in each case the consumption of supplies will be reduced to a money basis, the lowest cost per ton mile in each class to denote the winner.

In arranging the classifications, two broad divisions were established, one for machines intended to be used in transporting loads in bulk between central stations and distributing points, and hence designated as

the transfer class, and the other for machines which are suitable to be used in house-to-house delivery, and hence known as the distributing class. Provision was made for the independent competition of trucks entered by manufacturers and those supplied by private owners, while all vehi-

north on Broadway to Yonkers, Mount Vernon and New Rochelle, the routes varying slightly for the various divisions of the distributing class, and returning to New York. The transfer class continued beyond Yonkers to Dobbs Ferry, and Ardsley, crossing over to White Plains and Port Chester and returning to New York.

The day resulted in a considerable reduction in the number of contestants, no less than 11 machines being disqualified and two withdrawn. The Brush, Walter and Hewitt trucks, suffering disqualification for taking the wrong route, despite the advantages of a carefully prepared and very clear road book; the big Gaggenau truck took on an extra supply of gasoline outside the official station, and one of the Grabowskys failed to make the required number of stops. Among the electrics, six of the General Vehicle machines suffered disqualification in consequence of recharging batteries. In addition, one of the Lansden vehicles suffered from a short-circuited armature and was withdrawn, while the Chicago failed to finish the day's run.

Four cars were penalized. The Sampson, entered in division 4 in the manufacturers' class, lost 37 points for adjustment. Later, it was claimed in a protest filed by the Alden Sampson Co., that the adjustment was permissible under the rules, and that the delay, necessitated by adjustments to a brake shoe, was not subject to penalization. The Kelly truck, in the same class, had ignition trouble and lost 11 points; the General Vehicle, in the 1,000 pounds and under transfer class, was delayed by re-

THE HART-KRAFT TRUCK WHERE THE GOING WAS GOOD

cles were subdivided according to the weight classification sanctioned by the American Automobile Association. In pursuance of the principle of the class distinction, the transfer trucks were forced to cover 65 miles a day with full load. The distributing machines, while covering only 30 to 40 miles, were obliged to make 16 to 100 stops each, exactly as they would do in everyday service.

The first day's route lay south on Broadway from the New York Transportation Co.'s garage on 50th street, and thence

pairs to a wheel and lost 92 points; and another wagon of the same make, entered in the owners' section by the United Electric Light & Power Co., was penalized 31 points for tardiness.

The route for the second day lay across the Queensboro bridge and through Elmhurst to Jamaica, returning by way of Long Island City, Brooklyn and Brooklyn bridge, slight variations in the route being made to accommodate the different mileage requirements of the entrants in the distributing class. The transfer class reached

THE MOTOR WORLD

CONTRASTING TYPES IN CHAPTER II OF THE HEARST TRUCK TESTS.

EVERYBODY THERE SAW THE KELLY; IT WAS A BIG ONE

"MARY ANN," AN ELECTRIC, WELL LOADED—WITH BEER

Jamaica by the roundabout way of Lynbrook, Rockville Center and Hempstead, returning over substantially the same course as that taken by the other machines.

But three vehicles dropped out during the day, all of them being of the gasoline persuasion, and one, the Kelly, being disqualified for taking on gasoline; it also had had ignition difficulties. The Knox truck withdrew with a burned out connecting rod bearing, and the Cass truck was withdrawn in consequence of broken wheel bearings.

In the way of penalties, the largest was that assessed upon the Victor for tardiness and work on a steering arm—422 points. The only other car penalized was the British Atlas, which lost 30 points for work done on the magneto.

By way of adding spice to the interest in the contest as such, several of the competing machines were noteworthy in one way or another. "Mary Ann," otherwise one of the General Vehicle trucks entered by the Central Brewing Co., was nine years old, being the first motor vehicle put into service by the latter concern, and possessing a worthy record for continuous and efficient work. P. Daussa & Co., of Brooklyn, entered a wagon of the same make credited with seven and one-half years of

duty in hauling macaroni. In addition there were oddities in the way of a Brooklyn bake cart and a New York milk wagon. The biggest machine in the contest, the ten-ton Hewitt, with its load of coal, weighed nearly 30,000 pounds, thereby establishing a broad contrast with the little Brush entry, whose official load weighed just 600 pounds.

Most of the vehicles were entered by New York and Brooklyn owners or agents, but one, the one-ton Grabowsky, had been driven over the road all the way from Detroit in order to participate. In doing so, it was said to have made an average speed of 18 miles an hour, carrying its full load, and equipped in exactly the same way as when it entered the contest. Unfortunately for its record, this truck was disqualified on the second day, as already stated.

As a sequel to the contest the entrants of both the Hewitt and Gaggenau trucks have protested. Incidentally the point has been raised by one of them that the Morgan truck, the third competitor in the same class, did not cover the course properly on the second day of the contest. Up to the present time, however, the referee is not reported to have taken action.

The following table gives the complete list of starters, their road penalties for the

first and second days and the causes that led to the withdrawal and disqualification of those that did not survive.

#### Pipe to Make an Automobile Jack.

Ordinary pipe fittings can be utilized in making a very serviceable automobile jack, according to Robert H. Brockman, who describes the method in the Scientific American. Its construction, he says, calls for a piece of 1-inch pipe A, about 10 inches long, to one end of which a flange is secured which serves as the base of the jack. Within this pipe insert a ½-inch pipe C, 12

inches long, threaded throughout its length, and fit a cap to the lower end. Bend a bar of iron, about 15 inches long and ¼ by 1¼ inches, as shown in illustration, and bore a hole through it which will freely admit the pipe C. Screw a flange E down over the pipe C on to pipe A. The bar D fits over flange E, and one end is hooked under it. File notches in this flange to receive a pawl F, which consists of a piece of ¾ by ¼-inch iron 8 inches long. Secure the latter at its center to the bar D by means of a screw. In use, as the bar D is operated, the pawl F engages the notches of the flange, causing the latter to feed the pipe C upward. A rest, G, which is made by cutting off a portion of a 2-inch tee, is placed at the top of the pipe C. When it is desired to reverse the jack, the pawl E is swung about on its axis to engage the notches at the other side of the bar D.

#### Trucks that Earned Hearst's Honors.

Results of Chapter I of William Randolph Hearst's motor truck tests, tardily announced in Boston, reveal clean road scores for all but two Metz cars, the Reliance delivery wagon and the 1½ ton Frayer-Miller truck. The six private owners' cars that finished the two days contest, October 21-22, all were free from road penalization. In the machines of 1,001 to 2,999 pounds capacity, and less, the Warren-Detroit won with a fuel and oil cost of 2.48 cents per ton mile. The Franklin, the only air-cooled car

in the contest, triumphed in the class for machines of 1,001 to 2,999 pounds capacity, its cost figure being 0.68 cents per ton mile. To the Frayer-Miller truck, renamed the Kelly, went the distinction of winning two classes of the manufacturers section, its figure for the 3,000 to 5,999 pound division being, 1.46 cents and in the 6,000 to 7,999 division, 0.91 cents. In the class for five tons trucks, the Sampson entry captured the honors with a net expense for supplies of 1.15 cents per ton mile. In the private owners' class, the Autocar and Frayer-miller entries achieved the best results in their respective divisions, the former being credited with 1.03 cents, and the latter with 1.30.

#### For Prevention of Elevator Accidents.

Prompted by an accident wherein one man was killed and his car demolished by entering an open elevator shaft, a garage owner has built a contrivance to avoid any similar catastrophe in his own building. The elevator when down, lies flush with the floor. Out of the floor at the end upon which the cars enter the elevator, he cut a section of the floor boards and beams, large enough to allow a heavy oak plank about 10 by 3 inches and as long as the width of the elevator, to lay in flush. This heavy plank is hinged to the floor and when the elevator rises, leaving the heretofore unprotected opening of the shaft, it is brought to an upright position and securely locked. The progress of any automobile that entered before the elevator was lowered would therefore be stopped and an accident averted if the driver had not seen the opening or did not happen to apply his brakes in time.

#### French Trucks that Receive Subsidies.

Six different makes of trucks have received official authorization by the French war department, and in consequence, the owners of such machines are entitled to the subsidy which is granted in consideration of an agreement to release the vehicles for military service in the event of their being required. The announcement is based on the performance of the trucks in the recent industrial motor vehicle trials, the machines endorsed in this way being the Panhard, DeDion, Berliet, Delahaye, Peugeot and Vinot.

#### Giving Credit Where Credit is Due.

One of those slips of the pen which occasionally occur, made the Motor World say in one portion of its report of the Fairmount Park road race that V. Padula, who won the 161-230 cubic inches class, drove a Warren-Detroit, when as a matter of fact he piloted an Abbott-Detroit. However, as his correct mount was named in several other parts of the same story, there would not appear much room for anyone to place the credit elsewhere than where it belongs.

## TRUCK "DASHES" IN CHICAGO

Hearst's Western Effort Sportier than Those in East—It was Scored on Endurance Contest Basis, Too.

Chapter III—the Chicago chapter—of the Hearst motor truck stunts was somewhat different from the other chapters. It was run very much on the lines of an endurance contest, and although the formalities of weighing-in and measuring the fuel and oil consumed were observed with due dignity, the results were set down in the form of road and technical penalties and the treatment accorded the competitors on the road was virtually the same as though they had been engaged in a race for heavily laden vehicles, with certain "speed limits" understood to assist in classification. Chapter III also appears to have been the most remunerative of the series, as it required a special supplement in the promoter's Chicago newspaper to carry all the advertisements the benevolent Mr. Hearst's emissaries had been able to collect, when the final scores were posted on Monday morning.

The test, officially styled the Chicago Evening American's commercial motor truck reliability run—conducted under the auspices of the Chicago and the Milwaukee automobile clubs—was run on Friday and Saturday last, 28th and 29th ult., over the Chicago-Milwaukee course, making a distance of about 215 miles. Of something like 58 entrants, 54 actually started, and 37 finished, all but two of them being entitled to the designation "survivor."

After the technical committee had passed upon the condition of the machines, but three perfect scores remained, namely those of the Brush and Sears, which were tied for first place in Class 1, and the Gramm in the division for trucks of 4,001 to 6,000 pounds capacity. In Class 2, the winning Cino lost its one point through the technical committee's conscientiousness in bringing to notice a leaking water pump. The Grabowsky, winner in Class 5, also lost one point, because of a slack lock nut on the rear axle.

The winners in the other classes did not fare so well. The Sampson, for example, lost 30 points on the first day as a result of breaking through a light bridge at South Milwaukee. On the second day more time was lost in reconnoitering about the site of another bridge to see whether that was safe. The consequent assessment was 24 points. Later the first penalty was remitted because it was deemed no fault of the truck that the bridge broke. The truck, therefore, won with the remaining 24 points against it. The other two winners were the Chicago Motor Wagon, 10 points, in Class 3, and the Rapid, 19 points, in Class 4.

The schedules, which overlapped the weight distinctions in several instances, called for speeds of 14, 12, 10, and 8 miles an hour, respectively. Penalties were assessed for deviations from the scheduled rates as denoted by arriving times at checking stations, but the enthusiastic journalists

was ice on the ground. Hence it happened that, as the Commercial Truck company's Chicago Commercial car was hastening around a corner near the Kenosha garage, it skidded, and skidding struck the pace-maker's car a blow that put it out of business and nearly did for the official himself.

Also started: Class 2—Hart-Kraft, Chicago Pneumatic Tool; Class 3—Chicago Commercial, Owosso, Marquette, Randolph; Class 5—Rapid.

who accompanied the run, drew glowing pictures of the cars "dashing" from point to point, and of the "excellent time" made. All of which confirms the impression of eye-witnesses to the effect that the figures 8, 10, 12 and 14 were used in a very liberal way for purposes of average.

It was bitterly cold during the two days of the run, and also, in Milwaukee, there

He pulled himself together, however, and promptly commandeered another car, but the Commercial was disqualified. F. Ed. Spooner, the photographer, who, as usual, was on the spot, also was struck by the Chicago, but escaped with a few bruises.

The trucks started from Plew's garage, 2613 Wabash avenue, at 6 o'clock in the morning, after having been officially

weighed and sealed the night before, and checked out at the Automobile Club headquarters. Kenosha was the noon control and though many of the trucks were delayed by the deep sand between Zion City and that point, all succeeded in checking in without serious loss of time. Four trucks had been entered from Milwaukee, namely the Utility, Kissel, Brodesser and Hart-Kraft, and in consequence the local interest in the contest was even greater when the night stopping place was reached than it had been along the course. The combined effects of the sandy roads and mechanical troubles cut down the list of perfect scores to 14 at the end of the first day. The penalties arbitrarily announced were as follows:

Considerable interest was added to the undertaking by reason of the presence in one of the cars of Col. W. A. Glassford, U. S. A., who had been detailed from the Quartermaster's department to observe the performance of the trucks. The official organ of the contest observes that this "means that the government will supplant horse conveyances with motor trucks." Col. Glassford himself was so impressed with the success of the affair that he could not be restrained from talking for publication, and of course Mr. Hearst's bright young men were only too happy to have him talk. He is quoted as having remarked:

"The Hearst newspapers are great papers. They are full of enterprise. It is such things as this that show the 'get-up' of a

purpose with trailer attachments. The accompanying illustration shows two of the trucks in service, each loaded with two lengths of pipe and standing on one of the grades that has to be ascended. Each length of pipe is 30 feet long and weighs 6,600 pounds, the load, therefore, weighing approximately six and one-half tons, about half of which must be carried by the truck. The traction for the entire load, of course, must be supplied by the engine, so that the work involves continuous duty far in excess of the rated output of the machines, and at very low speeds. The capacity of the outfit is eight lengths of pipe hauled every 24 hours, and but four men are required to handle it. The old way, each man driving four horses would require 24 hours

WHITE TRUCKS THAT HAUL 6½ TON LOADS OVER 17 MILES OF OREGON MOUNTAIN HIGHWAY

Buick (3), Overland (39), Harder (109), Rapid (4), Randolph (14), Economy (16), Utility (15), International Harvester (5), Overland (11), Randolph (6), Chicago Commercial (77), Randolph (33), International Harvester (34), Chicago Motor (3), Nelson and Le Moon (1), Marquette (13), Herman (12), Atterbury (6), Kissel (8), Knox (1), Kelly (31), Reliance (35), Monitor (46), Kelly (21), Kelly (12), Rapid (3), Sampson (30) and Alco (13).

The only real accident of the day to be reported was that to the car of the chief checker, which turned turtle at Evanston as a result of a skid. No one was seriously hurt.

On the return trip Saturday, all of the cars that started back reached Kenosha, the route having been changed in consequence of the bad roads encountered on Friday, and all but two of the machines that finished covered the last stage of the trip in good form, reaching Chicago in mid-afternoon. The Sampson truck was delayed by the bridge-testing exploit of its crew, while the 3-ton Frayer-Miller, as a result of engine trouble, was abandoned at Kenosha.

newspaper." He further observed: "The horse is passing away. There can be no doubt of this in anyone's mind who has studied the matter."

The final results of the contest are given in the table on the preceding page.

#### Daring Use for Four Motor Trucks.

Schaw-Batcher-Bowles, contractors of Portland, Ore., have succeeded in getting rather more economy out of motor truck service than commonly is expected by a daring application of mechanical traction to a class of work that hitherto has been supposed possible only by the use of horses. The Portland contractors have a contract for hauling 52-inch iron pipe for the new Bull Run pipe line which is to supply the city with water from Mount Hood. The haul is 17 miles from Gresham to Bull Run Post Office, over mountain roads, and the contract was secured on bids made in anticipation that horses would be employed, as a matter of course.

After some figuring, however, it was decided to attempt a typically western stroke of business by purchasing four White gasoline trucks and rigging them up for the

to haul a single length. The White equipment therefore replaces eight men and 32 horses.

Naturally, under the circumstances, the White Company, builder of the machines, is not prepared to warrant the service of the vehicles for an indefinite period; since they are greatly overloaded and forced to work on low gear the greater part of the time. But, as is pertinently indicated, when the operator is enabled to save something like \$8,000 a month by their use, he is not apt to worry if they prove very short lived indeed; he could buy a new machine every month and still save not only time but money.

#### Town Responsible for Dangerous Road.

It has cost the little town of Salem, Wis., \$1,500 for maintaining a dangerous highway. E. Collier, a motorist, who was badly injured by being hurled down a steep embankment, having been awarded that sum for damages. A jury found the town board guilty of extreme neglect for refusing to widen the road at the point of danger. In the accident in which Collier was hurt, his companion was killed.

**DALLAS DERBY GOES TO DE HYMEL**

**He Also Picks the Other Big Plums at Texas Meet—Fatal Accident and Some Queer Proceedings.**

Tobin De Hymel in a Stoddard-Dayton, George H. Clark in a Cutting and Fred Malone in a Buick accounted for every race run at the three days' meeting, October 27-29, which comprised part of the program of the Texas State Fair in Dallas. the brothers Endicott—Bill and Harry—driving Coles, were fairly consistent runners-up. De Hymel, a native Texan, who just had returned from an Eastern campaign which included the Vanderbilt and Fairmount Park races, was the biggest winner. He captured six of the 12 events; Clark took four and Malone the other two. De Hymel's victories included all of the feature events save the 50 miles on the first day, which he probably would have won but for three attacks of tire trouble. He lost nearly ten miles because of these delays, and yet finished but four miles behind the winner, Clark, who completed the 50 miles in 52:38. Clark was the king pin on the first day, winning three of the four events. On the second and third days, however, De Hymel was unbeatable. He won everything he went after, including the hour race, which was marked by a fatal accident; the ten miles handicap in which starting alone from scratch he gave away starts up to 40 seconds; the 50 miles Dallas Derby, and the ridiculously-styled one mile State Championship, which consisted of time trials of three miles, the fastest mile of which decided the "champion." They appear to have queer ideas of both mile trials and championships in Dallas, as the same absurd procedure was employed at last year's racemeet.

The hour race was the feature of the second day, 28th. Five men started, De Hymel, Clark, "Bill" Endicott, Phil Wells (Moon) and Gaston Morris (Renault). De Hymel promptly took the lead and Wells was in second position on the fifth mile when a front tire on Morris's Renault blew out and caused the car to crash into the fence. Morris was thrown clear and landed uninjured on the turf, but his mechanic, Raymond Coch, who was seated on the step of the car and who had been performing the now obsolete trick of "balancing" the car on the turns, was crushed so badly that he died a few hours later. The race was stopped and restarted and went for 46 miles with De Hymel again leading all the way and Wells in second place, when another accident occurred, Wells being the victim. A front tire blew out and his Moon crashed into an electric light pole. Well's body struck the pole but, strange to say, when hurried to the hospital no bones were found

to be broken and save for bruises and lack of feeling in his lower limbs he was uninjured. Well's accident put a stop to the race. When the spill happened De Hymel was half a lap in front of Wells; Clark was three miles behind and Endicott five miles to the bad. The money was awarded on this positioning, Wells thus winning a purse despite his fall. De Hymel completed the 46 miles in 46 minutes. The Dallas meet had been preceded by another fatality, a motorcyclist having been killed on the 26th while practicing on the track and eight on-lookers injured on the 23d when a car while tuning up ran wild in trying to avoid a motorcyclist who had stopped on the track to pick up his cap.

The Dallas Derby on the last day, 29th, was the big event of the meet, the prizes being \$500, \$250, \$125 and \$50, with \$25 for the leader at 25 miles. The distance originally fixed was 100 miles, but this was cut to 50, and as the officials appeared to be panic-stricken by the happenings of the day previous, it was announced that in order to prevent accident the cars would be required to stop for examination at the end of 25 miles. De Hymel, Clark and the two Endicotts started and as usual De Hymel promptly went off in front where he remained until the nineteenth mile, when he was forced to stop for a repair. It was quickly made, however, but meanwhile Clark and Bill Cole passed De Hymel; they reached the 25 miles point in that order, Clark leading in 26:01 and thereby gathering the special prize of \$25. After the "stops for inspection" Clark led until the forty-third mile, when he developed engine trouble and went down and out. De Hymel who had been making up lost ground then went to the front and stayed there, completing the 50 miles in 51:10, not counting five minutes spent for the unusual "inspection." Bill Endicott finished second and his brother Harry third. The summaries:

**Thursday, October 27th.**

One mile time trials, stock chassis—Won by Geo. H. Clark, Cutting; Phil Wells, Moon, second; "Bill" Endicott, Cole "30," third. Time, 1:00¾.

Ten miles, stripped stock chassis.—Won by Fred Malone, Buick; Harry Endicott, Cole "30," second; "Bill" Endicott, Cole "30," third. Time, 10:43¾.

Five mile free-for-all.—Won by Geo. H. Clark, Cutting; Harry Endicott, Cole "30," second; "Bill" Endicott, Cole "30," third. Time, 5:27¾.

Fifty miles, stripped chassis.—Won by Geo. H. Clark, Cutting; Phil Wells, Moon, second; "Bill" Endicott, Cole "30," third; Tobin De Hymel, Stoddard-Dayton, fourth. Time, 52:38.

**Friday, October 28th.**

Ten mile free-for-all, handicap.—Won by Tobin De Hymel, Stoddard-Dayton; Geo. H. Clark, Cutting, second; "Bill" Endi-

cott, Cole "30," third; Harry Endicott, Cole "30," fourth; Phil Wells, Moon, fifth; Fred Malone, Buick, sixth. Time, 9:51¾.

Ten mile free-for-all.—Won by Tobin De Hymel, Stoddard-Dayton; Phil Wells, Moon, second; Geo. H. Clark, Cutting, third; Sanders, Moon, fourth. Time, 10:02.

One hour free-for-all, stripped chassis.—Won by Tobin De Hymel, Stoddard-Dayton; Phil Wells, Moon, second; Geo. H. Clark, Cutting, third; "Bill" Endicott, Cole "30," fourth. Race stopped in forty-sixth mile on account of accident.

**Saturday, October 29th.**

One mile time trials for "state championship," Class E—Won by Tobin De Hymel, Stoddard-Dayton; second, Geo. H. Clark, Cutting. Time, 1:02.

Five miles handicap, Class B—Won by Fred Malone, Buick (10 seconds); second, Bill Endicott, Cole "30" (15 seconds). Time, 5:15¾.

Five miles, stock chassis, Class B—Won by Clark, Cutting; second, "Bill" Endicott, Cole "30," third, Harry Endicott, Cole "30." Time, 6:14.

Five miles open, Class C—Won by De Hymel, Stoddard-Dayton; second, Clark, Cutting; third, Malone, Buick; fourth, Labadie, Hudson. Time, 5:16.

Fifty miles, Dallas Derby, stripped chassis, Class E—Won by De Hymel, Stoddard-Dayton; second, "Bill" Endicott, Cole "30," third, Harry Endicott, Cole "30," fourth, Clark, Cutting. Time, 51:10. Clark, Cutting, won prize for fastest 25 miles in this race.

**Visitors Capture the Prizes at Peoria.**

What was styled the T. J. Nertney Automobile Racing Association, of Ottawa, Ill., and the Peoria Motorcycle Club, were responsible for the mixed racemeet held on the Peoria (Ill.) mile track on Thursday last, 27th ult., which was poorly attended and furnished indifferent sport. Three automobile events were carded, but one failed to fill. The 15 miles race for 30 horsepower cars was won by Roy Sawyer, of Sandwich, Ill. (E-M-F), in 17:03; Hall, of Peoria (Stoddard-Dayton), was second. Sexton (Ford) and Wood (Buick) failed to finish. The 25 miles free-for-all went to C. S. Baldwin, of Muncie, Ind. (Inter-State), in 27:01. Wood (Buick) was second and Roy Sawyer (E-M-F) third.

**Post Prominent at Middletown's Matinee.**

James Brady Post, driving a Stearns, won the feature event of a matinee meet held on the half mile track in Middletown, N. Y., Saturday last, 29th ult. The distance, ten miles, was covered in 14:31¾. Blaine Worcester, Buick, was a good second. Worcester won the five miles for stock cars of 600 cubic inches in 7:03¾, and also accounted for a five miles pick-up-passengers race in 9:36¾. John Eagers in an Overland drove an exhibition five miles in 7:22¾.

## OLDFIELD FINDS COLD COMFORT

**Obtains Advertising and an Injunction and Quickly Loses It—Case Thrown Out of Georgia Court.**

Oldfield, the outlaw, yesterday made another cheap bid for notoriety and newspaper mention; and, so far as known, without the aid of his new friend, Jack Johnson, the negro pugilist, or that of their mutual friend, the New York sporting editor, or any other of the more or less "dead game sports" with whom Oldfield has cast his lot. Nor was the moving picture machine in evidence, probably because Oldfield's "bid" was made in court. He made it professedly because his entry for the Atlanta (Ga.) Speedway races which begin today had been rejected and because the Atlanta Automobile Association would not give him a chance to gather the "easy money" he had contracted to collect by exhibiting himself.

Oldfield first applied for and obtained one of those temporary injunctions which appear so easy to obtain; it restrained the Atlanta organization from interfering with his appearance at its racemeet. It proved exceedingly temporary, however, for when the Atlantans and the A. A. A. officials got busy later in the day Oldfield learned the lesson so many other "outlaws" and suspended competitors already had learned—that the rules of a sports governing body are supreme and that courts refuse to take jurisdiction of such matters.

The hearing was before Judge George L. Bell in the Fulton County Superior Court. Oldfield's attorneys declared that he had been disqualified by the American Automobile Association without a hearing and that the disqualification of his 200 horsepower Benz racer amounted to confiscation of property, because as a racer it was worth \$14,000, while if not allowed to race it was worth only \$2,500. They also tried to make the most of the color line existing in the South by arguing that Oldfield's farcial moving picture race with Jack Johnson, which caused the disqualification, was justifiable, because it would tend to discourage Johnson from future competition with white sportsmen.

The opposition counsel replied that Oldfield's disbarment was automatic under the rules he himself had signed, both against himself and his car, and they produced affidavits stating that Oldfield told officials of the American Automobile Association that he would disregard the rules on account of the money he expected to make with Johnson.

Judge Bell, after three hours and fifteen minutes had been spent in argument, ruled that he had no jurisdiction.

Oldfield's attorneys, however, fixed up a

consolation event for him in the shape of a suit for \$20,000 damages against the American Automobile Association, and one for \$5,000 against the Atlanta Automobile Association, which suits may serve to further advertise Oldfield and his moving pictures, and which for that reason may be worth the lawyers' fees.

## New Jersey Guessers Get Cups and Pens.

Fifty-two cars started in the first annual sociability run held by the Automobile Club of Hudson County, on Saturday and Sunday, October 29 and 30. The course was from Jersey City, N. J., to Easton, Pa., and return, but the pleasure of the run was marred by an accident causing the death of Miss Ella Fields, of Bayonne, N. J., who was a passenger in one of the cars. The affair was more or less of the guessability type of run, with an unusual number of prizes at stake. The Blakeslee Cup and Waterman fountain pen were offered for the first leg of the trip which ended at Easton. The cup was won by F. I. Stephens, of Weehawken, and the pen by E. Gothberg. William E. Smith and W. H. Vreeland won respectively the Collard Cup and Waterman pen for the Easton to Newton, N. J., guess. The Romaine Cup for the final leg into Jersey City was taken by W. A. Alexander, while Dr. L. A. Opdyke won the second prize, a fountain pen. The grand prize, the Perlmutter Trophy, for the motorist guessing nearest to the sealed time for the total distance, was won by David Miller. T. H. Edwards and William E. Scudder won the second and third prizes, each of which was a Waterman fountain pen, of which there was an unfailing supply.

## Draw Lots to Determine Prize Winner.

Eleven of twenty-four cars which competed in the reliability run of the Calumet Club of Roseland, Ill., made perfect scores according to the finding of the judges, and President Ton is in a quandary as to what to do with the prize, the Calumet Index Cup. The trip was held on Thursday, October 27th, over the Elgin-Aurora-Joliet route and was so great a success that it probably will be repeated this month as an interclub run with the South Chicago Automobile Club. Twenty of the twenty-four starters finished, the perfect scores being awarded to: R. J. Ton, Rambler; H. F. Getze, Rambler; L. E. Rollo, Rambler; A. Tenninga, Halladay; W. McLachlan, Mitchell; N. Larsan, Mitchell; J. Hess, Hupmobile; Ernest Bihl, Mercedes; Charles Novak, Lambert; M. E. Nelson, Buick; Dr. A. Billig, Buick. These eleven will be asked to draw lots to determine the "real" winner.

Nine gasoline service wagons just have been purchased by the Servian military authorities. The contract was placed with a Swiss manufacturer.

## TAME SPORT AT WHITE PLAINS

**Few Entries and a Small Crowd—Costello in a Maxwell Wins Feature Event—Imported Cars go Wrong.**

The bright young man who thought he might accumulate at least a small pot of gold by holding a racemeet on the fair ground half-mile track at White Plains, N. Y., on Saturday last, 28th ult., now is a much wiser individual. There were few entries and the "crowd" that attended was almost large enough to cause discomfort in a telephone booth.

Six events were decided, of which T. Costello, Maxwell, and H. Mendall, Jr., Mercedes, each captured two. One of Costello's victories was scored in the feature event, the 30 miles free for all, in which S. E. Wishart, who previously had won the mile time trials, set out to make a run-away. He was in a fair way to succeed when his engine struck work and forced him to stop. He made repairs and restarted, but again and still again was forced to halt by a recurrence of his trouble. H. Mendall, Jr., who also started in a Mercedes, ran into difficulty and likewise ceased to be a factor in the race. Meanwhile, Costello and Dorley, in Maxwells, were driving consistently and although the former once stopped to change a tire, he was so far ahead that his lead was never seriously in danger. The summary:

One mile time trials—Won by S. E. Wishart, Mercedes. Time, 1:14½. T. Costello, Maxwell, second. Time, 1:21.

Five miles, amateur drivers, stock cars—Won by H. Wandall, Jr., Mercedes; H. Van Wyck, Marion, second. Time, 7:09½.

Five miles, cars under 231 cubic inches displacement—Won by T. Costello, Maxwell; M. Dorley, Maxwell, second. Time, 6:44½.

Ten miles match race—H. Wendall, Jr., Mercedes, vs. J. Teabeau, Marion. Won by Mendall. Time, 14:11.

Thirty miles free-for-all—Won by T. Costello, Maxwell; M. Dorley, Maxwell, second. Time, 43:00½.

## Livingston Meets Death in Practice Spin.

Al Livingston, a member of the National racing team, was killed on Tuesday last, 1st inst., while practicing on the Atlanta (Ga.) speedway. A rear tire went down and threw him out of the car. His skull was fractured and he died a few hours later in the hospital. Livingston was a Californian and a daring driver. He acquired his greatest fame during the Elgin (Ill.) speed carnival in August last, when he won the Illinois trophy and finished second in the big race for the Elgin trophy. Later he performed creditably in the Vanderbilt and Fairmount Park races.

**NINE BODIES FOR ONE CHASSIS**

**Bergdoll Offers Varied Equipment for Standard Mechanism—Original Details in Power Plant and Axles.**

Affording a new and rather striking illustration of the advantages of interchangeable body design the Bergdoll Motor Car

with many good features of design and graceful body structures. In its various phases it is offered as a standard touring car, roadster, closed-front touring car, small tonneau, coupe, town car or cab, "colonial" coupe with rear rumble seat, limousine and landaulet.

The four cylinder engine of the Bergdoll is of the bloc type 4 inch bore by 4½ inch

sons white bronze bearings and metal liners to allow for the take-up of wear. The aluminum crank case is cast in two pieces, the upper half supporting the cylinders, crank shaft bearings, oil pumps, magneto, water pump and uni-sparker. The lower half forms an oil reservoir.

The oiling system is automatic, a constant level being maintained in the crank case

THE BERGDOLL CLOSED-FRONT "30" TOURING CAR

SMALL TONNEAU ARRANGEMENT OF THE BERGDOLL

Co. of Philadelphia is producing nine distinct styles of car with practically a single foundation chassis. Making slight allow-

stroke, and is characterized by large intake valves placed on the heads of the cylinders and exhaust valves on the left side,

for splash lubrication. An overflow opens into the reservoir below. A gear pump keeps up the supply of new oil; a sight feed

SIDE AND REAR VIEWS OF THE NEW BERGDOLL CHASSIS SHOWING ITS ORIGINAL CONSTRUCTION

ance for such differences as service requirements may dictate in the respective cases, it may be said that two chassis types are

which position the manufacturers claim gives 75 per cent. more power. The entire explosive chamber is water jacketed, as also

through which the flow of oil may be observed is arranged on the dash.

Two ignition systems are used, both of

THE NOVEL "COLONIAL COUPE" DESIGN

THE CONVENTIONALIZED LIMOUSINE PATTERN

employed. At a matter of fact, however, the distinction between the touring and roadster chassis is not conspicuous. The Bergdoll "30," which is one of the newer products on the market, is a rather striking member of the medium priced class,

are the valve seats. The best grade of alloy steel carefully heat treated is used in the crank shaft, each end of which is supported by annular ball bearings of much larger size than is necessary. The connecting rods are drop forged steel, with Par-

high tension variety; the regular equipment is the Atwater-Kent Uni-Sparker with coil and batteries, and the second, a Bosch magneto with separate spark plugs. Wires from coil to plugs are carried in tubes along the top of the motor and wires from

magneto are enclosed in vertical brass tubes, adding greatly to the appearance.

The cooling of the motor is accomplished by means of centrifugal pumps, forcing the water through the jackets and thence into the Livingston cellular radiator.

The clutch is of the multiple disc type, and consists of 24 discs, one-half of which are held in place by connection with the flywheel and the other half are keyed to the main shaft of the transmission. These discs are placed alternately, first one on the engine and then the next on the transmission.

The frame is of cold pressed steel, twenty to thirty point carbon, and unusually deep and heavy section for the weight of the car. A double drop gives the much desired low and rakish appearance. The transmission is of the selective type giving three speeds ahead and one reverse, and all gears and shafts are of nickel steel, heat treated according to the requirements. All working parts in the aluminum gear box may be inspected by removing the cover. The rear axle is of full floating type with a one-piece pressed steel housing the entire axle length. The pinion shaft with pinion gear and the bevel gear are assembled and adjusted before being placed in the housing and may be easily removed from the forward side without disturbing any other part of the axle. A large cover on the rear of the gear permits convenient inspection. Ten large annular and three thrust bearings are used in the rear axle. The brakes controlled by the hand lever are of internal expanding metal to metal type, and operate on the rear wheel drums, 14 by 2 inches in size. A large and powerful contracting brake, operated by a foot pedal, is located on the driving shaft immediately behind the transmission. It is of steel, lined with Thermoid, and very durable. The front axle is an I-beam section, drop forged, and mounted on four large annular ball bearings. Schwartz artillery type wheels are used, 34 inches in diameter, the hub flanges are large and the spokes very strong. On the rear wheels the spokes are bolted to the brake drums. The wheel base of all models is 115 inches. With the use of 39 inch semi-elliptical front and 45-inch three-quarter elliptical rear springs, the desired comfort is obtained. A worm and gear type of steering gear with ball thrust bearings is employed. The column is of large size with spark and throttle levers mounted on top of the 17-inch wheel. An accelerator pedal is interconnected with the throttle lever and conveniently placed on the toe-board. Two levers at the right side, one controlling the emergency brakes and the other a gear shifter, with two pedals, the clutch and foot brake, constitute the rest of the controlling factors.

A great feature of the Bergdoll cars this year is that Continental "Q. D." demountable rims, Livingston cellular radiator, Schwartz artillery wheels and Atwater-Kent

Uni-Sparker are a part of the regular equipment, whereas they are not generally supplied on medium priced cars except for an extra charge.

#### Carries Captive Man-Bird in His Car.

Karl Bishop, of the Crest Motor Co., which has the agency for the Abbott-Detroit car in Cleveland, O., gave that city cause for considerable neck-stretching and speculation one day last week. Taking advantage of the keen interest in aviation which now is so prevalent and of the presence in Cleveland of two aviators possessed of one of the Santos-Dumont Demoiselle monoplanes, Bishop obtained the loan of the latter and rigged it upon an Abbott-Detroit car in the manner shown by the accompanying illustration. With one of the

the outside, circling around slowly at Broadway and Fifty-fifth street. Their actions aroused the suspicions of the officers, and the latter got into an automobile and followed them at a distance to Lexington avenue and Fifty-eighth street. Several automobiles were drawn up at this point, and the men inside the electric, it is alleged, got out and passed up and down the row of cars, and then, getting into their own car again, went to 60 West Fifty-third street, the home of Robert C. Van Deventer, where an automobile belonging to Mr. Van Deventer was standing.

The electric stopped a few doors east of Sixth avenue, and the pair inside, it is alleged, jumped out and, running back to Mr. Van Deventer's machine, took the two automobile shoes on the right side of the

THE MOTOR CAR OR THE MONOPLANE—WHICH?

aviators, Clinton Miller, seated in the aeroplane, and with himself at the steering wheel of the car, Bishop paraded the streets and created something of a sensation. The average observer appeared to be in doubt as to whether the aeroplane was pushing the car or the car was pushing the aeroplane.

#### Four Tire Thieves Caught in the Act.

With the arrest of four men in an automobile, the New York police believe they have solved the mystery of the many tire robberies which have been stirring up the automobile district for the past six months. Several thousands of dollars worth of shoes have been stolen, according to complaints received by the police, but until Thursday last the policemen assigned to the cases were unable to catch the culprits. Then four Central Office men who were passing along Eighth avenue, near Columbus Circle, noticed a small electric automobile, in which two men rode inside and two on

car. They ran back to their rig with the shoes, the detectives declare, but before they could get away were arrested.

#### No More Horses for Atlantic City Mails.

In addition to being one of the most famous seaside resorts of the world, Atlantic City, N. J., soon will have another feather in its cap. It will have an exclusively automobile postal service, the first city of any size in the United States to be thus equipped. Five new motor cars have been ordered and will be installed within a few weeks.

#### Penalty for Tinkering With Taximeters.

Some of the one hundred taxicab drivers in the city of Geneva, Switzerland, recently have been caught tampering with the taximeter mechanism on their cars. To suppress the practice, the authorities have adopted the radical measure of cancelling the driving license of every chauffeur convicted of the offense.

**POPE PRESENTS ITS FIRST "SIX"**

**Has Some Features in Common with Improved Four Cylinder Model—More Power and Four Speed Gear.**

While it has been known for sometime that the Pope Manufacturing Co., Hartford, Conn., has had a new six cylinder model "in the works," the precise details of its construction, like those of the new four cylinder Pope-Hartford car, were not disclosed until this week. The announcement reveals that both machines are to be of similar design in a general way, perpetuating many of the characteristics that have proved so successful during the five years that the standardized four cylinder machine has been on the market. Both will be of 50 horsepower and many of the parts will be the same for both styles of chassis, among them the clutch, change gear and rear axle. The frame construction also will be similar, although the six cylinder car will have ten inches longer wheel base than the four.

As for the new four cylinder car, it is put up in exceedingly attractive form, two of the three prominent body styles following the trend of the moment in respect to closed front construction. One of these is termed a torpedo, and while lacking in the outlandish aspect of some representatives of that class, yet possesses the rotund back, relatively high sides and overhanging dash that are characteristic of it. The largest body equipment is that of the touring car, which is of the closed-front variety, with side rails level with the top of the bonnet, high backed seats and ample tonneau space. The third body design here illustrated is that of the small tonneau, which possesses seat lines similar to those of the touring body, but is more compact and which has, in place of the front doors of the touring car, a deep skuttle dash and high sides.

The cylinders are cast in pairs with water jackets of ample capacity integral. Conical seat valves, which are interchangeable, are located in the cylinder heads and operated mechanically by a set of overhead rocker arms and push rods. The construction of the push rods is changed from solid steel to small cold drawn steel tubes with the upper ends rounded and designed to work in similarly shaped cups on the end of the rocker arm, forming ball and socket joints. Flanged collars, forming seats for the spring that keeps the rocker arms tight up against the valve stems, are placed near the lower end of the rods. All these rods are actuated by a single cam shaft placed on the left-hand side of the motor and enclosed in the crank case. The valve rods are adjustable.

A mechanical oiler supplies oil through a positive and direct feed to each cylinder

and the timing gears and shaft. A large suction pump draws the oil to the oiler from a reservoir beneath the crank case. The pump is capable of lifting one gallon of oil every 26 minutes with the engine turning 1,000 revolutions per minute. Overflow oil goes to the cam shaft housing,

gear on the cam shaft is provided for use in the battery circuit.

Water cooling is effected by means of a gear-driven pump, located on the left side of the motor. A four blade, belt driven fan, mounted in an aluminum adjustable bracket is placed behind the radiator and

TORPEDO VERSION OF THE NEW POPE-HARTFORD

POPE-HARTFORD MODEL "W" CLOSED-FRONT TOURING CAR

THE NEW MODEL "W" IN SMALL TONNEAU FORM

lubricating the cams, cam rolls and their bearings, thence to each main bearing of the crank shaft. A constant level is provided for in the crank case, insuring proper connecting rod lubrication.

The standard ignition is the dual system with Bosch magneto. A single unit coil is used, and each cylinder tapped for two spark plugs. A commutator driven from a

induces cooling air through the radiator and around the motor.

A cone type clutch having a heavy leather face with cork inserts is used, connected to the transmission by a coupling of new design and interlocked with both the emergency and service brakes. Thus the release of the clutch is insured before the brakes are applied. The clutch spring,

wound of heavy square stock, is enclosed in the clutch hub itself.

The new four speed transmission is a deviation from the three speed of previous years. Fourth speed, or high, is on direct drive, and any speed may be selected without regard to rotation. The shafts and gears are of chrome nickel steel, highly tempered and oil hardened. As in the past an armored frame is used, consisting of chrome nickel steel, heat treated, side pieces of channel section, with the channels reinforced with straight grained white ash. The cross members are also channel section, hot riveted to the side pieces. The use of tough ash in conjunction with the steel frame gives the strength and flexibility required. The rear axle is of the full floating type with axle tubes brazed to the differential case. The whole differential may be removed while the car stands on its own wheels.

Each of the two sets of brakes acts on the rear wheels, the service brake, foot operated, being external contracting, and the emergency brake internal expanding. The action takes place on two separate sets of drums, which have sufficient clearance between to avoid the tendency of heating. The drums are bolted to the rear hubs, and are very efficient, either set of which will lock the wheels.

The front axle is a one piece solid forged steel beam of I-section. The wheels of the 4 cylinder models are 36 by 4½ front and rear, except on the 7-passenger and closed body cars which have 36 by 5 inch rear tires. The 6 cylinder cars have 38 by 4½ inch in front and 39 by 5 inch wheels in the rear. Demountable rims are included in the standard equipment of the latter models. Semi-elliptical springs are used both front and rear, and much more is claimed for them in easy riding qualities than those on previous models.

The steering is done through an irreversible worm and sector type of gear, enclosed in a dust proof case. A 1¾ inch column supports the 19 inch wheel, upon which are mounted the throttle and spark control levers. Two pedals, operating through the footboard, control the clutch and service brake, while the emergency brake hand lever and the gear shifting lever are placed conveniently at the right side. A compression relief rod is located on the dash and a pedal for the muffler cut-out is placed on the floor board.

#### To Lift the Body from the Chassis.

The lifting off of an automobile body from the chassis is generally a hard task and particularly if it must be done by only two or three men. In one garage, however, where the working force is limited, ingenious use is made of an elevator. The car is run under the elevator and the body tied with rope to the under side of the platform. As the elevator rises, the body goes with it, being lifted easily from the chassis and then easily lowered to the floor.

## FEATURES OF A MODERN FACTORY

### Hudson Takes Possession of New Plant Which Illustrates Present Tendencies—Many Comforts for Workmen.

On Saturday last the Hudson Motor Car Co. took possession of its new plant in Detroit, bag and baggage being removed from the old place to the new one, which comprises a main building 610 x 60 feet, one wing 410 x 60, another 210 x 60 and the offices which are 180 x 52. All buildings are two stories high and are absolutely fire-proof. The windows have the Fenestra steel sash and are so plentiful that the glass area in the walls comprises 90 per cent. of the total area. Ribbed glass has been used to diffuse the light so that the strong glare of the sun will not hurt the workmen's eyes.

The new plant is another of the modern establishments that is notable for the conveniences afforded the workmen. A private locker of steel is provided for each employe. Sanitary drinking fountains are scattered throughout the immense concrete buildings; there are rest rooms for the women, smoking rooms for the men, dining rooms for all, shower baths, recreation grounds, and every effort has been made to obtain perfect illumination, ventilation, and heating.

Every workman has a metal bench drawer with his own key. The benches are specially designed with maple tops, shellacked and varnished. Five electric elevators with a capacity of 8,000 pounds apiece, and a system of compressed air for riveting, drilling and reaming are other features conducive to low cost of production. The old system of long shaftings has been displaced by electric drives, which means a saving of power, and the short shaftings are on the Hyatt roller bearings further to cut down power consumption.

The system of bells and telephones is complete and is supplemented by a code of color signals. Superintendents of the departments have been given various colors. For instance, the superintendent of equipment—whose color is blue—might be out of his office when his phone rang. It might take many minutes to find him in the maze of machinery. But in whatever department the superintendent may be, a blue light flashing on an indicator will serve to notify him that he is wanted.

The experimental room was equipped almost entirely by Howard E. Coffin, the head of the Hudson Company engineering staff and designer of all its models. It contains about every known experimental device used in automobile engineering.

All electric wires are run in steel conduit fittings—a very recent improvement in factory wiring.

Special attention was given the hardware

used in the building. For the offices' statuary, bronze with satin finish has been used throughout. Every department has its master key, with a grand master key for each of the executive officers. That is, the head of one department can unlock all the doors in his own department, but the grand master key unlocks everything in every department.

A special overhead crane devised by Mr. Coffin, picks up cars and carries them to the paint shop in three minutes.

By the old method an old set of wheels had to be put on the car to get it to the paint shop. That took thirty minutes and the service of four men. Mr. Coffin's new device alone will save \$6,000 every six months.

The fire protection system consists of a 30,000-gallon tank erected on a tower 135 high. It connects with large underground fire pipes which are connected with fire hydrants throughout the yard and also with "risers" in the buildings which feed small sprinkler heads near the ceiling. In case of fire the sprinkler head opens, throwing a large spray of water and at the same time ringing a big electric gong, warning the watchman of the danger.

#### Two Tales of Traveling Men.

Charles F. Splitdorf, the New Yorker who makes magnetos, is a good story-teller, among other things. Once started, he can keep almost any party interested, which is not so strange, seeing that once upon a time he was a "footlight favorite" of the amateur stage. A few evenings ago when the changing order of men and things in the automobile industry was under discussion, he related a storiette that aptly illustrated the point.

"I was visiting an automobile factory when a young man presented himself to the manager of the establishment. He was seeking a position. When he stated that he was a traveling man, the manager half-exploded.

"Traveling man?" he replied. 'No; we don't need any. We have ten traveling men. What we want is one salesman.'"

And, of course, this reminded Splitdorf of another "good one," also involving a traveling man—a "star" salesman, in fact, whose expense account was in keeping with the size of his orders, and occasionally a little out of keeping with them. There came a time when the head of the house deemed it advisable to remark the fact. He did so, gently. Pointing to the item "Traveling" in the salesman's expense book and which represented a good round sum, not all of it expended for railway fare, he remarked affably:

"You can cover a good part of the United States for that sum."

"I know it, sir," glibly responded the salesman, whose readiness of tongue was his chief stock in trade; "but you know it is necessary for me to 'go some' even when I'm standing still."

**CORBIN OFFERS A NEW "FORTY"**

**New Comer a Notable Addition to the Line—New Bodies and Improvements for the Older Models.**

While the automobile manufacturers of the West and Middle West have succeeded in drawing considerable attention to their operations, the little group of car builders whose operations center about the New England states, Connecticut in particular, have been exceedingly busy in a quiet way; and announcements of their plans for the immediate future indicate that they are making arrangements for an even more successful year during 1911 than that which is

The motor in this new model "40" is one of 40 horsepower, having four cylinders,  $4\frac{3}{4}$  by  $5\frac{1}{2}$  inches, cast in pairs. The valves are located in the sides, those of the inlet located in the right and the exhaust on the left. By placing the valves on opposite sides the advantage of having large valve dimensions is gained, and the T head motor

utor and the other an imported high tension magneto. Cooling is effected with the use of a positive driven gear pump, Mayo radiator and a six-blade belt driven fan. The clutch is of the conical type, with springs under the leather facing, and is easily operated by compound engagement, and the brake on the clutch insures low in-

CORBIN "40" CHANGE GEAR

now drawing toward its close. One of the older companies in this class is the Corbin Motor Vehicle Corporation, of New Britain, whose affiliation with the great American Hardware Co. ensures it an enviable degree of substantiality.

During the present year the Corbin product has centered about a single chassis model of 30-35 horsepower. In the new line, which just has been announced, this is to be continued substantially in its former shape and built as a small tonneau or touring car. In addition to this, however, the line will be augmented by a second model of about the same capacity, known as model "30," which will be of shorter wheel base and produced in small tonneau and touring forms. A third member of the line, model "40," will be an entirely new and rather striking car selling at \$3,000, instead of \$2,750 or \$2,000, the prices of the other two models respectively.

is more symmetrical. The crank shaft is supported by five bearings of large size. The piston has four rings at the top, and two oil grooves, and is attached to the crank shaft by I beam connecting rod.

Lubrication is accomplished by means of a self contained circulating system supplied from a reservoir in the motor case. An indicator on the dash shows the feed, and an oil level glass is attached to the side of the motor. Two complete systems are included in the ignition equipment, one a storage battery with unit coil and distrib-

ertia and no clashing of the gears. Pressed chrome nickel steel, heat treated, is the material used in the construction of the frame. The side members are narrowed toward the front, and raised over the rear axle. The motor is supported by cross members and the pan. Three speeds forward and one reverse are secured in the selective sliding gear transmission. The drive is bevel gear and the rear axle is of the semi-floating type, annular ball bearings are used throughout and the gears are easily accessible. Two independent, equal-

CORBIN MODEL "18" EQUIPPED AS A ROADSTER

CORBIN MODEL "30" WITH CLOSED FRONT BODY

THE NEW CORBIN MODEL "40" TORPEDO TOURING CAR

**HERE'S A 75-YEAR OLD DRIVER**

**He Hails from New York State and Uses  
His Car in His Business—Tools  
that Are Historic.**

ized sets of brakes act on the rear wheel drums. The front axle is an I beam section one piece drop forged with Fiat type knuckles. Semi-elliptic springs are used in front and three-quarter elliptic in the rear. A worm and full worm type of steering gear, adjustable for wear in all directions, is set at a rakish angle through the dash board. On the 18-inch wheel are mounted the spark and throttle control levers, while the clutch and service brake are operated by separate foot pedals through the toe-board. Gear-shifting is accomplished by the lever at the right side, mounted together with the lever controlling the emergency brakes. The wheels are 36 by 4 inches on all chassis of this model except that of the limousine, on which they are 37 by 4½ inch. The wheelbase is 120 inches.

The two other chassis, Model "18," of 30 horsepower, and Model "30," differ to some extent from the new Model "40" in that the cylinders are cast separately, and the wheelbase of the smaller car is 115 inches. Each of the latter models has 34 by 4 inch tires. Universal "Q. D." rims are used on all 1911 chassis.

In respect to the new bodies the equipment includes the torpedo and closed front in addition to the standard touring, small tonneau, roadster and limousine on the "40" chassis, while the "30" is offered with touring or small tonneau bodies. Model "18" is a neat looking four-passenger car with a scuttle dash, concealed latches and other attractive features.

**France Counts its Private Motor Cars.**

Statistics for the year 1909 compiled by the French government and which tardily just have been made public, show that the total number of private automobiles in use in the Republic at the end of that year was 53,669. This total includes neither taxicabs, omnibuses nor commercial vehicles. The increase over the year 1908 was 8,900 cars. The average power of the 53,669 cars is 13 horsepower. The Department of the Seine, in which Paris is located, of course, accounts for the greatest proportion of the total or 10,045 cars; Seine-et-Oise has the next largest number, 2,429, while Corsica only boasts of 16 automobiles.

**How New York is Checking the Smoke.**

The first report concerning the working of the anti-smoke ordinance of New York City which covers the period from September 29 to October 17, inclusive, gives the total number of arrests as 119, the number of fines imposed as 100, and the amount of fines as \$340. Ten offending chauffeurs were discharged; one was held for Special Sessions and seven more let go under suspended sentences. The ordinance originally was passed to go into effect on July 1, but an additional three months was granted during which to make necessary alterations or arrangements calculated to obviate the smoking nuisance.

Mr. Vandenberg plowed up in a field. It has been used so much that its face is battered until it resembles the head of a mushroom.

**Indianapolis's License Law is Upset.**

The test case, recently instituted in Indianapolis, Ind., to establish the validity of the city ordinance giving magistrates and the board of public safety the right to suspend or revoke the license of offending chauffeurs has had a far reaching result. The entire license ordinance has been declared invalid by Judge Remster and the issuing of licenses to automobile drivers and motorcycle riders has been ordered discontinued. The money involved is quite an important item, as 4,224 drivers' licenses

C. C. VANDENBERG, BELIEVED TO BE THE OLDEST MOTORIST IN THE UNITED STATES

cupation, his car enabling him to answer calls that otherwise would be impossible. The tools he loads beside him, and he makes much better time and is able to go much further than he could were he obliged to rely upon his own physical powers in going to and returning from work.

While the old gentleman's means of locomotion is up to the minute, his tool kit is full of ancient history. Some of the tools were used during the war of 1812 by an uncle of Mr. Vandenberg, who fought in that war and was stationed at an arsenal at Albany, N. Y. He used the tools in construction work about the arsenal. The present owner has in the kit some the age of which he is unable to learn, but he believes some of them were made long before the beginning of the last century.

The tools which saw service during the war of 1812 are a long jointer plane, a short jointer, a hammer, two chisels, a handsaw, a hand-made square and several other small instruments.

Another of the tools is a hammer which

have been issued since the ordinance became effective last year. It has been decided, however, that the license fees will not be returned, because they had not been paid under protest.

The grounds on which the ordinance was declared invalid are unusual, and not apparently because of supposed conflict with the state law. Judge Remster held that the ordinance conferred "arbitrary and discretionary powers" upon the board of public safety in granting of licenses, in so far as no definite standard of fitness is set out in it, and that, in the opinion of the court, if such an ordinance was to be considered valid it must fix a definite standard for the successful applicant. Under the ordinance passed last year it would be possible, said Judge Remster, for the board of public safety to grant or refuse a license at the pleasure of the members of the board, regardless of the applicant's fitness. Such a possibility would be contrary to the doctrine of equal rights for all and therefore unconstitutional.

**BUILT FOR BANKING SERVICE**

**Armored Car Designed to Safeguard Funds and Other Treasure—Protection and Conveniences that It Affords.**

It is the popular impression that a great deal of money has been put into automobiles in this country up to this time, but

dinary banking operations with customers who might find it inconvenient to go to headquarters either to deposit or draw money. With the idea of encouraging enterprises of this sort and others of a kindred nature, the Bellamore Armored Car & Equipment Co., of New York City has just put on the market a decidedly original and ingenious type of protected vehicle.

The accompanying illustrations afford a

observed, are controlled from within by means of levers. The driver's compartment in front is entirely separate from the remainder of the machine and is protected by steel sides.

The interior of the machine is equipped with a swivel chair for the cashier, a desk under the grill, facing to the rear, and a large steel safe, which occupies the forward part of the compartment, leaving only suffi-

**BELLAMORE ARMORED CAR FOR TRANSPORTING FUNDS, MAKING COLLECTIONS AND PAYMENTS OR TRAVELING BANK PURPOSES**

the idea of a car especially designed to put money into still is considerable of a novelty in many quarters. Nevertheless, several such machines have been constructed for the specific uses of banks in transporting funds. In England, for example, the People's Bank of Brighton has adopted the novel plan of putting on the road a traveling branch establishment, mounted in a motor car, and equipped to carry on all or-

good idea of the external appearance of one of the several types which the Bellamore company is producing. It is of the so-called vestibule type, having a small, hooded platform at the rear, upon which the customer may stand while transacting business, but from which it is impossible to gain access to the interior. The gates to the vestibule and the shutters which close the cashier's little grilled window, it may be

cient room for entrance and egress on the right of the machine.

Under the desk are shelves suitable for the storage of books and papers, while provision is made for an extra folding seat, if required. The interior is electrically lighted by means of a storage battery system, while suitable means of communication are provided between the cashier or messenger and the driver. The walls and floor of the

interior are finished in hard wood and the outer door is provided with a duplicate key latch lock, with alarm bell attachment.

The windows and the dividing partition between the two sections are protected by means of electrified steel grill work while the body structure throughout is specially safe-guarded by a patent system of electric alarms which give instant warning of attack, either by drilling, wedging, cutting or annealing the linings or the steel grill work protecting the windows and partitions. The framework is made of armored steel, reinforced with a finish plate of hard wood on the inside. The sides, partitions and floor are constructed of alternate layers of tempered steel, hardened insulating material and electrified plates. In addition, the floor is further protected and stiffened by a heavy tempered steel plate. The alarm gongs, it should be added, are placed in a special compartment between the roof and ceiling over the driver's seat, and are protected in the same manner as the remainder of the vehicle, the construction being such as to produce a sounding board effect.

The safe is produced by a well-known safe maker and embodies the latest improvements both in construction and locking facilities. It is sealed by four heavy round bolts with a special anti-dynamite trigger device, as well as a duplicate master key arrangement, for use when large sums of money are to be transported from point to point.

The same general type of construction also is provided in a bank limousine, which, instead of the cashier's desk in the rear has a cross seat, in addition to two folding seats, its carrying capacity thus being five passengers, for which there is ample room back of the safe.

The mechanical equipment of the car here illustrated is that of a 20 horsepower double opposed motor in a chassis of standard construction. In addition, and for either the vestibule or limousine types of equipment, a four cylinder chassis of 40 horsepower may be obtained. The prices of the completely equipped bank cars range from \$4,750 to \$6,000, special arrangements, either of the interior or of the general design, of course, being obtainable. The machine is intended for use not only as a traveling bank, but for purposes of collection, disbursement—as in paying off men on contractors' operations—transferring funds, and in other ways where absolute protection for the cargo is necessary.

#### **Safeguarding the Repair Pit.**

In order to prevent cars from dropping into repair pits, raised stringpieces should be so placed along the edges that the wheels will be guided by them. On the end where the car enters, the pieces should meet in a V-point. This will greatly facilitate getting the car in position and will save considerable time in races where seconds often are precious.

## **AUSTRALIAN MARKET FOR TRUCKS**

### **American Consul Calls Attention to Its Unusual Promise—Conditions that Make for Extended Usage.**

Australia as a market for commercial motor vehicles is one of rich promise, according to the American vice-consul general, Henry D. Baker, who is stationed at Sydney, where he says there has been a great increase in the use of such vehicles during recent months. The municipality itself employs motor wagons for sprinkling the streets and removing garbage.

Its size, the great distances between its cities and towns and its inadequate railway facilities combine to make Australia a promising market; the huge wool teams and traction engines long employed serve further to indicate the possibilities that are presented. These slow, cumbersome traction engines will haul anything up to 30 tons, and the idea of replacing them with a relatively fast and flexible self-contained motor wagon carrying five tons or more is but just beginning to occur to the people.

"The enormous extent to which traction engines are used proves that it is possible to use power wagons, and also that they compare favorably in point of cost with horses. It must be admitted that the cost of running a traction engine, while being considerably greater than that of a motor wagon, is yet cheaper per ton mile when a continual full load is hauled, and under English conditions scarcely costs more than 1d. (2 cents) per ton mile," says an Australian in discussing the subject. "But the trouble with the traction engine is that it is very slow, rarely exceeding an average speed of 2 or 2½ miles per hour; it is strictly limited in regard to its radius of action on account of its enormous weight; and, lastly, it is comparatively rare to be able to provide a full load for it, so that when time, disability, and ultimate cost are considered and it is probable that the motor wagon will prove the cheapest of all methods to run.

"The cost of hauling heavy loads by horses in the State is enormous. A local firm states that the actual cost to them for five ton loads in the suburbs of Sydney, and for distances of something like 10 miles, works out to almost exactly 1s. (24 cents) per ton mile. If that has to be paid in suburban areas, one can well understand that on some of the more distant tracks sums like 2s. (48 cents) and 2s. 6d. (60 cents) per ton mile, if not still more, are being paid.

"We have no hesitation in saying that there is no one in New South Wales today who can point to a commercial motor vehicle that is not proving at least a thoroughly sound business proposition to its

owner. The causes of past failures are unsuitable vehicles, ignorance of owners, incompetence of drivers, and local conditions least of all, if at all.

"It is neither the too heavy nor the too light vehicle that is going to succeed in Australia under Australian conditions, but the one that strikes the happy medium which combines strength and lightness that will prove the most successful in Australia. But it must always be remembered that to carry a considerable weight of goods at comparatively high speed there must be great strength, and it is absurd for anybody to produce a light and flimsily built article and say that it will carry so many tons of goods when there is every prospect of its collapsing under a load but very little heavier. The margin over both the breaking strain and the carrying strain must be ample for all contingencies if a vehicle is to be successful, and that in itself must play a great part on the depreciation of the cars."

Although the use of commercial motors in Australia is still very limited, yet the successful beginnings of such cars seem significant of important possibilities in the future. In proportion to the population, Australia is a country of enormous distances, as it exceeds the United States in size (excluding Alaska). Therefore the economical transportation of goods presents a serious problem to traders, as the railroad facilities are very inadequate. With such a promising outlook, Vice-Consul Baker thinks it would profit American manufacturers of commercial motors to give serious attention to the market.

#### **To Make Wind Shields Rainproof.**

Any motorist or storekeeper who suffers a wind shield or a lamp or a show window to become befogged by rain or mist and thereby permits vision to be impaired has only himself to blame, according to the Motor Car Equipment Co., 55 Warren street, New York. That company bases its assertion on its experience with Glassco, a fluid preparation which it just has placed on the market. It is a combination of chemicals which when rubbed on a glass surface, sheds water much as a duck's back sheds it. A few drops applied with an unstarched cloth will last three days. Glassco is put up in bottles at \$1 each, one bottle being sufficient for a season's use.

#### **Cloth Screens for Subduing Headlights.**

Although many motorists make it a practice to render the lenses of their headlights opaque by rubbing whiting on them or by covering them with cheese cloth when driving in the city at night, the use of cloth screens, especially prepared for the purpose, and so contrived that they can be attached to the lamp fronts without delay, for some unaccountable reason has not become popular. Such screens can be made at slight expense.

## 1911 Cars Now Ready

Rambler  
Sixty-five

**T**HE 1911 Rambler is now ready and orders are being taken for early deliveries of all styles. The line includes landaulets, coupes, limousines, town cars, roadsters, toy tonneaus and five and seven-passenger touring cars with detachable fore doors. Details and construction alike for all: two sizes, forty-five and thirty-four horsepower. Forty-inch wheels on all seven-passenger open cars, thirty-six-inch wheels on all others. Seven-eighths elliptic springs and shock absorbers produce gratifying comfort. The offset crank shaft and straight-line drive enable you to travel through sand and up grades on high gear as slowly as ten miles an hour. That there is no need to rush the hard pulls is one of the charms of driving a Rambler.

*You may have a copy of the special  
number of the Rambler Magazine  
if you make request immediately*

## THE CARE OF STORAGE BATTERIES

Benefits of Charging by Ampere Hour Meter—Attentions that Increase Efficiency and Economy of Electrics.

One of the difficulties incident to the maintenance of electric vehicles has been that the innermost needs of the storage battery have been even more of a mystery to the average owner than have the requirements of the gasoline engine. In consequence the efforts of the painstaking garageman to afford his customers thoroughly effective service frequently have been met with suspicion, on the general assumption that he might be inclined to give the battery more care than it really needed. It is known to battery experts, however, that a relatively considerable amount of attention paid to the battery regularly, not only prolongs its life, but in the end renders its operation more economical than it otherwise would be. Of what operations such necessary attentions should consist, was explained by S. C. Harris in a paper read before the recent convention of the Electric Vehicle Association of America in New York City.

It is generally understood by those who have had experience with electrics that when the battery is first received, it requires to be put through a series of charges and discharges in order to "form" the plates. The details of this process, as a rule, are accepted by the owner as needful, and their importance is unquestioned. After the battery has been put into service, however, its need of constant supervision of an intelligent and well-directed sort cannot be too strongly emphasized. It was with the elements of this care that a portion of the paper in question dealt.

"The instructions given by the manufacturer for charging are that the battery be charged at the normal rate until the maximum voltage is reached, and then to charge at the low rate (half normal) until this same voltage is again reached," said Mr. Harris.

"These instructions are, no doubt, very good if followed, but they require considerable more attention to the switchboard than is likely to be given. It is often puzzling for the attendant to know just when the maximum has been reached where he has several batteries of different ages charging at the same time. I very much doubt that the degree of accuracy in charging required for the best life of plates is obtained where this method of charging is practiced.

"The charging of batteries by the ampere hour meter has been tried by a number of garages with good results. By this method, a certain percentage more charge is given than the discharge indicated on the dial of the ampere hour meter. The

hand of the meter is pushed forward in the direction of discharge until the meter reads the amount of charge to be put into the battery (10 to 15 per cent. more charge than discharge, as conditions require). The charge is then put on and the hand travels toward zero, where there is a contact which automatically opens the charging circuit when the required ampere hours have been put into the battery.

"This method of charging requires much less attention at the switchboard and is more accurate than the voltage method of charging. As a check on both the voltage and ampere hours' meter methods of charging, a pilot cell reading of specific gravity at the end of charge should be taken each week, and when the specific gravity falls below the maximum an extended overcharge at a low rate should be given to restore the electrolyte to its maximum gravity.

"The water used for filling the cells should be distilled unless it is found by examination that the water from the faucet contains no injurious impurities. When water from iron pipes is used it should be allowed to run a few minutes before using, to prevent any iron scale that may be in the pipes from getting into the battery.

"When filling the battery care should be used to avoid putting more water in each cell than is required to cover the plates about one-half of an inch. This advice should be closely followed, as it has been found in many instances that excessive slopping has been due to overfilling, with the result that wooden trays and packing become soaked with acid and therefore good conductors, causing burning of jars.

"The cleaning and keeping clean of the tops of the cells is very important, as the dust from the street and material that is hauled in the vehicle is sometimes found in considerable quantity on the top of the battery which, becoming saturated with acid, is another cause of burning jars. The battery compartment of the vehicle should be arranged to prevent this collection of dirt as much as possible.

"The inspection of the individual cell of a battery for the purpose of determining their state of charge consists in taking voltage, specific gravity and temperature readings at regular intervals over the entire battery. The frequency with which such inspections should be made is a matter of opinion and does not affect the life of the plates materially as long as the proper methods of operation are followed. I have known of batteries that have been in service in vehicles that have not been inspected as to their state of charge for a period of four months and were found to be up to full capacity when tested. The life obtained from these plates was as good as the life obtained from plates where the voltage and gravity readings were taken weekly. A simpler and just as effective method of inspection is to observe the gas-

sing of each cell at the end of charge once a week.

"The pilot cell readings are an indication of the conditions of the whole battery, and any cell that is in a sufficiently low condition to require special attention can be readily detected by slight gassing or the absence of gas at the end of charge. When the pilot cell indicates that the battery needs an overcharge to bring the specific gravity to a maximum, then voltage, specific gravity, and temperature readings should be taken on all the cells.

"The kind of care used in operating the vehicle has much to do with the results obtained from the battery. The route traveled by the vehicle should not be such as to require a complete discharge daily and an over-discharge should be a rare occurrence. The speed should be cut down going over rough roads to prevent the breaking of rubber jars. There is a considerable reduction in the cost per mile for running vehicles where the driver is held responsible for the condition of his vehicle and severely disciplined for carelessness in its operation."

### Rambler Wisdom in Magazine Form.

Rambler dealers, representing every section of the country, have co-operated with the Thomas B. Jeffery Co., Kenosha, Wis., in the production of a remarkable number of the Rambler Magazine, which just has been issued and which tells an interesting story of the success of the big Rambler organization, how the producing and selling ends are managed, why Rambler dealers have succeeded and including the complete announcement of the Rambler for 1911. It follows that it is of interest and instruction to the trade generally.

This number is of standard magazine size and is replete with attractive illustrations of dealers' headquarters in all the principal cities, factory departments, showing the extent and equipment of the Rambler plant and a narrative of the growth of the Rambler organization, showing how—with nearly forty years of manufacturing experience behind it and guided by a stable policy—it has become one of the great manufacturing and selling organizations in the world.

### Effect of a Bent Torsion Rod.

If the torsion rod is observed to be bent it should be removed from the chassis and restored to its proper alignment without delay. The effect of its being disaligned is to cause the universal joints of the propeller shaft to work at an unnecessary angle, thus absorbing extra power from the motor. Furthermore, there is some chance that the accident which resulted in the bending of the rod may have weakened it so that it is in more or less danger of giving way. If it is carefully inspected such an accident, which might result very seriously, can be avoided.

Volume XXV.

New York, U. S. A., Thursday, November 10, 1910.

No. 6

## CLIFTON AGAIN HEADS A. L. A. M.

**All Other Officials Also Unanimously Re-Elected—Conditions Discussed and a Conservative Policy Advised.**

Charles Clifton, of the Pierce-Arrow Motor Car Co., Buffalo, N. Y., for the seventh time has succeeded himself as president of the Association of Licensed Automobile Manufacturers. He was unanimously returned to the office at the annual election of the organization which occurred at its headquarters in New York on Thursday last, 3d inst.

All other of Mr. Clifton's colleagues also were unanimously re-elected, as follows: Vice-president, S. T. Davis, Jr., Locomobile Co. of America; secretary, L. H. Kittredge, Peerless Motor Car Co.; treasurer, George Pope, Pope Mfg. Co.; general manager, Alfred Reeves. Executive committee: Charles Clifton, Pierce-Arrow Motor Car Co.; S. T. Davis, Jr., Locomobile Co. of America; Thos. Henderson, Winton Motor Carriage Co.; Hugh Chalmers, Chalmers Motor Co.; Herbert Lloyd, Columbia Motor Car Co.

In addition to re-electing this board of managers, the association passed a vote of appreciation and endorsement of their guidance and services.

As is usual at annual meetings, most of the proceedings were of a routine nature, about the only thing that departed from the usual being the adoption of a resolution which may result in permitting the Licensed Dealers' Association of New York to become affiliated with the A. L. A. M. itself in the promotion of the national show in Madison Square Garden and thus participate, in a modest way at least, in the profits that accrue. The matter will be decided by the board of managers. Because of foreknowledge that something of the sort would be done, reports, manifestly absurd, had appeared in print that the dealers' association would take over the management of the Garden show.

During the course of Thursday's meeting there was considerable discussion of trade conditions, which, from reports then rendered, appear to be even healthier than at this time last year. It stated that these reports show that the increase in the automobile business during the past twelve months was almost 100 per cent., a record that has no comparison in any other line of trade. It was agreed that a conservative policy with increased care in the manufacturing and marketing of cars was the best procedure for the 1911 trade. There are now some 6,500 dealers handling the products of the licensees under the Selden patent.

## Two Importers Make Peace with A.L.A.M.

Two of the 18 importers against whom suits for alleged infringement of the Selden patent were filed in September last have made their peace with the Association of Licensed Automobile Manufacturers. They are the Daimler Import Co., of New York, which handles the Mercedes car, and the Hotchkiss Import Co., of New York, which represents the English car of that name. Both have been granted Selden licenses and been allotted space in the Madison Square Garden show.

## Hall Leaves Lamps to Join Barnes.

Charles M. Hall, secretary and general manager of the C. M. Hall Lamp Co., of Detroit, Mich., has resigned those offices and on January 1st will become the general representative of Claire L. Barnes & Co., of that city, which firm recently was formed to handle Billings & Spencer forgings and Van Wagner dies. Hall, however, will continue to have headquarters in Detroit.

## To Manufacture Motor Cars in Virginia.

The Richmond Iron Works Corporation, a big concern in the Virginia city of that name, which has been producing automobiles in an experimental way, is erecting a special building for their manufacture and purposes going into the business in real earnest. The car will be styled the Virginian.

## "FISHING EXPEDITION" FAILS

**Moto Bloc Cannot Examine Tire Men to Find Cause for Suit Against Them—Lower Court Reversed.**

If Leon D. Kaufmann and the Moto Bloc Import Co., of which he is president, etc., really believe that there exists in the automobile tire industry a conspiracy or combination in restraint of trade, they will have to produce reasons and not suspicions and not use the New York courts for "fishing expeditions." This in effect is the decision of the Supreme Court, Appellate Division, First Division, which just has been rendered in the more or less famous case of the Moto Bloc Import Co. vs Lee W. Bennett and Joseph M. Gilbert.

The Moto Bloc company had been engaged in the sale of tires at cut prices, but one day last summer it discovered that it no longer could obtain tires in the same old way. It laid the blame at the door of the Dealers Protective Association, which had been organized in New York by seven tire manufacturers to correct abuses in the trade and generally to assist the retail trade. Accordingly, the Moto Bloc company, claiming that it had been blacklisted, applied to the court for permission to examine Bennett, the manager of the association, and Gilbert, the manager of the only tire concern involved—the Continental Caoutchouc Co.—which is a New York corporation, to discover whether the Moto Bloc suspicions were correct. The court granted the application, and Bennett and Gilbert through their attorney, S. S. Meyers, as promptly secured a stay and carried the case to the Appellate Division of the Supreme Court, which just has reversed the lower tribunal. Kaufmann, the Moto Bloc president, meanwhile had asked the Department of Justice at Washington to investigate, and periodically the more sensational of the New York newspapers have printed "scare stories" regarding the "automobile tire trust," which seemed to bear Kauf-

mann's easily recognizable thumb marks.

In its application, the Moto Bloc Import Co. declared that it desired to examine Bennett in order that it "may intelligently frame a complaint on which it may base its action for the recovery of damages."

In its decision, against the Moto Bloc company, which is supported by numerous citations, the Appellate Division says:

"It is evident that the applicant's theory is that the combination of manufacturers, their manager and agents, by which it has been deprived of purchasing automobile tires at wholesale prices, was unlawful in that it was in violation of some statute of the State or of the United States, or in violation of its common law rights, and that the parties thereto are liable in damages, each for the acts of the others owing to the agreement in the nature of a conspiracy. It is manifest that the examination is desired in order to enable the applicant to determine whether or not it has a cause of action, and if so, against whom, for if the applicant knows that it has a cause of action and who are liable, then it could have commenced an action by serving a summons and thereafter, if necessary, have obtained an examination of the defendants to enable it to frame its complaint.

"The learned counsel for the appellant contends broadly that an examination of a witness or of a person intended to be a party may be had before action brought for the purpose of enabling the applicant to determine whom to sue and also to enable it to frame a complaint. It has long been the settled rule that an examination of a party or of a witness will not be allowed either in advance of or after action brought for the purpose of discovering whether or not the applicant or the plaintiff has a cause of action. An examination has been allowed in some instances where a cause of action was clearly shown, but the examination was necessary to ascertain who was liable therefor. The rule, however, has been consistently adhered to in this department that an examination will not be allowed for the purpose of discovering who is liable on a cause of action shown to exist in favor of the applicant, nor may a witness who is not an intended party be examined for the purpose of enabling the applicant to frame his complaint. In some instances where an application was made for the examination of an intended party before service of the summons, it clearly appearing that the applicant had a cause of action and that he intended in good faith to prosecute it, the courts have, without discussing the question of power, allowed examinations to enable the applicant to frame the complaint instead of denying the same until the service of the summons. Since, however, an examination will not be permitted for the purpose of enabling the applicant to ascertain whether he has a cause of action

or whom to sue, there is no necessity, whether the courts have power or not, of permitting the examination to enable the applicant to frame his complaint until after the service of the summons, which will indicate that he intends to prosecute the action in good faith and not leave it uncertain as to whether after the examination he will bring or abandon the action. The rule is that examinations are not allowed until necessary, and hence it is that an examination is not allowed until after issue joined unless required to enable the plaintiff to frame his complaint. Moreover, it has been recently held in this department and in the second department on an examination of the provisions of sections 870 to 873 inclusive of the Code of Civil Procedure and their history, that an examination either of a witness or of an intended party in advance of the commencement of an action is only authorized to perpetuate testimony, in which case the circumstances, which render it necessary for the protection of the applicant's rights that the testimony should be perpetuated, must be shown. In the case at bar no facts or circumstances are shown rendering it necessary to perpetuate the testimony sought to be obtained, nor is it claimed that the examination is sought for that purpose. It follows, therefore, that the order should be reversed with \$10 costs and disbursements, and motion to vacate this order granted with \$10 costs."

#### Nebraska Factory Going to Indiana.

Conflicting reports regarding the intentions of the American Automobile Mfg. Co. which was organized several months ago to take over and enlarge the plant of the Jonz Automobile Co., Beatrice, Neb., finally have been straightened out. During last week a deal was closed whereby the Beatrice factory itself will be removed to New Albany, Ind., and the main office established in Louisville, Ky., which is just across the river from New Albany. Louisville capital already is largely interested in the American company. Reports that a branch factory would be located in Kansas City arose from the fact that the Kansas City Real Estate Association had offered inducements to that end and though a site at that point recently was inspected no definite decision has been reached.

#### Patent Company, Too, Retains Old Officials.

Following the annual meeting of the A. L. A. M. on Thursday last, the Association Patents Co., the subsidiary corporation which owns or controls a large number of patents—other than the Selden patent—represented by various members of the license association, held its annual session, at which the chief business was the election of officers for the ensuing year. No changes were made in the official slate, however, the following officials being unanimously returned to office: President,

Charles Clifton, Pierce-Arrow Motor Car Co.; vice-president, Thos. Henderson, Winton Motor Carriage Co.; secretary and treasurer, Alfred Reeves. Directors: George Pope, Pope Mfg. Co.; I. H. Page, Stevens-Duryea Co.; L. H. Kittredge, Peerless Motor Car Co.; Hugh Chalmers, Chalmers Motor Co.; R. E. Olds, Reo Motor Car Co., and Herman F. Cuffin on patent matters.

#### Klaxon Stops Two More Price Cutters.

Following up its policy of rigidly maintaining the price of its productions, the Lovell-McConnell Mfg. Co., of Newark, N. J., has obtained injunctions against two more concerns that were cutting the price of the Klaxon warning signals, viz.: the Cut-Price Auto Supply Co., of Boston, Mass., and Matthew Strauss, of Buffalo, N. Y. The Klaxon people were put to some pains in running down the Boston offenders, who were doing business in a small way and, it appears, under assumed names. The names of the owners of the business were given as H. Reece and Louis Reece, but in the end it was found that their true names were H. Rothenberg and Louis Rothenberg, and the permanent injunction as finally issued was made out against H. Reece and Louis Reece, alias H. Rothenberg and Louis Rothenberg, doing business under the name the Cut-Price Auto Supply Company.

#### Fire Destroys Hartford Tire Branch.

Fire on Thursday night last, 3d inst., totally destroyed the Hartford Rubber Works Co.'s Philadelphia branch at 1425 Vine street, the large stock of automobile, bicycle and motorcycle tires being entirely ruined; the total loss was about \$75,000. Within 24 hours, however, the Hartford company secured a temporary location at the southwest corner of Juniper and Cherry streets, where with an entirely new stock of Hartford tires and sundries of all kinds business is going on as if nothing had happened.

#### Wagon Makers to Build Motor Trucks.

Mathias, Weber & Co., wagon makers of Dayton, Ohio, are making ready to take up the manufacture of motor trucks. It is not likely, however, that the new vehicle will be on the market for several months.

#### Fire Damages Lubricants Establishment.

The stock and fixtures of the New York & New Jersey Lubricants Co., at 49 Front street, New York, were damaged by fire on Wednesday of last week, 2d inst. The insurance amounted to \$14,500.

#### Clover Leaf Shows Signs of Withering.

John C. Paxson has been appointed receiver for the Clover Leaf Machine & Axle Co., South Bend, Ind., which manufactures automobile axles and parts.

**M. A. M. LINE-UP FOR BOTH SHOWS**

**How the Members Have Indicated Their Preference—Most of Them Will Exhibit the Full Two Weeks.**

Allotment by the Motor and Accessory Manufacturers, Inc., of the space for which they had contracted at the New York and

Chicago national shows, indicates that more members of the organization will "sit out" the full two weeks in both cities than at first appeared probable, the second or "commercial vehicle weeks" having proved more attractive than was thought would be the case. In New York, 146 members of the M. A. M. will exhibit during the first week, January 7-14, and 114 during the following week. In Chicago, 121 will be in evidence

at the first week's show, January 28-February 4, and 97 during the following week when the trucks will replace the pleasure cars. Exactly how the M. A. M. exhibitors have lined up is shown by the following table in which the number 1 indicates those who will exhibit the first week and number 2 those who will exhibit the second week; the figure 0, of course, indicates not exhibiting:

### Car Makers Booked for Palace Show.

That the "independent" show in Grand Central Palace, New York, Dec. 31-Jan. 7, will not lack exhibits of cars, some of them of wide repute, is indicated by the first "show-down" of the promoters, which was made last week. The list of automobile builders who have booked space is as follows:

Abbott Motor Co., Detroit, Mich.; American Motor Truck Co. of Michigan, Detroit, Mich.; Atterbury Motor Car Co., Buffalo, N. Y.; American Motor Truck Co., Lockport, N. Y.; H. H. Babcock Co., Watertown, N. Y.; L. J. Bergdoll Motor Car Co., Philadelphia, Pa.; Carhartt Auto Corp., Detroit, Mich.; C. S. Baeder (Lexington Motor Car Co.), New York, N. Y.; Car Makers' Selling Co., Chicago, Ill.; Chase Motor Truck Co., Syracuse, N. Y.; Chicago Pneumatic Tool Co., Chicago, Ill.; Cortland Motor Wagon Co., Cortland, N. Y.; Clarke-Carter Auto Co., Jackson, Mich.; Columbus Buggy Co., Columbus, O.; Demot Car Sales Co., Detroit, Mich.; F. A. L. Motor Car Co., Chicago, Ill.; F-Z-H Parts Co., Chicago, Ill.; Findlay Motor Co., Findlay, O.; Gramm Motor Car Co., Bowling Green, O.; Harry S. Hought Mfg. Co., New York, N. Y.; Imperial Auto Co., Jackson, Mich.; Johnson Service Co., Milwaukee, Wis.

Kelly Motor Truck Co., Springfield, O.; Krit Motor Car Co., Detroit, Mich.; Lion Motor Car Co., Adrian, Mich.; Metz Co., Waltham, Mass.; Martin Carriage Works, York, Pa.; Michigan Buggy Co., Kalamazoo, Mich.; New Haven Truck & Auto Works, New Haven, Conn.; Albert L. Otto (Saurer Truck), New York, N. Y.; Owosso Motor Co., Owosso, Mich.; Parry Auto Co., Indianapolis, Ind.; W. A. Paterson Co., Flint, Mich.; Penn Motor Car Co., East Liberty, Pa.; Penn-Unit Car Co., Allentown, Pa.; J. M. Quinby & Co. (Isotta), Newark, N. J.; Roder Car Co., Brockton, Mass.; Scioto Auto Car Co., Chillicothe, O.; Spencer, Llaana Brenner Co., New York, N. Y.; Staver Carriage Co., Chicago, Ill.; Warren Motor Car Co., Detroit, Mich.; West Side Garage & Motor Co. (Seitz), New

York, N. Y.; Whiting Motor Car Co., Flint, Mich.

### Dissatisfaction Not Due to the Makers.

Some one in Salt Lake City got the facts somewhat twisted in reporting the result of the suit of Mrs. M. E. Smith of that city, for the recovery of the purchase price paid for a Columbia electric, \$1,650, which when delivered was found to contain an old and worthless tray of batteries. It transpires that the judgment was rendered not against the makers, the Columbia Buggy Co., but against the Salt Lake dealers who sold the car, the Consolidated Wagon & Machine Co., and that the vehicle was returned not to the factory, but to the dealers. It also was brought out that the battery was tampered with after it left the factory in Columbus, Ohio, and sometime after it had reached Salt Lake City, no blame whatever attaching to the manufacturers.

### Bruce Becomes a United States "Energizer."

John M. Bruce, former sales manager for the United Manufacturers, Inc., has been "taken over" by the United States Motor Co. and will fill a somewhat unusual role. He will devote most of his time to the training of salesmen, agents and dealers as to the best methods of selling the cars affiliated with the United States company, making a special study of conditions in each dealer's respective territory, seeking to unravel any existing difficulties and generally to energize the dealer and his salesmen in the selling of cars. He will be attached to the headquarters staff in New York but will spend most of his time "on the road."

### Shiland and Collins are Shifted.

H. E. Shiland has resigned the sales management of the Buick Motor Co., of Flint, Mich., to become general manager of the Marquette Motor Co., of Saginaw, Mich. Both concerns are General Motors' properties. Shiland's place in the Buick establishment has been filled by the appointment of R. H. Collins, former manager of the Buick branch in Kansas City.

### Death Claims Founder of Corbin Industries.

Philip Corbin, president of the American Hardware Corporation and founder of P. & F. Corbin and of the other enterprises bearing that name, including the Corbin Motor Vehicle Corporation, died at his home in New Britain, Conn., on Thursday last, 23d inst. He was 86 years of age. He was one of six brothers, five of whom at different periods were associated with him in his remarkable career, which really dated from the year 1849, when with his brother Frank and Edward Doen, and a combined capital, they formed the firm of Doen, Corbin & Co. in New Britain, Conn., and commenced the manufacture of hardware, brass ox balls constituting their first production. In 1851, the firm became P. & F. Corbin, gradually expanding to its present immensity and throwing out various branches, among them the Corbin Cabinet Lock Co., the Corbin Screw Corporation, and the Corbin Motor Vehicle Co. In 1903 P. & F. Corbin and the Russell & Erwin Mfg. Co., in whose factory Mr. Corbin himself had been employed in his early youth, were taken over by the American Hardware Corp., of which Mr. Corbin became president. He was prominent in nearly all walks of life in his native state and was respected by all who knew him. As a youth he was noted for his great strength and vigor, much of which he retained in his old age, for despite his advanced years he was actively interested and played a real part in the conduct of his enterprises until a few months ago.

### Routine Business at N. A. A. M. Meeting.

Only routine business was transacted at the regular monthly meeting of the National Association of Automobile Manufacturers in New York last week, legislative affairs and show matters—the "independent" show in Grand Central Palace, New York, among them—being the chief topics of discussion. Among other things the transfer of the Willys-Overland Co.'s representation in the association from John N. Willys to George W. Bennett was recorded.

**SEPTEMBER'S GAIN 62 PER CENT.**

**Exports Continue to Bound Upward—  
France and Asia Account for the  
Month's Notable Advances.**

Bearing out the often repeated statement that there ought to be no "season" in automobile exports, the figures for September, 1910, show a decided gain over those of the same month of 1909, the number of exported cars being 592, valued at \$607,258, as against 286 cars, worth \$373,754, an increase of 62 per cent.

Great Britain, which for some time past has regularly increased its purchases, in September, 1910, dropped below the amount taken in the same month of last year, the respective values being \$96,029 and \$105,244, respectively. France, on the other hand, which for many months had decreased its quota, bought more than twice as many cars in September of the current year than in the same period of 1909, the figures being \$46,122 and \$20,132, respectively. "Other Asia and Oceania," which hitherto had only bought small quantities of American cars, increased its purchases by over 1,000 per cent. over those of September, 1909, buying \$105,071 worth as compared with \$9,676. South America registered only a slight decrease, its purchases in September, 1910, totaling \$6,000 less than those in the same period of 1909. Canada, though still the greatest individual buyer, showed only a slight increase as compared with September, 1909, the figures being \$248,232 and \$216,833, respectively.

The figures for the nine months ending September, 1910, still show the general upward tendency, \$8,874,066, as against \$5,481,707. With the sole exception of France every one of the twelve geographical divisions took more than during the same period of last year; in the case of Other Asia and Oceania this increase amounting to nearly 400 per cent. Canada still is the heaviest purchaser with \$4,137,771, with the United Kingdom second, with \$2,383,013, and France third, with \$659,859. The report in detail:

**Steenstrup Finally Tenders Resignation.**

Peter S. Steenstrup has "resigned" the secretaryship of the Motor and Accessory Manufacturers and at last week's meeting of the board of directors the resignation gravely was accepted and entered on the minutes. As a matter of fact, however, L. M. Wainwright some three months ago was elected to succeed Steenstrup, who went to the far West to shoot bears and fish for salmon and who wound up by engaging in the retail trade in Spokane. He thereby automatically forfeited his office in the M. A. M., which was filled by the election of Wainwright. Then, after a long lapse, Steenstrup evidently deemed it advisable to resign.

**Mail Order Man Escapes with \$50 Fine.**

Earl L. Ryno, president and general manager of the Belle Isle Motor Co., Detroit, Mich., who was indicted by a Federal grand jury for fraudulent use of the mails, was allowed to plead nolo contendere (no defense) in the United States District Court in Detroit on Thursday last and was fined \$50. Ryno tried to sell automobiles by mail and the charges against him were due to his failure to deliver the goods to those who had forwarded him money. He was once tried by a jury which disagreed. In March, 1909, Ryno sold his business to the New Belle Isle Motor Co., of Detroit, Mich.

**Record Order for Tire Treads.**

The Elyea-Austell Co., of Atlanta, Ga., has been appointed Southern distributor for the Leather Tire Goods Co.'s Woodworth tire treads, for which, the makers say, an order amounting to \$550,000 has been placed. Part of the order, which undoubtedly is of record size, is for immediate shipment and the remainder for delivery during 1911.

**St. Louis Men Launch Truck Project.**

Charles E. Brooks and Charles and Allen T. Latta, who have organized the Brooks-Latta Auto Co., in St. Louis, Mo., have in view the manufacture of motor trucks. The concern has been incorporated with capital stock of \$150,000.

**FIXING STANDARDS FOR METALS**

**Engineers' Society Makes Progress in that  
Direction—Three Committees Have  
the Work Well in Hand.**

As a result of the meeting in New York last week of the Iron and Steel Division of the Society of Automobile Engineers' standardization committee, the standard form of specimen used in testing automobile materials probably will be changed, and instructions as to the use of the test specimens and testing machines soon will be issued.

The Division took up consideration of the specifications for materials for automobile construction, which had previously been prepared by Henry Souther and distributed to the several hundred of S. A. E. members in the form of advance sheets.

Specifications for recommendations to the society of the following steels and irons were taken up in detail and acted upon: .15 carbon steel, .25 carbon steel, .45 carbon steel, .80 and .95 carbon steel (primarily for springs), .20 carbon 3½ per cent. nickel steel, .30 carbon 3½ per cent. nickel steel, .30 carbon chrome nickel steel, .20 carbon chrome nickel steel, .45 carbon chrome nickel steel, .15 carbon chrome nickel steel, .20 carbon chrome vanadium steel (primarily for case-hardening), .45 carbon chrome vanadium steel, silico-manganese steel, valve metals, steel castings, gray iron castings and malleable iron.

The following points will be considered at the next meeting of this division: Pyrometer and heat control; description and definition of heat treatments, tabulation of physical results of heat treatments.

A standard order of statement of the different elements in the metals will be recommended, something as follows: (1) carbon, (2) manganese, (3) silicon, (4) phosphorus, (5) sulphur, (6) chromium, (7) vanadium. The elements are now given in the forms of various laboratories and mills in many different ways, and standardization will eliminate much confusion and loss of time in trying to determine the composition of these various combinations.

The members of the Iron and Steel Division who were in attendance at last week's meetings were: Howard E. Coffin, president of the society; Henry Souther, chairman of the standards committee; W. P. Barba, Midvale Steel Co.; E. L. French, Crucible Steel Co. of America; M. T. Lothrop, Halcob Steel Co.; Coker F. Clarkson, secretary.

This week two other divisions of the S. A. E. standards committee are holding meetings at the society's office. These divisions are those on aluminum and copper alloys, and on plain, ball and roller bearings.

## A Town Car a Woman Can Crank

**T**HE sole objection to gasoline cars for women's driving has been the difficulty in cranking the engine. Every White Car has a compression release which makes cranking so easy a child can do it, and without danger of back fire. This one feature alone would make the White Coupe distinctive, but it has a door on either side—the driver's seat folds up to make entrance easy from either side and it seats comfortably three or four persons besides the driver.

### The White Coupe

**E**VERYWHERE the White Coupe appears—whether it be the shopping district of our most metropolitan cities, or in the parks, it immediately arrests attention by its beauty—it is an aristocratic, elegant looking car with a snugness all its own. Its equipment is refined—it is electrically lighted and the upholstery and little accessories are all of the finest imported materials. Money cannot buy better—in fact, a woman's wants have been studied and nothing has been omitted that could contribute to her personal comfort.

Let us send you today our booklet on town cars  
which tells a more intimate story of these cars.

### Concerning the Long Stroke Motor.

Just as at various periods since the automobile attained an entity of its own the respective merits of the horizontal and vertical cylinder arrangement, the cooling problem, the relative suitability of two, four and six-cylinder construction and at least three prominent methods of valve arrangement have given rise to almost factional discussions, it is to be expected that for a time the relative merits of the long and short stroke and bore ratios will be discussed with more or less heat. It is not to be questioned that such debates, whether oral or conducted through the medium of the press, are of considerable value to the

industry. They serve to bring out new ideas, increase the popular fund of information in respect to technical matters, and serve to call attention to the real advantage which each of the several systems under discussion may happen to possess. That either the long or the short stroke motor ultimately will be given exclusive prominence in the field of automobile construction by no means is probable. It is far more likely that each will be developed to fit into certain classes of service to the exclusion of the other.

As far as the question of the superiority of the long stroke motor over the short, or the short over the long, is concerned, it is much the same as trying to argue over the respective merits of the human mechanism as found in long-legged men and short-legged men. As a matter of fact, if permitted to choose their own stride and pace and if in normal condition, the performance of both types of the man-engine may be equally efficient, calculated on a basis of heat-energy absorbed and useful work performed. So, in cases of perfectly suitable application, where it is made to work under favorable conditions, the short stroke motor is likely to prove as efficient as the long stroke, taking all things into consideration, and vice versa.

The truth of the matter is that up to this time the industry has not had sufficient leisure to work out a proper method of classification for its motors, nor even to determine in the broadest possible way what are the relative conditions under which each of many types will prove most satisfactory. Incidentally, it may not be generally known that a beginning is now being made in work looking toward a method of classifying engine performance in such a way as to permit the segregation of various types according to the work which they are fitted to perform. One of the sub-divisions of the standards committee of the Society of Automobile Engineers is investigating the subject of motor characteristics. The work in contemplation not only will permit a close study of engine performance with respect to working conditions, but will lead to a direct method for determining what style of construction will best suit certain given service requirements.

In the same connection it is worth while calling attention to the fact that the commonly accepted horsepower formula, that which, in this country bears the stamp of

the Association of Licensed Automobile Manufacturers, fails in the case of the true long-stroke motor. As the formula method of rating has become so general, particularly as it now enters into the automobile laws of several states, it would seem well within the province of the Engineers' Society to undertake a permanent settlement of the problem in whatever way may be practicable.

Now that Barney Oldfield is an outlaw and no longer can race under the auspices of any recognized sports-governing organization, there is left a yawning opportunity for some clean-cut young man with a reputation as an automobile driver. Oldfield filled a peculiar want, as the thousands of dollars of "easy money" which he picked up at state fairs and similar places serves to show. Automobile racing has become almost a fixture at such functions and the promoters are not slow to appreciate the value of "star attractions." The fact that one of them paid Oldfield \$3,000 for an appearance is evidence of the value placed on such attractions. A racing man of the right stripe, who need not stick a cigar in his face or indulge in grandstand plays, and who will not humbug the public with "dirt track" or "square track" or "circular track" records and similar devices, ought to be able to earn a comfortable livelihood and do something to raise the level of even state fair racing.

In addition to favoring a county bond issue, a Georgia good roads meeting last week passed resolutions "specially requesting the Georgia delegation in Congress to intercede with the national government for immediate aid in road-building in Georgia and in the entire Southern States." The resolution suggests that were Federal aid in highway improvement a part of Col. Roosevelt's "New Nationalism," that doctrine might strike responsive chords in men and places that now are hostile or indifferent to it. There is no doubt, as the Motor World many times has remarked, that if but a small part of the immense sums spent by the national government for pulling snags out of remote creeks and bayous were devoted to the improvement of the common roads far more and far greater health, wealth and prosperity would follow in its train and the greatest good for by far the greatest number be achieved.

## IN THE RETAIL WORLD.

Hanf & Martin are building a garage in Baltimore, Md. It is located at 1421 Maryland avenue.

The Shaffer Mfg. Co., of Baltimore, Md., opened its new salesrooms at 408-10 Calvert street on November 2d.

Under the management of N. L. Rush an agency has been opened in the Motor Mart, Boston, Mass., for Kline cars.

Henderson Brothers have begun the erection of a garage in Cambridge, Mass. It is of brick and located between Blake and Hadley streets.

Clyde Stranathan has bought out his partners in the Glenwood Garage, Glenwood, Iowa, and will operate the business alone in the future.

Broken Bow, Neb., now has a garage, the Broken Bow Automobile Co., which has been formed in the little town, having opened its establishment.

The Valparaiso Auto & Garage Co., which recently was organized in the Nebraska town of that name, has opened its garage. Clarence Lynch is the manager.

Work has been started on the new garage for the Ross Motor Co., on Tower avenue, Superior, Wis. The new structure will be 50 x 140 feet, of brick and concrete.

Wm. Richter, who with Claude Simmons operated the Motor Mart Garage in Freeport, Ill., has bought out his partner and will continue the business in his own name.

John Weinknecht has started work on a new garage at 2308 East Fayette street, Baltimore, Md. It will be of brick with concrete flooring, 26 x 40 feet, and will cost \$2,000.

Under the style the Crown Commercial Car Sales Co. a company has been formed in Philadelphia, Pa., to handle Crown commercial cars. Salesrooms have been opened at 32d and Walnut streets.

The three story garage at 5205-07 Delmar avenue, St. Louis, Mo., has just been completed and will be occupied by the Brown Automobile Co. The concern handles Detroit electrics and Peerless cars.

Work just has been completed on the new garage which George Lacey will manage at the corner of Monterey and El Sausal streets, Salinas, Cal. It is two stories high and will be opened this week.

Work has been started on the new garage for Roberts & Son, at Gray and Baldwin streets, Elmira, N. Y. It will be three stories high, 159 x 75 feet, with 20,000 feet of floor space, and will be ready for occupancy by December 1st.

The large building standing at the corner of Third and Connell streets, Wilmington, Del., and known as the Music Hall, has been converted into a garage. It is under the management of Andrew Johnston, and will afford room for 60 cars.

The new garage just completed on North Third street, Harrisburg, Pa., will be occupied by the Rex Auto Repair Co., recently organized in that city. The building is 105 x 210 feet and so constructed that the entire front can be thrown open.

Fiat cars will form the mainstay of a new salesroom and garage which just has been opened at 114 South Olive street, Los Angeles, Cal. Joseph G. Kirchhoff is manager of the company, which does business under the style the Pacific Coast Motor Car Co.

H. F. Abbott, of Grand Rapids, has formed the Regal Motor Sales Co. to handle Regal cars in that Michigan city. Associated with him in the enterprise are several prominent merchants of Grand Rapids.

W. H. and M. L. Rose, formerly owners of the St. Clair Auto Co., have, under the name Rose Brothers, opened a garage and salesroom in Greenburg, Pa. They will handle Hudson, Selden and Locomobile cars.

D. W. Reinohl, formerly identified with the Hoover suction cleaner, has organized the Empire Motor Car Co., for the sale of Empire cars in northern Ohio. His partner, G. C. Deffresne, who was connected with the Paris branch of the Mercedes factory, will have charge of the mechanical end of the enterprise. The garage and salesrooms are located at 6506 Euclid avenue, Cleveland, Ohio.

Guy Stutzman, formerly with the American Simplex Auto Co., of Mishawaka, Wis., has gone into business himself and opened a garage next to the Mishawaka hotel. He will do business under the style the Star Garage, and will handle Oakland cars. His quarters are 50 x 100 feet, of brick and concrete, and in addition boast of a machine shop 32 x 40 feet.

The big Hippodrome, of Chattanooga, Tenn., which was used as dance hall, roller skating rink and the like, has been remodeled and will be used hereafter as a garage and salesrooms for several automobile concerns. So far headquarters for the Mitchell Automobile Co., which handles Parry cars, and for Duffy & Bell have been opened in the structure. The latter handle accessories and do general repair work.

## Recent Losses by Fire.

Philadelphia, Pa. — Hartford Rubber Works Co., salesroom and stock destroyed; loss, \$75,000.

Quanah, Tex. — Panhandle Garage & Sales Co., building destroyed; loss, \$15,000.

Newark, N. J. — H. W. Johns-Manville Co.'s asbestos storage house burned; loss, \$10,000.

San Francisco, Cal. — Pullman Automobile Garage and thirty-five cars totally destroyed; loss, \$100,000.

Boston, Mass. — Garage at corner of Monument avenue and Harvard street and two cars destroyed; loss, estimated at \$10,000.

## COMING EVENTS

November 7-11, Chicago, Ill. — Reliability contest under auspices of Chicago Motor Club.

November 10-13, San Antonio, Tex. — San Antonio Automobile Club's races at International Fair grounds.

November 11, Savannah, Ga. — Savannah Automobile Club's light-car road race.

November 12, Savannah, Ga. — International road race for the Grand Prize of the Automobile Club of America.

November 12, Yonkers, N. Y. — Mount Vernon Automobile Club's racemeet at Empire track.

November 22-26, Lake Charles, La. — Louisiana Fair Association's race meet.

November 24, Redlands, Cal. — Mile High Hill Climb Association's contest.

November 24, Santa Monica, Cal. — Southern California Automobile Dealers' Association's annual road race; 200 miles.

November 24, New Orleans, La. — Race-meet under auspices of New Orleans Automobile Club.

November 26-27, Los Angeles, Cal. — Motordrome races.

December 3-18, Paris, France — French Automobile Manufacturers' Salon in Grand Palais.

December 25-26, Los Angeles, Cal. — Twenty-four hours race at Motordrome.

December 31-January 7, New York City — "Independent" automobile show in Grand Central Palace.

January 2-7, New York City — Importers' automobile show in Hotel Astor.

January 15-21, Detroit, Mich. — Detroit Automobile Dealers' Association's annual show in Wayne Pavilion.

January 7-14, New York City — Association of Licensed Automobile Manufacturers eleventh annual show in Madison Square Garden. Pleasure cars and accessories.

January 16-21, New York City — Association of Licensed Automobile Manufacturers eleventh annual show in Madison Square Garden. Second week devoted to commercial vehicles.

January 16-22, Detroit, Mich. — Detroit Automobile Dealers' Association's annual show in Wayne Pavilion.

January 28-February 4, Chicago, Ill. — National Association of Automobile Manufacturers' tenth annual national show in Coliseum. Pleasure cars and accessories only.

February 6-11, Chicago, Ill. — National Association of Automobile Manufacturers' tenth national show in Coliseum. Second week devoted to pleasure and commercial cars, motorcycles and accessories.

### THREE DAYS' SPORT AT ATLANTA

Dawson and Burman the Biggest Winners,  
Though Horan Takes Fattest Purse—  
Hard Luck Played Its Part.

There was some bully racing on the big two-miles circular track or speedway at Atlanta, Ga., on Thursday and Friday last, 3d and 4th inst., and again on Monday, 7th. The three days meeting under the auspices of the Atlanta Automobile Association had been well organized and well heralded,

trophy at his mercy when with but two of the 100 miles to go rear axle trouble forced him to stop long enough to lose his lead. On the 7th, Dawson was prominent in the 250 miles Grand Prize race and was leading many men in far more powerful cars when a contrary carburetter put him out.

When Dawson was forced to stop in the Coca Cola race on the first day, Frank Gelnaw in a Fal was enabled to win; he covered the 100 miles in 1:26:17.62. Dawson in capturing the Atlanta trophy on the 4th completed the 200 miles in 2:51:12.73. On Monday, after Dawson and nearly every

but the shouting when with but two miles to go, he was forced to stop at the repair pits because of rear axle trouble. He then was eight miles ahead of his nearest rival and though he worked frantically to repair the damage, he could not work fast enough and Gelnaw (Fal) and Knight (Westcott) passed him before he got going again, the finish being in the order named. Louis Disbrow (Pope-Hartford) was fourth and Pierce (Fal) fifth. The real fight was between Gelnaw and Knight. For nearly the entire distance they see-sawed in second position, but a few yards separating them,

1—GELNAW AND KNIGHT BATTLING FOR COCA COLA TROPHY  
3—THE BLEACHERS DURING THE GRAND PRIZE RACE

2—BURMAN (No. 40) REGAINING LOST GROUND IN GRAND PRIZE RACE  
4—AN INTERESTING MOMENT IN THE RACE FOR THE ATLANTA TROPHY

plump purses had been offered and racing stars of the first magnitude had been attracted, but the crowd failed to put in an appearance. The bleachers were quite thickly peopled, but the big grandstand was never in danger of being congested and on two of the three days, the grandstandees while numbering a couple of thousands or more looked almost lonesome in the vast space. The Atlanta stands had been constructed for 50,000 and not a mere 2,000.

Joe Dawson, the Marmon star and the sensation of the Vanderbilt cup race, really was the "hero" of the meeting. He and Bob Burman, the Marquette-Buick daredevil, each won four races, but Dawson figured more prominently in the "quality events." He captured the 200 miles Atlanta trophy on the second day and he was winning the feature events on each of the other days when the demon hard luck overtook him. On the 3d he had the Coca Cola

one in the race had suffered tire or other trouble, Joe Horan, in a Lozier, captured the Grand Prize, completing the 250 miles in 3:26:15.1. These three races constituted the cream of the meet and so far outclassed the others in point of interest and otherwise that the latter appeared almost like skim milk. While track records were shattered, only two records will get into the books—one made by F. A. Witt (E-M-F), who in the 12 miles stock chassis race on the 3d, broke the record for the 161-230 cubic inch class, his time being 11:05.33, and the other the speedway record for 250 miles created by Horan in the Grand Prize race.

The Coca Cola trophy race on the 3d was limited to the 301-451 class, nine contenders started, but from the crack of the gun until the 98th mile it was all Dawson. That Marmon pilot took the lead and on every lap drew further ahead. None of the others could live with him, and it all seemed over

but on the last lap Gelnaw found an extra link and letting it out, he won by about 100 yards.

Previous to the start of the Coca Cola race an impressive ceremony occurred. After the contenders had lined up it was announced that for 15 minutes not a car would move out of respect to the memory of Al Livingston, the National driver, who was killed the day previous while practicing on the track. The band played a solemn tune, all hats were removed and during the 15 minutes almost absolute quiet prevailed. Because of Livingston's death, the other National entries, of course, had been withdrawn.

Although Dawson's hard luck lost him the Coca Cola trophy, he accounted for the 10 miles, 231-300 class, in hollow style. He simply ran away from the others, Heine-mann, one of Dawson's team mates, finished a poor second; the other four contenders

were nowhere. Ray Harroun, another of the Marmon stars, similarly accounted for the 20 miles free-for-all. This gave promise of being a good race until on the third mile a flat tire put out Burman (Marquette-Buick) and later a skipping engine caused Caleb Bragg (Fiat), who was making his first appearance as a "pro," to quit. Thereafter Harroun was never in danger and simply "put it all over" Joe Matson (Simplex) and Mulford (Lozier). He won by half

tire, but in the next lap Dawson also had tire trouble and Mulford regained the lead. On the 140th mile, the Marmon man again shed a tire, but made a swift change and when Mulford once more changed a tire, he regained his lost ground and in the 194th mile he went ahead and nothing that Mulford and his more powerful car could do could take the lead from him. He beat Mulford by four seconds in 2:51:12.73. There were 11 starters, but all the others were

handicap of 150 seconds, Adams (McFarlan) 120 seconds, was second and Harding (Stoddard-Dayton) scratch, third. Keplar's time was 7:22.45.

Monday's program was to have been decided on Saturday, but rain required that it be carried over. Three events were on the card, but only the Grand Prize 250 miles race was run. In addition to the trophy, victory carried with it a purse of \$3,000. Sixteen contestants started and, as so often is the case in long races, luck played a large part in the result. Early in the race it seemed as if Marmons would finish one, two, but first Dawson went down and out with a flooded carburettor on the 84th mile, and the same misfortune, plus a cracked cylinder, overtook Harroun on the 180th mile, after he had led from the fourth to the 120th mile; he then lost his advantage, but, driving like a demon, he was again in front at the 160th mile. Joe Horan (Lozier), the ultimate winner, drove a consistent race, alternating between third and fourth place most of the time; when Harroun was forced to quit he assumed the lead and was never headed, finishing the 250 miles in 3:26:15.10, thereby creating a new speedway record, since none existed for that distance. With Dawson and Harroun out, Burman (Marquette-Buick) must have won, for he had the speed, but stupid work in making tire changes at the repair pits cost him the victory. Burman made nine changes and at no time did the repair crew distinguish itself by quick work. The help-

GENERAL VIEW FROM TOP OF THE GRANDSTAND

a mile in 15:20:77. Burman, however, took the 10 miles Class D free-for-all in easy fashion. He stalled his motor in starting, but once under way he quickly overhauled Bragg (Fiat), Basle (Pope-Hartford) and Rutherford (Stearns) and Matson (Simplex) and won with lots to spare in 7:42:58. The others finished as named. Bragg came into his own and gathered his first pot of money in the mile time trials, which he won by covering the distance in 41:12. Mulford and Horan, both in Loziers, finished one, two in the 20 miles 451-600 class. Beardsley (Simplex) was the only other starter. Mulford's time was 16:13:02. From the competitive standpoint, the best race of the day was the 12 miles stock chassis 161-230 class which Witt (E-M-F) won in record time. He and Montague Roberts (Abbott-Detroit) remained within hailing distance until the last lap when Witt widened the gap to about 100 yards.

The racing on the second day, November 4th, was more interesting than that of the previous day. It opened with another victory for Witt (E-M-F) in the ten mile 161-230 class and ended with Dawson's triumph in the 200 miles for the Atlanta trophy, which latter was of course the feature event. Tire trouble served to add to the interest. The fight was between Dawson and Mulford. Matson (Simplex) led for the first 10 miles, when Mulford went ahead, followed by Horan and Dawson in that order, the Marmon man apparently being content to dog Mulford, and for 52 miles the order was Mulford, Horan, Dawson; the latter then passed Horan and until the 120th mile trailed Mulford, who soon after threw a

beaten off. Horan, the third man, was six miles behind and Gelnaw (Fal), the fourth one, 18 miles to the bad. Hughes (Fal), Matson (Simplex), and Keplar (McFarlan) were the other survivors.

Dawson also placed both the 12 miles

SCENE ON "GARAGE STREET" INSIDE THE PADDOCK

231-300 class and the 14 miles 301-450 class to his credit, in the latter beating Harroun, his team mate, and Basle (Pope-Hartford) after a running fight which proved the most exciting of the meet, the three men changing positions several times and finishing less than 30 yards apart. Burman won two events, the 10 miles and the 20 miles for Class D, in both of which Bragg (Fiat) and Harding (Stoddard-Dayton) were the runners-up.

The 10 miles handicap, Class D, went to Stanley Keplar (McFarlan) who had a

ers' fingers seemed to be all thumbs, and to make matters worse they twice made misfits. Burman, however, never despaired. He drove like mad, taking desperate chances and at the end was second to Horan and only 75 seconds behind. Mulford, Horan's team mate, broke a valve on the eighth mile and was 30 miles behind the leaders before a repair was effected and he was able to again get into the running. He nevertheless finished fifth. Matson and Beardsley, in Simplexes, finished third and fourth. Fann, an Atlanta driver who piloted

a McFarlan car, did notable work. Although hopelessly outclassed he stuck to his work and ran like a clock; he made no change of tires and stopped but once for oil and fuel. He finished sixth. A Halladay, a Westcott and a Firestone-Columbus were still running when the race was stopped. Disbrow's Pope-Hartford was eliminated by engine trouble early in the race, and his team mate, Basle, was put out soon after by a cracked cylinder. Church (Simplex) and Stoddard (Fiat) suffered steering gear trouble, which sent them flying through the fence, but fortunate without serious injury to themselves. The summaries:

#### Thursday, November 3d.

One hundred miles—Class B, 301 to 450 inches, for Coca Cola trophy and \$500.—Won by Frank Gelnaw, F. A. L.; second, Harry Knight, Wescott; third, Joe Dawson, Marmon. Time, 1:26:17.62.

One mile time trials.—Won by C. S. Bragg, Fiat, time, 41:12; second, Bob Burman, Buick, time, 42:95; third, Montague Roberts, Abbott-Detroit, time, 55:62.

Ten mile stock chassis, 231 to 300 inches.—Won by Dawson, Marmon; second, Heineman, Marmon; third, Gelnaw, F. A. L. Time, 8:34.70.

Twenty miles free-for-all—Won by Ray Harroun, Marmon; second, Joe Watson, Simplex; third, Ralph Mulford, Lozier. Time, 15:20.77.

Twelve mile stock chassis, 161 to 230 inches.—Won by F. A. Witt, E. M. F.; second, Montague Roberts, Abbott-Detroit; third, Mortimer Roberts, Abbott-Detroit. Time, 11:05.33.

Ten mile free-for-all.—Won by Burman, Marquette-Buick; second, Watson, Simplex; third, Bragg, Fiat. Time, 7:42.58.

Twenty mile stock chassis, 451 to 600 inches.—Won by Mulford, Lozier; second, Joe Horan, Lozier; third, Ralph Beardsley, Simplex. Time, 16:13.02.

#### Friday, November 4.

Ten mile stock chassis, Class B, division 2, 161 to 230 inches.—Won by Witt, E. M. F.; second, Montague Roberts, Abbott-Detroit; third, K. T. McKinstry, Firestone-Columbus. Time, 9:12.66.

Ten mile free-for-all, Class D.—Won by Burman, Marquette-Buick; second, Bragg, Fiat; third, Hugh Harding, Stoddard-Dayton. Time, 7:23.54.

Twelve mile, stock chassis, Class B, division 3, 231 to 300 inches.—Won by Dawson, Marmon; second, Heineman, Marmon; third, Hugh Hughes, F. A. L. Time, 10:15.48.

Twenty mile free-for-all, Class D.—Won by Burman, Marquette-Buick; second, Bragg, Fiat; third, Harding, Stoddard-Dayton. Time, 15:18.25.

Fourteen mile stock chassis, Class B, division 4, 301 to 450 inches.—Won by Dawson, Marmon; second, Harroun, Marmon;

third, Charles Basle, Pope-Hartford. Time, 11:30.86.

Ten mile free-for-all, Class D, amateur.—Won by William Stoddard, Fiat; second, Bob Heitemeyer, Simplex; third, Jack Ruthenford, Stearns. Time, 7:46.60.

Ten mile free-for-all, Class D, handicap.—Won by Stanley Kepler, McFarlan; second, Burt Adams, McFarlan; third, Harding, Stoddard-Dayton; fourth, Basle, Pope-Hartford; fifth, Harry Cohen, E. M. F. Time, 7:22.45.

Two hundred mile stock chassis, Class B, division 5, 451 to 600 inches.—Won by Dawson, Marmon; second, Mulford, Lozier; third, Horan, Lozier; fourth, Gelnaw, F. A. L.; fifth, Hughes, F. A. L. Time, 2:51:12.73.

#### Monday, November 7.

Two hundred and fifty miles free-for-all, Class D.—Won by Horan, Lozier; second, Burman, Marquette-Buick; third, Matson, Simplex; fourth, Beardsley, Simplex; fifth, Mulford, Lozier; sixth, Fann, McFarlan. Time, 3:26:15.10.

#### Herrick Leads Race Across Desert.

Maintaining an average of nearly thirty miles an hour over roads as trying as have ever been selected for an automobile race, Harvey Herrick, driving a Kissel car, won the third annual desert race from Los Angeles, Cal., to Phoenix, Ariz., which was held under the auspices of the Maricopa Automobile Club on Saturday-Monday, November 5th and 7th. The route which is fully 480 miles long, lies across the worst part of the Arizona-South California desert, and this year had been rendered particularly difficult by a heavy rainfall on November 4th. Considering the fact that the cars had to run a great part of the way on low gear; had to run through sand more than a foot deep; had to cross trackless desert, charging through sage brush, fording creeks and rivers, the running time, 15 hours 44 minutes, of the winner is remarkable. Second place in the long grind went to Ralph Hamlin, in a Franklin, time, 16:16½, while Bert Dingley, in a Pope-Hartford accounted for third money, time 17:11. The winner received a handsome trophy and \$1,300 cash; second place brought a cash award of \$550, while the third man earned \$250. Last year the race was won by Nikrent in a Buick, in 19:14:07.

Besides the winners, eleven other cars lined up for the start as follows:

Abbott-Detroit, E. Speizel; Apperson, Harris Hanshue; Durocar, Charles Fuller Gates, W. M. Varney; Ford, Charles Harris; Knox, Joe Nikrent, Louis Nikrent; Maxwell, Clarence Smith; Mercer, C. H. Bigelow; Ohio, Ross Henwood; Parry, W. Horrine; Rambler, Wm. Sheriff; Velie, H. Stickney.

The cars were ferried across the Colorado river and remained parked in the Ehrenberg control on the east side of the river from the time of their arrival until Mon-

day morning, November 7th, being then checked out five minutes apart, in the same order as at the start.

#### Printer's Error Arouses Kansas City.

A missing comma has been known to render invalid a law, to upset a will and to cause Supreme Court sentences to be reversed by the Appellate Division, so it is not surprising that a mere printer's error has cost the automobile owners of Kansas City, Mo., a few thousand dollars this year. In the revised tax statutes for this year the license fee for automobiles is given as \$10, whereas in the preceding year it was but \$5. Injunction proceedings have been started by the Kansas City Automobile Club to restrain the city license inspector from continuing to charge \$10 per license, as he has been doing for the past few weeks. The mistake is solely a printer's error, the original wording of the ordinance distinctly stating \$5 as the fee; the license inspector, however, maintains that the provisions of the ordinance as they appear in the charter are his guide, and that until he is directed otherwise he must continue to charge \$10. The only way out of the quandary is for the council to repeal the clause as it stands and to substitute the \$5 clause.

#### Detroit's Two Motor Clubs Amalgamated.

The Wolverine Motor Club, which was formed in Detroit, Mich., but a few months ago, has swallowed the older Detroit Motor Club. The swallowing process was a friendly sort and came of mutual belief that one big club was better than two smaller ones. To further the amalgamation, Joseph S. Stringham, president of the D. M. C., and the other officials of that organization, voluntarily "abdicated" in favor of H. J. Porter, head of the Wolverine club, and his fellow officers. It is possible that a new name may be adopted, but for the present, the title Wolverine will be retained.

#### Oldfield as Valuable as Six Bryans.

The comparative value of State Fair attractions has been disclosed by the publication of the financial statement of the recent State Fair in Springfield, Ill. It shows that the Wright brothers received \$5,000 for the aeroplane flights, and Barney Oldfield \$3,000 for his automobile stunts, while William Jennings Bryan, perpetual presidential candidate, was paid but \$500 for exhibiting himself and making his voice heard.

#### Jury Declares Accident was Assault.

Although the victims of his carelessness in driving an automobile were not very seriously injured, W. Gordon Dyer, one of the wealthiest men of Norristown, Pa., was last week found guilty of "aggravated assault and battery" and sentenced to nine months' imprisonment and a fine of \$250. He ran into a carriage in which were seated Walter Smith and his wife, and upset it.

## CHICAGOANS TESTING ENDURANCE

**Twenty-Nine Starters in 1,000 Miles Undertaking—Three Clean Scores Spoiled on the Very First Day.**

Twenty-nine hardy "tourists" are tasting the joys of near-winter "touring" under the stiff restrictions set down in the American Automobile Association's book of rules under Grade 1, and which are being applied on a zig-zag route of about a thousand miles laid out in the beautiful state of Illinois. The affair is styled the 1,000 miles endurance run of the Chicago Motor Club, and presents the culmination of many weeks of careful advance work and persistent path-finding. The contest started from Chicago on Monday last, 7th inst., Moline being the first night's stopping place. The fifth day, Friday, will see such of the contestants as have been able to survive the weather back in Chicago. The roads that the drivers feared would be treacherous after the recent rains, were found, on the first day of the trip, hard and dusty, so that the remainder also are thought to be in good condition the whole distance, or nearly so.

As in the Glidden tour of this year, which was administered on the same plan, the drivers are barely allowed to touch their cars without penalization. Penalties are inflicted on the point basis for practically all adjustments or replacements saving only those relating to tires. A technical examination of the surviving machines will be held after the run and suitable additions made to the road penalizations, the lowest demerits serving to determine the winners in the two major classes.

The two classes in question are those made up of standard touring cars that are competing for the Stewart Speedometer trophy, and the roadsters and runabouts that are in line for the Van Sicklen cup. Three other trophies have been provided to add to the interest of the run, however. They are the Chicago Motor Club trophy, a team prize, to be awarded to the team of two or more cars of the same make having the best aggregate score; the Standard Oil cup, which will be awarded to the car showing the least fuel consumption for the entire trip; and the Branstetter tire trophy.

The latter is an entire novelty in this branch of sport and likely to bring out some very interesting facts concerning tire performance. Although time lost in tire repairs, and the nature of such work will not figure in the results of the main contest, they will be observed and recorded in the regular way for determining the tire manufacturer winning this trophy. Penalties will be inflicted on the basis of one point per minute per man for each tire stop and the winner will be determined by computing the average penalizations per tire of

each make entered. At least eight tires of a single make must be entered for the manufacturer to qualify for the prize, although makers having less than eight tires in the race may have the benefit of scoring in the regular way. At least 50 per cent. of the competing tires must be carried on rear wheels. Where tires are covered by protectors of a different make than that of the tire, they are ineligible, although their penalties will be recorded. No restrictions are placed upon types of tread, but the sizes must not be greater than those regularly fitted to the same cars.

Of the contenders who left the Van Dyke commercial garage, 2441 Cottage Grove avenue, at 6 o'clock on Monday morning, those in competition for the Stewart trophy were as follows:

George D. Brown, Abbott-Detroit; Don Watson, Haynes; J. C. Emery, Cunningham; R. J. Faas, Halladay; L. Williams, Haynes; George Padley, Henry; George McKercher, Imperial; Fred Cassell, Glide; A. M. Robbins, Abbott-Detroit; Walter Donnelly, Cino.

Those who entered the runabout and roadster class for the Van Sicklen trophy were:

C. F. Van Sicklen and C. S. Pope, Fal; W. E. F. Nutling, Midland; H. E. Halbert, Grout; L. B. Randall, Hupmobile; C. H. Van Dervoort, Moline; W. M. Parker, Lion; J. A. Wickes, Moline; W. Jones, Case; E. T. Wells, Imperial; J. H. Quinlan, Speedwell; C. Aument, Halladay; G. Monckmier, Staver; T. Duis, Staver; Lewis Strang, Case; H. A. Habernicht, Krit; Harvey Lincoln, Brush; L. Wagner, Haynes; E. A. Hearne, Hupmobile; E. G. Salisbury, Moline.

At the very outset "that old 'stock car' rule" came into play. Its administration resulted in the substitution of a 1910 Speedwell for the new model that had been entered; the reason for the substitution being that the manufacturers had neglected to file with the contest board of the A. A. A. the necessary certificate of specifications.

The roads proving far better than had been anticipated the entire parade was able to reach Rockford, the noon stop, ahead of its schedule, and Moline, the wind-up of the 193 miles run for the day, long before it had been expected. And it may be stated parenthetically that there were no arrests for breaking the speed limits, such restrictions apparently being swept aside for the nonce.

It does not follow, though, that all of the cars arrived trouble-free. Three of them, as a matter of fact, were penalized before the technical committee went to bed, and several others received slight injuries that probably will count against them when the final day of reckoning comes late in the week. Of the three that suffered early penalization, the Case (formerly Pierce-Racine), driven by Lewis Strang, was the most unfortunate. It lost 50 points for work done on the magneto. The Ab-

bott-Detroit, driven by G. D. Brown, was penalized three points for adjustments to a push-rod, while Leon Randall's Hupmobile lost one point in consequence of a carburettor adjustment. The Case and Hupmobile are in the Van Sicklen trophy class and the Abbott is a contender for the Stewart trophy.

In addition to these sufferers, the Glide, in the touring class, broke a spring, while the little Krit runabout got mixed up with a skittish horse and came off with a bent fender. Whether the car will be penalized much or little will be determined when it is discovered whether the Krit or the "critter" was to blame for the encounter. In addition to these incidents, the Speedwell car in which Referee Beecroft was riding had so much tire trouble that he was forced to quit it in favor of a Thomas six. This machine, by the way, is the car which is minus some of its vitals and which is making an enforced "high-gear" run, having been sent out from the factory for that purpose, and with the intermediate and low speed gears removed from the gearbox.

Tuesday's run was to Quincy, 167 miles, and the shortest run of the tour. The third day's journey lay between Quincy and Peoria, a distance of 205.5 miles, with the noon control at Springfield. The fourth day the tour will cover 215.9 miles between Peoria and Champaign, with 237.3 miles for the final day's run from Champaign to Chicago.

### Hupmobile Globe-Girdlers On Their Way.

To the tune of what was called the biggest automobile demonstration since the start of the Glidden tour of two years ago, the Hupp "expo-t expedition," which aims to extend a practical demonstration of Hupmobile efficiency clear around the world, and incidentally to place agencies, left Detroit on Thursday last, 3d inst. The expedition carried the best wishes of Mayor Breitmeyer and also a silk flag presented by Detroit's chief executive to be carried around the globe. The globe-girdling party, consisting of Joseph R. Drake, Thomas M. Hanlow and Tom Jones, representatives of the Hupp Motor Car Co., was escorted as far as Chicago by a guard of honor made up of 42 Hupmobile dealers from Wisconsin, Illinois and Indiana, some of whom covered as much as 1,000 miles in the journey to and from their homes. Chicago was reached at noon Sunday, the journey being continued the following day in company with the contestants on the Chicago Automobile Club's endurance run. The expedition is now well out in central Iowa and headed toward Denver. Thereafter the route will extend through Utah, Nevada and the famous Death Valley, to California. Honolulu, the Fiji islands and New Zealand will then be visited in order before Australia is reached, and the homeward journey begun on the other side of the world.

## FIFTEEN TO TRY FOR GRAND PRIZE

**Savannah Again Astir for Saturday's Big Race, Once a Spite Affair—Preparations Thorough and Complete.**

Friday and Saturday, 11th and 12th inst., will be Savannah's great days. In a measure their glorification also will extend to the entire State of Georgia as well, and hopes are entertained locally that large bodies of

and the circumstance that it will be contested over the Savannah course is almost as much the result of accident as was the fact that the race was first run and won over the same highways two years ago. At that time, as may, or may not, be recalled, the A. C. A. was seeking to suppress the American Automobile Association, which had had the temerity to assert its right to control all forms of automobile contests in this country. The result of the broil was that the Vanderbilt Cup race for the first time

This year, as everyone knows, it had been planned to run the Grand Prize race over the Long Island Motor Parkway course, shortly after the Vanderbilt contest. But popular sentiment, under the apt but misapplied guidance of a few eager press agents, made it appear that the holding of the race in the vicinity of New York would be neither an easy nor a pleasant undertaking. It was almost decided to abandon the affair when a faint and distant cry, "We want the automobile race" was

VIEWES OF THE GRAND PRIZE COURSE, E-M-F CAR IN FOREGROUND

1—DANGEROUS TURN INTO HOMESTRETCH, 2—ONE OF THE STRAIGHTAWAYS 3—NEAR THE HOMESTRETCH 4—A WIDE BANKED TURN

citizens from North, South and West, but particularly North, will find urgent need of testing the joys of southern hospitality. For Savannah again is standing sponsor for the Grand Prize contest, with preliminary bouts on the previous day by way of whetting interest in the principal event. The course has been fixed up until it is declared to be in perfect condition, a lot of well-known cars and well-known drivers, including a galaxy of foreign cracks, have been assembled on the scene, the grand coterie of officials and their camp followers, whose very presence serves to authenticate any big automobile number, have begun to arrive, and latch strings are dangling in anticipation of the gathering of the crowd.

This will be the second race for the Grand Prize of the Automobile Club of America.

became a national event, instead of an international one, and that the A. C. A. clubbed together and put up the Grand Prize for an international contest.

Just about that time the City of Savannah was painfully aware that it wanted something. Just what it wanted it did not exactly know until the A. C. A. was shouldered out of the management of the Vanderbilt. Then all Savannah cried aloud, "That's it, that's it! We want an automobile race." As a matter of fact a very successful stock car race had been held there in the early spring, and the sequel showed that the local officials possessed the power to handle a big contest, and particularly to police a big course, in such a way as to put many a more experienced management to shame.

heard. Savannah was on the job again. Ultimately Savannah got the race again, and if Savannah does as well by it as it did before—which is saying a great deal—there can be no question about its being a fine race. It at least is no longer a "spite race."

In the contest for the Grand Prize itself, which is a most elaborate gold and silver piece representing what someone has described as a "parrot perched on the edge of a soup-tureen," there will be at least 15 contenders, as follows:

Ralph DePalma, Felice Nazzaro, Louis Wagner, Fiat; Victor Hemery, David Bruce-Brown, Willie Haupt, Benz; Joe Dawson, Ray Harroun, Marmon; W. A. Roebling 2nd, Roebling-Planche; W. H. Sharp, Sharp; Harry F. Grant, Alco; Joe Matson, Simplex; and Robert Burman, Ar-

thur Chevrolet and Hugh Hughes, Marquette-Buick.

This year's course will be somewhat different from that used before. By cutting out the greater portion of what composed the old "short" course lying nearest the city and mainly on the White Bluff road, and eliminating the loop of the Thunderbolt road, the distance has been brought down from a little over 25 miles to 17.3. The Grand Prize contestants will cover this course 24 times, making a total distance of 415.2 miles, which is 13 miles more than was required of Louis Wagner when he won the initial race in 6 hours, 10 minutes, 31 $\frac{3}{4}$  seconds, or at an average of 65.1 miles an hour.

Although there will be but two foreign teams in the race to give it its necessary international flavor, and but three foreign drivers—Wagner, Nazzaro and Hemery—among the six teams, they are of the most skilled and experienced the foreign field affords, while their co-team mates are no mean contenders, if less renowned. Among the American drivers of American cars, Dawson and Harroun, the Marmon team, are almost certain to display "class," while Grant, in the Alco, winner of the Vanderbilt, may be relied upon for cool, heady driving of the sort that counts in a long race. Joe Matson, who is slated to drive the Simplex entry, is known as a bright and intelligent driver who should give a good account of himself, while the Burman-Chevrolet-Hughes combination is expected to develop its usual sky-rocket performance. In addition to the regular entries, there are other possibilities in the shape of two Pope-Hartfords, three Nationals, two Loziers, two Oldsmobiles, a Westcott, a Chadwick and a Stoddard-Dayton, that have been listed as "tentative" entries.

The preliminaries on Friday will be two in number, namely, the (nominally) international light car race for the Savannah trophy, and the contest for the Tiedeman trophy—also international. The Savannah cup race will be 15 laps, or 259.5 miles, and is open to cars of 231 to 300 cubic inches piston displacement. The other event will be of 10 laps duration, 173 miles, and open to cars of 161 to 230 cubic inches displacement. Both will be run simultaneously after the confusing fashion of the merry-go-round, the Tiedeman trophy race starting an hour after the Grand Prize.

For the Savannah race nine cars have been entered: Dawson and Heineman, Marmon; Pierce, Gelnow and Hughes, Fal; Roebeling, Mercer; Witt, E-M-F; and a second E-M-F and a Pullman, the drivers for which have not been named. One foreign car will contend the race for the Tiedeman trophy, namely, the Lancia, which William Knupper will drive. The other drivers that have been entered, and their cars are: William and Harry Endicott, Cole; Costello, Wright and Dorley, Maxwell.

## ELECTRICS MADE BEST SHOWING

### But There Were Honors for Others in Hearst's New York Truck Test— Tie in One Class.

After allowing ample time for the deliberations of the technical committee, the results of Mr. William Randolph Hearst's New York motor truck contest, October 28-29, were announced in last Sunday's issue of his newspaper. As the arrangement of the affair provided for a multiplicity of divisions, technically there were 14 winners in their classes. The fact that the final awards were made on the ton-mile costs of running supplies, however, enables a general distinction to be made between the awards in the different classes. To the 10,000 pound General Vehicle truck entered by the Brooklyn Edison Co., belongs the credit for the lowest score in the run. Its ton-mile cost for electric energy amounted to only four-tenths of a cent. In the distributing class for manufacturers' entries, division 1, the Brush and Hart-Kraft tied for the best result with 2.69 cents each. It may be taken as a fortunate circumstance that the conditions of the test were such as to enable the electrics to make a favorable showing; the average performance of the winning electrics being much better than that of the winning gasoline machines. Pending the finding of the referee upon the protests of three dissatisfied entrants, the awards are as follows:

#### MANUFACTURERS' SECTION.

##### Gasolene.

##### Transfer Classes.

	ton mile cost, cents.
Division 1—1,000 lbs. and less, Chase...	2.96
Division 2—1,001-3,000 lbs., Atterbury...	1.88
Division 3—3,001-5,000 lbs., Kelly.....	0.86
Division 4—5,001-8,000 lbs., Alden-Sampson .....	0.88
Division 5—10,000 lbs. and over, Morgan .....	0.97

##### Distributing Classes.

Division 1—1,000 lbs. and less, Brush...	2.69
Division 1—1,000 lbs. and less, Hart-Kraft .....	2.69
Division 2—1,001-3,000 lbs., Grabowsky.	1.75

##### Electric.

##### Transfer Classes.

Division 2—1,001 to 3,000 lbs., Lansden Co. ....	1.06
Division 1—1,000 lbs. and under, G. V. Co. ....	2.53

#### OWNERS' SECTION.

##### Gasolene.

Division 2—1,001 to 3,000 lbs., Autocar, John Wanamaker .....	1.00
---	------

##### Electric.

Division 2—1,001 to 3,000 lbs., G. V. Co., John Meyer .....	1.08
---	------

Division 3—3,001 to 5,000 lbs., G. V. Co., N. Y. Edison.....	0.84
Division 4—5,001 to 8,000 lbs., Commercial, John Wanamaker.....	0.48
Division 5—10,000 lbs. and over, G. V. Co., Brooklyn Edison.....	0.40

The ton-mile costs are based upon the total consumption of gasoline and oil, or of electrical energy, divided by the product of the distance covered and the useful load in each case. The scores are based on allowances of 15 and 50 cents per gallon, respectively, for gasoline and oil, and four cents per kilowatt hour for electricity.

### September's Striking Import Shrinkage.

Only 86 foreign automobiles were imported during the month of September last, in contrast to a total of 150, which were required during September, 1909. Even more striking is the shrinkage in the demand for components, which fell away from \$80,400 last year to \$34,175, exclusive of tires. The total value of cars and parts imported during the month was \$213,444 this year, as against \$372,211 last. France, still the largest contributor of cars for American consumption, disposed of but 40 machines in September, instead of 74, its complement one year ago. Italy was the next largest contributor, with 16 cars, instead of 44; and the United Kingdom third, with 12 instead of 14. During the nine months ending September 30th, the total value of cars and parts imported from abroad exhibited a less decided shrinkage; the respective totals being \$2,214,000 and \$2,874,785, the corresponding periods for this year and last.

### New Orleans Decides to Hold a Show.

In connection with its annual Mardi Gras speed carnival, the New Orleans Automobile Club will hold an automobile show next year, February 24-27 having been fixed as the dates for it. It will be under the management of Homer George, who will work in conjunction with a committee of local dealers comprising Ginder Abbott, G. Edwin Demock and Albert Aschaffenberg. The racing which will begin February 25, will occur on the fair grounds track; the show exhibits will be located in the big enclosed betting ring under the steel grandstand on the fair grounds.

### Motor Truck Equal to 32 Mules.

What a motor truck can do when experienced hands was proven, and daily is being proven, by the truck used at the Benjamin Harrison army post, at Indianapolis, Ind. This truck, an Overland, is doing the work formerly performed by eight four-mule teams, according to the report of Lieutenant-Colonel Thomas Cruse, chief quartermaster of the post. As is but natural, the up-keep expense of the one truck is considerably less than that of 32 mules, while the initial expense was nearly the same in both cases.

## Putting the Car Away for the Winter

The disgust of the untutored motorist who orders out his car in the Spring, expecting to find it in readiness for immediate use, and discovers instead, that it requires several days' work to put it into running shape, is a picturesque and rather classical attitude. This disappointment is particularly characteristic of the bucolic who has permitted his trusty car to become a very rusty one through long months of neglect in a cold and damp barn. But it is none the less characteristic of the metropolitan owner who has failed to take the proper precautions when laying aside his machine in the fall. The experience is neither a pleasant nor a necessary one. It may be avoided by the expenditure of a relatively small amount of time and labor in the fall, much of which may not seem essential and most of which comes under the general head of preventive measures.

While few motorists are inclined to complain of the expense of automobiling during the active season, it is frequently the case that the financial complement of the pastime weighs heavily upon the approach of the period when thin blood congeals and frosty air drives all but the most rugged indoors. Hence, in the winter, if ever, the motorists also becomes a dyed-in-the-wool economist. Apropos of which, witness a most excellent dodge that several of the "wise ones" have practiced in the past with good success.

In the small towns that lie between the greater centers of municipal civilization are many carriage makers of experience and skill, who are ambitious to increase their business during the "dull" season by whatever legitimate means presents itself. Not a few such carriage makers are skilled painters as well as able repairers and manufacturers of carriage work. So the shrewd automobilist, whose car will need a few new coats of paint, and maybe some little alteration before spring opens, has been known to seek out the lone carriage maker in the small town, with profitable results. In the end the job is done pretty nearly as well as the city body builder would do it, only much cheaper; while the country artisan, having plenty of storage room at command, is glad to take care of the machine over the winter, having plenty of time for the work, and either making no charge for storage or a figure so low as to be hardly more than nominal.

But close competition in the cities is working out a condition hardly less attractive to the private owner than is the country painter's desire to "get into" the automobile business in a quiet way. Ga-

rages are multiplying at a rate that rapidly is forcing down prices, while the warehouse people are beginning to make storage rates that are far below the competency of the average garage to meet—at least under present conditions. Hence, the motorist, who is able to supervise the laying up of his machine in such a way as to ensure its being in fairly good condition when wanted again, is able to "save money" either way.

The real problem is not that of storage, but of taking care of the mechanism so that it can be put into service again at a minimum of expense and with the least possible delay. With this in mind the machine should be overhauled with the double object of protecting all parts from the effects of possible rust or corrosion and of determining exactly what work will be necessary in getting the machine into commission again. The latter idea involves deciding upon the details of any body improvements or modifications that may be desired, the replacement of worn and broken parts and the laying in of supplies and new equipment. While properly belonging to the spring overhauling, the annual inventory, if taken in the fall, permits orders to be given long in advance and enables the motorist to be sure of having the work done properly and without delay; also, in many instances, it enables him to gain some advantage in price, as well as in quality of workmanship, through avoiding the rush period.

As far as the mechanical side of the laying-up question is concerned, the general principle to be followed is, as already indicated, to protect all parts from the ill effects of dampness and varying temperatures. This means, first, that the car should be treated to some sort of protective coating. As far as the details of the laying-up operation are concerned, they may be as simple or as elaborate as the owner may desire.

Some motorists, who are finical in the extreme, have been known to have their machines entirely disassembled, the parts scoured and slushed, and carefully sorted and laid away in boxes and on shelves against the spring assembling period. On the other hand, others have been known just to roll their cars into a quiet corner on the upper floor of some garage and to let them stay there until wanted, without experiencing any serious difficulties.

In general, however, it pays to give the car a certain amount of attention along certain general lines which may be indicated in outline. The exact details may be

left to circumstances and, to a large extent, to the forehandedness of the owner himself. For it must be borne in mind that every stroke of work done in cleaning and preventing the accumulation of rust saves probably double the amount of work when the car is taken out of storage.

In preparing a car to be laid away it is important in the first place to see that it is given a thorough cleaning, all grease and mud stains being removed from the varnish and the surfaces being thoroughly dried. This will serve to forefend against the weathering effects of the period of disuse. Before the car leaves the wash-rack for the last time, all the drain cocks in the cooling system should be opened and the hose turned into the radiator filler cap while the engine is running. This will serve completely to flush out the radiator, the jackets and all passages, removing from them any particles of sediment or scale and rust that may be loose.

After the water flows from the drains perfectly clear the hose may be shut off and the engine run for several minutes more until absolutely no more water issues from the outlet. In doing this, care must be exercised to avoid overheating, the object being to exhaust the water from all pockets, low bends and kinks where it might accumulate and freeze, if the temperature happened to drop, and also to prevent rusting through leaving the passages damp.

When the car has been removed from the stand, it is well to drain all tanks, if for no other reason than for the sake of lessening the fire risk. The crank case should be thoroughly washed out, a squirt-gun and kerosene or gasolene being used for the purpose. All oil-feeds should be cleaned by the same method, the treatment also being applied to the upper portion of the cylinders and the valve ports. While this is being done the crank shaft should be spun occasionally in order to ensure the thorough cleaning of all parts and the removal of dirty and carbonized oil. Afterward all bright metal surfaces may be covered either with heavy oil or grease, or with the regular lubricant, to keep out the air. It is a good plan also to make sure that the combustion chamber walls and the unmachined ports are covered with kerosene as a means of loosening carbon and preventing rust. The external finished parts of the motor, such as valve stems, operating connections, magneto and pump shafts, and the like, should be wiped clean and coated either with heavy grease, which may be melted and applied to the cold metal with a brush,

or with a regular slushing compound, such as may be obtained from a dealer in lubricants.

In respect to the ignition auxiliaries, it is not a half bad idea to detach the magnet and send it to the maker or his agent, with instructions that it be thoroughly overhauled and returned in the spring; this will allow ample time for the work to be done properly and ensure its being done right, while preserving the instrument from damage or possible theft during the winter. The steel and iron parts of the timer, if battery ignition is used, must be treated to a cleaning and oiling process. All wire insulation should be wiped free of oil, to prevent it from rotting. The vibrator blades and screws should be wiped off with a greasy rag, also, with the object of preventing corrosion.

If storage batteries are employed, it is good economy to give them some attention, rather than merely to neglect them. Exact adherence to the principles of accumulator maintenance would require that the cells be flushed out, completely charged, and the plates removed, cleaned and dried after certain prescribed rules; but in most cases it will be sufficient to charge, flush out and lay away the cells without disassembling them, coating the terminals with wax to prevent the acid salts from "creeping."

To facilitate getting the machine into running condition when it is wanted again, it is a good plan to give the carburetter a thorough cleaning, not omitting to rid the strainers of the separator and the extra air inlets of moisture, as well as all dust and dirt. It is well to clean out the feed piping also, and, if the pressure feeding system is used, the pressure side of the system as well.

The transmission mechanism, throughout, should be treated to a thorough cleaning with kerosene or gasoline and all bright surfaces coated with rust-preventing grease. The differential and shaft housings of shaft-driven cars require this attention. In the case of chain-driven chassis, the chains should be removed, boiled in lye, and afterward suspended in hot tallow until they are heated through.

All braking and operating mechanism should be gone over in a similar manner, one particular trouble spot being the telescopic shafts that actuate the sliding sets in many selective change gear arrangements. Such long bearings, and all that are in any way obscure, require to be thoroughly cleaned and lubricated.

The muffler, exhaust manifolds and piping, the brake rods and all unfinished metal parts, including the wheel rims, require to be scoured free of rust and coated with asphaltum paint or some other rust preventive. If the car is to go under the painter's hands before it is used again, it may be sufficient to smear such parts with grease. Ordinarily, however, it is a good plan to see that they are well painted at the time

of laying away the car, and it is just as well to extend the treatment to the upper surfaces of the running boards also.

On the question of tires, some little difference of opinion exists. By some authorities it is held that no harm can be done, if the tubes are properly inflated, for them to bear the full weight of the car for an indefinite period. By others it is maintained that the car should be raised on trestles and the tubes partially deflated, to take the internal stresses out of the casings. By still others it is thought that the tires should be removed altogether.

For several reasons this would seem to be the best plan, after all. In the first place, it ensures the thorough cleaning of the rim surfaces, and prevents the creeping of rust, which otherwise might tend to cause deterioration of the beads of the casings. It also ensures a thorough examination of the tire equipment, so that it may be known what new material will be required for the following season. More important still, it permits the casings to be dried out, cleaned of any possible oil stains that might cause deterioration, and coated with powdered chalk. Otherwise it is not unlikely that a small amount of moisture might remain, even as a result of the last washing, as a matter of fact, and that the canvas probably would rot before spring.

The top should be opened, cleaned and a good grade of dressing rubbed thoroughly into the grain of the leather to prevent it from stiffening. Similar treatment should be given to the upholstery, if of leather. All brass and other plated trimmings should be covered with polish and left in that condition.

During the process, it is very important that the parts be inspected minutely for flaws or for signs of extreme wear. If this is done and careful note made of the result, it follows that when the car is required again it can be sent to the repair shop without the formality of being looked over. Furthermore—and with certain makes of car this is a valid consideration—it enables a requisition for necessary replacements to be lodged far enough in advance of the real need to permit delivery in ample time. On old cars, where it may be necessary to have new parts made to order, of course this is very important.

#### To Cure Carburetters of Strangling.

To cure his carburetter of an unpleasant tendency to "gag" or strangle when the throttle is suddenly opened, a foreign motorist has resorted to the plan of attaching a considerable length of tubing to the extra air intake. The difficulty, which is not uncommonly found with many different types of carburetter, is attributed to the more ready response of the air to the increased suction caused by the sudden opening of the throttle than that of the gasoline; the latter being restrained by the

greater inertia of the fuel and the friction of the jet. The idea of the improvement, in short, is to establish sufficient extra resistance to the flow of air to counterbalance the natural difference in inertia, thus effecting a braking influence on it at the instant of sudden change in the suction. Mechanically the improvement is effected by brazing a flanged brass tube over the air inlet and slipping a length of stiff rubber tubing over the collar thus formed. The tube is then coiled in such a way as to avoid kinking, and attached to the frame in any convenient manner.

#### House Wiring for Automobile Illumination.

With the increased use of electric lights on automobiles the question of wiring becomes important. Cases have been known in which the wiring was so carelessly done that a short-circuit has set the machine on fire, while in other instances defect in the wiring can be remedied only by tearing out the upholstery. In installing the electric lighting system on the new Franklin cars, as the H. H. Franklin Manufacturing Co., Syracuse, N. Y., is at some pains to point out, the underwriters' rules for house wiring have been followed. All wires are laid in conduits, while suitable junction boxes are placed in accessible locations where they can be got at in case of need. The burning out of any wire simply means the disabling of a single section of the system, while in locating any faults it is possible to test out the system by these sections in a perfectly simple manner.

#### One Way of Warming Feet in Winter.

As an antidote for cold feet when driving in winter one driver of experience recommends the dodge of removing the toe board, which in most cars is inclined and separate from the flooring. This permits a draught of warm air to be blown back from the motor and prevents the numbing of the feet even when no special foot coverings are worn. In cases where there is a tendency for cold air to be blown back through the radiator, it is sometimes necessary, according to this authority, to mount a deflector shield of light sheet metal to drive the air down into the sod pan.

#### One Sign of Careless Polishing.

It is a sign of careless work on the part of the floor man if a car is permitted to leave the garage with smooches of metal polish showing on the varnished surfaces immediately adjoining the brasswork. Incidentally, it is important that care be observed in polishing the trimmings of a machine to see that none of the cleaning compound works over on adjoining parts which are painted. As metal-polishes generally are both abrasive and acid or alkaline in their properties, they are practically certain to spoil the luster of any varnished surfaces with which they come in contact.

**GARFORDS BEARING OWN NAME**

**Pioneers Who Occupied Peculiar Position  
Present Their Own Production—Com-  
prises Three Striking Models.**

While the Garford car, manufactured by the Garford Company, Elyria, Ohio, is in a sense new in name, nevertheless the chassis upon which this car is founded is a tried and proven one, having been the foundation of several cars of proud repute. It follows that the cars which now bear the name Garford have no fame or future to carve for themselves. They are known qualities and their quality is beyond ques-

THE GARFORD 40 HORSEPOWER TOURING CAR

tion. They are being made in three models, a seven passenger touring car, a five passenger touring car, and a limousine, all of which are built upon identical chassis, and are very light in weight. The larger touring model has low front doors for protection against dust and wind.

The Garford, Model G-8, is equipped with a 40 horsepower motor of 4 cylinders, having a bore of  $4\frac{3}{4}$  inches and a stroke of  $5\frac{1}{4}$  inches. The cylinders are cast in pairs with offset intake and exhaust valves on opposite sides, making a "T" head motor of symmetrical and well balanced appearance. The crank shaft is a heat treated drop forging and runs in white brass bearings. Drop forged connecting rods are held in the pistons by wrist pins, case hardened and ground. The cams and cam shafts are made of high carbon steel, all bearing and cam surfaces being hardened and ground. The timing gears, helical cut, are noiseless. Aluminum is used as the metal for the two castings of the crank-case, the crank shaft being suspended from the upper half. Easy access may be gained by the removal of the lower half of the case without disturbing the engine itself in any way.

A positive feed mechanical oiler is used to accomplish lubrication. Oiling of the main bearings is done by splash from the case. Oil collecting rings, fed from the main bearings, lubricate the crank pin bearings. The cam shaft is lubricated by splash.

Ignition is by a low tension Bosch magneto with magnetic spark plugs, in combination with Bosch seat-starting device. A great objection to the make and break system was the small moving parts which have been done away with by the use of the magnetic plugs. The low tension system has also its waterproof advantages.

Cooling is effected by the use of a centrifugal pump, which circulates the water into the cylinders near the exhaust parts and out from the top, together with a radiator and an adjustable belt fan.

The clutch is of very light cast aluminum, leather-faced cone with cork inserts and flat springs. A feature of the clutch is that it may be lifted out without disturbing any other unit by simply removing a

few screws. A double universal joint is mounted between the clutch and transmission in a dust-proof housing.

THE GARFORD LIMOUSINE EQUIPMENT

The transmission is of the selective sliding gear type and the different speeds can be selected at will. There are four speeds forward and reverse, the direct drive being on third speed. The gear case is a one piece aluminum casting with a cover. The rear axle is of the full floating type.

Two internal expanding and two external contracting brakes comprise this part of the equipment. They are all fabric lined and adjustable. The front axle is an I-beam section, drop forged with integral spring

seats. All models have 36 by 4 inch tires in front and 36 x  $4\frac{1}{2}$  in the rear, but the wheelbase varies in the different models from 118 to 123 inches. Semi-elliptic springs are used both in the front and rear.

The driving position is on the right hand side. Spark and throttle levers are mounted upon the steering wheel. Pedals controlling the clutch and service brakes operate through the floor boards, while the gear shifting and emergency levers are located conveniently at the side in the conventional way.

**Pennsylvania as an Automobile Producer.**

According to the annual report of Chief John L. Rockey of the Pennsylvania Bureau of Industrial Statistics, which just has been made public, the seven automobile manufacturing establishments in that state report an investment in plants and machinery of \$3,147,455, which is an increase of \$505,948, as compared with the year 1908. The production for the past year was \$4,129,882, an increase of \$1,648,256. During the year 1,282 automobiles were turned out of the Pennsylvania factories, as compared with 831 the previous year. There was employed during the year an average of 1,579 wage earners, an increase of 775. These earned an aggregate of \$1,000,755 in wages, an increase of \$480,151. The average yearly wage was \$626.65 and the daily wage \$2.06. As managers and office help 158 persons were employed at salaries aggregating \$148,081. Of the wage earners 1,522

were Americans, 37 foreigners and three negroes. The average value produced per employe was \$2,592.29.

**Spokane Taxicab Companies Consolidate.**

The Spokane Taxicab Co. and the Taxicab Motor Co. of Spokane, Wash., have been consolidated under the style of the first named concern, whose capital stock has been increased to \$200,000. George E. Riegall, of the Taxicab Motor Co., will manage the enlarged enterprise.

## PAY TRIBUTE TO OLD EMPLOYER

**Workmen in Stoddard-Dayton Factory Present Bronze Tablet to Retiring President—What it Symbolizes.**

As a striking and unexpected testimonial to his many years of faithful and kindly service as an employer, the 2,200 or more employes of the Dayton Motor Car Co., Dayton, O., recently presented John W. Stoddard, retiring president of the company, with a bronze memorial tablet. The tablet, which is here illustrated, is about three feet

"Presented Oct., 1910, to John W. Stoddard by the factory employes of the Dayton Motor Car Company in appreciation of his long years as a considerate employer and in recognition of those sterling qualities which have made him admired by all men."

It is noteworthy that the tribute was an entire surprise to the officers and office employes of the company, as well as to Mr. Stoddard, Senior, himself, coming entirely from the men of the factory.

### Suspensions Aroused by Gasolene Permit.

Most people wait until a thing becomes an established fact, before they apply for

## VIRGIN HICKORY DISAPPEARING

**Federal Government Issues a Warning But Crisis is Far Removed—Extent of Automobile Trade's Demand.**

According to a bulletin which has been issued by the Department of Agriculture, at Washington, by Forest Assistant Anton T. Boison and J. A. Newlin, engineer in timber tests, the automobile industry annually consumes something like 3,350,000 board feet of hickory in the manufacture of spokes and rims. This represents about one per cent. of the annual cut of hickory, which, in 1908, was estimated at 335,000,000 board feet, including all necessary waste. The purpose of the bulletin is to point out the rapid diminution in the supply of the wood and to emphasize the probable effect of a shortage upon industries that are dependent upon it, as a result of the increase in its cost.

"Virgin hickory, which has hitherto furnished the chief supply, is disappearing rapidly, and there are no foreign sources which can be drawn upon when the home supplies are exhausted," it is explained. It is further stated that, "unless some entirely new material is found to take the place of hickory, and this seems quite improbable, it is only a question of time when the prices will advance sufficiently to place hickory on an equal footing with chestnut, poplar and other faster-growing species; even now it is practically on an even footing with white oak and white ash, the other trees most important for toughness and strength used for purposes similar to those for which hickory is used." The crisis is indicated as being some years off, but the continued exhaustion of the supply is likely to cause a continual increase in the price of the wood. Naturally, the vehicle industry as a whole, which uses about 65 per cent. of the entire output, will be the first to feel the effects.

### Cranked Car with Reverse Gear in Mesh.

Another of the many accidents caused by cranking the engine with the gear shifting lever in the wrong position occurred on Sunday last, on 60th street, New York, and only the fact that the steering wheel had been jammed over to the right saved the three year old boy occupant of the car from death or injury. The chauffeur had left the gear shift lever in the reverse position, and when he started to crank the car the latter backed up so rapidly that it took the man at least ten seconds to catch it. During those seconds the car backed onto the sidewalk and crashed into the window of a florist's shop, creating a general havoc therein. Damage exceeding \$500 was caused, but no one was injured.

MEMORIAL TABLET IN HONOR OF JOHN W. STODDARD

in length and mounted in a handsome satin lined mahogany case. Embodied in the design, at the left, is the date "1872," when Mr. Stoddard first started in the implement business and on the right, "1910," to commemorate his retirement from the automobile business which has occupied the attention of the company so successfully during recent years. In the lower left and right corners, respectively, the hay rake and cultivator and the modern motor car symbolize the products of the industry, while at either side of the bust at the top are representations of the implements with which the subject has been employed during various periods in his career. The central figure of the design is a relief bust of Mr. Stoddard, and below it is the following inscription:

an injunction—provided the proposed object does not meet with their approval—but James J. Phelan, Roxbury, Mass., has varied the procedure by asking the court for an injunction against Mary A. and Oscar L. Lomasney, restraining them from building a garage on their own land, which adjoins Phelan's property. Not that the Lomasneys had expressed any intention of building one, or had mentioned their desire to do so; they had simply asked the city council for a permit to store petroleum and gasolene on their premises, and Phelan jumped to the conclusion they intended to build a garage. As restrictions were placed upon the property some years ago forbidding the erection of a garage, it is thought that the injunction will be granted by the courts.

## MANY MODELS FOR MANY NEEDS

**Jackson Company Offers Striking Variety in Extensive Line—Convertible Closed-Fronts a Universal Feature.**

There is no sameness in the Jackson line for 1911. Not only is it more extensive than heretofore, but in respect to body designs, mechanical features and prices there is no small variety. Its makers, the Jackson Automobile Co. of Jackson, Mich., are not among those who limit themselves to one chassis on which they superimpose dif-

ferent types of bodies; the Jackson people

employ no less than five distinct chassis and one of the most striking new features of the 1911 line is the convertible torpedo body. Every Jackson touring model can be transformed into the closed-front type, as removable front doors complete with sills and panels are provided for this purpose. The advantages of this construction lie in the adaptability of the car for various

uses; for city travel or business purposes the standard touring car with free entrance is likely to be most preferable, while for fall or winter use or extended touring the front doors with their protection from dust and wind are to be desired. The closed-front bodies have a straight line effect from the tonneau to the dash, which is made more pronounced by the use of hardwood strips along the tops of both the front and tonneau doors and panels. These strips accentuate the unity and symmetry of the body, and, with the front doors, give to

son productions, as a result of the consolidation of the two concerns between which a strong financial relationship always existed. The Fuller models will include the two cylinder shaft driven touring car and the surrey of the modified motor buggy type having solid tires and a two cylinder motor. The surrey has high clearance and 36-inch wheels. It lists at \$850.

The four cylinder motor employed in Models "38," "35," and "25" is of the conventional "L" type, with single cam shaft, first introduced in the Jackson product in Model "H" of last year. The chassis of Models "38" and "35" are identical. Their motors, also four cylinders, are 4 by 4

THE JACKSON CONVERTIBLE BODY SHOWN ON THE "30 CT" CHASSIS WITH AND WITHOUT FRONT DOORS

fering types of bodies; the Jackson people employ no less than five distinct chassis and one of the most striking new features of the 1911 line is the convertible torpedo body. Every Jackson touring model can be transformed into the closed-front type, as removable front doors complete with sills and panels are provided for this purpose. The advantages of this construction lie in the adaptability of the car for various

"38," a full torpedo with front doors and metal scuttle dash, and finished in a rich cream color, making an exceedingly attractive car. The drive is from the left side with the gear shifting lever in the center of the floor boards and the service brake and clutch operated by the same pedal. A ratchet pedal operates the emergency brakes. This torpedo has 32-inch wheels and a wheel base of 110 inches.

inches, cast in pairs, while the motor in the roadster, Model "25," has a bore of  $3\frac{3}{4}$  inches by  $4\frac{1}{4}$  inch stroke. All valves are arranged on the left side and operated by a single cam shaft.

Lubrication is accomplished by the splash system, the oil being pumped from the oil reservoir through the motor and back to the reservoir.

Low tension magnetos, with batteries in

THE JACKSON MODEL "25" ROADSTER

MODEL "51" WITH CONVERTIBLE CLOSED-FRONT

Model "35" differs from Model "38" only in body design and driving position, while Model "30" has not only a different body but another type of motor. Both are five passenger cars and may be had with detachable tonneaus. Model "25" is the Jackson roadster, a two passenger vehicle distinguished by an oval gasoline tank and a trunk in the rear. The wheels of this roadster are 32 inch and the car has a wheel base of 105 inches. The Fuller cars, formerly produced by the Fuller company, now are listed as Jack-

son productions, as a result of the consolidation of the two concerns between which a strong financial relationship always existed. The Fuller models will include the two cylinder shaft driven touring car and the surrey of the modified motor buggy type having solid tires and a two cylinder motor. The surrey has high clearance and 36-inch wheels. It lists at \$850.

The four cylinder motor employed in Models "38," "35," and "25" is of the conventional "L" type, with single cam shaft, first introduced in the Jackson product in Model "H" of last year. The chassis of Models "38" and "35" are identical. Their motors, also four cylinders, are 4 by 4

reserve for starting, are supplied as the ignition equipment on all models. Cooling is effected by means of the thermo-syphon system of circulation and a six blade belt driven fan. Aside from the freedom of mechanical trouble by the use of this system, the Jackson company points out that its advantage lies in the constant working temperature it secures for the motor. There is no loss of efficiency from over-cooling as the circulation is governed by the temperature, and the useless dissipation of valuable heat is avoided.

reserve for starting, are supplied as the ignition equipment on all models. Cooling is effected by means of the thermo-syphon system of circulation and a six blade belt driven fan. Aside from the freedom of mechanical trouble by the use of this system, the Jackson company points out that its advantage lies in the constant working temperature it secures for the motor. There is no loss of efficiency from over-cooling as the circulation is governed by the temperature, and the useless dissipation of valuable heat is avoided.

The clutch used in Models "30" and "35" is of the leather faced cone type, with engage springs to allow for the necessary slippage when the load is being taken up. A multiple disc clutch running in oil is used in Models "51," "41," "38" and "25." The strength of the clutch is compounded through a system of toggles, so that the pressure on the plates when the clutch is fully applied, is enough to make slipping impossible.

The motors in Models "51," "41" and "30" are the type of engine which has been

which gives the full elliptic spring its greatest advantage. Cross members support the motor in Models "51," "41," and "30," at the front and rear, and it is fastened to them by round collars, inside of which it is free to rotate slightly to allow for any twist of the frame. In Models "38," "35" and "25," containing the "L" type power plant, a new method of motor support has been introduced this year, a cast iron piece attached to the forward end of the cylinders, extending on either side to the sides of the frame meeting the latter at points

located at the right side are the levers for gear shifting and the operation of emergency brakes. A single unit coil is placed conveniently on the dash, together with a sight feed oil indicator.

#### To Check Noises Caused by Bodies.

With the object of checking all noises arising from the working of the body of the car, a British builder has adopted the plan of rendering the outer frame of the dash entirely independent of the chassis and integral with the body, and of cushion-

JACKSON MODEL "41" CLOSED-FRONT

JACKSON MODEL "33" TORPEDO STYLE

used so successful in Jackson cars for several years past, with valves inclined at angles of 45 degrees in the head and with an overhead cam shaft driven by a vertical shaft and bevel gear. With the valves so placed in the head the intake and exhaust gases pass straight through the valves and valve ports without interference and the exhaust goes out freely and completely, clearing the cylinder of all burnt gas. The cams, rocker arms and shaft are enclosed

where the weight is evenly distributed.

The front axle is of the I-beam type, with tie rods behind and steering connections above. The transmission is incorporated in the power plant, insuring perfect alignment at all times. It is of the selective type, allowing three speeds ahead and one reverse. Roller bearings support the rear axle, with ball thrust bearings on each side of the differential. The roller bearing driving pinions are fitted with ball

ing the entire forward portion of the complete coachwork structure upon rubber cushions. For some years this particular maker has attached his bodies to the rear of the chassis by means of a hinged joint, so that they may be raised at the front end when repairs are to be made. By the new arrangement the metal tenons or resting blocks, which guide the fore part into place and restrain it from side motion, drop into sockets in the bottom of which are

JACKSON MODEL "41" POWER PLANT

THE POWER PLANT OF MODEL "38"

in dustproof housings. Cooling, lubrication and ignition are accomplished in the same manner and by the same means as in the above described "L" type of motor.

Throughout the Jackson line the unit type of power plant is used. All moving parts are completely housed, thoroughly protected from dust and dirt, and lubricated from within. The frames of Models "51," "41," "35" and "30" are dropped, bringing the weight closer to the ground, but still allowing the free and unrestricted action

bearings to take the thrust from the bevel gears.

All of the 1911 models are driven from the right side, except the full torpedo, Model "38." The steering gear is of the worm and gear type, and upon the steering wheel are mounted the throttle and spark control levers. The clutch and service brake are operated by separate pedals working through the toe-board and an accelerator pedal is interconnected with the throttle lever on the wheel. Conveniently

rubber cushions. The lubricator sight-feed, switches and other fittings that usually are mounted on the dash, are carried on a false dash, or mounting board that is fastened to independent uprights erected on the main frame.

#### Electric Horns Coming from Racine.

The Standard Electric Co., Racine, Wis., is about to add automobile horns to its productions. They will be of the electric variety.

**KISSEL HAS A "WESTERN SPECIAL"**

**It is Built to Stand Rough Work—The  
Remainder of the Line is Improved  
and Enlarged.**

Apart from the three ton truck, which already has been exploited, the 1911 line of the Kissel Motor Car Co., Hartford, Wis., will include another new comer, the "Western Special," which, as its designation

according to the type of body employed. Its wheel base is 132 inches, and it is supplied, together with Model D 11, in touring car, small tonneau, coupé or limousine forms. All models may be equipped with front doors, if so desired.

The bodies are made of metal over wooden frames, and designed to eliminate as many joints as possible. The door frames are made with a single bending instead of sections. The dash board, deck and door strips are solid mahogany with piano finish.

the other side. The cylinders are of the familiar "L" type, cast in pairs; in the 30 horsepower motor they are  $4\frac{1}{4}$  by  $4\frac{1}{4}$  inches, in the 50 horsepower motor,  $4\frac{7}{8}$  by  $4\frac{3}{4}$  inches, in the 60 horsepower motor,  $4\frac{1}{2}$  by  $4\frac{3}{4}$  inches.

Lubrication is accomplished by a self-contained oiling system, which has a reservoir in the lower part of the oil basin, and a gear pump bolted to one end pumps oil through all tubes to the different sections. The oil level can be raised or lowered to

THE 4-CYLINDER KISSEL CAR "D 11" WITH STANDARD TOURING AND SMALL TONNEAU BODIES

implies, is designed particularly for use in the Western country. The older models differ from the 1910 productions chiefly in that the wheel base of all has been materially increased; the frames have been given a double drop, lowering the car and lessening the leverage of side thrusts, and the brakes changed on all models but L. D. 11, from the double internal expanding, to internal expanding and external contracting.

The "Western Special," the addition to the line, is designed for rough country use, and is given more road clearance, has extra heavy wheels and only a single drop frame, adapting it for use over deep rutted or unimproved roads, sharp turns and hills characteristic of a large portion of Western country. The motor has four cylinders,

KISSEL CONTROL MECHANISM

meet the various needs, as when the motor is required to run without smoking, long hill work or at high speed. The adjustment is secured by a brass tube in the oil basin connecting with the overflow outlet. A lever attached to one side of the basin is pressed into this tube, regulating the flow. This lever is attached to the adjusting rod, enabling the driver to lower or raise the oil level as he sees fit at any time. A gauge is provided to insure proper oiling at all times.

All models are equipped with dual ignition, employing either Remy magneto and dry cells, or the Bosch dual system. Cooling is effected by means of a centrifugal pump and a square tube radiator. A belt driven, ball bearing fan increases the cool-

THE NEW "F 11" 6-CYLINDER CAR IN STANDARD TOURING AND CLOSED-FRONT FORMS

develops 50 horsepower and the wheel base is 120 inches. It is to be had with either touring car or small tonneau bodies and lists at \$2,000.

Model L. D. 11 is a four cylinder, 30 horsepower car with 116 inch wheel base, and supplied with touring car, small tonneau or coupé bodies. The 50 horsepower, 4 cylinder Model D 11, has a wheel base of 124 inches. The six cylinder member of the family, F 11, lists at \$2,500 to \$3,700,

Between the running board and the frame is a metal apron. The curved fenders are attached to the body by irons and braces, in brackets riveted to the side bars, making their removal easy. A sheet metal sod pan under the chassis serves to protect the machinery.

The motor remains the same in style and principle, as that in the previous models; the magneto and pumps are on one side, and all the valves easily accessible on

ing efficiency by forced draft. The clutch is of the cone type, leather-faced with adjustable springs beneath the leather to eliminate any jerk while the clutch is being engaged. Except in Model L. D. 11, which has three speeds, direct drive is on the third speed of the four speed selective transmission and the fourth speed is geared up 25 per cent. Heat treated chrome-vanadium steel replaces the carbon steel used heretofore. The rear axle remains the

standard full floating type, with tubing pressed into the housing.

The front axle is an I-beam section drop forging, with the spindles lowered and made heavier. The steering arm is placed above the axle and the rod in the rear. This arrangement gives protection against accidents caused by hitting an obstacle.

The braking system is changed on all models except L. D. 11. The new brakes are internal and external with a 14 x 4 inch face, instead of the double internal as used on 1910 cars and retained on L. D. 11. All front springs are semi-elliptic, and the rear are three-quarter elliptic with scroll ends, supported by an extension of the rear of the frame.

The driving position of all models is on the right side. Upon the steering wheel are mounted the throttle and spark control levers; the adjustable clutch and service brake pedal operate through the floorboards and the emergency brake lever is at the right side, together with the gear shifting lever. The shifting mechanism remains the same in all models except on L. D. 11, in which it will be placed outside the frame instead of inside as in the other 1911 models. An accelerator pedal is interconnected with the throttle control lever to facilitate traffic work.

#### Overland Factory Operating 24 Hours.

George W. Bennett, sales manager for the Willys-Overland Co., was in New York late last week after another visit to the Western country. There he says automobile optimism of the contagious sort still rules and is reflected by the dealers in the size of their orders. The Overland factory in Toledo, Bennett states, has felt the effects of this optimism to such an extent that it is being operated 24 hours per day. During the month of October it shipped exactly 1,002 cars, 66 of them being sent out on one day.

#### To Introduce Taxicabs in Ceylon.

The Indian Motor Taxicab Company (Limited), operators of taxicabs in Bombay and Calcutta, are shortly to begin operations in Ceylon. Consul Wm. C. Magelsen writes that a representative of the company is making the preliminary arrangements and offices have been opened at No. 4, Darley Stores, Darley Road, Colombo. It is believed that taxicabs will become very popular there. The concern intends to begin business by placing 60 cars on hire. The charge per mile is to be 50 cents Ceylon currency (\$0.16).

#### Locomobile to Enter Commercial Field.

After long experimentation and test, the Locomobile Co. of America is about to place its first truck on the market. It will be made in three and four ton sizes, will mount a 60 horsepower engine, and have double chain drive and four-speed selective gear.

## RADICAL FORM OF CARBURETTER

Of the Multiple Jet Type, it Differs Greatly From It—How It Lessens the Vacuum Required.

It is obvious that the efficiency of a carburetter must depend to some extent upon the readiness of its response to the suction of the motor—to how great an extent depends upon its ability to deliver a uniform and perfect mixture under varying conditions of load and throttle opening. It is claimed by the Carter Carburetter Co., St. Louis, Mo., which just has placed on the market a new and radical device of this

CARTER CARBURETTER CONSTRUCTION

class, that with the average carburetter, the piston of a well-designed motor must travel from 25 to 50 per cent. of its travel in order to create the necessary two to four pounds of vacuum which must be obtained before the mixture will be generated properly.

In the case of the new Carter carburetter, on the other hand, but 12 ounces of vacuum are required in order to raise the mixture, so that the piston must travel not more than 10 per cent. of its suction stroke in order to cause the delivery of the mixture to the cylinder. In consequence, as is claimed, from 15 to 40 per cent. more mixture is delivered to the cylinder in the course of the suction stroke than otherwise would be possible.

In support of these radical claims the Carter company offers its radical form of carburetter, in which the initial mixture is formed in much the ordinary way, while the additional increment necessary at medium and high speeds is secured by an arrangement of multiple jets that come into play automatically as the suction increases. Among other novel points about the device

is a spherical float which acts upon the needle valve through the intermediary of a single and very simple lever arrangement which is positive in its action.

The construction of the carburetter is shown in the accompanying illustration in which the principal jet is indicated at A and the float at B, the needle valve at N and the settling and strainer chamber at X, adjacent to the fuel inlet C. The chief point of originality about the system lies in the vertical, multiple-jet fuel tube, however. The purpose and action of this is best explained by tracing out the operation of the device itself.

When a partial vacuum is developed in the mixing chamber, due to the motion of the pistons, air is drawn in at A and up through an annular opening surrounding the base of the tube T, thus causing a mixture to be formed. This tube is formed of case-hardened steel tubing and is located in the center of the funnel-shaped air-tube F. It is closed at the top and held to its seat by means of the cap-screw K. The various jets consist of small holes drilled in its wall in a helical row from top to bottom. The main jet, P, is located at the base of the tube and just above the normal fuel level.

As the fuel issues from the main jet under the influence of the initial suction it strikes the surrounding walls of the tube seat and is given a whirling motion. The mixture thus formed is sufficient for all low speeds.

When the throttle is opened air also begins to enter at the high-speed air inlet, H. At the same time the fuel rises in the tube and begins to issue from one or more of the spirally arranged jets. As it does so it is met by the flow of air which is driven downward against the mixture rising from the main jet, the two thus being blended forcibly and impregnated with fuel vapor. At very high speeds, a supplementary air supply is delivered through the auxiliary air inlet valve V.

To provide against "strangling" when running at very low speeds or when opening the throttle suddenly, a so-called anti-strangling tube, O, is provided. This tube, or duct, leads from the lower mixing chamber to a point in the inlet pipe above the main throttle and, therefore, is never closed. Hence when the throttle is shut, it serves to draw the small amount of gas, required to keep the engine turning, around the principal mixing chamber, and at sufficiently high velocity to prevent it from becoming separated into its components. The mixing chamber in this way is kept dry and free from imperfectly mingled gas until such time as the throttle again is opened. When this is done the motor is not supplied with a few charges of over-rich gas, as frequently is the case, but with a perfectly dry and uniform mixture, so that it is enabled to accelerate smoothly and without gagging.

**MOTOR TRUCK FOR ROAD BUILDING**

**Almost Revolutionary Demonstration Now in Progress in Washington State—Does Work of 36 Horses.**

Something almost revolutionary in the way of road building is being demonstrated out West by enterprising contractors who are constructing a part of the State road which eventually will connect Seattle and Spokane. A three-ton Gramm truck, on which was built a special steel hopper, spreads gravel on the surface of the road through gates at the bottom, operated by a wheel at the driver's seat. This truck takes

per cubic yard being 2,500 pounds. The motor truck, however, carries three and two-fifths cubic yards each trip, the load being about 8,500 pounds, which with the 1,500 pound steel body makes a total weight of 10,000 pounds. This is a  $66\frac{2}{3}$  per cent. overload over the normal capacity of the truck. About 75 cubic yards are hauled daily by this truck, employing two drivers and making 22 round trips, which is 18 times the daily capacity of one team and driver.

By the modern method of hauling this rock, the daily expense is \$12, whereas by the old method of employing teams the expense would be \$90 a day.

According to the Gramm people, the daily travel of the truck is 110 miles. At this

A "THREE-TON" GRAMM THAT HAULS 10,000 POUNDS

the place of horse-drawn dump wagons.

The crushed rock, hauled to the bunkers by the railroad, is dumped from hopper bottom cars into specially constructed bunkers. A sunken roadway permits the truck to receive its load by simply opening the gates. The load is then hauled to the road under construction, where, as shown by the accompanying illustration, stringers are laid upon loose rock and the truck backed away on these as the load is dropped, in this way spreading it over the desired amount of surface.

The rock is handled entirely by machinery from the time it is crushed, automatically dumped into freight cars, hauled to the contractor's bunkers, loaded into the truck and deposited on the surface of the road.

The hauling distance from the bunkers to the road work is two and one-half miles, all up grade. With one team and driver only, four cubic yards of rock could be hauled in a day, one cubic yard to a trip, and at an expense of \$5 a day to the contractor, the approximate weight of the rock

rate over 3,000 miles would be traveled in thirty working days, and the truck would carry 5,610,000 pounds of rock at a total expense including wages, fuel, upkeep and depreciation, of \$350. The same amount of work if done by teams would cost fully \$2,500.

**Cost Him \$5 to Ride on the Box.**

Ignoring the fact that there is a law prohibiting taxicab chauffeurs from giving their friends a "lift" or allowing anyone else to ride beside them on the box of their cabs without the consent of the fare, James Graham, one day this week, jumped aboard a New York taxicab in which was a police sergeant. That officer ordered the chauffeur to drive to a point where a detective was awaiting such catches and Graham was arrested. When arraigned before the magistrate he found that his disregard for the law had cost him \$5. The ordinance is one designed to prevent hold-ups of passengers by "strong arm" pals of disreputable or crooked drivers.

**RUSSIA WANTS MOTOR STAGE LINE**

**Offers a Subsidy and Opportunity is Open to Americans—Estimates of Equipment and Capital Required.**

That Russia in some things is not quite so backward as some people believe is the case is made evident by the announcement that the Russian government is to establish an automobile route from the port of Novorossisk and the final point of the Vladikavkas railroad to Soukhoume, a distance of approximately 375 miles.

As the undertaking could not bring immediate financial benefit to a transportation company organizing such a service on its own initiative and with its own resources, without obtaining substantial aid from the government, the project includes a yearly subsidy by the government of \$36,000, and the terms of the concession are as follows: The concessionaire is obliged to make six trips a week from both points for transferring the mails, but has the right to transport passengers and baggage. The mails are not heavy—300 to 350 pounds daily. The passengers pay 6 kopecks per verst (3 cents per two-thirds of a mile).

Consul-General Snodgrass, stationed at Moscow, states that it has been found from experience that automobiles carrying from three to five passengers will average from 45 to 60 kopecks (22½ to 30 cents) per verst.

"On 70 versts of the route," he writes, "the automobile communication is already organized; five cars are in service, and the undertaker for this part of the country receives \$10,000 yearly subsidy from the government. The remaining 330 versts (220 miles) are to be organized without delay. Except the line from Tuapse to the north by a side road leading to the Maikop oil fields, and the Armavir-Tuapse railroad now in the course of construction, this transport method for mail is necessary for at least twelve years. Along the route of the proposed railroad mail will have to be carried and passengers transported by automobiles for at least three years.

"The estimates of the capital required for the automobile route are as follows:

15 light automobiles, at \$2,250 each.	\$33,750
8 automobile omnibuses, at \$4,000 each	32,000
10 baggage cars, at \$3,500 each	35,000
Reserve capital, tires, parts, etc.	12,500
Construction of houses and workshops	50,000
Active capital	12,500

Total capital required	\$175,000
The undertakers have already expended	37,500
The undertakers have deposited with the Government	12,500

Total requirements.....\$225,750

"The concessionaires thus figure that the

\$36,000 a year subsidy from the Government alone aggregates 14 per cent. upon the capital expended. It is thought that the income from the transportation of passengers and their baggage will cover the expense of exploitation, and it is expected that there will be more than is required for the sinking fund from the income of the transport line to the oil fields described hereinbefore. The concessionaires figure that in three years the income from the side line alone will be more than sufficient to cover the entire capital expenditure of the enterprise. The number of persons traveling on these lines is conservatively estimated at 20,000 a year.

"For the want of capital this concession is for sale, and on account of the government subsidy of \$36,000 yearly, it may appeal to American capitalists. The contract with the Government exists for twelve years. Communications addressed to the American Consulate at Moscow will be handed to the concessionaires."

#### Substitute for Garage Elevator.

In a two-story automobile establishment in Brooklyn, N. Y., where a regular elevator is out of the question on account of the floor space it would occupy, a unique lifting device has been substituted which does the required work, does not lessen the amount of floor space available, and leaves no open shaft liable for accidents. Over the driveway at the front of the building there is a door opening from the second floor. A platform, built the width of this door, extends about twelve feet inside and far enough outside to touch the ground at an angle of about 40 degrees. The sill of the door forms the fulcrum upon which this platform operates, somewhat after the fashion of a seesaw. The outer end is raised and lowered by an ordinary fall and tackle attached on upright poles on each side.

The automobile to be taken to the second floor is brought to the lowered end of the platform, where a rope or chain is hitched to the front axle, the car hauled up the incline by means of a windlass, and as it passes over the pivotal point of the platform the weight of the car gradually brings the upper end to the floor in a horizontal position. The car may then be rolled onto the floor. To take a car down, it is placed on the upper end of the platform, hitched by rope to the windlass, and, as the platform is lowered at the outer end by the tackle, the car is allowed to roll gradually down.

#### Tire Chains of the Unit Type.

The tire chains which have been added to the productions of the Avery Portable Lighting Co., of Milwaukee, Wis., constitute a considerable departure from the usual. As the accompanying illustration shows, the Avery chain is not of the continuous variety, but is made in individual units. Each sec-

tion is composed of two pieces of chain which lie over the tire and are attached to side bars. A leather strap secures it to the rim, which manner of fastening, it is claimed, takes the strain from the tires.

Six units go on each wheel, but less may be used if so desired, as for instance, when applying them to a wheel without jacking up the car. The chains list at \$4.50 per set.

#### Spark Plug that Lacks Points.

While most manufacturers lay stress on the "points" of their productions, the Wolverine Motor Specialties Co., which recently was organized in Detroit, Mich., to manufacture the Detroit spark plug, is making the most of the paradox that one of the "strong points" of its plug is that it has no points at all. The absence of points that bend or break or overheat renders it proof against most of the misuse and abuse that would put many other plugs "out of business." Instead of depending upon two

small points to carry sufficient current to ignite the gas, the Detroit, plug, as shown by the accompanying illustration, has a sparking channel all the way around the plug, making the spark jump always the same without adjustment. Current from the battery or magneto is carried by a steel stud or core, amply protected by oil proofing enamel and sheet mica from the top of the plug to the bottom, and here it jumps back across a ring of mica, then another and finally reaches the hexagon and the cylinder. It is claimed that the fire across these channels keeps them open and free from carbon even though the whole bottom of the plug may be furred with soot, which is pointed to as another good feature.

The Detroit plug also employs a special preparation of enamel mica instead of porcelain insulation.

#### When the Chain Drive Becomes Worn.

When the driving mechanism of chain-driven cars has worn to the extent of becoming unpleasantly noisy, the standard remedy is to turn the chains "inside out," not for the sake of bringing new metal in contact with the sprockets, which with the roller type of chain commonly employed for the purpose, is manifestly impossible, but for the sake of bringing new rivet surfaces into action. When this experiment no longer is effective, and when the sprockets have been ground down until they are altogether too large for the chain, it is well to see whether a different sized chain, having large rollers, cannot be employed. If this can be done, it will be found that the life of the drive will be considerably increased.

#### Comic Opera Device to Save Life.

Two Dutchmen have come to the rescue of the luckless pedestrian who risks his life and limbs whenever he crosses the street in front of an approaching car. They have invented a device, which was exhibited in Vienna, the other day, the purpose of which is to catch the unfortunate "human obstacle" to automobile progress, holding him—or her—firmly upright by taking a firm, metallic grasp of the lower limbs. The arrangement is designed for attachment to the front of a car and is intended to work automatically, regardless of whether the victim is desirous of being saved, or is suicidally inclined.

#### The Conquering Career of the Taxicab.

With the reports of the activity of the automobile trade in all parts of the world transmitted through the consular service and exemplified in the exports and imports statistics of the past months, attention has been called to the spread of the taxicab idea. These modern vehicles are a recent venture in the islands of Sicily and Ceylon, and they have been operated for some time in Bombay and Calcutta. There is hardly any city of importance in the whole world to which they have not penetrated.

#### New York Gets Biggest Animal Ambulance.

Mrs. Russell Sage recently presented to the New York Society for the Prevention of Cruelty to Animals, the largest motor ambulance ever built for the transportation of animals. It has three decks and will carry 200 dogs and cats.

#### Wells Once More Heads Louisville Dealers.

At the annual meeting of the Louisville (Ky.) Automobile Dealers' Association last week Prince Wells was re-elected president. E. G. Reimers was chosen vice-president and Hubert Levy, secretary and treasurer.

# Rambler

## 1911 Cars Now Ready

Rambler  
Sixty-five

**T**HE 1911 Rambler is now ready and orders are being taken for early deliveries of all styles. The line includes landaulets, coupes, limousines, town cars, roadsters, toy tonneaus and five and seven-passenger touring cars with detachable fore doors. Details and construction alike for all: two sizes, forty-five and thirty-four horsepower. Forty-inch wheels on all seven-passenger open cars, thirty-six-inch wheels on all others. Seven-eighths elliptic springs and shock absorbers produce gratifying comfort. The offset crank shaft and straight-line drive enable you to travel through sand and up grades on high gear as slowly as ten miles an hour. That there is no need to rush the hard pulls is one of the charms of driving a Rambler.

*You may have a copy of the special  
number of the Rambler Magazine  
if you make request immediately*

**MISHAP, NOT MURDER, SAYS JURY**

**New York's Celebrated "Millionaire Motorist" Case Results in Acquittal—Testimony Shatters Sensational Reports.**

Indicted for murder in the first degree, Edward T. Rosenheimer, whose car on the night of August 14 last, apparently "side-swiped" a light buggy containing a man and two young women, wrecking it and killing one of the girls, was acquitted by a New York jury on Thursday last, 3d inst., after 25 minutes deliberation. Because Rosenheimer and his two companions did not stop at the time of the accident and following the fire-eating performances of one of New York's always picturesque coroners, the sensational press made Rosenheimer, a man of family and refinement, appear almost a human monster, and the case became a celebrated one. Rosenheimer, although he had to mortgage his home to pay the expenses of his trial and who remained several weeks in jail because of inability to give the \$50,000 bail imposed, always being referred to as the "millionaire automobilist."

The testimony brought out that the buggy displayed no light, that the night was a dark one, that the buggy was overcrowded, that it was being driven at an angle in the middle of a wide road, Pelham Parkway, bordered by trees and not too well lighted, and that it was struck on the right side—it was going in the same direction as the automobile—that in seeking to avoid a collision, Rosenheimer had placed his foot on the accelerator instead of on the clutch pedal and that although the buggy was wrecked, the horse and harness practically were uninjured. Rosenheimer testified that he did not stop—for which even motorists were inclined to blame him—because one of his companions had looked back and seeing the horse standing had told him that everything was all right. Later in the night he returned to the scene in a cab and was unable to obtain information regarding an accident. He was arrested on his return to his home, a chauffeur who had secured his license number and who testified that he had overtaken and notified Rosenheimer that a girl had been killed, having given the information to the police. Before the case was given to the jury, the court struck out the indictments for first and second degree murder and for first degree manslaughter, leaving only manslaughter in the second degree to be considered. The jury regarded the accident as an unavoidable mishap.

Since Rosenheimer's acquittal, E. S. Cornell, the paid and over-busy secretary of the so-called National Highway Protective Society, has been denouncing the verdict as "a miscarriage of justice," and some of

those concerned are seeking to have Rosenheimer re-arrested for violating the provisions of the Callan automobile law affecting those who run away after an accident. Meanwhile any person or any society who desires to "protect" the highways will find overloaded buggies, minus lights, on Pelham Parkway and almost every other outlying thoroughfare, merely by visiting them after nightfall.

**Booming a Pacific Coast Trunk Road.**

Out on the Pacific Coast, too, the increase in automobile travel has sharpened the keenness for tourists' trade to such an extent that the Pacific Highway Association has been formed to promote the construction of a road from the British Columbia line to the Mexican border. It would pierce the states of Oregon, Washington and California and open up some of the most magnificent scenery in the world. Meetings are being held to further the project, and the line of the proposed road already has been "located" in Washington. This "grand trunk highway," as it is styled, is designed to connect with one which the Canadian government is building from Calgary to Vancouver and which British Columbia expects to extend to the American line near Blaine, Wash.

**Dead Bulls Charge a China Shop.**

The proverbial bull in a china shop was a gentle zephyr when compared with five tons of dressed beef which went on a rampage about midnight on Thursday of last week and broke into the crockery store of B. Aronowitz, on Second avenue, near 39th street, New York City. The "lifeless" remains of bulls and near-bulls proved considerably more lively than could reasonably be expected of "dead meat" and smashed the show window and enough crockery to total \$300 damages. Skidding of a heavy truck of the United Dressed Beef Co. loaded with meat caused the trouble, and the jar of the collision with the house was so heavy as to throw all the dwellers into a panic. It took three powerful trucks to pull the beef-truck out of the wreckage.

**Railway Embankment Cause of Suit.**

Railroads have been sued many a time because of grade crossings' accidents, but Roy Coppersmith, of Grinnell, Ia., has the distinction of being one of the first men to demand damages for sliding off a railroad embankment. He has sued the Ft. Dodge, Des Moines & Southern railway for \$25,000, claiming the death of his parents to have been due to the extreme steepness of the embankment, and the fact that the edge was overgrown with weeds to such an extent as to conceal the danger. The accident occurred a year ago, while Mr. and Mrs. Coppersmith were riding in an automobile; the car slipping down a high, weed-covered embankment, overturned and killed the occupants.

**QUEER SCHOOL FOR CHAUFFEURS**

**Exists to Teach Drivers the Location of London's Streets—Former "Cabbies" in Role of Instructors.**

It seems like an irony of fate that the "superannuated" cab drivers of London should in any way help their successors on the taxicabs to pass examinations as to the topography of London, but such has come to be the case. London streets are a nightmare to the uninitiated; the similarity of streets, and the frequency with which popular names occur in various quarters of the city, make driving a cab in London about one of the hardest jobs imaginable.

There are, for instance, something like eighteen King streets and twenty Queen streets and Queen's roads in London, and the unfortunate candidates are asked to give the shortest cuts from, say, the Bank of England to some obscure street in a remote suburb, bearing the same name as a score of others. It is this very trying examination which has completely floored those young drivers who have never driven hansoms or "four-wheelers."

One result of their tribulations has been the establishment of the "London School." The instructors are seasoned veterans of the old cab rank, and they guarantee to tell young drivers of taxicabs more about London in two weeks than they can acquire from any amount of examinations. The school has been packed with would-be drivers and has met with great success.

The "pupils" are not only made to study maps of London and answer questions, but for a small fee they are driven round the lesser known parts of the East End and the suburbs. It is stated that one of the larger taxicab companies financed this "school of knowledge."

**Where it is Legal to Exclude Automobiles.**

The so-called Bar Harbor automobile exclusion bill, passed by the legislature of the state of Maine last year for the purpose of barring automobiles and other motor vehicles from Bar Harbor, has been declared constitutional by Justice William P. Whitehouse of the Supreme Court of that state. The decision was rendered on November 3d, and Bar Harbor will continue to get along without motor cars. The bill had the support of many New York, Boston and Philadelphia people—one of them a former president of the A. A. A.—who have summer homes at Bar Harbor, but was opposed by many permanent residents.

The Elbert County Automobile Association has been formed at Elberton, Ga., with the following officers: President, Dr. A. C. Smith; vice-president, Dr. D. N. Thompson; secretary and treasurer, T. B. Fisher.

## RECENT PATENTS.

13,148. Hanger for Shock Absorbers. Ernst Flentje, Cambridge, Mass. Filed Feb. 9, 1910. Serial No. 543,003. Original No. 943,671, dated Dec. 21, 1909, Serial No. 519,776.

1. In a shock absorber, the combination with a cylinder and a piston therein, of a clip adapted to be secured to the axle of a car, a hanger member having a stem swiveled to said clip and provided with a laterally-extending foot which is connected to the cylinder, a bracket secured to the frame of the car, and another hanger device provided with a stem which is swiveled to the bracket and provided with an overhanging portion that is connected to the piston rod.

967,779. Tire Protector. Charles W. Jasmer, Marshfield, Wis. Filed June 2, 1909. Serial No. 499,828.

A tire protector comprising an annular body of semi-circular shape in cross section throughout its length, and a plurality of crescent-shaped clamps secured near opposite ends exteriorly of the body in contacting relation to each other, each clamp at its tread portion being of triangular shape in cross section.

967,786. Automobile Transmission Gearing. Frank F. Kohler, South Zanesville, Ohio. Filed Sept. 29, 1909. Serial No. 520,194.

1. In an automobile transmission mechanism, a drive shaft, a series of driving gears splined thereon, a pair of inwardly facing driven gears adapted to mesh with said driving gears, a differential gearing, a driving element therefor connected to said driven gears, and means to vary the position of said driving gears on said shaft and said driven gears with reference to said differential gearing.

967,806. Tire Shield. Herman F. D. Meyer, New York, N. Y. Filed Sept. 29, 1908. Serial No. 455,364.

1. A device of the kind described comprising a shield inclosing a pneumatic tire, a cape formed in overlapping sections, said sections being secured to the shield and overlapping upon a wheel rim, fastening means carried by the cape, casings carried by the wheel rim, radially arranged springs carried by said casings, radially movable plates bearing against the inner ends of said springs, and chains connected to said plates, said chains running through said casings and being secured to the shield.

967,808. Anti-Skidding Device for Automobiles. Robert A. Moore, Chicago, Ill., assignor to Frederick J. Reville, trustee, New York, N. Y. Filed Feb. 17, 1910. Serial No. 544,462

1. In combination with an automobile including a body and a rear driving wheel, an anti-skidding device comprising a hanger, means to normally carry the hanger elevated from the bottom of the wheel, and means to depress the hanger so as to engage the roadway adjacent the bottom of the wheel, said hanger including a foot disposed at an angle to the main portion of the hanger and provided on its lower surface with a series of straight parallel ridges arranged at an angle to the general direction of the foot.

967,828. Compound Internal Combustion Engine. Robert M. Pierson, New York, N. Y., assignor, by mesne assignments, to C. P. Power Company, Newark, N. J., a Corporation of New Jersey. Filed Aug. 14, 1906. Serial No. 330,537.

1. In a compound internal combustion motor apparatus, the combination of a high-pressure member adapted to isolate a compressed charge and to burn and partially expand the same, and a low-pressure member adapted during alternate phases to compress the charge for said high-pressure member and to expand the gases received therefrom, together with valve-mechanism between said members for alternately admitting the charge from the low-pressure to the high-pressure member and admitting the gases from the high-pressure to the low-pressure member.

969,290. Driving Mechanism for Lubricators. Alvaro S. Krotz, Chicago, Ill., assignor to Precision Appliance Company, Chicago, Ill., a Corporation of New Jersey. Filed Oct. 28, 1907, Serial No. 399,555. Renewed Feb. 7, 1910. Serial No. 542,647.

1. In a driving mechanism for force feed lubricators, the combination of an open top casing, an operating shaft of a pumping mechanism arranged inside said casing, a bracket gland secured to the side of the casing, a primary operating shaft journaled in said gland in axial alignment with the aforesaid operating shaft of the pumping mechanism, and a non-circular connection between the two shafts, the bracket gland and its shaft being adapted for endwise adjustment to release the engagement with the operating shaft of the pump mechanism and permit of the same

being removed through the open top of the casing, substantially as set forth.

969,374. Illuminated Sign and Signal Lamp. Worth E. Jepson, Los Angeles, Cal. Filed Dec. 9, 1909. Serial No. 532,196.

1. A sign of the class described having a case, a light within said case, a translucent plate disposed before said light and having corrugations on its inner face adapted to refract the light and an opaque number inscribed on the outer face of said plate having its characters or digits removed laterally from the central axis of the case which is transverse to said plate whereby the portion of the plate adjacent to said characters or digits transmits only refracted and reflected rays to an observer at a remote point.

969,389. Auto Tire. Frank Modlin, Sioux City, Iowa. Filed Oct. 8, 1909. Serial No. 521,656.

1. A vehicle tire consisting of opposed series of segmental spring plates, each plate having a laterally bowed outer portion and an inwardly extended rim engaging portion at its inner end, a tread interposed between and supported by the plates, and means extending between and clamping upon the plates for holding them against lateral and annular movement.

### "A REAL Commercial Truck"

## CASS Motor Truck \$1950

One Ton Only

Choice of several bodies. 30 H. P. Four cylinder motor. Get Catalog and full details of proposition.

CASS MOTOR TRUCK CO., 1031 Lapeer Ave., Port Huron, Mich.

### BY THE COMPANY IT KEEPS

That's a good way to judge the Warner Auto-Meter. You'll see it on the cars of quality everywhere; you'll find it used universally by motorists of experience.

And when a manufacturer furnishes it as part of his regular equipment, at three times the cost of an ordinary instrument, it's pretty good evidence of the quality of his car.

**WARNER INSTRUMENT CO.**  
998 Wheeler Ave. BELOIT, WIS.

# CLEAN AND POLISH YOUR CAR

3 in One will keep many parts of your car spick and span. Try this famous oil for any of the following:

**BODY**—After washing and drying the wood work in regular way apply 3 in One to preserve the varnished finish and keep it bright.  
**SEATS—TOP—CURTAINS**—all leather parts. Wipe with clean waste moistened with 3 in One. Prevents leather from hardening, cracking, rotting. Cleans and preserves.

**BRASS**—lamps—hand rails, etc.—Prevents tarnish, preserves brightness after you have cleaned with metal polish.

**NICKEL PARTS**—3 in One cleans and polishes and positively prevents rust in any weather, in any climate.

Sold at all dealers—10c., 25c., 50c. bottles. Write us for free generous sample. 3 in One Oil Company, 64 Broadway, New York City.

Volume XXV.

New York, U. S. A., Thursday, November 17, 1910.

No. 7

## BRISCOE FORMS FOREIGN COMPANY

**Personnel Not Made Public, but Salesrooms  
Already Located in London—Four  
Years' Guarantee is Offered.**

The foreign company which Benj. Briscoe, president of the United States Motor Co., crossed the water to organize—he still is there—has come into being under the style the United International Motors, Ltd., with temporary offices and salesrooms at 114 Wardour street, London, W.

The names of none of the foreigners identified in the undertaking have yet become public, the new concern contenting itself with the announcement that "we have completed arrangements with the United States Motor Co., of the United States of America, by which we become the concessionaires of that company, with the sole and exclusive right to manufacture and sell in the United Kingdom and on the Continent of Europe, the types of motor cars which have been brought to such a high state of development by that company," and expressing its purpose "to install a manufacturing department which, having the full co-operation of our affiliated companies, will have advantages which cannot be excelled."

Maxwell, Brush, Stoddard-Dayton and Columbia cars already are on exhibition at the London establishment and are being offered with a four years' guarantee.

### Dates Fixed for Selden Patent Appeals.

Monday, Tuesday and Wednesday next November 21, 22 and 23, have been set as the dates when the Selden patent finally will be threshed out to a finish, the Ford-Wanamaker-Gude and the Panhard-Neubauer appeals having been calendared for argument on those days. The argument will be heard in New York by the United States Circuit Court of Appeals for the Third District. That tribunal which sits but three hours each day, has given each side four hours and a half in which to present its pleas as to why the judgment of the lower

court sustaining the validity of the Selden patent should or should not be upheld. The attorneys for the plaintiffs and for the defendants named already have filed their briefs, which term is a misnomer, as all of them are lengthy documents, one of them numbering more than 200 pages.

### Receiver for Rothschild Body Builders.

On Monday last, 14th inst., a petition in bankruptcy was filed against Rothschild & Co. (corporation), the well known body builders at 550 West Fifty-seventh street, New York, by Lillian H. Mandel, of Mount Vernon, and Samuel H. Morrison and Jules Rehaut. Judge Hough appointed Henry B. Singer receiver, bond \$5,000, and authorized him to continue business ten days. There are contracts on hand for \$50,000 worth of bodies. Liabilities amount to \$100,000 and assets about \$30,000. The company, in which one of the French Rothschilds is interested, was incorporated in April, 1906, with capital stock of \$35,000, which was afterward increased to \$200,000.

### Ranger's President Asks for Receiver.

Following a judgment for \$6,083 which he obtained against the company, Oscar F. Schmidt, president of the Ranger Automobile Company, of Chicago, has asked that a receiver be appointed for the concern. The company was capitalized at \$25,000 and manufactured the Ranger car, but did not make very many of them.

### Fiat Brings up a Radiator Patent.

Possessed of the Enrico patent, No. 939,961, dated November 9, 1909, the Fiat Automobile Co., of Poughkeepsie, N. Y., is serving warnings on a number of manufacturers who are alleged to be infringing the Enrico rights. The patent covers a union joint for radiators.

### Bankrupt's Assets Sell for a Song.

The assets of the Southern Motor Car Co., of Houston, which went broke while trying to build automobiles in that Texas city, have been purchased by A. C. Burton, a Houston dealer, for \$1,104. The sale was made by the referee in bankruptcy.

## "CHAUFFEUR'S FRIEND" GOES FREE

**New York Garageman Who Issued Celebrated "Graft Circular" Acquitted—Arrested for Giving Short Measure.**

Although there was no lack of evidence that short measures of gasoline had been sold in his establishment and that the gasoline gauge had been tampered with, Edward Underhill, former proprietor of the Garage De Luxe at 57 East 108th street, New York, was acquitted by the Court of Special Sessions on Monday last, 14th inst. The fact that the chief witness against him, William A. Myers, a one-time employe, had removed across the river to New Jersey and could not be induced to come over and substantiate the affidavit he had made, and that Underhill himself denied everything including personal knowledge of the offense seemed to bear in his favor with the three judges.

Underhill's case was out of the usual order in that it was the first of its sort and that he posed as the "chauffeur's friend" and openly advertised that every chauffeur who brought him business of any kind would get his "bit." His circular holding out this promise of graft was introduced into his trial, but it had only an indirect bearing on the case, with the prosecution of which the Garage Owners' Association was identified. Underhill was charged with violating section 1290 of the penal code in that on July 26th last he sold to Lee J. Mills, an inspector of Weights and Measures, 10 gallons of gasoline at 14 cents per gallon, which when measured in front of Underhill and his employe, one Henry A. Roy, was found to be but 8 gallons and one gill. Mills testified to these facts and further, that after showing his badge he examined the pump or gauge and ascertained that it gave short measure. The pump—a Bowser Automatic—had been adjusted in such a manner as to raise a set screw which prevented the piston from reaching within 1¼ inches of

its limit. It thus delivered 12 to 13 per cent. short measure on each stroke. On August 3d, Inspector Mills returned to Underhill's garage with a representative of the Bowser company and found that the pump had been readjusted, a statement corroborated by the Bowser representative. W. S. Horner, of the Garage Owners' Association and A. P. Palmer, of Palmer & Singer, testified that they were present when Inspector Mills made his short measure purchase.

When placed on the stand in his own behalf, Underhill proved a breezy and loud-mouthed witness. He denied all knowledge of the short measure transaction and avowed that other garage owners were opposed to him because he sold gasoline at less than the prevailing retail rate of 20 to 25 cents per gallon. He frankly admitted that he sold it for anything between 12 and 18 cents, depending on what he thought the buyers would stand. His attorney made a great fight to keep out Underhill's celebrated "graft circular," but it was finally admitted in evidence and appeared to have visible effect on the court. It is as follows:

We make it a point in our business to always keep our word with a chauffeur. He can always depend on us. If we promise him a commission or a percentage or a job he always gets it. You would be surprised to learn what a lot of money we have paid out to wise chauffeurs who always pull with us and nobody else.

If you know of any tires, speedometers, tubes, horns, lamps, or tools for sale, come and see us. We will buy for spot cash and you get yours.

Remember you always get yours.

We have helped many a down-and-out chauffeur when out of a job.

If you know of any one about to buy a new car, bring him to us and get yours.

Keep your eyes open and inquire around and we shall be making money together.

Remember that Underhill is always the friend of the chauffeur, and always keeps his word and makes good.

Despite his attorney's fight to keep the document out of the case and without regard for the dignity of the court, when Underhill was asked if he wrote the circular, he responded in a loud voice:

"Yes; and I consider it a damned good one, too."

Before leaving the stand, he testified that he no longer owns the garage on East 108th street, being now in the same business on 145th street, between Broadway and Amsterdam avenue. After hearing two character witnesses and deliberating for five minutes, the court discharged Underhill, to the surprise and disappointment of a large number of New York tradesmen who were present at the trial.

#### Confusion that Caused Misconceptions.

By a slip of the types, it was stated in last week's Motor World that it was the Columbia Buggy Co. that was in no way involved in the Salt Lake City suit of Mrs. M. E. Smith for the recovery of the pur-

chase price of a Columbus electric, \$1,650, when it was meant to say the Columbus Buggy Co., of Columbus, Ohio. The suit was due to the finding of an old and worthless tray of batteries when the car was delivered and the evidence showed that the substitution had been made after the car had left the Columbus factory and had reached Salt Lake City.

#### San Franciscans Secure Sacramento Site.

The "A" Automobile Mfg. Co., of which E. C. Collins and T. F. Cooke, both of San Francisco, are president and treasurer, definitely has decided to locate in Sacramento, Cal., where a ten acre site has been secured. An office has been established in the Hotel Land building and as soon as the company's architect has made "a thorough examination of the ground," a steel and concrete factory will be erected. In addition to making this announcement, the "A" people have stilled some fears by making known that they mean not merely to assemble cars but to build them entire and "sell them at considerably lower prices than those manufactured in the East."

#### Bostonians Form a Truck Association.

Under the style the Boston Motor Truck Association a new body was organized on Saturday last, 12th inst., by automobile dealers in the Bean city. Twenty-five members were enrolled and these officers elected: President, J. W. Maguire; vice-president, A. P. Underhill; treasurer, J. S. Hathaway; secretary, Chester I. Campbell; board of directors: the above-mentioned officers and A. B. Henley, V. A. Charles, L. B. Butler and C. F. Whitney.

#### Robinson Republic Rubber's Chairman.

Thomas L. Robinson, trust manager of the Dollar Savings & Trust Co., of Youngstown, Ohio, has been elected chairman of the board of directors of the Republic Rubber Co., of that city. He succeeds the late Warner Arms as the financial head of the big company. After the death of Mr. Arms, J. F. McMaster was elected president to succeed him, but he will devote all his time to the duties of president and general manager.

#### Waverley Establishes Branch in Chicago.

The Waverly Co., of Indianapolis, has taken over the business of the Waverley Electric Vehicle Agency in Chicago and henceforth will conduct it as a factory branch at 1714 Michigan avenue, although it soon will be removed to larger and handsomer quarters further south on the same avenue. J. C. Cooley, who previously was identified with the agency, is in charge of the branch.

#### Koehler Carries Hupmobiles to Boston.

The H. J. Koehler Co., of New York, Eastern distributor of the Hupmobile, is to establish a Boston branch for the ex-

clusive sale of that car; in fact, temporary headquarters already have been opened at 17 Ipswich street, but the new branch will be permanently located at 1074 Boylston street, which place when its appointments are completed, will be one of the handsomest retail stores in New England. It will be under the management of W. H. Shutt, formerly metropolitan manager of the Koehler company.

#### Spare Tire Cases Get into Court.

The Gilbert Mfg. Co., of New Haven, Conn., has filed suit in the United States Circuit Court, against the B. E. Mfg. Co., of New York, alleging infringement of the Fredson E. Bowers patents on spare tire cases. The usual injunction and accounting is asked for. The patents involved are Nos. 779,578 and 915,069.

#### Engineers Fix Date for Annual Meeting.

The annual meeting of the Society of Automobile Engineers will take place in New York, January 11 and 12. Officers will be elected, of course, and there will be discussed several technical subjects concerning which printed papers will be distributed in advance of the meeting.

#### Moline Superintendent Sails to Paris.

Eugene Grunewald, superintendent of the Moline Automobile Co., sailed on Tuesday last to Europe. He goes principally to cast a critical eye over the Paris show and with long stroke motors specially in mind, the Moline company being one of the American advocates of that type of engine.

#### Jewel Capital Increased to \$450,000.

The Jewel Carriage Co., of Carthage, Ohio, maker of the Jewel car, has increased its capital stock from \$250,000 to \$450,000. Of the new issue, \$150,000 is 6 per cent. first preferred cumulative stock and \$50,000 second preferred, non-cumulative.

#### To Build Big Truck Plant in Detroit.

The Universal Motor Truck Co., of Detroit, Mich., has contracted for the immediate erection of a factory at Theodore and Dequindre streets. It will be of four stories, 253 x 61 feet, of concrete and pressed brick.

#### Faurote Quits the Automobile Business.

Fay L. Faurote, advertising manager of the E. R. Thomas Motor Co., Buffalo, N. Y., has resigned that position to become attached to a large corporation in Chicago. His resignation becomes effective November 30th.

#### Pelletier Suffers a Double Affliction.

E. Leroy Pelletier, the widely known publicity manager of the E-M-F Co., is seriously ill at his home in Detroit. A supposed indisposition has developed into a case of typhoid pneumonia.

**BANKERS RETIRE OLD DIRECTORS**

**Wall Street Shakes Up General Motors and Retains Only Durant—Doings at the Annual Meeting.**

Wall Street tightened its grip on the General Motors Co. on Tuesday last, 15th inst., when at the annual meeting of the company, held in Jersey City, the men who advanced the \$15,000,000 loan, formally elected their representatives as directors. In accordance with the program, all of the former General Motors' directors, save W. C. Durant, stepped down and out, and were succeeded by these men who had been nominated by the voting trustees: W. C. Durant, Anthony N. Brady, James J. Storrow, Albert Strauss, J. K. McClement, Nicholas L. Tilney, Richard Lakeman, Jr., George Richard, Jr., Benjamin F. McGuckin, Herbert L. Carlebach and Arthur P. Bush, Jr. The last four named, it is understood, are merely temporarily on the board. They will be succeeded later by four Detroit men.

Four of the new directors represent the General Motors Company. The others represent the financial interests which floated the note issue. Mr. Storrow is of Lee, Higginson & Co., of Boston, and Mr. Strauss is with J. and W. Seligman & Co.

The new board shortly will meet to elect officers.

The retiring directors are William E. Eaton, Curtis R. Hatheway, J. T. Smith, William J. Mead, Henry Henderson, A. M. Bentley, Samuel McLaughlin, Schuyler B. Knox, E. R. Campbell and W. C. Leland.

The directors also declared the semi-annual dividend of 3½ per cent. on the preferred stock, which had been deferred from October 15, to be paid on November 30, 1910. It is payable to holders of stock trust certificates on record at the close of business November 21, 1910.

The fact that Anthony N. Brady, one of the new directors, is also interested in the United States Motor Co. has revived the often denied reports of a probable merger of the General Motors and United States companies.

After Tuesday's meeting, W. C. Durant, vice-president of the company, gave out a statement to the effect that the company had received sufficient funds to pay all its debts and those of its subsidiaries and that checks are "now in process of being mailed." The statement continues:

"To provide for the repayment of these advances the company has issued \$15,000,000 of 6 per cent. five year sinking fund notes of a total authorized issue of \$20,000,000 secured by a first lien upon the manufacturing plants of the subsidiary companies to the Central Trust Company of New York as trustee. The deed of trust provides for

a sinking fund which is payable as follows: On or before the first day of October, 1911, the sum of \$1,500,000.

"On or before the first day of October, 1912, the further sum of \$1,500,000.

"On or before the first day of October, 1913, the further sum of \$2,000,000.

"On or before the first day of October, 1914, the further sum of \$2,000,000.

"The \$5,000,000 of reserved notes can be issued only subject to the restrictions of the deed of trust.

"Pursuant to an agreement with the bankers a majority of the outstanding capital stock of the company has been deposited with the Central Trust Company of New York as depository to be voted until repayment of the notes by Messrs. James N. Wallace, William C. Durant and Anthony N. Brady as voting trustees."

For several days preceding Tuesday's meeting, the recorders of mortgages in the places where the General Motors' properties were kept busy recording deeds of transfer from the subsidiary companies to the General Motors Co. In Detroit, the Cadillac transfer represented a consideration of \$1,840,000, the Welch realty, \$300,000, and the Northway Motor & Mfg. Co.'s \$529,000. In Saginaw, Mich., the transactions represented transfers of the Marquette Motor Co.'s property, \$475,000, and the Jackson-Church-Wilcox Co., \$132,000.

Despite the final consummation of the big loan, the value of General Motors' shares has refused to soar even in Detroit. Instead of rising, on Saturday last, the preferred went off 3 points, being quoted in Detroit at 75, while the common still linger around 40.

**Carples Resigns to Enter Import Trade.**

James M. Carples, since their organization the manager of the Licensed Automobile Dealers of New York, has tendered his resignation. He is to become general manager of the Daimler Import Co., of New York, which handles the Mercedes car in this country. His successor has not yet been chosen. At the last meeting of the Dealers, however, they filled the vacancies caused by the resignations of George W. Bennett and Harry Fosdick, both of whom have gone into the manufacturing end of the business. Their successors are R. H. Johnston (White) Co., and I. M. Upperson (Cadillac).

**Boston Top Makers Building Big Plant.**

The Columbia Tire & Top Co., of Boston, Mass., which makes tops and windshields and not tires and which recently transferred itself into a corporation, is using much of its new capital for the erection of a two-story concrete factory building, 144 x 60 feet, on Commonwealth avenue, Boston. The structure will be ready for occupancy January 1st. Meanwhile the company is continuing its business at 31 Irvington street.

**THE "SECOND HAND" SITUATION**

**The Used Car Still a Baneful Factor—Some Causes and Remedies Discussed by a Man High Up.**

Despite the time and effort devoted to its attempted solution, the used car problem still remains very much of a question and one which does not contribute to either the peace or the plenty of the industry. In some places the situation has assumed serious proportions. In Chicago, for instance, the accumulation of second-hand cars attained such proportions that auction sales were resorted to as a means of relieving the glut; and auction sales usually are disturbing factors and do not contribute to the health of any business.

In at least two other known instances, in Eastern cities, the dealers concerned took so many used cars in trade for new ones that they were seriously crippled. One of them saved himself from bankruptcy only by the most drastic measure. With some fifty-odd second-hand cars in stock at the close of the season he awakened to his peril and met it by resolutely refusing to contract for a single new car for the ensuing year; he applied himself wholly to the task of getting rid of the "old fellows;" in other words, during most of the season just closed the dealer was to all intents and purposes a "second-hand dealer," not from choice but from necessity. By hard work and with good luck he "cleaned house" and once more is able to smile; but he is a much chastened individual.

Most of the trouble is due of course to the desire of the dealer to do too much business, and apart from winning new customers to keep his old ones. To serve these ends he is prone to take too many old cars in trade and to allow for them prices that are far too high. Usually the higher the price of the car he handles the higher the price he allows for the car that is taken in trade; in fact, it is the dealer who handles cars listing at more than \$1,000 or \$1,500 to whom the used car question is most serious. The very price of the product induces him to engage in "trades" which agents for lower-priced cars could not consider even for a moment.

"It is bad enough for an agent to allow fancy prices for old cars," said a man high up in the trade who did not attempt to disguise the fact that the used car is something of a menace, "but the matter is made worse by the manner in which he usually hangs on to them. Always he is bent on 'getting his money back,' and usually he is over-sanguine on the point. Rarely does he seem fully to appreciate that nothing depreciates more rapidly than second-hand goods, and as a result he holds on to his traded-in cars until they become practic-

ally dead weights on his hands. I know so many instances of the sort that it irritates me to think of them. I know one chap who allowed \$1,400 on a "trade" and who a week later was offered \$1,200 for the used car. He laughed it to scorn. He was intent on 'getting his money back.' But when after several weeks he decided to sell for \$1,200, he could obtain but \$1,000 and again he refused it. When toward the close of the season he finally brought himself to 'take his loss,' he sold the car for \$900. While the amounts may vary, this is typical of the average dealers frame of mind and of the general result. No agent can do that sort of thing very often or very long and remain in business, or at any rate do much more than live from hand to mouth. To be safe, the dealer must cease placing fictitious values on old cars. He must let the owner bear the loss, and when he does take a used car in trade he must get rid of it just as quickly as the law allows. Every day that he holds it lessens its value, and it is time this important truth was realized. The matter is of concern to the manufacturer, because if the dealer cannot make money, the manufacturer cannot do so."

"Is not some of the trouble due to the desire of the manufacturer to book large orders and thus cause dealers to overpurchase and overstock themselves?" asked the Motor World representative.

"I don't think so," responded the high-up man. "I don't think many manufacturers are doing that sort of thing nowadays. Most of them realize the folly of deceiving themselves, and if they are doing anything, they are urging their agents to buy conservatively and in many instances actually are paring down the agents' orders. There really is no reason why any dealer should overbuy or overstock himself. The supply now practically is abreast of the demand, and there is no necessity for any dealer to indulge in guesses as to the extent of a whole season's demand. All he need do is to place orders for early spring deliveries; the remainder of the year will take care of itself, and there is small likelihood that he then will be unable to get cars just when he wants them."

"But is it not a more or less notorious fact that the manufacturers' branch houses have been among the worst offenders in respect to the trading-in evil. Generally speaking, have they not been allowing for used cars prices which the ordinary agent scarcely could dream of quoting and is it not frequently merely a polite form of pricecutting?"

"I won't say 'yes' and I won't say 'no' to those questions," replied the man high up. "If they represent the situation correctly, then the manufacturers concerned have paid a high price for their folly, and I think you will find that it is no longer true and that the wings of the branch stores have been considerably trimmed."

### THE WEEK'S INCORPORATIONS.

Sioux Falls, S. D.—Ashton Auto Co., under South Dakota laws, with \$20,000 capital.

Grand Blanc, Mich.—King Shock Absorber Co., under Michigan laws, with \$5,000 capital.

Muskegon, Mich.—Calhoun Motor Materials Co., under Michigan laws, with \$1,000 capital.

Detroit, Mich.—Wolverine Motor Supplies Co., under Michigan laws, with \$25,000 capital; to deal in supplies and accessories.

Bronxville, N. Y.—Bronxville Garage Co., under New York laws, with \$10,000 capital; porators—H. C. Andrews, G. C. Betts and A. D. Britton.

Detroit, Mich.—Jeffery-Dewitt Co., under Michigan laws, with \$50,000 capital; to manufacture spark plugs. Corporators—M. E. Lewis, Sarah A. Dewitt, B. A. Jeffery.

Syracuse, N. Y.—Regal Auto Co., under New York laws, with \$5,000 capital; to do general automobile business. Corporators—Charles J. Travers, Otto Johnson, W. F. O'Connor.

St. Louis, Mo.—Brooks-Latta Auto Co., under Missouri laws, with \$150,000 capital; to manufacture automobile trucks. Corporators—Charles E. Brooks, Charles Latta and Allen T. Latta.

Boston, Mass.—Lenox Motor Car Co., under Massachusetts laws, with \$75,000 capital; to deal in motor vehicles. Corporators—A. A. Martell, Boston, and F. A. McKlaskey, Brockton.

Danville, Ky.—Danville Motor & Electric Co., under Kentucky laws, with \$5,000 capital; to maintain a garage and deal in automobiles. Corporators—E. B. Nelson, H. P. Beasley, Alfred B. Nelson.

Milwaukee, Wis.—Evinrude Motor Co., under Wisconsin laws, with \$20,000 capital; to deal in automobiles and other motor vehicles. Corporators—Ole Evinrude, Christopher J. Meyer, Amanda Meyer.

Dayton, Ohio—Dayton Taxicab Co., under Ohio laws, with \$25,000 capital; to operate a taxicab service and maintain a garage. Corporators—J. D. Hodson, J. G. Hamilton, G. G. G. Peckham, A. S. Iddings.

San Antonio, Tex.—Commercial Motor Car Co., under Texas laws, with \$100,000 capital; to manufacture and deal in automobiles and motor vehicles. Corporators—Z. Z. Brandon, B. A. Gramm, H. O. S. Kinner.

Buffalo, N. Y.—Lutz Motor Co., under New York laws, with \$20,000 capital, \$3,000 of which has been paid in; to deal in motor cars. Corporators—Edward J. Hussey, William G. Pennypacker, Jr., William A. Lutz.

Toledo, Ohio—Standard Garage Co., un-

der Ohio laws, with \$5,000 capital; to maintain a garage and deal in automobiles. Corporators—R. A. Parker, Jennie Parker, William Searles, M. M. Turner, William G. Clark.

Indianapolis, Ind.—Roberts Mfg. Co., under Indiana laws, with \$10,000 capital; to manufacture carburetters and other mechanical devices. Corporators—J. N. Kelly, L. J. Edmunds, W. H. Roberts, Elmer Wetzel.

Milwaukee, Wis.—Automobile Directory Co., under Wisconsin laws, with \$5,000 capital; to publish lists of persons employed in the automobile trade. Corporators—W. J. Murphy, John McLaughlin, W. J. McLaughlin.

St. Paul, Minn.—Electric Auto Light Co., under Minnesota laws, with \$50,000 capital; to manufacture automobile lamps. Corporators—Franklin G. Curtis, Robbinsdale, Clarence D. Price, Fred W. Price, of Minneapolis.

Brooklyn, N. Y.—Purchasers Automobile Co., under New York laws, with \$10,000 capital; to deal in automobiles and other motor vehicles. Corporators—Clyde E. Black, Joseph M. Schwartz, Nathan T. Schwartz, all of Brooklyn, N. Y.

Detroit, Mich.—Lodewyck-Hyder Motor Co., under Michigan laws, with \$15,000 capital; to deal in automobiles and operate a garage. Corporators—A. G. Lodewyck, Ralph W. Binkley, Edward A. Cother, Henry A. Lodewyck, all of Detroit.

New York City, N. Y.—J. S. Bretz Co., under New York laws, with \$30,000 capital; to manufacture and deal in carburetters, magnetos, ball bearings, etc. Corporators—J. S. Bretz, A. L. O'Shea, of New York City; C. V. Tuthill, of Jersey City, N. J.

Bloomington, Ill.—People's Bus Line and Livery Co., under Illinois laws, with \$38,000 capital; to do general garage, livery, omnibus and carriage business. Corporators—John A. Beck, Chester E. Montgomery, Jennie A. Beck, Richard A. Jolly, all of Bloomington.

Poughkeepsie, N. Y.—Cleveland Taxicab Co., under New York laws, with \$10,000 capital; to rent automobiles for hire and conduct a general livery business. Corporators—Manning Cleveland, Frederick H. Cleveland, Nora B. Cleveland, all of Poughkeepsie, N. Y.

Newark, N. J.—Brown-Sautter Motor Truck Co., under New Jersey laws, with \$100,000 capital, of which \$2,800 has been paid up; to manufacture and deal in commercial motor vehicles. Corporators—John E. Brown, George Sautter, Harry Sautter, all of Newark, N. J.

### Increases of Capital.

Chicago, Ill.—Clark Delivery Car Co. from \$5,000 to \$150,000.

## IN THE RETAIL WORLD.

W. S. Mitchell, of the Citizens Auto Co., San Marcos, Tex., has sold his interest to W. A. Schrutchin and Marion Wills.

A new garage is being erected in Jacksonville, Fla., by Claude Nolan. It is located at 15-17 East Church street, and will house the Cadillac line.

Under the style Harding & Glanville, a new firm has opened in Mason City, Ia. Clarence Harding and Charles Glanville compose the partnership.

L. L. Dixon has purchased the Palace Garage, 497 Main street, Dallas, Tex. Dixon formerly was engaged in the automobile business in Fort Worth.

William Van Orsdel has purchased a half interest in the Dunagan Garage at Glenwood, Ia. The firm name has been changed to Dunagan & Van Orsdel.

J. H. Moorse has purchased the business of O. W. Lane and will continue it under his own name. The garage is located on River street, Lansing, Mich.

The Southern Motor Works, which manufactures the Marathon car in Nashville, Tenn., has established a branch in Dallas, Tex. It is in charge of H. H. Brooks.

E. T. Sterling, a banker of San Francisco, Cal., has formed a partnership with A. J. Smith to handle Elmore cars in that city. The firm name will be Smith & Sterling.

At a cost of \$4,000 the Brown Auto Co., of Louisville, Ky., is erecting a one-story brick garage on Third street. The building is to be ready for occupancy by December 1.

Finding its former quarters too cramped, the Straeffer-Arterburn Motor Car Co., of Louisville, Ky., has moved its offices from 1103 East Broadway to 324 East Market street.

Samuel W. Avis, who conducted a garage and renting establishment in New Britain, Conn., has filed a petition in bankruptcy. His liabilities are \$5,032.16 and his assets \$1,965.02.

T. A. Davis, Harry W. Smith and C. S. Cummings have formed a partnership and opened a garage and salesroom in Seattle, Wash. They will handle Lozier cars and Mack trucks.

The Longstreth Motor Car Co., of Reading, Pa., has moved into more commodious quarters at 212 Penn street, and will continue to show Pullman automobiles. E. F. White is the manager.

Work has been started on the new garage which H. W. Balsley is building at South Clinton and Tallman streets, Syracuse, N. Y. The structure will be 82 x 125 feet, of steel and concrete.

The agency for Regal cars in Wichita, Kans., has been taken over by the Baldauf & Liggett Co., which also handles Crawford and Franklin cars. The headquarters are at 118 North Emporia avenue.

A new garage is under course of construction for the Central City Motor Car Co., at Taylor and South streets, Syracuse, N. Y. E-M-F and Haynes cars will form the mainstay of the company.

A. T. Segura, of New York City, has established a salesroom for second-hand cars at 5355 Stanhope street, Boston, Mass. He is associated in the venture with Fred A. Load, who builds automobile bodies.

S. M. Ament, formerly with the Oldsmobile agency in Pittsburg, Pa., has purchased an interest in the Metropolitan Motor Car Co., at 1311-15 Fifth avenue. The company handles the Alco and Pullman productions.

The Deck & Stewart Auto Tire Co. is the style of a new concern that has opened up an automobile tire business at the corner of Fifth and Lafayette streets, Waterloo, Ia. Jacob Deck and A. C. Stewart are the men in charge.

With a capital stock of \$5,000, fully paid up, the New Auto Exchange Co. has been incorporated in San Diego, Cal., to operate a garage and salesroom at 2345 H street. J. W. Coats, H. A. Kiersey and E. Brockway are the men behind the venture.

Incorporated under the laws of Ohio with a capital stock of \$5,000, the Standard Garage Co., of Toledo, Ohio, has opened up at 233-37 Ontario street. R. A. Parker, Jennie Parker, William Searles and William G. Clark are the incorporators.

The Paxton & Gallagher Co., of Omaha, Neb., one of the West's big hardware jobbing houses, has added to its stock a complete line of automobile accessories. The company also has been appointed distributor of Sterling tires in the Central West.

Organized with the intention of marketing National cars in Southern California, the National Motor Car Co. has opened a garage at 2414 West Seventh street, Los Angeles, Cal. The firm is composed of J. D. Scouller, A. M. Brown and E. Y. Booth.

Schedules in bankruptcy of the Cloud-Marts Co., of 1871 Broadway, New York City, show liabilities of \$6,072 and no assets. The assets were transferred by order of the Supreme Court on September 20 to Franklin Leonard, Jr., as receiver in dissolution proceedings.

R. A. Cruzan & Co., the Cartercar agents in Des Moines, Ia., have purchased the property at 909-911 Walnut street in that city, which is being remodeled to suit their needs. When the improvements are completed, the firm will have a much larger and much handsomer establishment.

The Reo Motor Distributing Co., of Atlanta, Ga., has been formed for the distribution of Reo cars in the South, and has located at 222-224 Peachtree street. H. E. F. Jones is the president of the company, R. C. Smith, vice-president, and Jere

F. Turnlin, secretary-treasurer and manager.

The Cartercar Sales Co. has been organized in New Orleans, La., and has located at 1922-24 Common street. As its title indicates, it will handle the friction-driven Cartercar. J. A. Jaeger is president of the company, T. B. Cucheran, vice-president; R. L. Gaeger, secretary, and Victor Shaw, manager.

Under the style Shallberg & Howard, the three Shallberg brothers of Moline, Ill., and I. T. Howard, the inventor of the electrical block signal system used on the Rock Island railroad, have opened a garage, salesroom and repair shop at 1204 Fourth avenue, Moline, Ill. The building is 45 x 151 feet, of brick construction, two stories high, and will serve as headquarters for Cole cars and the Rauch & Lang electrics.

A petition in bankruptcy has been filed in the United States District Court against the Pennsylvania Motor Car Co., which was doing business at 128 North Broad street, Philadelphia, Pa. The proceedings, which were taken by three creditors whose aggregate claims amount to \$534,24, form the climax to the disappearance on November 5th of Walter M. Cram, manager of the company, and the execution of a judgment for \$2,009.24 obtained against the company by John G. Vogler, of 622 Chestnut street. The petitioning creditors are Walter E. Lanagan, Vulcan Brazing & Machine Co., and Lovegrove & Co. The assets and liabilities of the company cannot be estimated at this time, owing to the disappearance of the manager and difficulties in locating the proper items in the books.

## Recent Losses by Fire.

Council Bluffs, Ia.—J. C. Erler's garage totally destroyed. Loss, \$10,000.

Cleveland, Ohio—Acme Brass Foundry Co.'s Woodland avenue plant burned. Loss, \$5,000.

New York City, N. Y.—Bretton Hall Garage, 152 West 83d street, damaged and five cars destroyed. Loss, \$25,000.

Philadelphia, Pa.—Automobile Sales Corporation, 144 North Broad street, one car burned and garage damaged. Loss, \$3,000.

South Windsor, Conn.—J. E. Lathrop's garage and four cars destroyed. Loss, \$10,000; covered by insurance.

## Changes Among Prominent Tradesmen.

Orin S. Wilson has been appointed manager of the Studebaker Colorado Vehicle Co., of Denver. Previously he was connected with the Studebaker headquarters in South Bend, Ind.

E. B. Tozier has been transferred from the management of the Diamond Rubber Co.'s Cincinnati branch to similar duty at the Diamond branch in Minneapolis, where he succeeds W. E. Roby. Tozier has been in the Diamond service some seven years.

## A New Car

**T**HE WHITE COMPANY presents its latest model, a 40 Horse-power Gasoline Touring Car—with five passenger torpedo body priced at \$3,000.00; with seven passenger body at \$3,200.00. This car being an entirely new design finds our engineers unhampered by precedent, and with but one idea uppermost, to produce the best type of car possible. This car, therefore, combines the best and most advanced engineering of the day, and the finest examples of the body builder's art. The triumph of the motor design will be found in its economical operation. Our engineers have but one order, and that, to produce the best. It is with pride that we announce that the essential characteristics of the White Gasoline Construction are retained—the cylinders are cast en bloc and the economical long stroke engine is continued.

In fact, so typical of the best and latest engineering practice is the 30 horse-power White gasoline motor, that with the experience of the world's engineers from which to draw, no improvements have been suggested in the new engine—and it may be called only a larger type of the same design.

Sample cars will be on display  
on or before November 25th.

### About Safeguarding the Accelerator.

Probably most people are not aware that an automobile is possessed of nerves. Yet there exists in the patter of the professional chauffeurs a phrase that shows plain recognition of such an attribute. "Will she jump if you jump on her?" they ask, and the answer affords a prompt and terse measure of the "life" of the machine under discussion. By a stretch of the imagination the strange lack of agreement between the novice driver and his car also may be laid to the same cause; the car resents unfamiliar handling and a quarrel ensues in which the driver is lucky if he comes off skin-whole.

Among engineers the same quality is recognized under the term acceleration, and the fancied "nervous system" of the car is known to center about the mechanism of control. If the car is possessed of sufficient accelerative power it will literally step from under when the throttle pedal is trod upon

violently—it will "jump" when it is "stepped on." But, by the same token, the response in a good car will be just as prompt and decisive whether the pedal movement is intentional or otherwise. Hence the occasional mishaps of the amateur or excited driver who mistakes the accelerator for the clutch or brake pedal.

In the case of the novice and some who are not novices, it almost invariably happens that a wrong movement is made at a critical instant. There are exigencies when action must be, if possible, as rapid as thought, and even more certain. At such a juncture even an experienced driver may become confused for the moment if the arrangement of the car offers a chance for confusion. In the recent and more or less celebrated Rosenheimer case in New York, the defendant testified that at the instant of colliding with the buggy he inadvertently touched the accelerator in mistake for the brake pedal, and there have been other instances in which experienced drivers have made equally fatal mistakes under similar circumstances.

About the question of control mechanism much difference of opinion exists. At the present time there is a certain sort of rough standardization in the arrangement of pedals and levers, yet the uniformity is not sufficiently close so that a man may climb out of one car and into another of a different make and drive it with equal assurance in every instance. Sometimes the differences may be only embarrassing. More often they are really dangerous, and this is especially true when emergency brake levers are found to work in opposite directions, when the positions of first, second and third speeds are transposed and especially when the accelerator and clutch pedals are brought too close together.

Apart from the irregularities in the practice of different manufacturers, it is a fact that few, if any, control systems are ideal in arrangement. It is true that cars are not built for children to drive, that a certain amount of mechanical intelligence is presupposed in a person who is otherwise competent to drive, but it is recognized that the more elementary the control arrangements may be the simpler the problem of learning to drive and the less the liability to confusion. Obviously the matter is one that will bear a great deal more study than yet has been given it.

Insofar as the "nerves" of the average

car are concerned, it is obvious that their control depends upon the nature and position of the accelerator. A needless variety of patterns exists and no uniformity of location. And while it is not easy to dictate just what arrangement is best, it is possible to criticize faulty arrangements. For example, the push-button and piano pedal types should go, as being inclined to weary the foot and ankle; the crowding of the accelerator close to the clutch and brake pedals, where it may be touched by mistake should be eliminated and above all, the accelerator should be so far removed from the clutch pedal that there will be no temptation to apply the clutch foot to it. Wherever it should be and however it should be arranged, the "ticklish spot" should be of such a nature that it cannot be reached accidentally.

### Salesmanship at the Annual Shows.

It may be possible to sell a large number of pianos on the merits of their cases, and where this condition obtains it is the varnish maker as much as the clerk who furnishes the real selling argument. But every experienced and successful piano house finds it expedient to have on the floor at least one representative who is both a technical musician and an expert in the construction of actions, sounding boards, harps and strings. Similarly it occasionally may happen that the seductive lines and lustrous surface of its body actually perform the function of selling an automobile, while the demonstrator and salesman merely serve as accessories to the display. It would be very fine if such were invariably the case in the marketing of motor cars—both handy and economical—but it is not.

The wisdom of the public in respect to automobile matters is increasing at a rate that puts some of the alleged experts of the industry to blush. Competition is forcing manufacturers to assist in popular education; to establish conviction as to the advantages of their respective products it is necessary to define their excellences, to make the demonstration clear it is necessary to expound certain fundamental principles. The result is that the average motorist, and particularly the motorist-in-embryo, are delving into automobile theory to an almost embarrassing extent. The automobile salesman of the old school often feels the effect, and unless he has been

bright enough to get thoroughly acquainted with the works of his car he frequently finds himself shifting from the aggressive position of assured knowledge to the uncertain and often fatal one of ordinary bluff.

Of course it is recognized that the retail dealer is not wholly to blame if his staff is ignorant, careless or just plain incompetent. It is not so easy to get good men in the first place, and, when they are really good, that is, well informed, competent, courteous and experienced in the wiles of salesmanship, it is not always easy to hold them. The case of the manufacturer is somewhat different. And it is passing strange that in many instances the maker's own representatives give the impression of being no better versed in the mechanical properties of their cars than the ordinary run of garagemen.

The sad truth never is more apparent than at show time, when thousands of eager students of automobiling crowd around the booths in an effort to clinch information they have been grasping at for months, possibly for a whole year. And while the average exhibitor probably would shrink from the thought of running his part of the show merely as an educational exhibit, that is what it actually amounts to in large measure, and that explains in part its attraction for the public. Ignoring the possibilities, however, it has been the custom for many years to put on the stands attendants of the grade of furniture salesmen. One who has had experience of the sort, expresses his views forcibly elsewhere in this issue, and it may be said that his disappointments are similar to those of many seekers after real information at the shows. There is no question about its being hard to get good salesmen, but it also is hard to build a good car; it is the lumpiness of certain organizations that affords the real cause for complaint.

#### Possibilities of Portable Telephones.

From as far North and West as Duluth comes the news of a movement that is small in its way, yet evidence of the big ideas that spring in the newer sections of the country. The project is to enlist the co-operation of the telephone companies and secure the installation of plug sockets on every fifth telephone pole along established lines. The motorists, who are responsible for the scheme in its present form, then could hire portable instruments, which

## COMING EVENTS

November 19-26, Oakland, Cal.—First annual show of Oakland Automobile Dealers' Association in Idora Park.

November 22-26, Lake Charles, La.—Louisiana Fair Association's race meet.

November 24, Redlands, Cal.—Mile High Hill Climb Association's contest.

November 24, Santa Monica, Cal.—Southern California Automobile Dealers' Association's annual road race; 200 miles.

November 24, Guttenberg, N. J.—Race meet under auspices of the Automobile Club of Hudson County.

November 24, New Orleans, La.—Race meet under auspices of New Orleans Automobile Club.

November 26-27, Los Angeles, Cal.—Motordrome races.

November 30-December 1, New York City—Annual meeting of American Automobile Association in Hotel Belmont.

December 3-18, Paris, France—French Automobile Manufacturers' Salon in Grand Palais.

December 12-17, Los Angeles, Cal.—First annual "independent" show of Los Angeles Motor Car Dealers' Association at Shrine Auditorium.

December 24-31, Los Angeles, Cal.—Second annual show of Licensed Motor Car Dealers' Association of Los Angeles at Fiesta Park.

December 25-26, Los Angeles, Cal.—Twenty-four hours race at Motordrome.

December 31-January 7, New York City—"Independent" automobile show in Grand Central Palace.

January 2-7, New York City—Importers' automobile show in Hotel Astor.

January 7-14, New York City—Association of Licensed Automobile Manufacturers eleventh annual show in Madison Square Garden. Pleasure cars and accessories.

January 11-12, New York City—Annual meeting of the Society of Automobile Engineers.

January 13, New York City—Annual banquet of the Motor and Accessory Manufacturers at Waldorf-Astoria.

January 14-28, Philadelphia, Pa.—Annual show of Philadelphia Licensed Automobile Dealers' Association in Third Regiment Armory.

January 15-21, Detroit, Mich.—Detroit Automobile Dealers' Association's annual show in Wayne Pavilion.

January 16-21, New York City—Association of Licensed Automobile Manufacturers eleventh annual show in Madison Square Garden. Second week devoted to commercial vehicles.

January 16-22, Detroit, Mich.—Detroit Automobile Dealers' Association's annual show in Wayne Pavilion.

January 28-February 4, Chicago, Ill.—National Association of Automobile Manufacturers' tenth annual national show in Coliseum. Pleasure cars and accessories only.

February 6-11, Chicago, Ill.—National Association of Automobile Manufacturers' tenth national show in Coliseum. Second week devoted to pleasure and commercial cars, motorcycles and accessories.

February 14-19, Dayton, Ohio—Second annual show in Memorial building.

February 15-21, Kansas City, Mo.—Fifth annual show of Kansas City Automobile Dealers' Association.

February 18-25, Minneapolis, Minn.—Minneapolis Automobile Show Association's annual show in National Guard Armory.

February 20-26, Omaha, Neb.—Third annual show of the Omaha Automobile Show Association in Auditorium.

February 24-27, New Orleans, La.—First annual show of New Orleans Automobile Club at Fair Grounds.

February 25-March 4, Toronto Canada—Annual show under auspices of Ontario Motor League.

February 25-27, New Orleans, La.—New Orleans Automobile Club's annual Mardi Gras racemeet on Fair Grounds track.

March 4-11, Boston, Mass.—Boston Automobile Dealers' Association's annual show in Mechanics building.

March 7-11, Des Moines, Ia.—Third annual show of Des Moines Automobile Dealers' Association at the Coliseum.

March 15-18, Louisville, Ky.—Louisville Automobile Dealers' Association's annual show in First Regiment Armory.

could be carried in suitable cases in their cars, and so would be able to secure immediate connection with towns and villages from any point on the road.

Essentially the scheme is not a new one. For a number of years telephones have been carried on the cars of some suburban trolley lines, stations being installed at the turn-outs so that the crews might get into

touch with the despatcher at any time when signals were insufficient. The idea also has had other applications. Its particular significance as advanced in this connection is that it opens the way to efficient public service in the future when motor travel over trunk-line highways shall have reached a magnitude and importance as yet undreamed of.

## CLOSE SCORES IN CHICAGO CONTEST

Even Technical Examination Failed to Break One Tie—Awards for Reliability, Economy and Tires.

It required the technical examination to evolve the winners of the Chicago Motor Club's five days 1,000 miles reliability contest, which finished on Friday last, 11th inst. In fact, in one class, that for the

here to the schedule. The final score was as follows:

## Stewart Speedometer Trophy.

Driver and Car	Road Score	Tech.	Total
Williams, Haynes .....	0	2	2
Fundleburg, Imperial .....	0	5	5
Padley, Henry .....	0	6	6
Donnelly, Cino .....	0	13	13
Emery, Cunningham .....	1	22	23
Robbins, Abbott-Detroit...	1	34	35
Brown, Abbott-Detroit ...	3	38	41
Daubner, Halladay .....	57	6	63

Nutting, Midland.....	3	10	13
Aument, Halladay .....	0	25	25
Wells, Imperial.....	16	15	31
Halbert, Grout.....	0	39	39
Salisbury, Moline.....	35	31	66
Jones, Case.....	72	30	102
Holtzmler, Speedwell....	0	117	117

The following were penalized for withdrawing: No. 2, Haynes, 1,014 points; No. 103, Hupmobile, 1,021; No. 104, Case, 1,050; No. 115, Krit, 1,000; No. 116, Brush, 1,009; No. 118, Hupmobile, 1,000.

This standing gives the Fal car and the two Molines, driven by C. F. Van Sicklen, Vandervoort and Wicke, respectively, the Van Sicklen cup for roadsters; Williams's Haynes, the Stewart Speedometer trophy for touring cars, and Emery's Cunningham, the Standard Oil trophy for the car with the best percentage in the fuel economy test, while two Molines received in addition the Chicago Motor Club trophy, offered as a team prize to the two cars of the same make that obtained the best aggregate score.

The first leg of the run was to Moline, a distance of 193 miles, and the running proved much easier, than was anticipated, as the roads unexpectedly were found to be in very good condition. The noon stop at Rockford, 86 miles out, was reached by nearly all at 10 o'clock, and after a hearty meal, all were on the road again. The inhabitants of all the small towns en route were out in full force. At Warengo the town marshals were stationed at the turns to direct the drivers, and here speed

L. WILLIAMS (HAYNES) WHO WON THE STEWART TROPHY

Van Sicklen Trophy, not even the technical examination served the purpose, as three cars still remained tied and the honors were distributed with characteristic Chicago originality. Two Molines and one Fal were the cars that were "even up," and accordingly the manufacturers of the Moline will hold the trophy for two-thirds of a year and the makers of the Fal car one-third.

The H. P. Branstetter cup for the best tire performance went to the Michelin, which fitted to two of the competing cars, was penalized only fifteen points and had a percentage of 1.67. Penalties were inflicted on a basis of one point per minute per man for each tire stop and winner determined by computing the average penalizations per tire of each make entered. This was the first time that an attempt had been made to "keep tabs" on tires and evolve a winner.

The Standard Oil trophy, offered as an economy prize, was won by the Cunningham, driven by J. C. Emery, which, in addition to having a perfect road score, carried .459 pound for 1,050 miles on one ounce of gasoline.

Of the 29 contenders that started from Chicago on Monday, 7th inst., 24 survived the hard test, 14 of them finishing with perfect road scores, and only two of the penalties being inflicted for failure to ad-

EMERY (CUNNINGHAM) WHO CAPTURED THE ECONOMY TEST

Cassell, Glide .....	66	332	398
----------------------	----	-----	-----

## Van Sicklen Trophy.

Van Sicklen, Falcar.....	0	0	0
Vandervoort, Moline .....	0	0	0
Wicke, Moline .....	0	0	0
Wagner, Haynes.....	0	1	1
Monckheimer, Stav.-Chi...	0	2	2
Duis, Staver-Chicago.....	0	6	6
Bloomstrom, Lion.....	0	11	11

laws were not observed on the boulevard-like roads, as the town authorities gave the welcomed invitation to "beat it."

As was stated in last week's Motor World, there was not much in the way of incident connected with the first day's run, when three of the cars received road penalties, the Lewis Strang Case Car and the Leon Randall Hupmobile, in the Van Sick-

low class, and G. D. Brown's Abbott-Detroit in the Stewart trophy class. The Case drew 50 points for work done on a magneto, the Hupp one point for a carburettor adjustment and the Abbott 3 points for adjusting a push rod.

The route on the second day was from Moline to Quincy, a distance of 167 miles, over excellent roads as a whole, but up and down many hills and over enough rough places to make a good test for the cars.

The only accident of the day was the overturning of a touring car containing four motorists of Macomb who were attempting to keep up with the contestants for a time. Three of the four were doctors and the Red Cross began its work at once.

During the day three more touring cars were penalized, leaving six with perfect road scores. Irby's Haynes drew 14 points

drawal, and the technical committee charged the full 1000 points and accepted the withdrawal of each. They were Strang's Case, Habernicht's Krit, and Hearne's Hupmobile; the clutch in the Case going wrong, a front wheel of the Krit smashing and a brake rod of the Hupp breaking. Of the others in this class, the Brush lost 8 points and the Midland two, both penalties being for carburettor trouble.

As a result of the third day's run into Peoria, 205 miles, two more cars dropped from the perfect score list. In the touring class the Halladay had clutch and carburettor trouble and was charged with 52 points. Randall's Hupp and Well's Imperial did not reach the night control until late.

On the fourth day, the run was from Peoria to Champaign, 215 miles. As the worst hill of the entire route is just out-

inflicted for aid, but the time consumed counted in the schedule.

At the end of the run into Champaign, an error, found in the rules, took from Fundleburg's Imperial and Brown's Abbott-Detroit the perfect scores with which they were credited. That the penalties were not given before was due to a misunderstanding, the referee thinking that a stalled motor, if started again in one minute or less, was not cause for penalty.

When the observers' cards of the 24 remaining cars were checked up at the close of the fourth day, 15 were found to have perfect scores at the end of about 800 miles of road work.

The hardest part of the run in all respects was made on the final day, Friday; the weather was the coldest, the start the earliest and the roads the roughest.

VANDERVOORT AND WICKE IN THE MOLINE CARS THAT TIED FOR THE VAN SICKLEN TROPHY

for the breaking of a rear axle truss rod; Emery's Cunningham lost one point for tightening the cover of the gear box, and the Glide, driven by Cassell, lost 66 points for replacing the left front spring.

Among the roadsters, three saw enough penalties impending to cause their with-

side of Peoria and there is no chance to get a running start, the drivers were warned to use chains in case of rain. The rules were also read as to help for temporary relief if stalled on the hill, anything from a team of horses to a block and tackle being temporarily allowed. No penalty was

The cars left Champaign at 5:30 a. m. for the 237 mile run into Chicago, and at the finish four touring cars and ten roadsters had perfect road scores. In the touring car class competing for the Stewart trophy were the Cunningham, Haynes, Henry and Cino. In the runabout division for the Van Sicklen trophy were the Falcarr, Grout, two Molines, Lion, Halladay, Speedwell, two Stavers and Haynes.

Referee David Beecroft and technical experts F. E. Edwards, Berne Nadall and G. W. Gaidzik, of the Chicago Motor Club, worked all Saturday and Sunday examining the 22 contesting cars.

The penalties imposed by their technical examination were as follows:

George D. Brown, Abbott-Detroit: Broken mud apron, 5 points; loose oil cup, 1; two broken lamp brackets, 12; brakes, 20; total, 38 points.

J. C. Emery, Cunningham: Left rear spring seat bearing nut loose, 1; broken lamp bracket, 6; total, 7.

J. Daubner, Halladay: Lost mud apron nut, 1; lost nut on left front fender bracket, 1; lost bolt steering column clamp, 2; lost screw in clutch, 2; total, 6.

L. Williams, Haynes: Anti-rattler left rear brake lost, 2; total, 2.

George Padley, Henry: Loose fender, 2;

#### Summary in the Economy Contest.

#### Texas Track Bans Automobile Racing.

Neither automobile nor motorcycle racing will be again permitted on the State fair grounds track at Dallas, Tex. The series of accidents, two of them fatal, which occurred previous to and during the recent three days racemeet which formed one of the features of the State fair, "got on the nerves" of the park commissioners to such an extent that without a dissenting vote they adopted a resolution prohibiting all future contests of the sort.

#### Thanksgiving Meet on Guttenberg Track.

The only racemeet scheduled for Thanksgiving Day in the metropolitan district will be held at the old Guttenberg race track. O. D. Corbett, secretary of the Automobile Club of Hudson county, has planned the meet and it will be under his personal direction. Six races will be decided.

## ARIZONA'S REMARKABLE MEET

Contenders Comprised the Men and Cars that Had Raced Across the Desert—  
Hanshue Takes the Lion's Share.

Phoenix, Ariz., had a race meet on Thursday, November 10, that was out of the usual. It was held under the auspices of the Maricopa Automobile Club and constituted one of the attractions of the state fair then in progress, and it was unusual in that all the men and cars that competed were the same that just had finished what one of the Phoenix papers described as "the transcendent road event in all the history of the automobile world," in other words, the 480 miles race across the desert from Los Angeles to Phoenix and which, if not quite so grandiloquent as the Phoenix word-compounder described it, was yet very much of a race and undoubtedly one of the most trying and gruelling competitions which ever has been held.

The race meet at the fair grounds track was designed not only to subject the men and cars to further trials and to provide entertainment for the Arizonans, but also to enable the contestants to obtain further honors, not to mention the coin which goes with the honors. The program was so arranged that none of the competitors could corral all the honors and the cash, there being events for the cars according to their cubical capacity. Most of the men and cars acquitted themselves creditably, but Harris Hanshue, in an Apperson, who finished late in the desert race because of tire trouble, easily captured the lion's share of the spoils. He won the twenty-five miles race for cars of 301-600 cubic inches displacement, the fifteen miles free-for-all, the fifteen miles handicap and the one mile time trials, taking all of them "hands down." In the time trials, Hanshue negotiated the mile in 57½ seconds, fast going for a dirt track and for a hard-worked car.

Probably the most interesting contest was the fifteen miles race for the first three cars to finish in the Los Angeles-Phoenix race. They were the Kissel, Franklin Pope-Hartford. Hanshue, of course, was not eligible. The Pope-Hartford, driven by A. E. Gage, defeated the other two in easy style, and left them so far behind at the start that all the excitement was created by the fine fight between Herrick, Kissel, and Guy Irwin, Franklin, who ran nip and tuck from the fourth mile to the finish. Gage won in 16 minutes and 15½ seconds, and Irwin beat out Herrick in the Kissel, the victor in the desert race, by seven-tenths of a second, finishing in 16:30½.

The ten miles race for the smaller cars with piston displacement of 201-300 inches was won by Cliff McKeague driving a Durocar. There was some changing of the

lead until the third mile, after which McKeague stayed in front. His time was 10 minutes and 37 seconds.

In the ten miles handicap, L. M. Dull, Parry, was given 2½ minutes start, and R. Stearns 3½ minutes, while the McKeague Durocar started from scratch and although the latter made the fifth mile in one minute and ran a good race, he could not overcome the lead of the others; Dull winning. No time was taken. Summary:

Twenty-five miles for cars which participated in the Los Angeles-Phoenix race, with piston displacement of 301-600 cubic inches—Won by Harris Hanshue, Apperson; second, Will Sherriff, Rambler; third, Herrick, Kissel. Time, 26:55.

Ten miles for cars which participated in the Los Angeles-Phoenix race, 201-300 inches—Won by Cliff McKeague, Durocar; second, C. H. Bigelow, Mercer; third, A. E. Gage, Pope-Hartford; fourth, L. M. Dull, Parry. Time, 10:37.

Fifteen miles free-for-all for all cars in the Los Angeles-Phoenix race—Won by Harris Hanshue, Apperson; second, A. E. Gage, Pope-Hartford; third, Stearns, Ford. Time, 16:14.

Fifteen miles for the first three cars to finish Los Angeles-Phoenix race—Won by A. E. Gage, Pope-Hartford; second, Guy Irwin, Franklin; third, Herrick, Kissel. Time, 16:15½.

Ten miles handicap—Won by Dull, Parry (3½ min.); second, Stearns, Ford (3½ min.); third, McKeague, Durocar (scratch). No time taken.

Fifteen miles handicap—Won by Hanshue, Apperson (scratch). Time, 14:49.

One mile time trials—Won by Hanshue, Apperson, time, 57½; second, McKeague, Durocar, 1:00½; third, C. H. Bigelow, Mercer, 1:02; fourth, Dull, Parry, 1:08½; fifth, Sheriff, Rambler, 1:10.

#### Newburgh Sees Racing and a Spill.

The inhabitants of the old Hudson river town of Newburgh, N. Y., had an opportunity on Saturday last, November 12th, of witnessing some more or less thrilling automobile races, which were held on an old one-half mile dirt track, and they also had occasion to gasp because of an accident in the 25 miles race. At the 12 miles post Joe Judge, in a Pope-Hartford, blew out a front tire, causing a wheel to collapse and the car to overturn. Neither the driver nor the mechanic were injured seriously, though the mechanic was pinned under the car. Chuck Martin, driving a Stearns belonging to Senator John B. Rose, won the race in 39:15. A 10 miles race with but two starters was won by Jack Eager (Overland), with Worcester (Buick) second. Time, 17:30½. John Q'Hearn, piloting a Rambler, won the five miles race, completing the 10 circuits in 11:31. A five miles race for cars owned by Elks was won by Charles Burant in a Rambler. His time was 8:20.

## DE HYMEL KILLED AT SAN ANTONIO

South's Most Famous Driver Meets Death  
On Native Soil—Had "Cleaned Up"  
in First Day's Racing.

The race meet held on the Fair Grounds track in San Antonio, Tex., on Saturday last, 12th inst., was brought to a sudden termination when, in the last race of the day, an accident cut short the meteoric career of the best known racing driver in the South, Alfred De Hymel, known in racing circles as "Tobin" De Hymel. When the accident happened he was at the wheel of his Stoddard-Dayton in a twelve miles handicap race which had seven starters. With six left in the race the big car, with victory in sight, crashed into a bank while making fully sixty miles an hour, and turned completely over. De Hymel's body was badly crushed and he died while being carried into a nearby hospital. When De Hymel flashed past the grandstand just before the accident a number of people noticed that one front wheel was wobbling, but he was past before he could be warned and before he came around again he came to grief. The wobbling wheel collapsed and from the nature of some of his injuries it appeared that his chest had been crushed before he was thrown out of the car.

The three nine miles races which were run off before the accident were marred by the withdrawal of several cars as results of arguments. In the first race the Abbott-Detroit team objected to competing with cars of somewhat larger piston displacement and were allowed to withdraw and the Stoddard entries were withdrawn in another race. But for Meleun and Clarke those races would have been dismal failures, but as it was, there was some interest.

In the third race Clarke attempted to run on batteries, his magneto being out of order, but after one lap his Cutting began missing and he finished a poor second to Meleun, Buick.

The first race was won by J. Geary, driving a small Stoddard, DeHymel in the larger Stoddard holding back and finishing second. Meleun, Buick, was third.

The forty-five miles free-for-all was the feature event of the day. DeHymel, Stoddard; Meleun, Buick; Slagle, Cutting; and Plummer and Dunn in Marions started.

There was a heated contest between the Buick and Stoddard from the start, until DeHymel was forced to quit at the end of the fifteenth lap by tire trouble. Shortly after the Buick was also forced off by the white flag because of a thrown tire tread and fear of serious mishap. While the Buick was changing tires, Slagle, in the Cutting, gained four laps and was never headed. The summary:

Saturday, November 12.

Nine miles, Class E, 300 cubic inches and under.—Won by James Geary, Stoddard-Dayton; second, Tobin DeHymel, Stoddard; third, Fred Meleun, Buick. Time, 9:32½.

Nine miles, Class B, Div. 3c, 450 cubic inches and under.—Won by George W. Clark, Cutting; second, W. Dunn, Marion; third, Plummer, Marion. Time, 9:53.

Nine miles, Class E, 450 cubic inches and under.—Won by Meleun; second, Clark, Cutting. Time, 9:00.

Forty-five miles, free-for-all, Class D.—Won by H. E. Slagle, Cutting; second, Meleun, Marquette-Buick; third, Dunn, Marion. Time, 49:02½.

Sixteen miles, Class E, handicap, called off because of fatal injury to Tobin DeHymel.

On Thursday, the 10th inst., which was the first day of the racemeet held by the San Antonio Automobile Club, the unfortunate De Hymel made a characteristic "clean-up." He was eligible to but three of the six events, and he had no trouble in winning all of them as he pleased. Those which he annexed were the one mile time trials Class D, the 30 miles free-for-all, and the nine miles, Class C.

Of the remaining three events two of them, the 12 miles Class C and the nine miles Class B, were captured in easy style by Mortimer Roberts, driving an Abbott-Detroit. The other one had but two contestants, as shortly before the start an accident to Leo De Hymel's Velie left Meleun, Buick, and Clarke, Cutting, to fight it out. Meleun won, covering the nine miles in eight minutes 56½ seconds.

A comedy was added to the program in the shape of a 4½ miles truck race between a Brush, a Gramm and the truck of a local farm. The Buick finished first without difficulty, with the Gramm second. The summary:

Thursday, November 10.

Twelve miles, Class C, 161-230 inches piston displacement.—Won by M. Roberts, Abbott-Detroit; second, Meleun, Buick; third, Tune, Abbott-Detroit. Time, 12:48.

Nine miles, Class C, 301-450 inches.—Won by Meleun, Marquette-Buick; second, Clarke, Cutting. Time, 8:56½.

One mile time trials, Class D.—Won by De Hymel, Stoddard-Dayton Fifty; time, 57; second, De Hymel, Stoddard-Dayton Forty; time, 1:02; third, Roberts, Abbott-Detroit; time, 1:02½; fourth, Clarke, Cutting; time, 1:04½; fifth, Tune, Abbott-Detroit; time, 1:05; sixth, Dunn, Marion; time, 1:11½.

Nine miles, Class B, 300 inches and under.—Won by Roberts, Abbott-Detroit; second, Clarke, Cutting; third, Tune, Abbott-Detroit. Time, 9:43.

Thirty miles free-for-all.—Won by De Hymel, Stoddard-Dayton; second, Meleun,

Marquette-Buick; third, Clarke, Cutting. Time, 31:14.

Nine miles, Class C.—Won by De Hymel, Stoddard-Dayton; second, Clarke, Cutting. Time, 9:54.

### Quakers Start Electric "Guessability."

On Friday last, 11th inst., Philadelphia was the scene of another of the so-called "roadability runs," which originated in that city of brotherly love and other things. Although the run was the usual guessing contest, disguised by the more dignified title, it was unlike any other that has ever been held in Philadelphia, or anywhere else, in that it was confined exclusively to electric vehicles. The run was promoted by the Philadelphia North American and was taken very seriously, a confetti car preceding the parade and motorcycle policemen gravely guarding the route. The distance covered, 50 miles, was traversed in the city and its suburbs. Of the 39 guessers who started, 36 finished the run, Mrs. B. L. Townsend with a guess of 4:14:20 coming nearest to the secret time, which was 4:24:24½. Mrs. Townsend did not drive her car, a Baker electric, this service being performed by a mere man, but as she had entered the car she received the first prize, a gold chatelaine bag valued at \$100. The second prize in the women's division, a \$50 silver chatelaine bag, went to Mrs. E. V. Stratton, who drove a Studebaker. Dr. C. W. Haughton captured first honors in the men's division with a Studebaker. He received a gold loving cup valued at \$100. Harry Peyton guessed well enough to annex the second prize in this section. He drove a Waverley and got a \$50 silver loving cup.

### Tragedy Precedes the Grand Prize Race.

Although the actual running of the Savannah races was free from fatalities, death took its toll from the drivers assembled for the meet. On Thursday last, November 10th, W. H. Sharp, driver and designer of the car bearing his name, and Albert Fuchs, his mechanic, were thrown from the car in a practice spin over the course. Fuchs was dead when eye-witnesses of the accident reached his side, his skull being fractured by striking a log in the road. Sharpe was unconscious and was removed to a hospital, where he died on Tuesday, November 15th.

### Oldfield Cuts Some Didoes in Louisiana.

Barney Oldfield has put the Shreveport (La.) fair grounds track "in bad." Despite his disqualification by the A. A. A., he and his outlawed Benz car were permitted to cavort there on the 10th inst. and of course Oldfield earned his fee by "establishing" one of his customary "records." He was timed a mile in 53½ seconds, which was announced as the "Southern circular track record." He also ran around the track twice and thereby created a local record for two miles.

# Bruce-Brown Upsets the "Talent" at Savannah

American, Driving Big German Car, Captures Grand Prize in Eye-lash Finish—Defeats Imported Veterans and Sets New Mark—Italy Stumbles with Victory in Sight—American Cars too Small but Burman "Gets in the Money."

GENERAL VIEW AT STARTING AND FINISHING POINT OF THE GRAND PRIZE RACE

It was a reasonably safe bet that Germany would figure in the forefront of the Grand Prize race of the Automobile Club of America which was run near Savannah Ga., on Saturday last, 12th inst. She was represented by far the biggest and most powerful cars and by two of the most famous and most seasoned drivers that ever sat behind steering wheels; and as the world already knows, it was a German car, the Benz, which won that one-time spite race. But it was not one of the famous and seasoned drivers that steered the car to victory, neither was he a German importation. He is David Bruce-Brown, an American, despite his hyphenated name, and quite unlike the average man who figures as a man who drives for hire. For Brown was born with a silver spoon in his mouth and was reared accordingly. He has ample means of his own and if the desire for the coin that constitutes the victor's reward plays any considerable part in his calculations the fact is very well concealed

Rather does he seem to engage in the dangerous sport for the very love of it.

On Saturday last he negotiated the 415.2 miles of Georgia road in 5 hours, 53 minutes, 5.75 seconds, an average speed of 70.55 miles per hour, which is the best long-sustained speed ever made on American roads and is a performance which compares favorably with Nazzaro's average of 74.3 miles made in the Florio cup race in Italy in 1908. Bruce-Brown's triumph was won almost by an eyelash. Less than two seconds behind him thundered Hemery, also in a big Benz—both the man and the car having been imported especially for the race. The other representative of Germany, Willie Haupt, literally was nowhere. On the 13th lap he sideswiped a tree, broke a wheel, overturned and was out of it. Italy was sorely tried and sorely humbled. Three times victory seemed within its grasp, for as often had its representatives, Wagner, Nazzaro and De Palma, shown in front, but never were they able to stay

there. De Palma, an American, although driving a foreign car, was in the lead with but two laps to go and looking all over a winner when engine trouble overcame him. In fact, excepting Hemery, it was a combination of foreign car and American driver that proved the best combination, so far as the "invaders" were concerned.

If the American drivers proved the peers if not the superiors of the foreign cracks, American cars were hopelessly outclassed in respect to power, and that one of them, Robert Burman's Marquette-Buick, was able to finish, third, but 18 minutes behind the winner, is no small plume in Uncle Sam's headgear.

The story is best told by a comparison of the piston displacement of the cars involved. The two Benzes, which finished first and second, each had a displacement of 920 cubic inches. The Marquette-Buick, which finished third, was of but 593.7 cubic inches displacement, and it was the biggest of the American cars, which tapered

down to 318.1 cubic inches in the case of the Marmon driven by Harroun.

The German car needed the victory, too for in both the Vanderbilt cup race and the race for the Fairmount Park trophy, although numerously represented, it had signally extinguished itself. Smaller Benzes were used in those races, but at that they were larger than most of the American contenders, but still were they slowed or snuffed out by one thing or another. Bruce-Brown himself drove one in the Vanderbilt, but he was more than 20 minutes behind when Grant drove his Alco to victory.

The race was started at 9 a. m., the contenders being sent away in the following order: 1st, Arthur Chevrolet, Marquette-Buick; 2d, Ralph Mulford, Lozier; 3rd, Charles Basle, Pope-Hartford; 4th, Harry F. Grant, Alco; 5th, Joe Dawson, Marmon; 6th, Victor Hemery, Benz; 7th, Felice Nazarro, Fiat; 8th, Joe Horan, Lozier; 9th, L. A. Disbrow, Pope-Hartford; 10th, Ray Harroun, Marmon; 11th, David Bruce-Brown, Benz; 12th, Louis Wagner, Fiat; 13th, Robert Burman, Marquette-Buick; 14th, Willy Haupt, Benz; 15th, Ralph De Palma, Fiat.

The non-starters were W. A. Sharp, Sharp-Arrow; W. A. Roebing, 2d, Roebing-Planche; Joe Matson, Simplex; Hugh Hughes, Marquette-Buick; the first two of whom had been eliminated by accidents previous to the race.

Most of the officials and distinguished men of Savannah, and quite a few from

other parts of the state witnessed the start Governor Brown himself was among the number. Spare of build, and serious of mien, with a growth of whiskers with which the winds of many years seem to have taken undue liberties, the governor was a picturesque figure and was made to play several picturesque parts. He himself fired

e crank shaft.

the starting pistol and the camera caught him in the act. His Honor's appearance, as the photograph shows, suggested that he was performing almost one of his sacred duties. Though the governor fired the pistol, Fred Wagner, of New York, sometimes styled the "Starter's Trust," shouted the word "Go" and accompanied it with his

usual hearty slap on each contestant's back.

The day was more or less of a holiday in the vicinity of Savannah and as a result a great crowd witnessed the race. Some rapid-fire statisticians estimate that 200,000 persons were present, but despite the maximum, figures do sometimes lie. The estimate is over-generous. The grand stand which

seats approximately 20,000 people was comfortably filled, but there was room for more than one more, and around the course of 17.3 miles, which was well guarded by militiamen, the spectators formed only a thin fringe and the state soldiery had little trouble in preserving order and keeping the course clear.

There were fewer motor cars in evidence than some of the visitors expected to see, but no lack of negroes. Savannah is in the "black belt" and even though many of them scarcely knew what it was all about, it was a great day for the darkies and their interest was keen if not intelligent.

Chevrolet, first away, was first to return to the grand stand. He had made the round of 17.3 miles in 14.19, but he was not first in point of time. Hemery, sixth in order of starting, was the real leader, but at that, and despite the enormously larger car that he was driving, the German had been able to gain but one second on the American representative. On the next lap, Hemery was still ahead, but Wagner had displaced Chevrolet in the second position. This order remained for the succeeding lap, Bruce-Brown, the ultimate winner, then being in

# All the Cars that Finished Behind the 1911 Model \$1000 E-M-F "30" on the Atlanta Speedway and Savannah Road Race sell for \$1500 or more—that's the Best Part of this Story.

**Here's a Lettergram** that tells of the latest E-M-F record: "The one element of international character developing in the Savannah Road racing was the contest between the Lancia, made in Italy, and the E-M-F "30," which represented Detroit, and was the only car of the American contingent which seemed able to give the foreigner an argument.

**The E-M-F Kept Close** on the Lancia's heels for eight of the eleven laps. Driver Witt then stopped to take on oil, a precautionary measure as it proved. The Lancia's immense tanks allowed her to continue without a stop. This made it impossible for the American car to close the gap, although the E-M-F averaged 55.28 for the 190.3 miles, a clip faster than that of the winner in any American road race of that length in the annals of motor racing. The Lancia is a special built racing car equipped with a multitude of adjustments and requiring an expert driver. Priced at a figure more than three times as high as the E-M-F, it needed all its speed to win.

**Witt in the \$1000 E-M-F** tore off the fastest lap of the race, 17.05, unofficially timed, and did not falter in the least at any stage of the race. The other contenders in the race selling for \$1500 or more, did not figure, except as demonstrations of consistency of lower speeds. A gap nearly 15 minutes separated the cars finishing second from the one finishing third in this event."

**The First Car Home in the Atlanta Race**—and to establish a new world's record—and the same car which starred at Savannah—was produced by the company which was the first to place on the markets of the world a genuine, practical car of the real touring type at a price within the reach of the man of average means.

**Others Have Always Been Behind.** Progress in manufacturing at the big E-M-F Company's plants has gone hand in hand with the quality of its product.

**A Practical Demonstration** is always given in a race and the E-M-F Company has always been glad to give it. It wants to take this occasion to impress on the mind of the public a number of logical lessons to be drawn from this demonstration.

**No E-M-F "30" Was Ever Built Solely for Speed.** The ability to circle the Atlanta speedway and Savannah road course faster than any car of its class is only an incident to the manufacture of a high-quality motor car, as the E-M-F Company sees it.

**There Are No E-M-F "30" Racers.** Any E-M-F "30" that the factory in Detroit ever built—there are 20,000 of them in the hands of satisfied owners—would go just as

fast as the car that set the world's record—about 65 miles per hour. That must be the case. It's an essential of the E-M-F Company's system of manufacture.

**All E-M-F "30's" Are Fast**—Just as fast as Witt's "Polar Bear." They are made by automatic machinery—machinery, the purchase of which is possible only to a company that builds cars in large lots and can consequently afford it, saving a large labor expense that would otherwise make the car unprofitable, if sold at twice the price in smaller quantities.

**E-M-F Durability** is something we can't show only in a race, however. All the South knows, though, that our old E-M-F "30" "Bullet" has been run 60,000 miles and is as good as when she was shipped—the first E-M-F "30" that went south of the Ohio.

**We Agree with a Competitor**—who sells automobiles at a higher price than we—who advertised "A 200-mile road race at sustained speed of 40 to 80 miles per hour puts a car to a severer test than the average owner could put it to in a whole year's use."

**Because This Proves the Life** of an E-M-F "30" car—the "Bullet" used as a racer and demonstrator at Atlanta has a record of 60,000 miles—most of which was run on high speed at road races. Our 1909 Glidden Tour pathfinder has run over 50,000 miles and is today in active service as a "pick up" between our various plants in Detroit. These are the records of just two of 20,000 E-M-F "30" cars in daily service all over the country in the hands of satisfied owners.

**E-M-F Economy** is something we want to demonstrate any time we have an opportunity. The E-M-F "30" is the best balanced car in the world. It shows in the small expense of tire maintenance. Light weight makes for small gasoline consumption, just as it does for speed. The most ingenious, if not the most simple lubricating system in existence helps E-M-F "30" owners to save on their oil bills.

**And the Biggest E-M-F Economy** is in the first cost. You can buy a duplicate of Witt's race-winner with the added equipment of five-passenger touring body, for \$1,000. Not a car in the field that finished behind the E-M-F "30" on the Atlanta Speedway could be purchased, in stock form, for less than \$1,500.

**Best and Cheapest!** It's an E-M-F "30." Price and performance simply can't be denied. They are in the records.

Standard 1911 Model E-M-F "30" Touring Car—\$1,000

Change the body equipment and it's a racer, just like Witt's with which he won at the Atlanta Speedway and Savannah Road Race.

BLACK EMBROIDERY THAT EDGED THE COURSE DURING THE GRAND PRIZE RACE

fourth place. Wagner was the first man to stop at the repair pit. At the end of the third lap he made a lightning tire change. Chevrolet, also because of tire trouble, stopped at the pit on the fourth round and again on the sixth. He then lost his advantage and never again figured prominently. He drove a furious pace, but on the ninth lap he broke a crankshaft and was out of it. Disbrow, Pope-Hartford, while in twelfth place, cracked a cylinder on the same lap and became a looker-on. Before either Disbrow or Chevrolet had received their quietus Joe Dawson, in a Marmon, and the sensation of the Vanderbilt cup race, had been placed hors de combat. After driving four furious laps he broke his crank-shaft. Dawson himself however, got into the running again on the twelfth lap. Then, by a procedure never before witnessed in a contest of the sort, he took Harroun's place in the other and smaller Marmon car in the race. Harroun at the time was in eighth position and when Dawson took charge he drove to such good advantage that he finished in sixth place, completing the 415.2 miles in 290 minutes.

22.22 seconds. Harry Crant, twice winner of the Vanderbilt cup, on whom some of

GOV. BROWN, HE FIRED THE PISTOL

America's hopes had centered, dashed the hopes to earth on the tenth lap when he

broke his change speed gear and was forced to retire. Up to that time he had driven his usual heady, consistent race, his rounds having been made with almost clock-like regularity in approximately 15½ minutes. When forced to quit he had worked from tenth to seventh position.

The first accident of the race, and the first foreign representative to be eliminated was Willy Haupt. Driving the smallest of the three Benzes, on the eleventh lap he had, by his dare-devil work, wrested the lead from Wagner, Fiat, who had headed off Hemery two laps before. Knowledge that he was in the lead seemed to excite Haupt to utter abandon. His pace was furious to the point of danger and although it is stated that the Benz camp signaled him that he was driving too fast to stay on the road, he heeded it not. He flashed the twelfth lap in 13:23, the fastest lap of the race and an average of 77.55 miles per hour. On the very next lap, after a long straight-away, he took chances in negotiating a turn and so great was his speed he left the road and dashed for a huge oak tree. By a lightning-like move he changed his direc-

THE SCENE WHEN BRUCE-BROWN FLASHED ACROSS THE LINE A WINNER

tion and although he avoided plunging headlong into the oak he struck it a glancing blow and the big car performed a somersault. Haupt and his mechanic were spilled out, the former being thrown clear and the latter being pinned under the car. Despite the fact, both men escaped with slight injuries.

he again halted and again replaced a chain at a loss of about eight minutes. The bent axle, which caused his chain trouble, forced him to quit on the nineteenth round.

Bruce Brown, after two bad spells on the eleventh and twelfth laps, had regained third place and when Nazzaro retired he moved up one, and the spectacle then was

like mad to make up lost ground, he struck a bad spot in the road and skidding struck a bridge over a runway and, with his mechanic, was thrown out of the car, which was wrecked. Wagner landed in the road, but with presence of mind crawled out of the way of the oncoming cars. At first he was thought to be seriously injured,

VIEWS DURING THE GRAND PRIZE RACE. 1—BURMAN, MARQUETTE-BUICK. 2—GRANT, ALCO. 3—HEMERY, BENZ. 4—BURMAN PASSES MULFORD, LOZIER. 5—WHEN BRUCE-BROWN (15) OVERTOOK DE PALMA (19). 6—BASLE, POPE-HARTFORD

With Haupt out of the way, the flag of Italy, in the person of Nazzaro, swept to the front and stayed there until the seventeenth lap, despite an axle which seemed to have been bent. He stopped for a few seconds on that lap and on the next one stopped still longer, when he replaced a broken chain and lost the lead to his teammate, De Palma. He still remained in second place, but on the eighteenth lap

witnessed of two Americans driving foreign cars, and representing foreign nations, running one, two. Few anticipated that De Palma would win for Italy. Either Nazzaro or Wagner, the latter the winner of the previous Grand Prize race, was expected to turn the trick, but after leading for two laps early in the race, Wagner however, suffered several "bad times" and on the seventeenth round, while driving

zut examination proved that he had escaped with two broken ribs. His mechanic fell into the brush at the side of the road and was not so badly hurt. On the very lap on which he suffered accident, Wagner had dropped a bolt while passing the official stand and had been given the white flag, which signal required him to stop. He failed to stop, however, and later claimed that he did not understand the meaning

of the white flag. It was on the 17th lap that Basle (Pope-Hartford) went out with a seized piston.

With all of the famous foreign drivers except Hemery eliminated, it then was a fairly good gamble that an American driver, if not an American car, would win. But the fates were against De Palma. With

Brown's pace slightly slackened Hemery, drove like a whirlwind and, finishing faster than he started, gained all but 1.42 seconds on the gentle bred American who surprised even himself. It is the closest finish ever recorded in any of the world's great automobile races.

Bruce-Brown's victory was splendidly ac-

tribute to his speed and daring than to the rapidity with which men helped him change tires, for if ever the demon Tire Trouble pursued a man he pursued Burman. It "got him" first on the fourth lap and fourteen times thereafter he repeated the performance. Burman, despite his many delays, worked steadily forward

THE INFLUENCE OF FLOWERS. 1—ON BRUCE-BROWN. 2—ON WITT. 3—ON KNIPPER. 4—ON HEMERY. 5—ON DAWSON. 6—ON GOVERNOR BROWN WHEN DAWSON "PUT ONE OVER" ON HIM

but two laps to go, and while nearly two minutes in the lead, a cylinder of his Fiat cracked and the gold cup and the \$4,000 purse were placed beyond his grasp. Bruce-Brown then took command. With De Palma out, he was leading Hemery by one minute and 29 seconds on the twenty-third lap and with but one round to go it did not seem that he could be headed. Hemery, however, was made of stern stuff and did not despair. He drove the last lap with the daring born of desperation, and while Bruce-

claimed, the Americans at least cheering for the man, and the importers of the car, and their immediate followers, cheering for the machine and waving a few small German flags to emphasize their feelings.

Robert Burman, in a Marquette-Buick—"Wild Bob," some folks call him—finished third, and he earned the place and the \$2,000 which it brought to him, \$1,000 of which was offered for the first American car to finish. How he did so well is not short of remarkable and is not less a

from tenth place in the first lap to third place at the finish.

The Lozier team, Mulford and Horan, finished fourth and fifth respectively. They did not have the power to get further to the front, but they performed consistently and well.

The race concluded, there was something of a flower show. There were bouquets for all who finished, roses for some, chrysanthemums for others. They were presented in the presence of the crowd and the crowd

enjoyed the spectacle. The effect of the flowers on the faces of the men was a study in itself. They produced such a variety of smiles and grins that it were worth the while to witness. The serious Governor Brown himself presented some

of the flowers. When he handed a bunch of roses to Joe Dawson, who had performed the unusual feat of driving two cars in the same race, that round-headed young Westerner literally "put one over" on the Governor. He plucked one of the flowers

from the bunch and leaning over he insisted on placing it in the buttonhole of the Governor's coat. The Governor stood for it without cracking even a semblance of a smile. In fact, it seemed almost that he could not smile.

## Dawson and Knipper Easy Victors in Savannah's Light Car Races

Like all curtain-raisers, the small car races of last Friday, 11th inst., the day preceding the Grand Prize race, relatively were of minor importance. Being set on the

Mr. Tiedeman, the donor, is the mayor of Savannah—was William Knipper, sometimes called the unlucky, who finished the 11 laps, or 190.3 miles, in three hours, 15

out on this plan, the spectators were afforded the more or less pleasing sight of a more or less constant procession of cars and an opportunity to exercise a little mental arithmetic in ciphering out the relative positions of the various contenders.

Dawson, winner of the Savannah club's trophy, which was for cars of 231-300 class, was followed over the tape by Washington Roebling, driving a Mercer car, who finished 11 minutes and 54 seconds behind the leader. Roebling's elapsed time was four hours, 35 minutes and 25 seconds. Hugh Hughes, one of the three Fal car contenders, was third, with a total of four hours, 46 minutes and 11.34 seconds to his credit.

The cars were started at 30 seconds intervals, Hughes, in the Fal, the first to be counted out and given the familiar shoulder pat, slipping away at 10 o'clock. He was followed by Heineman (Marmon), Roebling (Mercer), Gelnow (Fal), Dawson (Marmon), and Pearce (Fal)—six in all and one less than had been expected to start.

DAWSON (MARMON) RUNNING AWAY WITH THE SAVANNAH TROPHY

stage of the big event, however, and arranged with all the ceremony of the great race they were full of interest. Moreover, the crowd, while not as large as that of Saturday, was not small, Grand Prize day being a very great day and, as has been remarked, Friday being the day before. In keeping with their preliminary character they afforded sundry minor thrills to the spectators, and a very fine exhibition of speed. But as races they were lacking the gingery spice of close competition, for in each of the two component events—that for the Savannah trophy and that for the Tiedeman prize—of the composite merry-go-round affair a leader developed who led his field from the start and never was headed. Therefore as far as the element of contest is concerned the story of the light car races is soon told.

Joe Dawson, it was, who, driving a swift Marmon, skimmed over the tarred highways of the course in the Savannah trophy race and literally ran away from his five competitors. His time for the 16 laps, or 276.8 miles was four hours, 23 minutes, 30.98 seconds. Dawson's average speed was 62.68 miles an hour, figures which fail to express the true wonder of the performance for it must be added that he whose performance was one of the marvels of the Vanderbilt race ran his entire distance from start to finish without a single stop and with astonishing uniformity. The star performer in the Tiedeman trophy event—

ROEBLING (MERCER) SWINGING INTO SECOND PLACE

minutes and 22.67 seconds, driving his befunneled Lancia at the rate of 58.44 miles an hour. Figuratively speaking, he had his pursuers hull down all the way. Witt, E-M-F, was the only man who came within hailing distance of him, and he was 11 minutes and 12 seconds behind at the finish.

Under the circumstances the only thing that saved the affair from becoming the tamest sort of an exhibition performance with a few understudies in the background was the fact that the two races were run simultaneously and that in neither case did the fastest driver start first. Therefore, and as always is the case in contests carried

The Pullman entry failed to arrive in season to go into the race.

As has been stated, the race was all Dawson. He simply took to his heels at the word "go," and on each succeeding lap gradually drew further and further ahead. His fastest lap, the third, was negotiated in 15.45. The fight was all for second place, and it was not much of a fight at that. For the first lap Heineman, Dawson's team mate, followed him around and it was a case of one, two. But on the very next round, Heineman suffered ignition trouble which forced him to stop, and he not only lost his place, but fell back to

the last position. It was not until the fifth lap that he regained his stride and then gradually he pressed forward and worked his way to fourth place, which position he held when called off the course when the race was stopped.

With Heineman out of the way, Gelnaw, Fal car, looked the most dangerous runner-up. He slipped into second place, which

This race was of even less interest than the fight for the Savannah trophy. As did Dawson, in the latter race, so did Knipper do in the former. He simply took to his heels and left the others far behind. He was never headed. His fastest lap, the eighth, was reeled off in 17:20. Witt, the E-M-F man, planted himself as firmly in second place, and held that honor safe from

KNIPPER (LANCIA) GOING "ALL OUT" FOR TIEDEMAN TROPHY

he retained for two rounds, or until ousted by Roebeling, in the Mercer. Thereafter, and until the ninth lap, when Gelnaw went down and out with a broken tie-rod, which affected his steering gear, he and Roebeling see-sawed in second place. Roebeling finally remained in the latter until the end of the race.

Pearce, one of Gelnaw's team mates, broke an axle also on the ninth lap and was heard of no more. Hughes, the other

start to finish. He finished the 190.3 miles in 206 minutes and 34 seconds.

Cohen, the other E-M-F entrant, gave some promise in the first lap, when he held third position. But engine trouble then overtook him, and after limping around once more, he retired. Knight, Cole, also retired on the third round with a cracked cylinder. Endicott, his team mate, suffered misfortune even earlier. A broken crank shaft put him out on the second

COHEN'S MECHANICIAN GIVES THE E-M-F A CHARGE OF OIL

Fal car entry, drove consistently, but lacked the necessary speed, trailing respectfully and gradually getting into third place, as the others were eliminated by accidents of one kind or another.

The race for the Tiedeman trophy, for the littlest cars, started immediately the Savannah cup contenders were under way. The eight starters were sent away in the following order: Cohen (E-M-F), Wright (Maxwell), Knight (Cole), Knipper (Lancia), Witt (E-M-F), Doorley (Maxwell), Bill Endicott (Cole), Costello (Maxwell!).

round, when he had forged into fourth place, from his start in sixth.

With Knipper and Witt leading the procession and Cohen, Knight and Endicott eliminated, the struggle for third position resolved itself into a see-saw match between the three Maxwell entries. They changed positions several times during the race, the scrap between Costello and Wright being a pretty one, the former finally beating his mate for third place by a scant four seconds. During the last two laps Wright made up more than five minutes.

SUMMARY OF THE TIEDEMAN TROPHY RACE, 161-230 CLASS, 190.3 MILES, AT SAVANNAH, GA., FRIDAY, NOVEMBER 10, 1910.

**NEW HUDSON MINUS 900 PARTS**

**Which Shows How Simple It Is—Built in Three Styles with One Chassis—Radical Changes Effected.**

While the new models presented at this time of the year usually differ from their predecessors or from each other in the

ance of a solid cast block with no moving part but the fly wheel. The exhaust manifold is detachable so that short pipes for racing purposes quickly may be bolted on to a projection through the side of the bonnet. The motor is characterized by few projecting parts and corners. The top of the cylinder block water jacket has been entirely cut away and a large cap piece

Hudson design is that the exhaust and intake manifolds are carried on opposite sides, the former on the left and the latter on the right. The gases are taken from the carburetter, past easy bends through the casting between the cylinders, into the intake valve ports on the opposite side.

The cam shaft, which is 17-16 inches in diameter, is driven from the train of gears

THE ROADSTER FORM OF THE NEW HUDSON

THE HUDSON "33" WITH TORPEDO BODY

matter of bodies or slight changes in mechanical details, the Hudson "33," manufactured by the Hudson Motor Car Co., Detroit, Mich., is an exception to the rule. This new car is quite a departure from the Hudson "20" and incorporates some radical changes in respect to motor, motor suspension, clutch, frame and other parts of the chassis. As its title indicates, it is of 33 horsepower. The appearance of the bodies also differs from the "20," the larger radiator and the metal dust apron between running boards and fenders and the frame rendering it quite distinctive. The car is claimed to contain some 900 parts less than the average car of its class.

The new "33," with five passenger body, will sell for \$1,250, with four passenger tonneau for \$1,300 and a five passenger

HUDSON CLUTCH MECHANISM

in front, which are of the spiral type. There are but two gears in the front gear case, one of which is on the crank shaft and the other on the cam shaft. On top of the cam shaft gear in a separate housing is the transverse spiral gear on the magneto and pump shaft, driving the same.

On the left side of the motor are two plates covering the valves, springs, push rods, etc., not only protecting them from dirt and dust, but deadening the slight noise. The mere removal of these plates renders the valves immediately accessible.

The two-bearing crank shaft is of generous proportions. The front bearing is  $2\frac{1}{8} \times 3\frac{1}{2}$  inches and the rear one  $2\frac{1}{4} \times 4$  inches. The crank case, which surrounds the crank and cam shafts, is of barrel construction, and as it is not split in two sec-

HUDSON STANDARD FIVE PASSENGER TOURING

HUDSON THREE PASSENGER RUNABOUT

torpedo form for \$1,350. In addition the 20 horsepower roadster at \$1,000 will be continued.

The motor in the new model is cast en bloc as heretofore with cylinders 4 by  $4\frac{1}{2}$  inches, but this year incorporates many original features. It presents the appear-

fitted over it, tapering to a good sized neck at the forward end, over which is slipped the hose making one of the connections with the radiator. There are but two base connections, both of which are extremely short.

Another notable change from previous

tions, two end doors are set in to carry the crank shaft bearing and to be used also for their removal.

The motor is cooled by means of a pump, radiator and fly wheel fan. The radiator is the same type as that in Hudson "20," but it is made two tubes deeper, thus

END AND SIDE VIEWS SHOWING THE GENERAL CONSTRUCTION OF THE NEW HUDSON MOTOR

having more cooling service and greater capacity.

Lubrication is accomplished through a horizontal force-feed pump, operated by an eccentric cam on the cam shaft. The discharge from the pump leads directly to the timing gears, then from the gear case to the crank case, filling the various compartments to the proper level and overflowing at the rear into a reservoir bolted to the base of the crank case. The pump operates a sight-feed on the dash board, and the oil level is determined by means of a try-cock located on the right side of the reservoir.

The ignition is by means of a Bosch Duplex magneto, a coil and batteries. The coil is non-vibrating and on the dash presents the appearance of a simple switch. The batteries are used for starting, being switched off after the motor is running, of course.

The cone clutch has been abandoned in the new model, and in its place is substituted one of the multiple disc type. The position of the clutch spring is novel, in that it is inserted in the bored out rear end of

the crank shaft. It is so controlled that it cannot expand more than about  $\frac{3}{8}$  of an inch. This control is established by two cups with a bolt extending through them,

HUDSON BRAKE MOUNTING

so that the spring when removed is somewhat in the shape of a cartridge. It does not have to be compressed by hand when assembling the clutch, as the tension is

given by means of the clutch case bolts. Great economy of space is secured by this arrangement as the clutch and its mechanism are carried entirely within the fly wheel. The entire clutch with the fly wheel, bearings, and ball thrust bearings may be removed from the case by removing the nuts of through bolts which carry the outer clutch discs, and from cap screws which hold the cover in place, the transmission end having been uncoupled previously.

The transmission is of the selective sliding gear type, giving three speeds forward and one reverse. It is bolted directly to the two rear legs of the motor by four heavy bolts, and is not supported by the frame. All of the clutch, brake pedal and clutch throw-out mechanisms are carried on the transmission legs instead of being supported by the frame. The usual universal joint between the clutch and transmission is eliminated.

The drive is through a Spicer joint to a rear axle of the full floating type. The forward end of the propeller shaft is supported by a roller bearing, the rear end by ball bearings, and the shaft is enclosed

CHASSIS OF THE HUDSON "33" SHOWING METHOD OF ASSEMBLAGE AND CONTROL SYSTEM

in a torsion tube, no rod being used.

For the weight of the car, the frame used is very strong, the mid-section being a channel section, tapering to both ends. Four heavy cross members are used, one in front for the rigid support of the radiator, one at the point where the operating levers are attached, the third at the point of anchorage of the rear springs and the fourth at the rear, projecting beyond the side members and embracing the upper quarter of the three-quarter elliptic rear springs. No sub-frame is used in the new "33," the large box-section legs of the motor being bolted directly to the frame and resting on supports which project slightly out from the mid-section. Six heavy bolts hold the motor in place, one on each forward and two on each after leg.

The service brake, operated by a foot pedal, acts externally and the emergency brake controlled by a lever at the side acts internally. The drums are large in size and an improved leverage arrangement makes their operation easy and effective.

The front axle is an I-beam drop-forging, with flanges at the spring seats greatly widened.

Round section spokes are substituted for the usual thin section forward and rear, adding strength and durability. Both the front and rear wheels are 34 x 3½ inches on all models. The wheel base is 114 inches. The springs are semi-elliptic in front and ¾ elliptic in the rear.

The car is driven from the right hand side and controlled by a rakish set steering wheel, upon which are mounted spark and throttle control levers. Two pedals are conveniently placed, working through the floor boards, one of which operates the multiple disc clutch, and the other controls the service brakes. At the right hand side attached to the frame and set together in an integral casting are the two levers which operate the emergency brakes and the change speed gears respectively. An accelerator pedal is interconnected with the throttle control lever.

#### Motor Truck Goes to S. P. C. A. Assistance.

The Boston Society for the Prevention of Cruelty to Animals, the aged head of which declared about two years ago that automobiles were nuisances, has been using one of the despised vehicles to assist its work. To discourage the overloading of teams the S. P. C. A. has let it be known that it will assist teamsters in surmounting the steeper grades in the business portion of the city and last week it did so by stationing a 30 horsepower Atterbury truck, contributed by the Waite-Robbins Motor Co., on the Asburton Square hill, up which the heavily loaded wagons were assisted. They were hitched to the Atterbury truck and coal carts, with loads of 8,000 and 9,000 pounds, and were pulled to the top of the grade at a pace that forced the horses to step lively.

## MONITOR BUILDS A STATION BUS

Janesville Product Designed to Serve Hotels, Clubs and Theaters—Its Chassis Made for Heavy Duty.

With the elimination of the idea that a special body on a standard pleasure car chassis constitutes a true commercial vehicle, manufacturers are beginning to develop tendencies to specialization in business wagon production, as, to a certain extent, has been the case in the building of pleasure cars. In this way the sight-

the ceiling being of redwood and white pine laid in alternate strips. There are four drop windows on each side, three in front and two in the rear in addition to the door, and they may be lowered or closed without trouble at any time as the different conditions of the weather may require.

The chassis used is the regular type "A" style of the Monitor line. It is rated at 2,000 pounds capacity and has a 20 horsepower double-opposed motor of 5 by 4 inch cylinder dimensions. Transmission is through a planetary change speed gear and enclosed driving shaft to a semi-floating rear axle. The wheel base of 100 inches

THE NEW MONITOR 20 HORSEPOWER STATION BUS

seeing car, the massive truck, the light-weight truck, the delivery wagon and the cab have been developed. Still another type of vehicle that appears to have a peculiar field all its own is that of the small omnibus for transfer, station and theater work, and that there are few communities in which such conveyances cannot be advantageously employed is indicated by the increased and increasing demand for them.

A new and compact member of this class just has been developed by the Monitor Automobile Works, of Janesville, Wis. As the picture shows, it is of the conventional form, patterned after the style that has been used in horse-drawn equipments for so long. In adapting it to the automobile, however, it has been modified to the extent of introducing a number of modern features. The interior, which offers accommodation to 10 persons, is 65 inches in height and 76 inches long, the seats are 14 inches wide and the aisle is 22 inches in width. The interior trim is of quarter-sawed oak,

is sufficient in this case to permit the entire vehicle to be hung between the wheels thus affording easy suspension assisted by the semi-elliptic front, and full elliptic rear springs. The wheels are 34 inches in diameter, shod with 2½ and 3 inch solid tires in front and rear, respectively.

#### Australia Makes Queer Customs Ruling.

Although automobile parts may have been assembled and imported into Australia as complete cars, the government of that country in its most recent customs orders provides that the duty on automobiles be levied on the home consumption value in the exporting country of each part. In addition to setting forth the price of the complete car, the accompanying invoices must include the prices ordinarily charged for the body, footboards, mud guards, lamps, etc., when sold separately, and the exporter must file a declaration stating that the prices shown are not less than are charged to purchasers of similar cars and parts in the country of origin.

**MEET MARRED BY POSTPONEMENTS**

**Small Crowd Rewards Mount Vernon's Efforts—Wishart Scores Twice and Splitdorf Trophy Winner is Disqualified.**

Two postponements did not help the racemeet of the Mount Vernon Automobile Club when the affair finally was run off on Saturday last, November 12, at the Empire City track, near Yonkers, N. Y., and even then Jupiter Pluvius was not on his best behavior, for he frowned ominously and the atmosphere was of the sort that chased shivers up and down the spectators' spines. There was not much of a crowd present, however. A few cars were parked behind the grandstand and a handful of spectators was grouped in the stand itself.

The "lion" of the meet was Spencer E. Wishart, who twice drove a 60-horsepower Mercedes to victory. He captured the 10 miles race for cars of over 300 cubic inches piston displacement and the five miles free-for-all handicap.

The feature event on the card was a one hour race for the Splitdorf magneto trophy, which must be won three times to become the property of the holder. It was not much of a contest, however, as E. S. Hessels, driving a Pope-Hartford, took the lead at the crack of the gun and held it to the end, covering  $47\frac{3}{4}$  miles in the hour. Hessels, however, was protested and disqualified, it being claimed that his Pope-Hartford was not a stock car. This gave first prize to C. W. Lowa (Maxwell), and moved Otto F. Rust (Black Crow) and P. von Bartmer (Buick) into second and third places, respectively.

The 10 miles for cars having over 300 cubic inches piston displacement brought out five starters, and up to the half-way mark the race was a pretty fight between Milton McBride in a 60 horsepower Stearns and Spencer E. Wishart in his 60 horsepower Mercedes. Thereafter it was all Wishart, with W. Harold Mendel in another Mercedes closely following McBride and giving him a run for second place. These three drivers finally crossed the finish line in this order in the following times, respectively: 10:52, 11:35 and 11:45.

Percy Haycock (Reo) won the 10 miles for Class B stock chassis, in 13:52 $\frac{1}{2}$ , leading throughout, except for the first half mile in which he trailed von Bartmer (Buick), who finished second. Lowa (Maxwell) was third.

In the five miles free-for-all handicap the contenders were handicapped in yards instead of in the usual way. Wishart (Mercedes), after having allowed starts up to 1,000 yards, soon left the other scratch men, McBride and Mendel, and quickly collaring the long markers, won as he pleased in 5:23. McBride (Stearns)

was second in 5:46 and Mendel (Mercedes) third in 5:54.

The last event was restricted to members of the Mount Vernon Automobile Club and was a handicap race at 10 miles. Edmund L. Hass (Stearns), scratch, proved victor, with Mendel (Mercedes), another scratch man, second. Time, 10:55.

The Overland "Wind Wagon" was driven an exhibition three miles against time and performed consistently, the clockers catching the time for the first mile at 1:36 $\frac{3}{4}$ , the second mile at 3:10 $\frac{3}{4}$ , and the three miles in 4:35 $\frac{3}{4}$ . The summary:

One hour race for Splitdorf Trophy, for stock chassis 231-300 cubic inches—Won by C. W. Lowa, Maxwell. Distance, 44 $\frac{1}{2}$  miles. Otto F. Rust, Black Crow, second. Distance, 44 $\frac{1}{4}$  miles. Paul von Bartmer, Buick, third. Distance, 43 miles. E. S. Hessels (Pope-Hartford) finished first, but was disqualified.

Ten miles for cars over 300 cubic inches piston displacement—Won by Spencer E. Wishart, Mercedes. Time, 10:52. Milton McBride, Stearns, second. Time, 11:35. W. Harold Mendel, Mercedes, third. Time, 11:45.

Five miles free-for-all handicap—Won by Spencer E. Wishart, Mercedes. Time, 5:23. Milton McBride, Stearns, second. Time, 5:46. W. Harold Mendel, Mercedes, third. Time, 5:54.

Ten miles for stock chassis, Class B—Won by Percy Haycock, Reo; Paul von Bartmer, Buick, second; C. W. Lowa, Maxwell, third. Time, 13:52 $\frac{1}{2}$ .

Ten miles club race—Won by Edmund L. Hass, Mercedes (scratch). W. Harold Mendel, Mercedes (scratch), second. Otto F. Rust, Black Crow, third. Time, 10:55.

**Kansas's Way of Suppressing Joy Riding.**

"Joy riding," particularly in a judge's car, will lose most of its charm if the verdict of a Kansas jury finds many echoes in other directions. Judge Lee Munroe was the man whose car was taken out of a Topeka garage without permission by George Rutter, a chauffeur, who then wrecked before he returned. Judge Munroe promptly entered suit for \$1,000 damage, not merely against the garage owners, A. C. Longren and H. H. Potter, but against the offending chauffeur, his companion and the man who was in charge of the garage on the night the car was removed, and after two hours deliberation the jury returned a verdict holding all of them liable for the amount.

**Floridans Form a Touring Club.**

Thirty-one motorists of Jacksonville, Fla., have formed an organization styled the Jacksonville Motor Touring Club, and elected the following officers for the first year: President, Herbert B. Race; treasurer, O. S. Albritton; secretary, Charles L. Bagwell. The club has become affiliated with the A. A. A.

**TWO WHO TOP VANDENBERG'S AGE**

**Pennsylvania Produces 76-Year Old Motorist, but a New Jersey Youngster of 80 Years Claims the Honors.**

C. C. Vandenberg, of Lafayette, N. Y., is not the oldest operator of a motor car in this country, after all, his photograph published in the Motor World, having brought forth two more aspirants for the honor. Although Mr. Vandenberg is 75 years old, S. I. Fries, of Altoona, Pa., admits having seen the snows of 76 winters, thereby eclipsing the age-record of the former gentleman by a slight margin.

In addition to driving his own car, a 1904 model Franklin runabout, Mr. Fries writes that he does all his own repair work. Being a mechanic by trade, he has on several occasions completely dissembled his car and put it together again without assistance. He considers the car to be in better condition now than when he bought it and will sell it if he can get a used Franklin surrey of this year's make at a fair price.

As old as is Mr. Fries, however, Abram Cochran is older. Mr. Cochran's age exceeds man's allotment of three-score years and ten, by 10 years and he has driven and cared for his own car for the last two years. In his letter to the Motor World, Mr. Cochran says of Mr. Vandenberg:

"He is only a boy—I can go him one better. I am in my eightieth year and have been operating my car myself and also caring for it for the last two years. I have been looking for a man of my age who is operating a car, but have been unable to find one." Mr. Cochran is an attorney-at-law, whose home is in Elmer, N. J.

**Boston Now Permits Tire Chains in Parks.**

Recognizing the necessity of anti-skidding devices on automobile tires in winter, the Metropolitan Park Commissioners of Boston, Mass., finally have modified their regulations regarding the use of non-skidding devices on the metropolitan park roadways. Heretofore the use of chains has been prohibited altogether by the Metropolitan board, while the city board of park commissioners allowed them to be used. Under the new ruling motorists may now use chains in the metropolitan park system from November 15 to March 31. The favorable decision was brought about by the petition of the Boston Automobile Dealers' Association.

**Harrisburg Gets Its "National Association."**

Another "National Association of Automobile Owners" has just "opened up" in Harrisburg, Pa. Its "headquarters" are at 24 South street, where some supplies and accessories are to be sold on the co-operative plan.

## WHAT IS A LONG STROKE MOTOR?

**Many Engines Improperly so Termed, Claims an Authority Who Favors Short Stroke—Aeroplane Motors Cited.**

Much has been said of the superiority of the long stroke type of motor for automobile use, but, strange to say, relatively few arguments have been advanced in favor of the opposite type. This may be due in part to the fact that no dividing line between long and short stroke limits as yet has been established. At all events one authority who advocates the short or medium stroke, as compared with the other extreme, makes a strong plea in its favor, drawing supporting evidence from the new and aggressive field of aviation.

"Characteristics tending to render the short stroke motor better suited to the requirements of automobile service than the long stroke are its saving in weight, its better fuel economy and ability to attain higher speeds," is his assertion. Regarding the definition of what a long-stroke motor really is, he goes on to say:

"The idea is somewhat prevalent that any motor which has a stroke longer than the bore is a long stroke motor. There are some motors with  $3\frac{1}{2}$  inch bore by 4 inch stroke, developing about 18 horsepower, and others with about  $4\frac{1}{4}$  inch bore and 4 inch stroke, developing from 30 to 40 horsepower, that are properly classed as short stroke motors. Really an automobile motor is not a long stroke motor unless the stroke is 6 or 7 inches long, with a  $3\frac{1}{2}$  or 4 inch bore. Nearly all American cars, therefore, have motors which properly belong in the short stroke class.

"As to the relative weight of long and short stroke motors, the engines used in various aeroplanes furnish good comparisons. Naturally they are all of extremely light weight and most of them are air cooled. Taking the bore, stroke, weight of motor, weight of engine per horsepower and ratio of stroke to bore of over a score of aeroplanes, the result shows that the long stroke motors have the greatest weight per horsepower unit or power developed. In several cases the weight per horsepower is less than four pounds where the ratio of stroke to bore is about one, while the engines which have the stroke greater than the bore show a weight of over  $6\frac{1}{2}$  pounds per horsepower. Only 3 of over 20 of these airship engines have a stroke more than an inch longer than the bore.

"Another disadvantage in many cases of the long stroke is that the increased weight in engine and chassis is greater in proportion than the increase in power. The most powerful engine for its weight seems undoubtedly to be one with the ratio of bore to stroke nearly equal.

"A few of the reasons for the low weight of the short stroke motor are shorter connecting rods, shorter and lower cylinders, smaller crank case and lighter flywheel. The center of gravity is lowered, and furthermore the shorter leverage reduces the amount of strain on the gears, joints and shaft. The motor may be cranked with more facility, will respond quicker to the accelerator, and in general is more flexible because an engine of this type has a greater possible variation in revolutions than a long stroke motor. As a greater number of revolutions is made by a short stroke motor for the distance the piston travels, other things being equal, higher speed is possible."

### Greased Ways to Save Fenders.

When leaving or entering a garage, and particularly where the entrance is steep or

otherwise difficult, the fenders, wheels, running board or some part of the car are apt to strike the door casing at one of the sides, marring or otherwise damaging the body. Even though the utmost care is exercised in the handling of the car, this happens frequently on account of the extremely narrow passage through which one is compelled to drive to gain entrance to these narrow-door garages.

For the prevention of any such accidents a Brooklyn (N. Y.) garage has at its entrance two string pieces, about two by four inches, secured to the floor of the driveway, tapering apart, from the ends of the door sill, and extending outward about four feet. Two like pieces similarly are placed inside on the floor and each is connected to the respective outside strips by short parallel strips. All the pieces are rounded and planed, so that they will not cut or injure tires, and greased to facilitate the guiding of the cars. With the use of these pieces it is readily seen how easily a car may be run either in or out without any chance of scraping or marring any part of it. It is important, of course, that the strips be so placed as to allow ample clearance for the fenders.

## SALESMANSHIP AT THE SHOWS

**Kansas Dealer Draws a True-to-Life Picture—Necessity for Salesmen Who Really Know Their Cars.**

In an article recently published in one of our weekly periodicals in regard to automobiles being sold among the rural districts, the writer thereof drew attention to the fact that the buying public were becoming educated, technically, and that no longer did they accept the general appearances of the car as a guarantee of good qualities but that it was becoming necessary to "show them" that the car was technically right.

This brings to mind the fact that a great many of the manufacturers exhibiting in the large automobile shows throughout the country seem to lose sight of the fact that a salesman must be able to talk something besides what the car has done and what a fine finish it has, etc.

During the Chicago show last winter "yours truly," who has had several years experience in selling, operating and repairing cars, called at different booths and engaged the salesmen in conversation in regard to technical points and it was surprising how lacking most of them were in technical knowledge.

For instance, in ten or twelve cases the salesman had to look at his catalog before he could tell the size of the bore and stroke of the cylinder. In very few instances did they know the size of the crank shaft, the diameter of the crank pins or the number of inches in bearing surface on the main and crank bearings. Very few of them knew the size of the driving shaft or of the live axle shaft. The number of rings on the piston and the diameter of the valves was also Latin to most of them.

These are a few of the things that the man technically posted wishes to know. He may not care anything about it when he buys his first car, but when he is out after his second machine he wishes these things for comparison. Some salesmen will hand you a catalog saying: "That will give you all of the dope." This, however, is not the case, as very few of the above questions are answered in the average catalog. Factories seem to think it is wasting good space to state these things, or they are afraid their competitors will make "thunder" out of it. This is a mistake.

In fact the average catalog gives very little information in regard to measurements, outside of the size of the cylinders. Some will ask, "Of what benefit is the knowledge of the size of the crank pin and width of the crank box?" In answer to this, the man who knows will, by a little figuring, tell you whether your engine has as many inches of bearing surface on this

Another engineer of established reputation, in speaking of motor express possibilities, said:

"The fact that long distance motor express service would involve but one handling of merchandise is one of the greatest arguments for this kind of service, for it is evident that parcels are shifted several times in regular express haulage, and shifting invariably means but one thing—damage. Such a service as a New York-Boston route, with intermediate stops at perhaps New Haven, Hartford, Springfield and Worcester, would have to be planned on the established railroad methods with a trained organization of men to operate night and day in three shifts, with a suitable equipment of spare trucks.

"Such a service, per truck, would cost to operate, figured at the maximum, including wages, fuel, repairs, etc., about \$40 per full day of 24 hours. The bodies of trucks could be shifted, fully loaded, from chassis to chassis, at any point along the route if desired. This would only occur for minor repairs."

#### To Test the Line-Up of Wheels.

Wheels out of line cause undue strain and wear upon tires, and, as expense of tire up-keep is one of the greatest which the motorist has to meet, it is well occasionally to investigate their line-ups. There are several different ways by which to find out whether or not the wheels are running truly. In the first place it is important to see that the front axle is straight across the car. Then take a string and see whether or not it touches the rims of a front and a rear wheel at four places when drawn from the forward part of the first wheel to the rear part of the back wheel and several inches above each hub. Draw it across several inches below the hubs in the same manner. Any wheel out of line also may be detected by measuring the distance between the front rims, both forward of the axle and in the rear. Another means often used is the spinning wheel method. The car is jacked up and the wheels white-washed. When the wheels are revolved rapidly the whitewash is thrown off in a straight line from each one. Obviously if the lines are not parallel the wheels are not in proper alignment. This latter method, while detecting a considerable deflection, does not answer satisfactorily when absolute accuracy is sought.

#### Celluloid that Causes "Frothing."

Especially in storage batteries of the celluloid-cased type, the frothing of a cell is a rather common complaint. As one of the principal constituents of celluloid is camphor, an extremely volatile substance, celluloid is not particularly staple. Frothing in most cases has its origin in the use of impure water, lime salts being deposited on the plates and interfering with the process of charging.

## EVOLVES NEW SELECTIVE SYSTEM

**British Maker Develops Novel Gearset—  
Forward Speed Slots in Front—No  
Gears Meshed on High Speed.**

By the adoption of a triple-slotted gear-shifting segment the builders of the British Napier cars have been able to secure the desirable feature of a direct driven high speed with no gears in mesh and the lay shaft at rest. This feature has been used on several American cars, though it is believed not at present employed, the complication thought necessary in order to secure the result commonly having been

the pivoted joint at its lower end and slipper blocks C free to move in the slotted portion D of the gear lever, allows universal movement and freedom of motion.

When the direct drive clutch is engaged the lay shaft is rendered idle by the disengagement of its driving gears. These gears are re-engaged when the lever is moved out of the high speed slot and carried transversely to engage either the second or first speeds forward, or the reverse.

The small handle E, close to the segment, is employed to bring into action the ratchet sprag, with which all Napier cars are equipped. The device is so arranged that when the handle is turned and dropped, to engage the sprag, the reverse slot in the segment is blocked so that it is impossible

SHOWING THE NAPIER'S NEW SELECTIVE SYSTEM

deemed too great to be justified by the advantage gained. In the case of the new Napier gearset, however, the arrangement is not extremely complicated, while the result of stopping the lay shaft when it is not in use is to get rid of the humming of the idle gears and thus reduce the noise of the gearset considerably when the high gear is in use.

The accompanying illustrations indicate the appearance of the new control segment and also illustrate the method of its operation. The lower end of the shifting lever is pivoted to a bracket and is free to move across the segment and to be pushed into either of the slots, which are marked, to indicate the speeds, 1, 2, 3 and R. From the segment the tube A, shown in the left-hand illustration, connected by the bracket B to the gear shifting lever, is connected with the selective mechanism in the interior of the gear box; as the lever is moved into either of the four slots this sliding tube actuates the gears. The speed lever, having

to engage the reverse gear until the sprag has been released. The band brake segment G is integral with the lever assembly.

#### How Gasolene May Cause Trouble.

It is well understood that water left in the radiator or jackets of a motor car, stored in a cold climate for the winter, is very liable to freeze and cause considerable damage. The fact that gasolene left in the tank or pipes may also cause trouble in freezing weather is not, however, so generally realized. Though gasolene will not freeze, it does collect moisture from the air by condensation, and as the water so collected has a tendency to settle in the lowest points of the piping, it would freeze during very cold weather and might burst the pipes or their connections. It is advisable, therefore, to drain all gasolene as well as water from the car, if it is to be stored in a garage or a place where there is no heat, in order to avoid any possibilities of any such trouble.

## REORGANIZING MORGAN COMPANY

**New Yorker Assumes Presidency of Old Truck Building Concern—Disputed Contract Causes Some Trouble.**

Investigation of reports which have been current regarding trouble within the R. L. Morgan Co., Worcester, Mass., and of a reorganization that is in process, results in a ready explanation of the trouble but a not so ready disclosure of the nature of the reorganization.

The trouble, it transpires, was less serious than appeared on the surface and arose from a disputed contract which generated so much personal heat that a keeper was placed in the Morgan plant at Worcester, at the instance of Blake & Johnson, of Waterbury, Conn. This firm made some motors for the Morgan company which the latter declined to accept, alleging that they were not according to contract. When payment of the account, \$3,900, was refused, the resort to law followed. It is stated, however, that an amicable adjustment now is under way.

The Morgan company has been building trucks for several years and recently was granted a Selden license; a number of strong men of Worcester are financially interested in it, but when Henry E. Whitcomb, the treasurer, was asked concerning the trouble and the reported reorganization, he referred the inquirer to Clair Foster, in New York, Foster recently having become president of the Morgan company. Mr. Foster, who is water register for the city of New York, and who is largely interested in the Standard Plunger Elevator Co. and other concerns, is, however, rarely at the Morgan company's New York office, 40 West 60th street. He is a busy man and could not be seen, but over the 'phone and through Frank F. Weston, the Morgan company's New York representative, he recited the cause of the trouble as stated and while admitting that reorganization of some sort is in process he would give no

information regarding it. Reports have associated the names of Hugh Chalmers and Carl H. Page, Chalmers' New York representative, with the reorganization movement, but both sides deny and decry the reports which appear to have been founded on shadows. Although unfamiliar with automobile affairs, Mr. Foster, the new president, has the reputation of being a first-class organizer and apparently is expected to put the Morgan company in a position where it almost rightfully belongs.

### Michigan Men Reach Into Rhode Island.

The Grant & Wood Co., of Chelsea, Mich., which was organized in May last with \$1,000,000 capital and which took over the Grant Automatic Machine Co., of Cleveland, Ohio, has acquired the Potter & Johnson Co., of Pawtucket, R. I., a \$1,500,000 corporation engaged in the same line of industry—the manufacture of automatic machinery and machine screw parts. For the present the Pawtucket plant will be continued, but the headquarters of the amalgamated companies will be located in Detroit. W. E. Flanders, president of the E-M-F Co., is one of the directors of the Grant & Woods Machine Co., of which his right hand man and counsel, H. M. Brownson, is president and general manager, and A. O. Smith, the Milwaukee parts manufacturer, vice-president.

### Great Southern Goes to Half Million.

The Great Southern Automobile Co., of Birmingham, Ala., of which E. F. Enslen is president, and which is the only company in the Southern tier now manufacturing automobiles, has increased its capital stock from \$100,000 to \$500,000. The new money is to be used for improvements of the plant.

### Will Market the Henry Output.

Henceforth the Henry car will be marketed by the Henry Motor Sales Co., which has been formed for the purpose and which has located at 1549 Michigan avenue, Chicago. It will have to do with the sale of the entire output of the Henry factory, which is in Muskegon, Mich.

## FINAL APPEALS IN SELDEN SUITS

**Battle of Legal Talent Lasts Three Days and Court Grants Extra Time—Working Models Introduced.**

During the past three days oratorical eloquence, entwined with legal logic and technical lore, and illustrated by working models, has filled the United States Circuit Court of Appeals for the Second Circuit in the Post Office building in New York, where the final argument for and against the validity of the Selden patent have occupied the attention of Justices Lacombe, Noyes and Ward.

Yesterday (Wednesday) the flow of eloquence ceased long enough for the court and counsel to visit No. 45 Barclay street and examine some historic and precious original exhibits—cars and engines—in the case that are stored at that address. Originally the court, which sits but three hours daily, gave each side 4½ hours in which to present its argument, but on Tuesday it granted each an additional hour on Friday, when the heaviest legal artillery will be brought to bear in the closing arguments.

The appeals being heard are those in the Ford-Wanamaker-Gude and the Panhard-Neubauer cases, in all of which the lower court decided in favor of the Selden patent, which in the proceedings is represented by the Columbia Motor Car Co., as plaintiff, though, of course, all the weight of the Association of Licensed Automobile Manufacturers is behind the latter. Being appeal cases, no new evidence is being introduced, but the employment of working models by both sides to illustrate points of their arguments has added a touch of human interest and served to illuminate otherwise dry proceedings. The testimony which is being reviewed is impressive in volume and has been brought to court in books, satchels and trunks. Of the court, Justice Noyes appears to be following the case most closely, his questions,

## THE MOTOR WORLD

addressed to both sides, being frequent and pointed.

Of the principals directly involved only Henry Ford and James Couzens, of the Ford Motor Co., have been in attendance at the hearings. Alfred Reeves, general manager of the A. L. A. M., and Hermann F. Cuntz, the association's patent expert, have represented the "other side"—the Selden side. There has been present, however, a great array of attorneys, forty or more, representing companies which have been or may be sued for the infringement of the patent, and they have followed the arguments with the keenest attention.

Of the counsel directly engaged, the defendants are represented, the Ford company by Edmund Wetmore, Livingston Gifford and W. Benton Crisp, and the Panhard interests by Frederic R. Coudert. Mr. Gifford consumed all of the 4½ hours originally allotted to his side and Mr. Wetmore will use the extra hour on Friday for the closing argument. For the plaintiffs and in favor of the Selden patent, S. R. Betts made the opening address; he was followed by W. A. Redding and Frederic P. Fish, whose argument will carry over and close the case on Friday. The other Selden attorneys are Edward Rector, of Chicago, and J. W. Peters, of New York.

### Old Victor Succeeded by a New One.

The Victor Motor Truck Co., of Buffalo, N. Y., last week filed a certificate of voluntary dissolution and immediately thereafter another and larger company of the same name was incorporated with \$250,000 capital stock, it being the intention of the new company to greatly enlarge the size and scope of the business. The Victor factory is located on Niagara street near Potomac avenue, Buffalo, and is under the superintendence of Christian Miller, who has been engaged with motor trucks for some eight years. T. Ross Lippard, at one time connected with the H. H. Franklin Mfg. Co., of Syracuse, is the general manager.

### Heinze May Leave Lowell for Detroit.

It is not unlikely that the plant of the Heinze Electric Co., of Lowell, Mass., will be removed to Detroit, Mich. Congressman Butler Ames, of Massachusetts, who is interested in the Heinze company, made the announcement in the course of an address to the Detroit Board of Trade last week. He stated that he had heard so much of Detroit's "gasolene aristocracy" that he had spent several days in the city seeking to effect arrangements to remove the Heinze plant bodily from Lowell.

### Otis Cook Quits the Federal Service.

Otis R. Cook has resigned the general management of the Federal Rubber Co., of Milwaukee, Wis. Cook, who long has been one of the well known figures of the tire industry, has not yet made known his plans for the future.

## COULDN'T CARRY ANHUT'S LOAD

### Even Elimination of His Name Did Not Help Barnes Company and it Fails—Assets Questionable.

Having succeeded to the business of the embarrassed Anhut Motor Car Co., only a few weeks since, the Barnes Motor Car Co., of Detroit, Mich., was petitioned into bankruptcy on Thursday last, 17th inst, by Frank Howard, of that city, who had bought up claims against the company aggregating \$34,000. William M. Walker, its president, was appointed receiver, and he hopes in some way to obtain assistance in continuing operations, but the prospects of the creditors recovering any considerable sums are not very promising. The liabilities amount to \$64,242.33 and the assets to \$143,540.25, of which \$10.32 represents the cash in bank.

Many of the assets, it is frankly admitted, are of a doubtful character. The assets are made up chiefly of parts, machinery and unfinished cars at the plant, 510 Howard avenue, Detroit, valued at \$21,500; notes due, \$2,116; due on open accounts, \$26,571.23, in which is included about \$20,000 in fire, insurance policies, and \$50,000 in real estate and a factory in Chatham, Ont., which, plant, however, was never operated and the title to which is clouded and can be established only by litigation. The factory on Howard street, Detroit, was leased property.

The blame for the crash is laid at the door of State Senator John N. Anhut, who organized the Anhut company and created something of a splash by announcing a six-cylinder car listing at \$1,700. Anhut is a young man and in addition to having political ambitions he appeared to be imbued with ideas of "high finance" which, according to reports, helped to line his own pockets while the company was reduced to such straits that it was forced to ask for an extension. The young Senator was rather vividly and at great length exposed by the Detroit press. When his name became a detriment instead of a help to the company, others stepped in, changed its title to Barnes Motor Car Co., and tried hard to patch up the wreck. That they were unsuccessful, the bankruptcy proceedings are sufficient evidence.

### Fisk Facilities to be Greatly Enlarged.

Once more the Fisk Rubber Co. has found it necessary to enlarge its already large plant at Chicopee Falls, Mass., contracts having been let for a steel and brick addition, 187 by 36 feet, four stories in height. A new engine room also is being constructed and the boiler house enlarged. The enlargement will add about 2,000 square feet of floor space to the Fisk plant, 75

per cent. more power capacity, 60 per cent. more to the mills and calenders and will increase the machine shop capacity about 30 per cent. A new 1,200 horsepower engine is to be installed and also 300 horsepower additional electric equipment. These additions and alterations will permit of an increase of about 40 per cent. in the output of Fisk tires. It is expected that the new building will be completed and the machinery installed by January 15th next.

### Goodyear Takes Over Durham Plant.

The purchase of the Durham Rubber Co., of Bowmansville, Ont., by the Goodyear Tire & Rubber Co. of Canada, Ltd., of Toronto, finally has been consummated and the new owners already are preparing to enlarge the Bowmanville plant and otherwise to reach out for more of the Canadian tire business, of which it is claimed it secured 41 per cent. during the last year. Branches are to be established in Montreal, Vancouver and Winnipeg. F. A. Seiberling, the head of the Goodyear company in Akron, Ohio, is president also of the Canadian company; L. C. Van Beder is vice-president, and C. H. Carlyle, secretary and treasurer.

### Two Tire Reductions Already Effective.

In sympathy with the reduced price of rubber and the forthcoming reduction in the price of pneumatic tires, the price of the solid rubber article also is coming down. The Firestone Tire & Rubber Co. made the first move on Thursday last when it announced an immediate reduction of 10 per cent. on its side-wire tires. On the same day the Michelin company also "stole a march" on the other pneumatic tire manufacturers by reducing its prices, the new figures becoming effective that day. The other makers had set December 1st as the date when their revised lists would become operative.

### President's Troubles Involve His Company.

Judge Carpenter in the United States District Court has appointed the Chicago Title & Trust Co. receiver of the Standard Auto Supply Co., Chicago, Ill. Liabilities are scheduled at \$130,000 and the assets at \$75,000. This action is the outcome of bankruptcy proceedings instituted recently against Louis Bergman, president of the company. He obligated himself for the purchase of considerable material, and the creditors, fearing that his difficulties would embarrass the company, asked for the receiver.

### To Make Clark Wagons on Large Scale.

The Clark Delivery Car Co., of Chicago, which recently increased its capital from \$5,000 to \$150,000, intends to greatly enlarge its output and the scope of its operations. Its new light delivery truck already is ready for the market. Senator A. C. Clark is president of the company and William C. Smith, secretary and treasurer.

**KLAXON AGAIN BLOCKS KAUFMANN'S**

**Big Pittsburg Firm Can't Even Give Orders on Third Parties—Fined for Thus Evading Injunction.**

There has been no let-up in the Lovell-McConnell Mfg. Co.'s unusually thorough and vigorous campaign against all who trifle with the price of its Klaxon horns. Heretofore these suits for violation of the patent license, which fixes the price at which the horns may be sold at retail, have been in the nature of injunction proceedings which in every case have resulted successfully.

These suits have been unusual in that they have restricted the offenders from not merely selling Klaxon horns at any price but from purchasing or using them in any way or at any cost. Last week, however, the campaign took a new turn when Kaufmann Brothers, proprietors of a large department store in Pittsburg, were brought before Judge Young, in that city, and fined for contempt of court, the contempt consisting of having violated an injunction forbidding them to sell, use or in any way deal with Klaxon horns. This injunction was granted on April 21st last and shortly thereafter the Lovell-McConnell Mfg. Co. was advised that the Pittsburgers still were selling Klaxons. When they secured the necessary evidence, and despite the prominence of the firm involved, they promptly instituted contempt proceedings.

The case graphically illustrates how far reaching are the effects of an injunction in the hands of those possessed of desire and intention to make the most of it, for in the Pittsburg case the evidence showed:

First—That Kaufmann Brothers actually had issued orders to all employees of the store not to sell Klaxon horns.

Second—That the sale was made by an employe who should have known of this order.

Third—That the Klaxon sold was not in stock in Kaufmann Brothers' store, and was not delivered from that store, but was obtained on Kaufmann Brothers' order from a third party.

Notwithstanding all these special circumstances, Judge Young found that such sale was a violation of the injunction and imposed upon Kaufmann Brothers a fine for the contempt they had thus committed.

**Names that Caused Undesirable Confusion.**

Due to the publication of reports of the failure of the Pennsylvania Motor Car Co., which did a retail business at 128 North Broad street, Philadelphia, and the manager of which disappeared, Manager Page, of the Pennsylvania Auto-Motor Co., of Bryn Mawr, Pa., manufacturer of the Pennsylvania car, states that considerable unde-

sirable confusion has arisen, the Bryn Mawr concern being mixed with the Philadelphia retailers, when no connection whatsoever existed between them, which fact the former is anxious to have generally known. The Philadelphia people did not even handle the Pennsylvania car.

**Imposing Plans for California Plant.**

Published plans for the plant for the "A" Automobile Mfg. Co., which recently secured a ten acre site in Sacramento, Cal., are of an impressive character. They depict seven buildings, all of steel and concrete construction, the administration building alone being a three story structure, 90 x 270 feet. The machine shop and the foundry each will be 90 x 270 feet, the assembling room 150 x 230; the wood working shop 90 x 400, the receiving and shipping building 90 x 400, and general store room 150 x 230 feet.

**Credit Association to Repeat Banquet.**

The Automobile Trade Credit Association has programmed its annual banquet to occur on January 18th, during the second or commercial vehicle week of the Madison Square Garden show in New York. The function is to be conducted on a much larger scale than those of previous years.

**Dayton Truck Secures a Factory.**

The recently organized Dayton Auto Truck Co., of Dayton, Ohio, has leased a plant in that city at First avenue and Taylor street. The necessary equipment is being installed and it is expected that the first Dayton truck, as the product will be styled, will make its appearance before the end of the year.

**LaDue to Make Tops in Toledo.**

The LaDue Auto Top Co. has been formed in Toledo, Ohio, and is equipping a plant for the manufacture of tops and trimmings. Robert M. LaDue, who had long experience in the business in Detroit, is the moving spirit in the enterprise.

**Dr. Dusseau Displays His Car in Toledo.**

The Dusseau Fore & Rear Drive Auto Co., which was recently organized in Toledo, Ohio, has set up at 235 Erie street. Dr. S. V. Dusseau, the inventor of the car, which is being exhibited at that address, is president of the concern.

**Hunter Becomes Maytag-Mason's Manager.**

B. B. Hunter, of Waterloo, Ia., has purchased an interest in the Maytag-Mason Automobile Co. of that city. He will become general manager of the company.

**Gorton Joins Timken-Detroit Selling Staff.**

C. E. Gorton, formerly vice-president of the Western Malleable Iron Co., has joined the selling staff of the Timken-Detroit Axle Co. He will represent the latter on the road.

**MATHESON IS AGAIN ON ITS FEET**

**Reorganization Completed and Receiver Discharged—One of the Receivers Becomes President of Company.**

The Matheson Automobile Co., which marketed the Matheson car, has taken over the Matheson Motor Car Co., which made it, and henceforth the first named company will both manufacture and sell the Matheson product. This transaction was authorized by the Court of Common Pleas of Luzerne county, Pa., on Thursday last, 17th inst., and terminates the receivership of the Matheson Motor Car Co., which has existed since last July. The court's action took the form of a final decree confirming its order of October 31st, to the receivers, W. C. Sheperd and Asher Miner, to transfer and convey to the Matheson Automobile Co. all the property, rights and franchises of the Matheson Motor Car Co. The selling company had not become involved in the embarrassment but was reorganized and its capital increased to permit of the new arrangement.

Following the discharge of the receivers, the stockholders of the reorganized company met in Wilkes-Barre, Pa., and elected the following directors: W. C. Sheperd, J. W. Hollenback, Asher Miner, W. H. Conyngham, John A. Turner, W. H. Son, John C. Bridgman, R. Nelson Bennett, I. M. Thomas and C. W. Matheson, of Wilkes-Barre; M. W. O'Boyle, of Pittston; Henry Hess, of Philadelphia; E. S. Fretz, of Pottstown; J. B. Russell, of New York, and Cortez Jennings, of Towanda.

The trustees in turn chose W. C. Sheperd, president and general manager; J. W. Hollenback, vice-president; E. F. Matheson, secretary, and Henry H. Pease, treasurer. The president is the same man who served as one of the receivers and he is preparing to relinquish his other interests in order to devote himself wholly to the automobile business.

The paid in cash capital of the Matheson Motor Car Co. was \$350,000 and the bond issue \$200,000. The paid in cash capital of the Matheson Automobile Co., which was the New York selling company, was \$150,000. Seven hundred thousand dollars new money has been added to the reorganized company in the form of \$595,000 first preferred stock issued and \$105,000 bonds issued. The new money gives the reorganized company a paid in capital of \$1,100,000 plus the bond issue of \$300,000. The authorized stock and bond issues of the company are \$1,000,000 first preferred stock, second, \$400,000 stock and \$1,250,000 common stock and \$300,000 bonds.

During the period of the receivership the factory at Wilkes-Barre continued operations and now is in position promptly to

till orders for both its four and six cylinder cars, both of which are impressive creations of undoubted quality.

The New York salesrooms and garage on Broadway, near 62d street, probably will be continued as a retail branch to supply the metropolitan district. The wholesale sales department, however, has been transferred from New York to Wilkes-Barre.

#### Timken Takes Exception in Lindsay Suit.

Exceptions to the report of Master of Chancery Edward Daniels on the issues raised by the cross bill in the case of the Timken Roller Bearing Axle Co., of Canton, Ohio, against Thomas J. Lindsay and Willard Harmon, of Indianapolis, Ind., were filed in Indianapolis on Saturday last, November 19th. The exceptions protest against the entire report of the master, which was favorable to Lindsay and Harmon, holding that in the last three years the Timken company had infringed the patents Nos. 612,360 and 748,760, held by Lindsay and Harmon, and that the patentees are entitled to an accounting.

The action is the outcome of a suit in equity brought against the Timken company for breach of contract. The Timken company, it is claimed, had agreed to pay royalties to Lindsay and Harmon for every axle in which their ideas were incorporated, and to mark each axle with the name of the patentees. The patentees claim that these agreements were not carried out by the Timken company, and in particular that no royalties have been paid to them in 1908, 1909 and 1910. The patents involved are the so-called "Lindsay axle patents," once alleged to be "foundation patents" which would rival the famous Selden patent. At various times several "scares" were born of them, but even the Timken company finally became convinced of their lack of value.

The exceptions filed by the Timken company assert that the report of the master of chancery enlarges the scope of the patents issued to Lindsay, and object to the statement contained in said report that the plaintiff should be required to account for royalties which were to have been paid in the three years 1908 to 1910, inclusive. A further exception contends that the court had no authority to appoint the master, because the issues of the cross bill are alleged to be out of jurisdiction of the United States Circuit Court.

#### They Will Exhibit in Chicago, Too.

In the report of the line-up of the Motor and Accessory Manufacturers at the New York and Chicago shows, the Diamond Rubber Co. and the Apple Electric Co. were recorded as exhibiting both weeks in New York and not at all in Chicago. As a matter of fact, the Diamond company is booked for both weeks at both shows and the Apple company for New York and for the first or pleasure car week at Chicago.

#### THE WEEK'S INCORPORATIONS.

Detroit, Mich.—Ajax-Grieb Rubber Co., under Michigan laws, with \$400,000 capital. Corporators—W. J. Grieb and others.

Lancaster, N. H.—Lancaster Garage & Auto Co., under New Hampshire laws, with \$6,000 capital; to operate a garage and renting service.

Milwaukee, Wis.—Milwaukee Automobile Dealers' Association, under Wisconsin laws, without capital. Corporators—Robert G. Bates and eight others.

Seattle, Wash.—Franklin Motor Co., under Washington laws, with \$40,000 capital; to deal in automobiles. Corporators—H. A. Baird, Walter French.

Cleveland, Ohio—Gyro Motor Co., under Ohio laws, with \$10,000 capital. Corporators—C. W. Hunt, W. L. Cary, H. R. Palmer, Plym C. Davis, J. W. Courts.

Los Angeles, Cal.—Siegmond Motor Car Co., under California laws, with \$50,000 capital. Corporators—E. F. Siegmund, M. Ray Costerisan, George F. Costerisan.

Dayton, Ohio—Dayton Taxicab Co., under Ohio laws, with \$25,000 capital; to operate a garage, taxicab and renting service. Corporators—J. D. Hodson and others.

Boston, Mass.—Rambler Auto Co. of New England, under Massachusetts laws, with \$10,000 capital; to deal in automobiles. Corporators—Perry Rockwell, Arthur P. Teele.

Bucyrus, Ohio—Sommer Motor Co., under Ohio laws, with \$125,000 capital; to deal in automobiles. Corporators—L. A. Sommer, L. M. Smith, S. S. White, F. L. Hopley, D. F. Flohr.

Boston, Mass.—International Automobile Association, under Massachusetts laws, with \$100,000 capital; to deal in automobile supplies. Corporators—W. T. Morgan, Chicago, Ill., S. M. Booth, Boston.

Jersey City, N. Y.—Remington Tire & Rubber Co., under New Jersey laws, with \$100,000 capital; to manufacture rubber products. Corporators—H. G. Remington, D. J. Reynolds, C. S. Cairns, Minneapolis, Minn.

Rochester, N. Y.—The Freckleton Palace Stables, Inc., under New York laws, with \$50,000 capital; to operate a garage and livery stable. Corporators—G. W. Freckleton, T. E. Freckleton, W. H. Rowerdinck, Rochester.

Columbus, Ohio—Packard Taxicab & Auto Livery Co., under Ohio laws, with \$30,000 capital; to operate taxicabs. Corporators—Louis M. Gillespie, G. L. Sitgreaves, G. F. Castle, N. Hutchinson, A. Alexander.

Houston, Tex.—Texas Automobile Co., under Texas laws, with \$10,000 capital; to deal in automobiles. Corporators—R. H. Thompson and Sterling Myer, of Houston, and E. R. Richardson and F. W. Blackburn, of San Antonio.

Vernon, Conn.—Buick Garage Co., under Connecticut laws, with \$25,000 capital; to operate a garage and deal in automobiles. Corporators—Thomas F. O'Loughlin, of Vernon, and David B. and Maud I. Roberts, of Ellington, Conn.

Oakland, Cal.—United Electric Vehicle Co., under California laws, with \$50,000 capital; to deal in automobiles and other vehicles. Corporators—W. D. Vance, R. Scraba, W. Hughes, F. R. Fageol, R. H. Morris, all of Oakland.

Richmond, Va.—Southern Motor Car Co., under Virginia laws, with maximum capital of \$25,000, minimum \$1,000; to do general automobile business. Corporators—L. M. Lee, R. E. Eastwood, C. W. Yeamans, all of Richmond, Va.

New York City, N. Y.—Otto Motor Car Co., under New York laws, with \$50,000 capital; to manufacture engines, motor vehicles, motors, machinery, etc. Corporators—J. J. McDonald, New York City; J. M. Lang, H. A. Bedell, Brooklyn, N. Y.

New York City, N. Y.—Madison T. B. Washington Co., under New York laws, with \$100,000 capital; to manufacture automobiles, machinery, electrical and otherwise. Corporators—M. T. B. Washington, M. W. Gilbert, J. S. Brown, Jr., all of New York City.

Hartford, Conn.—Mythib Rubber Tire Preserver Co., under California laws, with \$400,000 capital; to manufacture tire preserving product "Mythib." Corporators—C. H. Chaffee, East Orange, N. J.; Daniel H. Haneckel, Brooklyn, N. Y.; Thomas G. Prioleau, New York City.

Charleston, W. Va.—Remington Standard Motor Co., under West Virginia laws, with \$1,000,000 capital; to manufacture Manly motor trucks under letters patent. Corporators—Philo E. Remington, Emerson Brooks, of Newark, N. J.; F. M. Staunton, Charleston, W. Va.; George A. Grounds, Pittsfield, Mass.; Eliphalet Remington, Ilion, N. Y.; DeWitt Bruce, Lenox, Mass.; Harrison B. Smith, Charleston, W. Va.

#### Increases and Decreases of Capital.

Sandusky, Ohio—Vim Motor Mfg. Co., from \$25,000 to \$60,000.

Detroit, Mich.—Herreshoff Motor Co. from \$140,000 to \$230,000.

Carthage, Ohio—Jewel Carriage Co. increase from \$250,000 to \$450,000.

Oklahoma City, Okla.—Overland Automobile Sales Co. decrease to \$35,000.

Johnstown, Pa.—Johnstown Automobile Co. increase from \$10,000 to \$100,000.

Birmingham, Ala.—Great Southern Automobile Co. increase from \$100,000 to \$500,000.

Lansing, Mich.—W. K. Prudden & Co., manufacturers of automobile wheels, from \$350,000 to \$500,000.

## IN THE RETAIL WORLD.

The Seaboard Auto Storage Co., of Norfolk, Va., has filed a petition in voluntary bankruptcy.

D. C. Baker, of Burton, Tex., has invaded the neighboring town of Brenham and built a garage there.

Wright Elsom, Jr., last week broke ground for a new garage in Oak Park, Ill., where Mitchell cars are to be shown.

Isaac A. Schwarz has purchased the property at 228-230 North 15th street, Philadelphia, Pa., and will erect a garage thereon.

E. V. Kirby is building a garage on Market street, Urbana, Ill. It is 76 x 125 feet, one story high, and will cost when completed \$8,000.

The Philadelphia branch of the Michelin Tire Co. has been removed from 320 North Broad street to 1304-1306 Race street, in the Steppacher building.

The Maine Supply & Garage Co. is erecting a garage on Lower Lisbon street, Lewiston, Me. City Marshall Cailler and others are interested in the project.

The Polson Implement Co., of Seattle, Wash., has taken over the Washington agency for Regal cars. In addition it will continue to handle the American line.

Foster & Co., Hartford distributors of the Regal and Rambler cars, have taken possession of new salesrooms at 10 Jefferson street. The garage is a concrete structure.

The Brainerd Auto Co., which just has been formed in the Minnesota city of that name, will act as distributor of Overland cars. John Ernster is president of the company.

The name of the Suburban Auto & Garage Co., 125 East Seventh street, Cincinnati, Ohio, has been changed to Kruse Bros. Edward Kruse, the manager, is the Marmon agent.

Work is progressing rapidly on the new steel garage which is in course of construction on Locust avenue, Long Beach, Cal. When completed the building will be occupied by the Pacific Garage.

G. E. & H. J. Habich, New England agents for the Cole "30," have taken possession of their new salesrooms on Massachusetts avenue, Boston, Mass. They will also display Hart-Kraft trucks.

W. W. Land, formerly of the Ford Auto Co., has organized the Land Auto Co., in Little Rock, Ark., with headquarters at 407 West Fifth street. He will deal in Ford cars and conduct a general garage service.

M. M. Mudd, of St. Louis, Mo., has purchased the Palace Garage, at 614 State street, Fremont, Ohio, and is building a new cement addition 45 x 90 feet, to be used as a repair shop. He is handling the Buick line.

The Roman Automobile Co., of 1740 Market street, has leased the showrooms and garage at present occupied by the Auto-car Co., at 240 North Broad street, Philadelphia, and will shortly establish itself in the new quarters.

Arthur Willoughby, of Hutchinson, Kan., has purchased the entire business of the Salt City Motor Car Co., and will continue the business under the old name. The employees of the Salt City concern have been retained by the new owner.

Constantine Link, of Springfield, Ohio, has purchased for the sum of \$10,000 the

HARTFORD TIRE'S NEW BOSTON HOME  
Branch Store at 863 Boylston Street

property located on Fountain avenue, between Columbia and North streets, where he will erect a garage. The ground is 75 feet wide and 198 feet deep.

Incorporated with a capital of \$10,000, the Texas Automobile Co. has opened salesrooms at 904 Main street, Houston, Tex., where it will show Packard cars exclusively. R. H. Thompson is president and general manager, and Sterling Myer the secretary and treasurer.

J. G. Patterson, owner of the Capital Machine & Auto Co., of Sacramento, Cal., has sold his interest to George W. Hipple, of Oakland, Cal., and the name of the company has been changed to Superior Machine & Auto Co. B. B. Treat is the man in charge.

Maine's first taxicab company went into the hands of a receiver on November 16th, with liabilities of \$20,000 and assets estimated at less than \$5,000. The concern is known as the Taxicab Co. of Maine, with headquarters at Portland, while the receiver appointed is George F. Gould, of Portland, Me.

Organized under the laws of Indiana, the Premier Sales Co., of Indianapolis, Ind., has opened up in the latter city, succeeding the Gibson Automobile Co. Its salesrooms at 233-235 North Pennsylvania avenue will be under the management of Henry L. Johnson, former manager of the Boston branch of the Premier company.

Under the style Taylor Motor Sales Co. a company has been formed in Boston, Mass., to handle Herreshoff cars. The salesrooms are located at 157 Massachusetts avenue. John I. Taylor, president of the new company, is the owner of the Boston American baseball club, while the vice-president is A. H. Mitchell, a well-known sporting writer.

The business of the American Garage Co., of St. Louis, Mo., has been absorbed by its neighbor, the Pope-Hartford Motor Car Co., of 5883-5891 Delmar boulevard, and its garage building with all contents has been joined to the garage of the Pope-Hartford company. The latter company is capitalized at \$166,000, and is under the management of Tom J. Thaxton and Ira L. Bell.

T. Edward Oakes, of the firm Thomas Oakes & Sons, 11 Haynes street, Hartford, Conn., has gone into business on his own account and opened a repair shop under the style T. Edward Oakes & Co. He is the president also of the Hartford Automobile & Boat Supply Co., which latter company will be affiliated with the Oakes concern and do business at the same address, 183 Allyn street.

The H. O. Harrison Co., of San Francisco and Los Angeles, Cal., has purchased the Mantell Motor Co., of Seattle, Wash., and will handle the Peerless and Everitt "30" cars. C. S. Mantell, former owner of the absorbed company, has been retained to act as sales manager for the Everitt line, while Jack Gardener Tennant will take charge of the Peerless cars. The salesrooms of the company are at 301-303 East Pike street.

Attorney Robert A. Mowbray, of Baltimore, Md., has been appointed receiver with a bond of \$1,000, of the Royal Auto Co., of 201 West Biddle street, in bankruptcy proceedings instituted before John Stockbridge of the Circuit Court. The petition in bankruptcy had been filed by Frank L. and Nellie C. Hiser, stockholders of the company, and stated that the concern practically has suspended business; it asked the court to dissolve it. The company was incorporated January 31st last, with an authorized capital stock of \$20,000.

## THIS IS THE NEW 40

**T**HIS is the new car—the design produced by our experienced engineers unhampered by precedent, seeking to produce the best type of American car. With five-passenger torpedo body it is priced at \$3,000.00, with seven-passenger body at \$3,200.00. Within the limits of human fallibility this car is intended to represent the best and the latest in engineering, combined with the best in the body builder's art. With so lofty an ambition to guide our engineers, it is with pride that we announce that the essential characteristics of all White Gasoline construction are retained—the cylinders are cast en bloc and the long-stroke engine is continued. We consider it the best tribute to our thirty-horsepower White cars, that the experience of the world's engineers has been able to suggest no improvement in our new engine, and that it is only a larger type of our first design.

Sample cars will be shown at all  
branches on or before November 25th

### The Advertising of a Tourists' Agency.

If the several energetic and enterprising gentlemen who comprise the private corporation styled the Touring Club of America are not chuckling in their sleeves, their risibilities sadly are in need of a tonic. For if ever a party of men banded together for the pursuit of the dollar richly earned the right to chuckle it is the Messrs. Touring Club of America. Their "publicity stunt" in calling a conference of state officials to discuss laws relating to automobilists and in actually getting some of them to gather for the purpose in the "club's" office was quite the cleverest job of the sort that has been accomplished in a considerable term of years.

The advertising thus secured was worth very many thousands of such luncheons as were purchased for the "come-ons," and is sufficient to make the average professional press agent turn not merely green but purple for very envy. It was a coup of the undeniable sort, admirably conceived and

admirably carried out. It is so superior, for instance, to the "special despatches" from Albuquerque and elsewhere recording the travels of the Touring Club's field solicitor which have been mailed to the press for publication, that the wonder is that time should be spent in concocting such trivial if fulsome "despatches."

But while greatly admiring enterprise, cleverness and audacity, it is well to warn the Touring Club that such qualities may be carried too far. Many clever people have been undone by their own cleverness. There are those who appear to fancy that things always are what they seem but who, when light dawns, do not relish the deception and have unpleasant ways of showing it. What, for example, will be the feelings of the state officials who attended the "conference" of the Touring Club of America when they awaken to the fact that the "club" is wholly a commercial venture—a tourists' agency akin to Cook's or Gillespie & Kinsport's and, like them, existing wholly for the purposes of revenue? The officials cannot but feel that they were "taken in" and used for advertising purposes, and if their friends poke gentle fun at them, their friends cannot be blamed. And how many motorists will thank the "club" for leading up to "resolutions" adopted by ten or twelve men favoring the revocation of the motorist's right to use the public highways for all and any infractions of the laws affecting them and even for causes that are not defined by law?

The very title Touring Club of America is so suggestively uncommercial that it has been worth hundreds of thousands of dollars in free advertising to the several gentlemen who are doing business under it; and where they can get such advertising they are entitled to it, but the automobile interests have a right to protest against "publicity stunts," rendered easier because of a name, when their general issues are at stake. Undoubtedly the Touring Club principals intentionally would do nothing to adversely affect these issues, but there are times, as in the present instance, when they cannot prevent it if they would. Their "club," despite its misleading title, is a perfectly legitimate business institution; it probably fills a want, just as does Cook's tourists' agency, and they merit all the profit they may earn, but they should stick to their business and let the bona fide clubs and associations attend to those affairs which are of general or governmental con-

cern and which so easily may be prejudiced by the cry of commercial self-interest.

Incidentally, it would not be a half bad idea if, at the annual meeting of the American Automobile Association next week, resolutions were passed bearing on the unwarranted interference in such matters of commercial "clubs" and strictly business "associations" with misleading titles. It would serve to prevent further confusion in the public mind and in the official minds.

### For the Self-Starting of Motor Trucks.

It long has been admitted that some sort of self-starting device for the internal combustion motor would be a valuable acquisition insofar as its application to the automobile is concerned. The matter has been expressed even more strongly, but it does not matter now. With a few notable exceptions the manufacturers have not seen their way clear to developing just the right system for the purpose, the public has not been particularly insistent in demanding it and, naturally enough, the starting crank has remained. The business sense that governs the development of the commercial vehicle, however, is causing the incidentals of design to be scrutinized in an entirely different way where that type of vehicle is concerned than has been the case with the pleasure car. And it is beginning to appear that discretion soon will teach the need of engine starters if the gas car is to continue long in city service.

It is generally admitted by those who have given close attention to motor truck operation that within city limits the advantages of the gasoline machine are overshadowed in certain respects by those of the electric. For delivery purposes, indeed, the former suffers exceedingly because it is inconvenient to stop and restart the motor during the short waits which constitute such a large proportion of its daily schedule. If the motor is stopped each time, considerable additional labor is imposed upon the driver; if it is kept running, it consumes considerable fuel and oil during the intervals of unprofitable operation. The electric, on the other hand, ceases to draw upon the battery as soon as it is brought to rest, starts upon the single movement of the controller, and makes no demands upon the operator save those incidental to its control while in motion.

To offset this advantage the gasoline machine has other merits not possessed by the electric. Its speed, radius of action,

flexibility and susceptibility to sudden overload demands and prolonged operation are in its favor. But the inconvenience of the hand starting crank still remains one of its most important drawbacks in this connection.

Were the problem of starting a gas engine by mechanical means an insurmountable one the case would be different. As it is there are several thoroughly practical ways in which the object may be accomplished, methods which do not necessarily involve expensive outlays in the first place nor entail serious mechanical complication. There can be no question that such a device is very much needed just at present in the commercial vehicle field, and it remains to be seen whether its possibilities will be developed in season to assist in popularizing the light car for general business uses.

Apropos of the accidents attending the Vanderbilt Cup race, the New York Evening Mail lauded the air races at Belmont Park. It remarked that "one sterling advantage of the Gordon Bennett Cup race in the air over that for the Vanderbilt Cup on the earth lay in the fact that the innocent bystander was reasonably safe." Whether an aeroplane going at 50 miles an hour into the upper tiers of the grandstand would do less execution than an automobile charging into the crowd lined up at the course remains a matter of conjecture. Spectators in the grandstand seats are "reasonably safe" during an automobile race, however, even if those in the field are not, but during an aeroplane race there is no place wholly safe.

E. T. Rosenheimer, the New York motorist who recently was acquitted of a charge of murder has been reindicted for felony in that he failed to stop after colliding with the buggy involved in the original charge, and other motorists periodically are being rounded up in batches for permitting their cars to smoke and for failure to have their rear numbers properly illuminated. But all manner of horse drawn vehicles continue to ply the streets after nightfall, many without lights of any sort, others with lights so improperly placed that they illuminate only the horses' tails. Is it possible that only the laws applying to automobiles are enforceable or that the New York police cannot take an unlighted

## COMING EVENTS

November 19-26, Oakland, Cal.—First annual show of Oakland Automobile Dealers' Association in Idora Park.

November 22-26, Lake Charles, La.—Louisiana Fair Association's racemeet.

November 24, Santa Monica, Cal.—Southern California Automobile Dealers' Association's annual road race; 200 miles.

November 24, Guttenberg, N. J.—Race-meet on Guttenberg track.

November 24, New Orleans, La.—Race-meet under auspices of New Orleans Automobile Club.

November 29-30, New York City—New York Automobile Trade Association's two-days endurance run; 275 miles.

November 26-27, Los Angeles, Cal.—Motordrome races.

November 30-December 1, New York City—Annual meeting of American Automobile Association in Hotel Belmont.

December 1-3, Peoria, Ill.—First annual show of automobile dealers in the Coliseum.

December 3-18, Paris, France—French Automobile Manufacturers' Salon in Grand Palais.

December 12-17, Los Angeles, Cal.—First annual "independent" show of Los Angeles Motor Car Dealers' Association at Shrine Auditorium.

December 24-31, Los Angeles, Cal.—Second annual show of Licensed Motor Car Dealers' Association of Los Angeles at Fiesta Park.

December 25-26, Los Angeles, Cal.—Twenty-four hours race at Motordrome.

December 31-January 7, New York City—"Independent" automobile show in Grand Central Palace.

January 2-7, New York City—Importers' automobile show in Hotel Astor.

January 7-14, New York City—Association of Licensed Automobile Manufacturers' eleventh annual show in Madison Square Garden. Pleasure cars and accessories.

January 11-12, New York City—Annual meeting of the Society of Automobile Engineers.

January 13, New York City—Annual banquet of the Motor and Accessory Manufacturers at Waldorf-Astoria.

January 14-28, Philadelphia, Pa.—Annual show of Philadelphia Licensed Automobile Dealers' Association in Third Regiment Armory.

January 15-21, Milwaukee, Wis.—Milwaukee Automobile Dealers' Association's second annual show in the Auditorium.

January 16-21, New York City—Association of Licensed Automobile Manufacturers' eleventh annual show in Madison Square Garden. Second week devoted to commercial vehicles.

January 16-22, Detroit, Mich.—Detroit Automobile Dealers' Association's annual show in Wayne Pavilion.

January 18, New York City—Annual banquet of the Automobile Trade Credit Association.

January 28-February 4, Chicago, Ill.—National Association of Automobile Manufacturers' tenth annual national show in Coliseum. Pleasure cars and accessories only.

February 6-11, Chicago, Ill.—National Association of Automobile Manufacturers' tenth national show in Coliseum. Second week devoted to pleasure and commercial cars, motorcycles and accessories.

February 14-19, Dayton, Ohio—Second annual show in Memorial building.

February 15-21, Kansas City, Mo.—Fifth annual show of Kansas City Automobile Dealers' Association.

February 18-25, Minneapolis, Minn.—Minneapolis Automobile Show Association's annual show in National Guard Armory.

February 20-26, Omaha, Neb.—Third annual show of the Omaha Automobile Show Association in Auditorium.

February 24-27, New Orleans, La.—First annual show of New Orleans Automobile Club at Fair Grounds.

February 25-March 4, Toronto, Canada—Annual show under auspices of Ontario Motor League.

February 25-27, New Orleans, La.—New Orleans Automobile Club's annual Mardi Gras racemeet on Fair Grounds track.

March 4-11, Boston, Mass.—Boston Automobile Dealers' Association's annual show in Mechanics building.

March 7-11, Des Moines, Ia.—Third annual show of Des Moines Automobile Dealers' Association at the Coliseum.

March 15-18, Louisville, Ky.—Louisville Automobile Dealers' Association's annual show in First Regiment Armory.

or improperly lighted horse drawn vehicle when they see it?

Several railroad officials of national repute are this week in Washington, D. C., assisting in the organization of a national road improvement association. If they will

do something also to abate the deadliness of the grade crossing, they will perform a service that should go hand in hand with all highway improving efforts. Safe roads are as important as smooth ones, and only the final abolishment of grade crossings will make roads safe.

## LONDON SHOW LACKED NOVELTY

**Big and Impressive but Developed No Striking Departures—Trend Toward Block Motors, Worm Drive and Wire Wheels More Apparent.**

Insofar as it is possible to judge by the status of the great and only Olympia show in London, the British industry is living up to its reputation in the matter of building and selling small cars. While the present show, the ninth, which closed its doors on the 12th inst., probably exhibited a greater variety of models than any of its predecessors, one of its most striking features was the prevalence of the low-power four cylinder car.

The records of last year's Olympia indi-

this country—there was a total of 409 cars and chassis.

A careful count of the exhibits further shows that 294 machines were British built—or nominally so, at least—while 185 came from France. The United States stood fifth in the list of foreign contributors, with 18 machines. These were contributed by the local representatives of the White, Ford, Overland, Cadillac and Stanley. The United International Motors, Ltd., as the new British representative of the United States Motor Co., is styled, had not come into existence soon enough to secure space in the show. In consequence it was holding a private show in its salesrooms on Wardour street, where about a dozen models, representing the Maxwell, Columbia, Brush, Stoddard-Dayton and Courier lines, were on view. The Mitchell line likewise was on exhibition at the Great Portland street headquarters of the Mitchell-Lewis

duced to 33. But 10 per cent. of chain driven cars survived for the show of 1908, while this year it figures up—or rather down—to two per cent.; in other words, chain drive now appears upon only 12 distinct vehicles of the entire aggregation at Olympia hall.

In other respects, as well, the settlement of questions of design is apparent. The growing use of the block motor already has been mentioned in connection with the increased production of small cars of the better class. In addition to the "little fellows," however, there was perhaps another dozen cars in which block cast engines were mounted ranging upward in power to a nominal listing of 25 horse, for the, so to speak, standard types. In addition to the well known cars of Continental build in which this style of engine has become a fixture, such as the Panhard, Peugeot, Lorraine-Dietrich, Fiat, Lancia and Renault,

TWO EXAMPLES OF HIGH-SIDED BODY CONSTRUCTION—26 H. P. METALLURGIQUE AND 12 H. P. REX

cate that 25 makers staged cars of this type, ranging in power from ten to 17 horsepower. This year's exhibition revealed more than twice as many machines of corresponding pattern. By actual count there were 51 machines of 16.9 horsepower (A. L. A. M. rating), or less, still referring to the four cylinder type. There were many others besides, with ratings of the hyphenated variety ranging, say, from 14-20 to 16-24, that were not included in the enumeration. Of the number mentioned, 28, or practically three-fifths, were of the block type, a large proportion of them embodying such approved features in light car construction as thermo-syphon cooling, magneto ignition and circulating lubrication systems.

Although 111 stands were allotted to the exhibition of complete cars, the additional vehicle displays staged by body builders and others, constituting supplementary exhibits, brought the number of car exhibits up to 139. In these spaces no less than 457 complete cars were shown, or a total of 589 vehicles including chassis. Last year the number was 597, while at the Boston show—the largest held last year in

Motor Co., making an extensive display of four and six cylinder cars.

In point of numbers, the American representation was exceeded by examples of German, Italian and Belgian products, the actual number of machines shown from the three countries being, respectively, 29, 28 and 25. Seven cars of Swiss manufacture and three of Dutch origin also were included among the imported exhibits.

Apparently there is no further question about the supremacy of the gasoline engine as a motive power agent in the heart of the Briton. As compared with two electrics and nine steam cars, produced by three makers, two of whom were American, by the way, there were 578 gasoline cars and chassis on view. Similarly the local demand is now positively settled in respect to the method of final transmission. Out of the total number of cars and chassis no less than 571 were of the shaft driven type. The decline of double chain drive has been strikingly uniform abroad during the past six years. In 1904, 66 per cent. of the gasoline cars were chain driven. In 1906 the percentage was re-

there were the Ford and White, from this country, and such well known domestic products as the Argyll, Armstrong-Whitworth, Gladiator, Crossley, Jackson and Straker-Squire.

The six cylinder motor appears to retain its position as the proper equipment for the car de luxe and hence is found on a relatively small number of productions—not over a dozen to be exact—but invariably in cars of the better class. Its most notable exponents were the Rolls-Royce, Standard, Austin, Arrol-Johnston, Lancaster and Wolseley-Siddley.

Freak motors, once so prevalent at the English shows, were even less prominent than last year. The valveless, which for several years has continued to hold its own despite the odds of most radical construction, retains the distinction of possessing two intercommunicating cylinders, two crank shafts and, of course, no valves, since it is of the two-cycle order of operation. Another example of a promising but little favored class is the Turner motor, which is air-cooled and of the twin cylinder V pattern. This motor, it may be ob-

served in passing, represents the first internal combustion motor to be shown by one of the old-line builders of steam cars. The Gebron motor, with its twin piston arrangement, remains, as of old, as do the Hewitt and Bentall motors, which were exhibited for the first time a year ago. Both are examples of the new school of valve design the former being of the piston type, but so built that the pressure of the exploding gas actually furnishes an impulse to the valve mechanism. In this sense its valves are self-actuating. The Bentall engine has sleeve, or hollow piston, valves, of a different type, which are so arranged that they move at half the speed of the pistons and therefore absorb very little engine power—the more so as they are of balanced construction.

As for the redoubtable Knight, who recently has been again engaged in controversy with the British industry over the

feed to the cylinders. This arrangement also is employed on the Minerva. On the new Mercedes, however, the lubrication of the sleeve valves is taken care of by special feeds direct to the walls the outer sleeve being drilled through to ensure proper distribution. This motor also differs from the other Knight-licensed products in that the sleeves are driven by gearing instead of by silent chain.

Expressing very modern ideas in a most striking way the new Delahaye six deserves to be classed among the extraordinary motor types. It is a combination of the V and block types, its six cylinders being arranged in two banks of three, set at an angle of 30 degrees and all enclosed in a single casting, the valves being entirely enclosed on both sides. The exhaust manifolds are cast integral, so that the motor is unusually free from outward encumbrances.

pump draws from a tank external to the engine and feeds to the distributor main from which the bearings get their supply. The second draws from the safe level point in the crank case, returning all surplus to the tank. The Adler system provides one pump that draws from the sump, and a second that returns the spent oil from the crank case to it. In the Wolseley engine the crank case is without the separate lower reservoir, a settling and straining chamber being provided in an independent tank on the left side of the engine. An independent pump is required to drain the case on this account. Otherwise the system is regular, the feeds being secured by ordinary pump circulation.

In the Albruna and Brown oiling system a pedal on the foot board is provided to enable the operator to deliver an extra supply of oil to the crank case, when required, despite the provision of a nominally auto-

CONTRASTING TYPES—DAIMLER COUPE DE LUXE AND ARROL-JOHNSTON "BOAT BODY"

merits of his so-called valveless engine, there is every indication that his prosperity is increasing. In addition to the Daimler engines of the Knight pattern, Panhard, Mercedes, Minerva and Rover cars were shown equipped with motors of the same sort and built under license. The Panhard-Knight motor is absolutely new, the Mercedes-Knight never before had appeared on British soil, while the Rover was particularly distinguished by reason of the fact that it employed the system in one and two cylinder units.

Again it is written that the Knight motor has been improved, and though the improvement apparently is of a slight and unimportant nature, those who have questioned the advantages of the sliding sleeve valve system promptly indicate that the alteration touches upon the vital point of lubrication, which always has been held somewhat in doubt. By the new arrangement the scoops on the connecting rod ends dip into oil troughs placed under them in the crank case, and the troughs are so interconnected with the throttle lever that they will be raised when the throttle is opened, thus causing the scoops to dip more deeply and increase the rate of oil

Other motors possessing unusual features, though otherwise of normal design, are the new Lancia, in which the pressure for the fuel tank is developed by a plunger pump, instead of an exhaust check-valve; and the Germain, in which the cylinder block is offset no less than  $1\frac{1}{4}$  inches from the crank shaft center, which would seem an extraordinary amount, considering that its bore is only 80 millimeters, or roughly 3-16 inches, were it not for the fact that its stroke is 130 millimeters, or about 5-16 inches. La Buire practice is distinguished by a new six cylinder block motor of 85 by 140 millimeters cylinder dimensions, which also is out of the ordinary in that its cam shaft is driven by silent chain instead of by the usual spur gear arrangement. One of the Humber models also shows the same feature.

The improved lubrication of the Knight motors has been mentioned. Other motors in which new lubrication features were brought out were the Deasy, Adler and Wolseley, in each of which the circulating system is employed with a slight modification. In addition to the regular feed pump, which circulates oil through the bearings, a second is installed. In the Deasy, one

matic system. The new Lancaster models are provided with an unusual lubrication feature whereby oil is pumped to the clutch as well as being circulated through the engine. In the Adler, it may be added, a press-button on the dash sight-feed glass, enables the operator to feed oil directly to the forward universal joint of the propeller shaft, while in the Wolseley the entire gearset is provided with a lubricating system which is fed by an independent pump.

Magneto ignition, of course, is well-nigh universal. What appears to be a new trend, however, is the adoption of the fixed spark arrangement, whereby the control of the timing is taken out of the driver's hands. No less than a dozen makers have adopted this practice on one or more models, among them the builders of the Arrol-Johnston, Star, Thornycroft and A. G. R., in England, and the Darracq, Opel, N. A. G., Delaunay-Belleville and Peugeot, on the Continent. The Germain and N. E. C. cars are equipped with magnetos on which the spark timing is automatically governed.

Thermo-syphon cooling also is growing in favor. No less than 42 makes of car shown at Olympia were equipped with pumpless cooling systems, the system being

in greatest favor with the small block motors, already referred to as one of the features of the show taken as a whole.

In the matter of carburetters, no practical unanimity is observable, and few new styles have been developed. One or two novel arrangements are in use, however, as in the Bell cars, in which upon closing the throttle an extra air port is opened in the intake pipe, whereby provision is made to scavenge the cylinders while coasting. The N. E. C. carburetter is provided with one of the few novelties in the shape of an automatic speed governor which acts on the extra air supply.

Another direction in which improvement had been looked for, that of the self-starter, proved disappointing to the show goer. But two makes of car, the Adams and S. C. A. T., at present are equipped with such arrangements, while only one system of the

in service, and the other is the return to popularity of the four speed change gear. Among the marks on which stationary lay shafts are provided are the Napier, Riley, Bell and the new Zedel, an imported car shown for the first time. Gear box position and general design remains fixed, for the most part, the selective arrangement and the mid-chassis position being the favorites. Exceptions are the Sheffield-Simplex, which has an axle-mounted change gear, and the Sizaire, which retains its original and peculiar axle gearset.

The Pilain and DeDion cardan axles still are employed by their respective makers, other exceptions to the rule of transmission standards being the Pilot, with its belt drive, the Phoenix, with its silent chains from engine to change gear and change gear to rear axle. The division between the cone and multiple disc clutches still

be gaining ground slowly in certain quarters, though for the most part the status of spring design is standardized and the leaf type is dominant. A noteworthy, and almost the only, exception to the rule is the Cowey car, which is built around the Cowey suspension. This is a pneumatic system which does away with all springs, and permits solid tires to be used.

Four cylinders are mounted on the four corners of the chassis, into which fit plungers, carried by the axles. Air pressure, at 100 to 120 pounds per square inch, is forced into the cylinders by a pump driven by the engine, the pressure being uniform for all the cylinders, and variable to suit road conditions. Suitable means for providing a hydraulic seal for the piston is included in the system, while maximum and minimum pressure valves take care of excessive loads and rebounds.

TWO STYLES OF WET-WEATHER BODY—ROLLS-ROYCE PULLMAN AND THORNYCROFT RUNABOUT

sort was to be found in the accessory section of the show.

As for transmissions, the development of the season may be termed the worm drive, although its adherents are not marshalled in very startling array. There were nearly a dozen of them, however, which, considering the reluctance of most manufacturers to take up the system in the past, speaks well for growing confidence in its value. A noteworthy point in this connection is the divergence in practice observable. One school of constructors places the worm above, and the other below the axle. In the former instance the advantage claimed is that of the straight line drive. Adherents to the latter style, however, point to the need of adequate lubrication and claim that it is necessary to drop the worm below the axle in order to have it work in a constant bath of oil. Among the cars now driven by this system are the Daimler, Argyll, Standard, Sunbeam, Wolesley-Siddeley, Dennis and Lancaster. Belsize cars are so equipped on order.

Two tendencies are noticeable in the matter of change gear design. One is the growing use of arrangements whereby the lay shaft is rendered inoperative when not

remains a fairly even one, taking the show 'round. One or two new ideas have been brought out, however, as in the Delayhay, in which a rubber cushion ring is introduced beneath the leather of an otherwise ordinary leather-faced cone clutch, and the Mass, which has a very ingenious form of pressed steel cone clutch, in which little tabs of the metal are pressed outward to secure gradual engagement. The Metallurgique expanding clutch and spring drive is retained, as is the original form of expanding clutch developed for the Mors.

Another essentially British feature, the detachable wire wheel, also is slowly gaining favor. Ten makers staged cars at the show on which this form of equipment was used, including the Napier, Daimler, Delage, S. C. A. T., Standard, Singer, Austin and A. G. R. Front wheel braking, still another point in which the English engineers have taken the initiative, likewise shows some slight gain, the Adams, Thames, Crossley, Argyll and Arrol-Johnston all carrying front brakes on certain models, though it is a fact that one of the new Arrol-Johnston models is being made without them.

Three-quarter elliptical springs appear to

British body design always has been a thing to admire, if not to appreciate. As revealed at Olympia this year, however, it proved to have fewer irrational developments than commonly and to be working along lines of utility and even grace to a degree fully commensurate with the skill of the old-time builders. The increased use of the torpedo effect in bodies of all styles was particularly noticeable, the imposing "boat" body on the Rex touring car, and the closed-front effect obtained on the Metallurgique touring landaulet, being rather striking examples in point.

Two styles of runabout with closed-front, the small Arrol-Johnston and the massive-looking Thornycroft, afford a contrast which is illustrative of the wide range of development and also of the individuality sought by the different body makers. A more important line of development, however, is that of the closed car of the coupe or cabriolet pattern. Perhaps the most noteworthy example of this at Olympia was the huge six cylinder Rolls-Royce, with its Pullman body, fully enclosed and having but two doors, one on either side. In its severity of line, it is almost plain, yet its plainness lacks nothing of grace nor im-

pressiveness. Still another striking body was that of the 58 horsepower Daimler, which was of the coupe type, but following the general lines long ago laid down in the Sedan chair. Its particular claims to distinction are very wide doors and windows, an entire absence of overhang, and special equipment; the electric dash lamps and even the horn being embodied in the dash structure in permanent fashion.

In addition to the Daimler, Adams and Austin cars are now equipped with electric lights, the latter having a Bleriot dynamo lighting set, and the former the new C. A. V. system, in which a dynamo is employed which is automatically regulated as to voltage, by a most original and ingenious system of windings. The Adams also is equipped with an automatic horn-blowing appliance, worked from the tank that is used in connection with the self-starter.

THE COWEY CHASSIS WITH PNEUMATIC SUSPENSION

On the Albruna-Brown the horn is blown by the engine suction, the reed action being just the reverse of that ordinarily employed. This car, incidentally, is equipped with the Roper speed control, which is designed to regulate it to any fixed speed that may be desired, regardless of the inclination of the operator.

In the matter of control systems, several instances have developed in which makers have come back to the old American scheme of using tilting or otherwise adjustable steering columns. The Armstrong-Whitworth, Humber, Imperia, Lancaster, Mass and Overland afford examples of this. In most instances the engine controls are arranged much after the American standards—insofar as standards may be said to exist in this country—but in the Gregoire the throttle control is by pedal only, the ignition being handled from the top of the steering column. The Leon Bollee, S. C. A. and Le Gui cars have the same feature, the latter, in particular, having a "limit lever" mounted on the dash, which regulates automatically the speed to which the engine returns when the pedal is released. Engine braking is provided on some of the Panhard models, while in the case of the rather unusual N. E. C. cars, which are

among the few in Great Britain to be equipped with horizontally mounted engines, a "decelerator pedal" is employed, which not only slows the engine but applies the brakes. In the new Maudsley models, the long-time desired feature of a non-slippery pedal has been achieved by the simple expedient of applying the principle of the safety stair tread. That is to say, the interstices of the grid which is formed on the face of the toe-plates, are filled with lead.

Strictly speaking, the show developed little or nothing of the "world-beating" order. Even the accessory sections brought forth little that was really noteworthy, the one striking development being in the influx of electric lighting systems, with automatic voltage regulation, battery cut-outs and elaborate switchboard arrangements. The only exception to the rule, at least as

applied to the car section of the exhibition was the Phanomobile.

The Phanomobile, strangely reminiscent of the days of the so-called "Bicycle Trust" in the United States, is designed to run on three wheels, and has its little air-cooled motor mounted over the front wheel. Steering is done by means of a tiller, this and several of its other peculiarities recalling to mind a product that enjoyed a brief existence just at a time when many bicycle manufacturers were beginning to turn their attention to the construction of self-propelled vehicles.

#### Rating that Reduces Large Fees.

While it appeared from first reports that high-powered motor cars were at present somewhat unpopular on account of the extremely high license fees for cars with high horsepower, it now seems that both English and French manufacturers have found a way to "beat" these new license regulations. The horsepower of motor cars in the United Kingdom is calculated according to the formula of the Royal Automobile Club, which does not take into account the stroke of the piston, but merely the bore of the cylinder.

"The result of this assessment of duty

and license fees based on the bore of the cylinder alone," says Consul Augustus E. Ingraham, of Bradford, England, in a report to the Department of Commerce and Labor, "is that constructors have been induced to build motors with longer strokes, thereby increasing the horsepower. A striking illustration of this is shown in a new motor by a leading French firm, which has a bore of 100 millimeters and a stroke of 300 millimeters. Under the Royal Automobile Club's rating this would be liable to duty as 'not exceeding 6½ horsepower,' whereas it will develop 35 horsepower."

#### Using Cars Not Wisely but Too Well.

"In the readjustment of things relating to automobiles that now is in gradual process, there is one idea that probably will enter into the spirit of the dreams of the average owner," remarked an abstract man a few days since, "and that is the fact that automobiles are made for exactly such uses as other vehicles are put to and should be used in exactly the same way. As it is now most owners seem to fancy that if they do not keep their cars on the go all the time they are not getting their money's worth and not getting adequate return for their investment. They seem to think it is absolutely necessary to use the cars every day and to go everywhere, no matter how short the distance, when they would not even begin to think of doing that sort of thing with their horses and carriages after a while they will learn that it is almost as convenient and considerably cheaper to use street cars for many of their purposes and then we will hear less about the cost of upkeep and the people themselves will get more real pleasure out of their automobiles. To use even such good things as a matter of duty—for that's what it too often amounts to nowadays—rather takes the edge off one's appetite."

#### Show Rivalry Begins in Los Angeles.

Out in Los Angeles, Cal., where the Sel-den patent line has been drawn with great precision by the retail trade, the "licensed" dealers have made ready for their second annual show, which is to be held at Fiesta Park during the week commencing December 4th, and continuing to December 31st. As soon as their plans were made public, the large number of "independents" who were to have been "left out in the cold" promptly organized and decided to hold a show of their own, and "jumped" the "licensed" function by staging their show two weeks ahead of it. It will open at the Shrine auditorium on December 12th.

To further their venture the "independents" have incorporated under the name Los Angeles Motor Car Dealers' Association, with the following officers: President, George H. Whitcomb; vice-president, H. K. Butterfield; secretary and treasurer, W. J. Burt. The association has 30 members, and its show will be open to all comers.

**NEW YORK TRADE ENDURANCE RUN**

**Will Occupy Two Days and Traverse Three States—Restricted to Class A Cars—Thirty Entries Assured.**

Entry blanks have been issued for a two days' endurance run on November 29th and 30th under the auspices of the New York Automobile Trade Association, and though the notice is rather short, it is stated that assurances of more than 30 entries render its success secure. The run is to start and finish each day in New York City. Only stock cars, Class A, are eligible, but there will be three divisions, according to price, allowing competition under these price classifications. The winner in each division will receive a silver trophy. The entry fee for a single car is \$25; a second entry is \$15, a third \$10 and a fourth and subsequent entries \$5.

The first day the start will be made at 8 o'clock in the morning from Columbus Circle. The objective point is Danbury, Conn., and will be reached by way of New Rochelle, Stamford and Ridgefield. The return trip will take the motorists further inland, and will then lead them home over the Carmel, Lake Mohapac and Briarcliff route, the day's distance being 136 miles. Checking stations will be established at Briarcliff, Danbury and Stamford. It is probable, however that the route will be reversed. The second day's run will cover about 139 miles. The cars will be checked out on the New Jersey side of the 42d street ferry at 8 o'clock in the morning. From that point they will pass through Hackensack, Suffern and Tuxedo, to Newburg, N. Y., where the noon stop will be made. Returning, the route lies through Little Britain, Chester and Southfield, from which point the morning route will be retraced. The checking stations will be Tuxedo, Newburg, and Suffern. Entry blanks may be had from W. A. Poertner, the New York representative of the National Motor Car Co., 1933 Broadway, New York, or of C. H. Larson, of the Oldsmobile Co., 1653 Broadway. Entries will be received up to November 25th.

**Tour to "Open Up" Western Canada.**

If the plans which are brewing in Winnipeg come to a head there will be a fine large "reliability tour" in western Canada next season. It is a country of vast expanse and prairie roads of which little is known by the average American but which is, nevertheless, proving a splendid market for American automobiles. The tour is being fathered by the Modern Power Co., of Winnipeg, and according to its tentative plans will start about August 1 from Winnipeg, and after touring about 2,300 miles through the provinces of Manitoba, Saskatchewan and Alberta the tourists will

return to Winnipeg 12 days later. A. A. A. rules will govern the contest. In addition to passing through such comparatively large places as Carnduff, Calgary, Edmonton, Saskatoon, Regina, Brandon and Portage la Prairie, those participating will have an opportunity of visiting such interesting places as Moose Jaw, Drinkwater, Swift River and Medicine Hat. The roads covered will be "some of Canada's best," according to the announcement, and will consist mainly of smooth ungraded prairie trails with few hills.

**"Good Roads Tour" Off to 'Frisco.**

Another "good roads tour" left New York for San Francisco on Tuesday last, 22d inst. It was contained in an Ohio car, which will carry Christmas greetings from the mayor of New York to the mayor of San Francisco. It is also carrying E. L. Ferguson, G. W. Finney, Charles Thatcher, who is driving the car, and a mechanic. Instead of following the usual route, the party will travel via Philadelphia, Baltimore, Washington, through Virginia, the Carolinas to Florida, and thence north to Alabama, Tennessee and Kentucky, thence west and south again to Missouri, Kansas, Oklahoma and Texas to New Mexico, Arizona and California, a distance of about 5,000 miles. The "tourists" will stop only for food and sleep and their impressions of the roads will be published for the benefit of whom they may concern.

**Indianapolis to Regulate Municipal Cars.**

According to an ordinance recently introduced in the Indianapolis city council, automobiles in use for city business must be marked "City of Indianapolis." The measure also provides for the appointment of a city mechanic and a municipal garage and prohibits the use of city cars for other than city business. A fine of not more than \$100 is provided for violations.

**A. A. A. to Meet in Hotel Belmont.**

The annual meeting of the American Automobile Association will occur Nov. 30-Dec. 1. It will be held in Hotel Belmont, New York City. It is understood that L. R. Speare, of Boston, will not accept a re-nomination and that he will be succeeded as president by Robert P. Hooper, of Philadelphia, who now is first vice-president of the association.

**Mile High Hill Climb is Postponed.**

The "Mile High" hill climbing contest at Redlands, Cal., which has been one of the important occurrences of the Thanksgiving season for several years, will not take place today as originally planned. It has been postponed and may occur early in January.

The motorists of Hartington, Neb., have organized the Automobile Club of Hartington, with W. S. Preston, president, and J. Albert Olson, secretary.

**TALKED AT A TOURISTS' AGENCY**

**Several State Officials Assist the Advertising Campaign—"Conference" Leads to an Undesirable "Resolution."**

What the enterprising secretary of the so-called Touring Club of America declares, almost without stopping for breath or a comma, was "the largest and most representative conference of state officials ever held for the express purpose of considering measures whereby the automobile laws of the different states in the Union may be so framed as to permit residents from one state, after having complied with the regulations of their home locality, to tour in adjoining states without being subjected to additional legal requirements," occurred in the "club's" office in New York on Thursday last, 17th inst.

The conference was a clever "publicity stunt" engineered by the "club," which really is a private corporation operating a tourists' agency for revenue only, and apparently in ignorance of its real nature, representatives of the governments of at least six states and the District of Columbia innocently used their taxpayers' money unknowingly to further the corporation's advertising scheme and to partake of the luncheon which it could well afford to provide.

The conference of course could do nothing but talk and adopt "tentative resolutions," as they are called by the "club." There were two of these "resolutions." One of them apparently favors the enactment of laws giving non-residents exemption for unlimited periods of 15 days on a reciprocity basis, but the wording of the resolution, which rather seems to be the draft of a suggested section for inclusion in the statutes, is such that it is difficult to say how any court would construe it. It is as follows:

The provisions of the foregoing sections shall not apply to motor vehicles owned or operated by non-residents of this state while such vehicles are being operated within this state for a period not to exceed 15 days at any one time, provided the owners or operators thereof shall have complied with the provisions of the law of the state, territory or federal district of their residence in regard to motor vehicles, and shall comply with such law while operating or driving a motor vehicle upon the public road or highways of this state: provided, however, that the foregoing sections of this act are substantially in force as law in the state, territory or federal district of the residence of the owner of such motor vehicle, otherwise all provisions of this act shall apply.

Of the intent of the other "resolution," of which the "Touring Club" does not crow very lustily, there is no room for doubt. It proposes that no person, owner or otherwise, shall drive a car unless he has passed an examination; that no one under 18 years

## THE MOTOR WORLD

of age shall operate a car without special permission from the state, and that all licenses or permits "shall be subject to revocation for any violation of this act or on any other reasonable ground."

Those who attended the "Touring Club's" conference were as follows: Assemblyman A. S. Callan and Secretary of State-elect Edward Lazensky, of New York; Robert B. Caverly and Harrington Mills, representing the commissioners of the District of Columbia; from New Hampshire, Secretary of State Edward W. Pearson; from New Jersey, J. B. R. Smith, commissioner of motor vehicles; from Maryland, John E. George, commissioner of motor vehicles; from Pennsylvania, Joseph W. Hunter, state highway commissioner; from Ohio, Frederick H. Caley, registrar of automobiles of Ohio; from West Virginia, Charles P. Light, state highway commissioner, and C. N. Briscoe, president of the West Virginia State Automobile Association. Alfred Reeves, general manager of the Association of Licensed Automobile Manufacturers, who goes wherever there is likely to be "something doing," also looked on and was the only real representative of the automobile interests who attended.

#### Dunn Wins Three Hours' Race in Texas.

The three hours' race, scheduled for the last day of the San Antonio (Tex.) Automobile Club's racemeet, was held on Sunday, 13th inst., but only after a meeting of the directors of the club had been called to consider whether or not the meet should be continued after the death of Tobin DeHymel; it finally was decided that as legal proceedings might be taken by the Fair Association and the drivers, and as the American Automobile Association might blacklist the local club, to complete the original program.

Just before the start of the three hours' race, while the six entrants were lined up, the band played "Nearer My God to Thee." It was a requiem for DeHymel, who was killed in a race there on the day previous. Between three and four thousand spectators stood, the men with bared heads. The starters were William Dunn, Marion; Ben Johnson, Hudson; Mortimer Roberts, Abbott-Detroit; Fred Meleun, Marquette-Buick; George Clark, Cutting, and H. E. Slagle, Buick. The latter two went out during the race, Cutting on account of timer trouble and Slagle because of some derangement which made his car uncontrollable and threw him out, the wheels passing over his body; his left thigh was fractured. Dunn, driving the Marion, finished first, beating out Johnson in the Hudson. Meleun, driving the Marquette-Buick, was in the lead when tire trouble caused him to stop, and he finished fourth. Dunn covered during the three hours of running time, 155.25 miles, or an average of 51.75 miles an hour. Roberts in the Abbott-Detroit was third.

### AUTOMOBILE HAULS LOCOMOTIVE

**Proves Equal to Task of Moving 110 Tons on the Rails—The Test Recently Made in Los Angeles.**

To the many feats of prowess performed by automobiles Harry A. Lord, president of the Lord Automobile Co., of Los Angeles, Cal., has added another remarkable demonstration of the power of a gasoline engine by hauling a 110-ton railroad locomotive along the tracks of a railway in Los Angeles, his E-M-F "30" touring car being employed for the purpose. The feat, which was witnessed by a number of rail-

man, C. B. Moon, C. Adams, A. D. Lord and H. H. Stone.

#### Lamps Law that Fails of its Purpose.

That it takes an astute "legal" mind to pick flaws in a seemingly perfectly worded ordinance, was proven again last week in Hutchinson, Kan. As might be expected, the recent automobile regulations of the city have been subjected to close scrutiny and it was discovered that the ordinance relating to the carrying of lighted lamps on all automobiles was completely and entirely null and void. The discovery was made when Daniel Barkman, who was pitched out of his buggy by an automobile driven by Thomas Keddy, of Plevna, Kan., endeavored to have Keddy arrested for

LORD'S E-M-F "30" HAULING LOS ANGELES LOCOMOTIVE

road men and automobile owners, was accomplished from a dead standstill, the automobile being coupled to the locomotive by means of a heavy rope attached to the rear axle of the E-M-F and the cowcatcher of the locomotive, as shown by the accompanying illustration.

Obtaining traction was difficult at first on account of the soft condition of the ground over which the test was made, but this was overcome by a number of heavy men getting into the tonneau of the E-M-F and weighting it down. For a few moments the locomotive seemed glued to the tracks, and some of those present offered to bet that the automobile would be unequal to the task; they expected to see the rear construction of the E-M-F yanked out, but they were disappointed, as slowly but surely the big wheels of the locomotive commenced to revolve and a moment later it was being dragged down the track.

Engineer Love, who has charge of the locomotive, No. 479, on the regular passenger service run of the Salt Lake road, sat in the automobile with Mr. Lord, who drove the automobile. The others in the car were J. W. Flickwen, round-house fore-

driving along the roads without lights. To his dismay he found that a warrant could not be issued, for the statute reads:

"Every automobile or similar motor vehicle shall be so constructed as to exhibit during the period from one hour after sunset to one hour before sunrise one or more lamps showing white lights visible within a reasonable distance."

While the law doubtless was written for the purpose of compelling automobilists to light these lamps after dark still it does not read so, as only the "construction" of the car is mentioned.

#### When an Owner is Not Responsible.

That an owner is not always responsible for damage done by his employes again was established last week when the New York Supreme Court dismissed a \$15,000 damage suit brought against ex-Senator W. A. Clark, whose automobile ran over and injured a 12-year-old boy. Mr. Clark testified that his chauffeur had been "joy-riding" without his permission, and therefore he claimed exemption from liability. The court in the person of Judge Davis upheld this view.

**DEPARTURES IN THE LOCOMOBILE**

**Shaft Drive and Jump Spark Finally Adopted—New "Six," Full of Good Features, Added to Line.**

Not only because it formally heralds the adoption of a six cylinder model is the annual announcement of the Locomobile Co. of America made more notable than usual. That model has been exploited for several months and already is fairly well known,

ononymous with cars in the higher class. A conspicuous feature of the new Locomobile is its compactness, its bonnet being but three inches longer than that of the four cylinder car. This result is obtained by giving the crank shaft seven main bearings, a construction which markedly economizes shaft length.

The different bodies supplied on the model "L," 30 horsepower chassis are touring, torpedo, small tonneau, limousine and landaulet. By undoing two bolts the left front doors, on the touring and closed bod-

are located on opposite sides of the motor. Extremely quiet valve action is secured without the use of fiber buttons embedded in the tops of the valve lifters; this result is obtained by a very little play and accurate work which allows clearance to be reduced to a few thousandths of an inch between the lifters and valves.

A new single jet carburetter of unusual construction solves satisfactorily the problem of six cylinder motor carburation. The tendency of the ordinary automobile air valve spraying carburetter is to strangle

LOCOMOBILE, 4 CYLINDER, WITH TORPEDO BODY, \$3700

LOCOMOBILE 4 CYLINDER TOURING CAR, \$3500

and that it is a production in every way worthy of the Bridgeport (Conn.) concern there is abundant evidence. More significant, however, is the adoption of shaft drive and jump spark ignition for the entire line of 1911 Locomobiles, the experienced and conservative company having during many years held fast to chain drive and low tension ignition with make-and-break igniters. Nor do these changes represent the sum total of all that the improving hand has been able to accomplish. The new line is marked by a number of lesser

ies, are removable, making it more convenient for summer use.

The new six cylinder motor is a direct extension of the four cylinder power plant, by the addition of two cylinders. They are cast in pairs and are "square," bore and stroke each being  $4\frac{1}{2}$  inches. The upper half of the crank case is bronze, and the aluminum lower half is carried down, forming a two-gallon oil reservoir. A false bottom of sheet steel, 1-16 inch thick, is located just low enough to clear the cranks and connecting rods, and it contains troughs

the air supply, while this model increases the supply of gasoline. The auxiliary valve has a light spring for low speeds, and a stiffer and shorter spring which does not take hold until the valve has begun to open. The valve is held shut to facilitate in starting, by increasing the tension of its springs by means of a lever on the dash. The spray passage is water jacketed, and in addition, the air is heated by being drawn from a passage around the exhaust manifold.

Ignition, as already stated, is the jump

LOCOMOBILE, 6 CYLINDER, TORPEDO BODY, \$4800

LOCOMOBILE 6 CYLINDER TOURING CAR, \$4800

but far reaching refinements that add value to cars that always have enjoyed prestige because of their value.

The new six cylinder model, rated at 48 horsepower, replaces the four cylinder car of 40 horsepower, the four cylinder 30 horsepower, however, being continued with certain revisions. These two constitute the chassis upon which the Locomobile line is founded.

Model "M," the six cylinder car, is supplied in touring, torpedo, limousine and landaulet styles, either with or without front doors. The open bodies are long and low in appearance, and have those refinements in body design and detail which are syn-

into which dip scoops forged integral with the bottom caps of the connecting rods; the scoops pick up oil which lubricates the crankpins. The surplus oil overflows from the edges of the troughs into the reservoir below. The oil is driven by a gear pump through a screen, thence under pressure through a system of outside pipes and drilled passages to the main bearings. A pressure gauge on the dash indicates the flow of oil from the pump. A large screw plug allows drainage of the reservoir and a pair of try-cocks, aided by a cork float tell-tale show the amount of oil on hand. The pistons are lubricated by splash.

The valves are mechanically operated and

spark method, which replaces the low tension make and break system so long adhered to by the Locomobile makers. The Bosch magneto is used in connection with the Bosch coil and switch for starting on the battery. Only one set of plugs is employed.

Cooling is effected by a square tube honey-comb radiator and an adjustable belt-driven fan. The water is circulated by a bronze centrifugal pump having a positive gear drive.

The type of clutch employed is a multiple disc containing 43 steel discs. The forward universal joint is contained inside the clutch, and the rear universal drives the

EXHAUST AND INLET SIDES OF LOCOMOBILE 6 CYLINDER, 48 HORSEPOWER, MOTOR

clutch pinion through a taper fit and Woodruff key. A large ball bearing around the clutch shaft acts as a thrust bearing to withdraw the clutch. When in action, however, the clutch is self-contained. It can be removed bodily without disturbing either the engine or the gear box by taking out six bolts holding the clutch housing to the flywheel web and at the same time undoing four bolts holding the sleeve surrounding the rear universal joint of the clutch shaft. A slotted jaw universal is used, and, when the sleeve around it is removed, the clutch shaft is simply slipped out laterally between the jaws.

The transmission does not differ from previous practice, the four speed selective type being used. The gear shafts run on Hess-Bright and F. & S. annular ball bearings, as do all other parts of the transmission and running gear, except the front wheels. The propeller shaft has one universal and one slip joint. The rear axle is of the full floating type, and the inner ends

of the axle shafts are squared where they enter the differential gears, having the

LOCOMOBILE REAR CONSTRUCTION

outer end upset to form a jaw clutch engaging the hub of the rear wheel. The axle

tubes are forced by hydraulic pressure into the axle casings and are riveted for additional security, thus dispensing with brazing. The axle is stiffened also by a truss rod placed underneath. The bevel pinion shaft is assembled as a unit with its bearings before it is placed in the axle. These units are so arranged that their positions can be adjusted from the outside after the axle housing is assembled, ensuring correct alignment and therefore absence of noise when running.

The ends of the axle tubes are tapered, and the radius rod forgings and spring seats are bushed where they go over the axle. The radius rods contain swivels at their front ends, to avoid straining on rough roads.

The brakes are internal expanding and external contracting for emergency and service respectively. The external bands are wider, but both are lined with reinforced asbestos, and either set is powerful enough to lock the wheels. The foot

LOCOMOBILE 4 CYLINDER MOTOR, EXHAUST SIDE

LOCOMOBILE 4 CYLINDER MOTOR, INLET SIDE

brakes are adjusted by outside wing nuts, and the emergency brakes by means of threaded tension rods which operate them, in place of cables.

The front axle is an I-beam section drop forged with spring seats integral. The springs in the front are semi-elliptic and those in the rear are three-quarter elliptic.

The four cylinder model differs from the six cylinder in that the engine is lubri-

simple and consists of adding a little light oil to that already in the transmission case or removing it all and substituting a lighter grease or oil.

#### When the Car "Picks Up" Slowly.

When the throttle is suddenly opened about half way, the motor should "pick up" without hesitation or "strangling." If it fail to do so, the trouble may be that the

gines in the hands of other than professional drivers would bring to light spark gaps of from 1-32 to 1-16 inch in spite of the fact that the usual instructions which accompany European magnetos specify about .02 and domestic manufacturers advocate 1-64 inch as the proper interval for the best results. It is safe to assume that a magneto will give the most satisfactory service with a gap of this size, unless special instructions are given by the maker.

#### What Causes Automobiles to Smoke.

The smoking of automobiles usually is attributable to three causes—over lubrication, over-rich mixture, or oil or grease coming in contact with the hot exhaust pipe or muffler. In the first instance the remedy is obvious. When an over-rich mixture is the fault, it will cause heavy, black smoke (easily distinguished from the bluish grey smoke caused by burning oil) which will quickly soot up the spark plugs and foul the muffler. Smoke which is caused by oil or grease getting on the hot exhaust pipe is most likely to be detected after the car has come to rest and the motor has stopped. It may be found that one of the universal joint boots has become loosened, thus allowing the grease to be thrown out or oil may have leaked out of the rear bearing of the transmission and working along the shaft been thrown onto the pipe. The exhaust pipe or muffler seldom will become hot enough literally to burn the oil, but will slowly fry it, causing a slight smoke and a disagreeable odor. To obviate this, the leak must be

REAR AXLE SHOWING TORSION BAR AND DISTANCE RODS

cated by a mechanical oiler attached to the crank case and driven from an extension of the exhaust cam shaft; the oiler driving gears operate in a grease tight case; the clutch of Model "L" is a leather faced cone with springs under the leather to permit easy engagement. Both of the models have the four speed transmission, and the main details of the rear axles, transmission and control are similar.

The wheel base of Model "M" is 135 inches, with 36 x 4 inch front tires and 37 x 5 inch rear tires. The roadsters, however, have 36 x 4½ inch rear tires. Model "L" has a 120-inch wheel base and 34 x 4½ inch tires front and rear.

Both of the cars are driven from the right side. The gear is of the standard worm and sector type; the column is rigidly braced, and supports a bronze steering wheel with hard rubber grip. The clutch and service brakes are operated by separate pedals, between which is an accelerator pedal, independent of the throttle lever on the wheel. At the right and outside of the front doors or panels are the hand levers for controlling the emergency brakes and for gear shifting.

#### How Cold Weather Increases Gear Noises.

If the transmission appears unusually noisy on cold days the trouble probably will be found to be due to a hardening or thickening of the lubricant. If the latter becomes sufficiently hard the gears will merely cut a channel through it and will not be properly lubricated. The remedy is

tension on the auxiliary air-valve is not quite strong enough, or that the points of the spark plugs are too far apart. If a quarter or half turn of the screw which tightens the air-valve spring fails to ob-

CHASSIS SECTION SHOWING BRAKE CONSTRUCTION AND MOUNTING

viate the difficulty, this adjustment should be returned to its original position and the spark plugs removed and examined. Like as not it will be found that the points of the plugs have been burned away, thereby increasing the distance the spark must jump, and making it weaker than it should be. A great diversity of opinion obtains with regard to the proper size of gap to use. The examination of a number of en-

stopped or something, preferably a piece of sheet-iron or tin, fitted in such a way that it will catch and deflect the oil or grease. Where light oil is used for lubrication, it may be found that after the motor has run at high speed for any length of time, some of the oil has worked past the pistons and valves and lodged in the muffler where it slowly burns. The use of heavier oil will prevent this trouble.

## EDUCATING USERS OF ELECTRICS

Service which May be Rendered by Central Station Men—Campaign that Helps all Concerned.

It would seem rather extraordinary were the Standard Oil Co., to start a campaign of publicity and education in an effort to increase the use of automobiles; it would be even stranger were it to undertake to supervise the operation of gasoline cars and teach their owners how to care for them in an economical manner. Yet just such a campaign has been undertaken by the central station men throughout the country on behalf of the electric vehicle. Viewed from another angle, the movement is not only perfectly logical, but promises exceedingly beneficial results to the entire industry; to the electrical portion of it directly, and to the section that is committed to the gasoline motor by the indirection of increased competition and popular information. How the project is forming and the directions in which it is likely to manifest itself were explained before the first annual convention of the Electric Vehicle Association of America, recently held in New York, by Louis A. Ferguson, of Chicago. As this authority explained:

"There is a certain relation which the electricity supply company bears to the electric automobile business which many central station managers appear slow to realize. In a way this relationship is analogous to that of the consulting engineer and his client. . . . The central station company is one of the three principally interested partners in the business of extending the use of electric vehicles, the vehicle manufacturer and the user being co-partners. What affects some affects the others. Each should be alike interested in putting only the most serviceable and economical vehicles before the public, and each like desirous of having the owners well pleased with their purchase and use. To accomplish this there must be substantial evidence of good faith on the part of each.

"The builder must be progressive and honest in his endeavor to make his vehicles the most serviceable that can be produced. The user should show a degree of tolerance and sincerity, and willingness to accept advice that will insure against possible failure due to lack of co-operation. The central station management, should not only supply charging energy at a reasonable rate, but should also assume that it is to a large degree responsible for the efficient operation of the vehicles. It should be sure the user is not wasting energy by overcharging his batteries. It should be kept in touch with its customers, and be able to give free advice as to the proper time for cleaning and repairing batteries in order

that there may be no chance for battery plates to be damaged through lack of attention or through ignorance on the part of the owner in the use of the vehicles.

"The fact must not be lost sight of that practically every new electric vehicle customer is unfamiliar with common battery charging practice and should be carefully instructed as to methods which are giving the best results. As a rule, the vehicle manufacturer furnishes him with printed instructions, but too often these are not followed. The inevitable result is that charging is done in a haphazard manner. Either too little or too much energy is put into the battery. If too little the user will soon find that the mileage on a single charge is not what it should be and the charging period is extended. A false impression is created in the mind of the user that by giving the battery a good charge greatly increased mileage may be obtained. Consequently good charges are the rule. The owner is pleased with the service which he is obtaining with his vehicle and all goes well until he receives his bill for charging energy.

"Right here is where the central station man is valuable. It is left to him to explain why his bill is so excessive. He must tell the owner that charging energy is being wasted; that the battery would give as much mileage if charged less, and that the battery plates would last longer. Not only must he tell the vehicle owner these facts, but he must prove that what he says is true. . . . It is not to be understood that overcharging is the cause of all battery troubles, but it is usually the cause of excessive electricity bills, and it is through that medium that the central station man is drawn into the case. . . .

"What is true of the private vehicle owner is to some extent true of the public garage manager. The owner of the vehicle complains that it does not run as far as it should on a charge, and insists that the battery is not being fully charged. Sometimes this is true, but more often the battery needs cleaning and a greater part of what would be a full charge is wasted through internal discharge due to short circuits. The garage manager issues instructions that the battery shall be overcharged every time it is charged. This only makes matters worse in that it hastens battery plate deteriorations, and increases the amount of electricity used, but it satisfies the owner's demands for mileage. It is deplorable that there are garage managers who do not understand how to properly charge batteries and it would seem that they would quickly familiarize themselves with standard practice, but the mere fact that there is a wide variation in the amount of energy used per mile by the same style of vehicle housed in different garages proves that there is a great deal of missionary work yet to be done, before all vehicle batteries will be charged properly

"We have made an investigation of the actual cost of operation of six modern design 3,000-pound capacity electric delivery wagons, over an average period of one year; the oldest wagon having been in service since January, 1909, and all since October, 1909. These figures are taken from the Commonwealth Edison Company's Statistician's Report and show actual costs of operation, including electrical energy at 4 cents per kilowatt hour, supplies, tires, battery and all other repairs, but exclusive of fixed charges (such as interest, rent, taxes, washing and driver) and antiquation of 6 cents per mile when averaging 30 miles per day.

"As to service performance of vehicle, it is unusual for the one and one-half ton capacity wagons above referred to to use more than 3 ampere hours per mile, while running under average conditions, the average being between 2.5 and 3 amperes. Under these conditions an 11 B. V. Exide battery rated at 140 ampere hours will drive a wagon from 45 to 60 miles on one battery charge.

"Recently during a period extending over two weeks, one of the wagons equipped with 64 cells of type A 6 Edison battery was run two days on a single battery charge. All together six complete discharges were made. The average mileage per discharge was 94 and the average discharge was 263 ampere hours. These figures demonstrate that the electrical commercial truck of to-day is capable of meeting practically all requirements of the average user, and in addition, furnishes him with more economical, cleaner and all-around better service than can be obtained from either of its competitors, the horse-drawn vehicle or the gasoline power wagons."

As showing the profitable nature of the electric vehicle business as compared with other classes of service, Mr. Ferguson adduced some interesting, not to say startling, figures.

"When it is remembered the income from the sale of energy for charging one electric pleasure vehicle battery is on an average from 3 to 5 times that from the sale of energy for lighting the average 20-light house or apartment, and further that it is used mainly during the off peak period of the system, the wise thinking manager will realize that it is not only desirable business to have, but he will also wonder whether he is doing all he can to encourage and popularize electric vehicles.

"A study of the Commonwealth Edison Company's statistical records illustrates this point in a very interesting manner. The average monthly income of various classes of business is as follows:

Flats .....	\$1.84
Houses .....	3.08
Small stores.....	4.32
Electric pleasure vehicles.....	6.87
3,000 lb. electric trucks.....	12.00
5-ton truck—electric....	20.00
Freight elevators.....	20.00
Passenger elevators.....	40.00

**WARREN-DETROIT ADDS TO LINE**

**Closed Front Models and a Delivery Wagon  
Now Included—Mechanism Changed  
Only in Minor Details.**

Among the manufacturers who are limiting themselves to one chassis, upon which they superimpose different types of bodies, is the Warren Motor Car Co., Detroit, Mich., which recently installed itself in a

give very uniform circulation. The ports are all water jacketed and built so that they offer the least resistance to the flow of gas. The crank shaft is made from high carbon steel drop forged, and aluminum is used in the crank case construction.

A reservoir under the crank case contains the lubricating oil, and this oil is pumped through the sight feed on the dash, into the crank chamber, which is provided with partitions between every two cylinders to keep a constant level for connecting rod

The rear axle is of the semi-floating type with propeller shaft squared where it takes a Spicer universal joint at the rear of the transmission. The front axle is an I-beam section, drop forged with integral spring seats. The spindles are bushed with hardened steel to take the pivot pins. The axle is rear steer with ball lever over the axle.

Internal expanding and external contracting brakes are set in the hubs, the face being two inches wide and ten inches in

A NEAT DEVELOPMENT OF THE \$1200 CLOSED-FRONT PATTERN

THE LIGHT TWO PASSENGER \$1200 RUNABOUT

new factory in that city. For 1911, however, the Warren-Detroit line has been increased by the addition of several models including a four-passenger torpedo model, 11F, and a four passenger closed-front type of body, Model 11G, each of which sells for \$1500. The demi-tonneau model 11B sells for \$1300—an increase of \$50—while the five passenger touring car, model 11 C, lists at \$1,325, and the inside driven

splash feed. Two separate systems of ignition are used, employing two sets of spark plugs. One system is by Bosch magneto, and the other by four-unit vibrating coil and commutator. Cooling is effected by means of a centrifugal pump, a vertical tube radiator and 16-inch adjustable belt driven fan of six blades. The cone type of clutch is leather faced, with adjustable springs under the leather to allow for easy

diameter. On all models the springs in the rear are three-quarters elliptic and in front semi-elliptic, both being provided with rubber bumpers.

On the torpedo, closed-front and coupe models the tires are 35 x 4 inches, while on the roadsters, small tonneau and touring car they are 34 x 3½ inches. The wheel base of all models is 110 inches.

The drive and control is on the right side.

THE NEW \$1300 WARREN-DETROIT 30 SMALL TONNEAU

TORPEDO DESIGN APPLIED TO THE \$1500 WARREN-DETROIT

coupe, \$1,750. The roadsters, Models 11 D and 11 A, are listed at \$1,200; last year they were priced \$1,100 and \$1,150 respectively.

In respect to mechanical changes, only minor refinements were found possible. All of the Warren-Detroit cars are equipped with a 30 horsepower Renault type motor of four cylinders, 4 x 4½ inches. The valves all are located on the right side and the spark plugs are placed over the inlets. The cylinders are cast according to the European idea of block construction, and the water jacket is so constructed as to

slipping in. It is controlled by a horizontal shaft with levers working on a shifting collar, which works on steel flanges of the clutch yoke. The foot lever is adjustable to position.

The frame is narrower at the front than at the rear, where it is raised over the rear axle. The motor is mounted, together with the transmission, upon a sub-frame. A three-speed selective sliding gear transmission is used on all models, the gears being contained in an easily accessible aluminum box.

A seamless steel tube with a polished brass tube cover supports an 18-inch cherry wheel. The gear is of the worm and nut type. Spark and throttle levers are mounted upon the wheel, while the clutch and Nabe pedals operate through the toe boards. The spark advance is used only with the batteries, the magnets having a fixed spark. The gear shift and emergency brake levers are at the side.

In addition to the pleasure cars there is a Warren-Detroit 1,000 pounds light delivery wagon listing at \$1,300.

## How Service Should Regulate Truck Selection

One of the greatest individual marvels of present day business accomplishment is the way the great city department stores manage their deliveries. Purchases made in the morning are delivered in the afternoon of the same day in many cases, even though the distance be 12 or 15 miles; sometimes the customer returns after lunch from a morning shopping tour to find the delivery boys from one or more stores already have arrived with the bargains. This is true of a daily traffic aggregating many tons of merchandise.

To add to the complication that is involved in the attempt to distribute a miscellaneous assortment of wares over a wide area within a few hours, there are the C. O. D. and shipment on approval systems. These permit the feminine shopper to exercise without restriction the special prerogative of her sex, and while giving the merchant certain psychological advantages in securing and holding trade, also add a vast amount of labor and expense to the delivery end of the business. If the C. O. D. purchaser happens to be "not at home" when the boy calls, it means that the goods must be taken away and one or more later attempts made to deliver it; if the goods do not suit, if the lady has "changed her mind" or if she happens to be "out of change," the goods must go back to the store, to be held, or put back into stock as the case may be.

Whatever intricacies in the way of book-keeping, losses and depreciation of stock and entanglements of administration this sort of policy may involve, it is very evident that it serves to throw an exceedingly heavy burden on the delivery department. With the general expansion of all business interests, therefore, and with the tremendous pressure of competition, it is not strange that the big stores of the big cities should have been among the first to look favorably and intelligently upon the motor vehicle as presenting a probable economic solution of some of their difficulties. Hence the great retail enterprises of New York, Boston, Philadelphia and Chicago may be taken not merely as affording a promising market for the power wagon of the future, but as having developed already some of the ripest and most consistent ideas in regard to motor vehicle applications to business needs.

How extensively some of these merchants have gone into the use of motors already is known; it is not intended here to demonstrate the extent of their application. That their use of trucks and deliveries has led to certain conclusions that

ultimately may tend to a great division of effort in the automobile industry is not so generally understood.

The point is that in store deliveries, as in all delivery systems of any magnitude, for that matter, the work immediately shapes itself into two broad classes. In one class loads of considerable magnitude are carried considerable distances, for the most part being received and discharged in bulk. In the other class lighter and less bulky loads are handled and are distributed piece-meal, usually from house to house. This subdivision of the work is the result of economic necessity. Suffice it to say just here that it has proved cheaper to haul three tons of merchandise, say, ten miles on a large truck and then shift the burden to three, four or even five small motor or horse-drawn deliveries than to carry the large transportation units clear through to the end of the line.

In this way the delivery problem is divided into transfer and distributing classes. In the recent commercial vehicle contest in New York City, cognizance of this distinction was taken in a public way for the first time, so far as is known. Commercial vehicle manufacturers and users rapidly are coming to see the importance of such a distinction, and sooner or later it is bound to have its effect upon design. What is more important, the development of the distributing class, as such, gives promise of accomplishing the complete establishment of the electric vehicle in municipal service.

In order to appreciate just what is involved it is necessary to go more deeply into the science of motor vehicle operation. Perhaps the best illustration of the principle involved is that which so frequently has been used in urging the advantages of motor vehicle haulage as contrasted with animal haulage, namely, that the machine does not "eat its head off" when not in use. Which is very true. But it is also true that the motor truck is earning money for its owner only when it is on the road and carrying a load. Furthermore, it yields its best returns only when it is carrying as nearly as possible its full rated capacity under suitable running conditions.

Pursuing this argument a little further it may be considered that every time the truck stops it ceases momentarily to be a remunerative factor in the business and becomes a burden. The heavier the truck investment, the greater the burden resulting from non-use, whether momentary or prolonged, and the greater the reduction

in earning power resulting from use under unprofitable conditions. In other words, ideal results would be obtained were it possible to employ as large truck units as the highway conditions would stand and to keep them in practically constant operation. To the small user, these considerations may not seem to be of material import, but where the tonnage is heavy and the user is accustomed to reckon all his profits in fractional coinage the consideration is of great import.

Applied to the delivery problem, the principle naturally leads to the use of large trucks for trunk line work. Goods are hauled to sub-stations directly and there split up into smaller loads, which are taken up for distribution to the destination of the respective parcels. For short radius deliveries within the immediate vicinity of the main distributing point it is customary to handle small loads exclusively.

Having thus established the requirement of the transfer vehicle, and also defined roughly the principle that it requires regular operation for economical results, it is possible to consider the individual needs of the distributing type. In the last analysis this type is used mainly for house-to-house delivery. That means that it starts with a full load and operates under a constantly decreasing load until it is empty, when it must return light from the limit of its route.

Another point about it is that it is subjected to frequent stops and starts. Theoretically, every time it stops it ceases to be a paying investment for its owner. Every time it starts it has to do a little extra work in overcoming its own inertia. That is to say, regardless of the size, type and motive power of the vehicle, more energy is consumed in traversing one city block if three stops are made than would be consumed if the distance were traversed without stop.

In making city deliveries, which is the bulk of the work undertaken by the big department and other retail stores, the time lost in stops frequently exceeds that consumed in actual movement between stops. This is particularly the case when the boys have to run long flights of stairs, wait for goods to be examined, attend to the details of receipts, credit slips, exchanges, returns, making change and answering complaints. It may be said that the time lost while the delivery outfit is standing at the curb is largely under the control of the merchant; it being his good pleasure to permit his customers all sorts of leeway in closing sales at their own

doors instead of at the counter. Obviously, however, so much of the cost of waiting time as may be governed by the nature of the equipment belongs to the delivery department, and hence is pertinent to the question of equipment.

An incident that arose in connection with the commercial vehicle run from Philadelphia to Atlantic City not long since will serve to indicate a crucial point in the problem. When the contest first was proposed the electric vehicle people exhibited considerable reluctance to enter. The situation is explained by George M. Graham, who engineered the affair for the benefit of a local newspaper, of whose staff he is a member. At a preliminary conference of intending competitors in the run representatives of the three concerns selling electrics in Philadelphia were present.

"These representatives were frank to say that the run was not one of a nature designed to show their product to the best advantage," says Mr. Graham, "particularly in comparison with gasoline trucks.

"They argued that the run was too long, and called them into a field that they did not claim to cover. Moreover it was not their purpose to deceive prospective customers into the belief that an electric was the proper vehicle for such extended trips. They explained that the electric was not designed for long road tours but was in its proper class when doing local and suburban delivery with frequent stops. One representative asked for a modification of the plan so that the run should cover about 50 miles through Philadelphia proper and the suburbs, specifying that 200 deliveries be made. These stops for deliveries were to average approximately two minutes. It was explained that while two minutes seems a short time, 200 times two minutes means 400 minutes or six hours and 40 minutes.

"If with a gasoline car, power was cut off 200 times and the car actually cranked 200 times, the minimum of power would be consumed, but the delay and the work of the driver would be seriously increased. Hence in 99 cases out of 100 the engine would be allowed to run during each of those 200 two-minute intervals, six hours and 40 minutes, and for the period when the car was stationary it would continue to burn oil and gasoline.

"The electric cannot be stopped without turning off power. The start requires no cranking and changing of gears. The actual miles measure the cost of operation. The representatives of the electric cars contended that a run planned on these lines would be much fairer to them."

The circumstances that the gasoline engine is so constituted that it must be cranked before it will start, and that it will consume both fuel and oil if left running while the vehicle is at rest constitute drawbacks to its use for short-haul deliveries that are not possessed by the electric. Conversely this explains in part why the elec-

tric so frequently is found in the metropolitan service of large stores.

But while it is true that the electric is better fitted for distributing work where short hauls and frequent stops are involved than the small gasoline car in its present state, it by no means follows that it affords the ultimate solution of this part of the problem. Under some circumstances it is still cheaper to use horses than electrics. In the opinion of Louis A. Ferguson, of Chicago, an eminent central station expert, the only real competition between horses and the electric delivery wagon comes at an average daily route of 25 miles. Below that distance animal traction is apt to prove less expensive under present circumstances, while with greater mileages, the electric should prove more economical, other things being equal.

Several known instances in actual practice may be cited in support of this conclusion. One large furniture dealer in Boston, after several years of experimenting with various types of equipment has reached the conclusion that for deliveries within a 15 mile radius from the distributing point the electric is more economical; outside the 15-mile radius gasoline cars are universally employed. In one case in New York City, a large store uses motor trucks only for longitudinal transfer purposes, hauling goods from its shipping rooms to transfer stations uptown. From that point the distribution to consumers' homes is carried on by means of horse-drawn wagons. Still another firm in this locality has had conspicuous success in distribution, sub-stations being located in surrounding towns, where the truck loads are rehandled by horses. One reason for the success of this system has been that it provided a night schedule for the truck. Not only does this permit a maximum of economy to be derived from the motor vehicle equipment through service both day and night, but in using the highways and city streets at night, when they are free from traffic, good running time can be made; and it is a significant comment on the efficiency of the system that it ensures more prompt service than is possible in the particular territory served when the regular express system is depended upon.

The mere fact that horses still are employed so extensively by houses that rely on motor trucks for a part of their work, however, by no means can be taken as significant of present understanding of the economies of the distributing problem. What is definitely known is that the large truck can be worked in the service of a large business in such a way as to bring about considerable economies, replacing two, three, sometimes four, horse-drawn rigs. The establishment of the motor truck in transfer work thus is pretty well under way. But in the distributing end of the average business, particularly that of the

large stores, in addition to the uncertainties that are recognized in regard to the absolute economies of motor wagons, there is the point that the users already have a heavy investment in horses and wagons.

It is not easy to persuade a large operator to sacrifice such an equipment at prevailing market prices, nor is it an easy matter for the commercial vehicle salesman to guarantee that the automobile equipment will be sufficiently economical to wipe out the loss by disposing of the old installation and still show a profit. Therefore, even where operators are favorably disposed toward the motor vehicle, there is a disposition to motorize the equipment gradually, letting the installation of the automobiles come in the form of renewals of worn-out equipment of the other sort.

A striking and, so far as is known, the only exception to the rule, is the case of the big Gimbel store in New York City, which, being newly equipped throughout, has a horseless delivery installation. It also is significant that provision has been made for the use of both gasoline and electric cars, although the latter predominate, and that the bulk of the equipment consists of electric delivery wagons.

As far as the future of the industry is concerned, it is plain to see that it must be affected in some measure by the distinction between transfer and distributing service. Furthermore, the nature of the territory to be covered and the demands of the service must be considered in weighing the qualifications of any one type for the work. There appears to be small question of the efficiency of the electric for short-haul city work. Similarly, it would seem that the handling of deliveries over long hauls and particularly through country districts comes unmistakably within the province of the light gasoline machine. The longer the haul and the fewer the stops, the larger the economic capacity of the car. The limit approaches that of the true transfer vehicle, which is designed for trunk-line service. But the absolute dividing line between the proper zone for the electric and the gasoline car remains to be determined.

Likewise it remains for the gap below the effective mileage of the electric to be filled by some lighter and even more economical type of delivery vehicle. That it might be of the small gasoline type and of a style of construction approaching that of the motorcycle is a suggestion well worth pondering.

#### Automobile Road in Mining District.

Built by subscriptions from the citizens of Nogales, Ariz., and Nogales, Mex., an automobile road from Nogales to Altar, Mex., just has been opened for travel and an automobile stage service instituted. The road is 80 miles in length and penetrates the Mexican gold mining district.

## CHANGE SPEED GEAR IN NEW FORM

**Bevel Gears and Positive Clutch Replace Sliding Pinions—High Efficiency and Other Advantages Claimed.**

Change speed gears in which each connection affords a direct drive have been produced by several inventors at different times, but in the Collins system, which is just being introduced, the effect is secured by an entirely novel method whereby the individual gears are required to transmit less than the full power of the engine. In explanation of this seemingly paradoxical assertion it must be added that the system

Considering the construction in detail, the form of the axle housing and torque tube, A-B, is perfectly regular. Instead of the usual driving pinion at the rear end of the propeller shaft, however, a double gear member, C, is employed. The gear face, which constitutes the smaller face of this member meshes with two large crown gears, D-E, one on either side of the shaft, while the larger pinion face engages a smaller crown wheel, F. The large bosses of the gears D and E constitute the journals upon which they run and which are supported in bearings cored out of the housing structure, A, and suitably bushed to take both radial and thrust loads. The inner crown wheel, F, floats between the gear member D and the fixed inner frame-

unit is provided with extended sleeves, the extremities of which are carried in annular ball bearings, which are splined and upon which are mounted the sliding toothed clutches, H-I, actuated by the control shafts J-K. By moving the clutch H toward the center of the axle the inner crown wheel, F, is positively connected with the axle and the high speed drive is thereby secured. When the same member is moved to its extreme outward position, the outer crown wheel, D, is connected with the axle, and the low forward speed relation is secured. The reverse is obtained by engaging the clutch I, thus locking the bevel gear E to the axle.

The system in this way provides a direct drive on every speed and also has the ad-

THE NEW COLLINS TRANSMISSION AXLE WITH CONSTANTLY MESHED BEVEL GEARS

provides a group of constantly moving bevel pinions and gears between which the load is divided automatically. The entire arrangement, indeed, suggests very broadly the ordinary bevel type of differential, and with this in mind its action is easily understood. The new change gear is being produced by the Collins Axle Manufacturing Co., Pittsburg, Pa., and is embodied in a neat and rather conventional rear axle of the full floating type.

From the accompanying illustrations, which show the arrangement in side and end sections, a good idea of its simplicity and compactness may be obtained. It differs from the ordinary rear axle of its class mainly in that there are three large bevel gears instead of only one, and two driving pinions, instead of one. Either of the three driven gears may be connected to the axle proper by means of positive clutches to secure the two speeds forward that are provided or the reverse.

work of the housing, shown at A in the end view of the axle.

Up to this point the system does not differ materially from other forms of bevel change gear which have been developed. An important point of difference is involved in the introduction of a pair of idler pinions on a short shaft carried in the case directly opposite the driving shaft and coaxial with it. This group is shown at G and is identical in form with the driving group to the extent that its smaller bevel meshes with the crowns D-E and its larger face with the small crown wheel F. The entire arrangement thus may be likened roughly to a differential within a differential. The whole group of gears constantly is in mesh and constantly in motion regardless of the speed ratio. The driving stresses, moreover, are distributed between the gear faces so that the load is balanced over a large area of effective tooth surface.

The floating housing of the differential

vantage that the maximum torque transmitted is that of the engine—no multiplied power being carried through the gear teeth, as the Collins company expresses it. On this account it is possible to employ 8-pitch teeth with the same effective strength as would be obtained ordinarily where 4-pitch is employed. A wide variety of ratios is possible, thus rendering the system adaptable to many different running conditions, while the sizes are approximately those of the present styles of driving axle.

In addition to claiming a high rate of efficiency, which is borne out in laboratory tests with the transmission, it is claimed that the system, with two speeds, will equal the performance of any other gear having three speeds, and do so with greater ease of operation, less noise and less wear. The drawings here shown indicate two different sizes of pinion, as showing the applicability of the system to different running conditions. This is done merely for

purposes of illustration, however, the diameters of the pinions on opposite sides of the axle, obviously being equal in practice.

Certain tests of the Collins axle, which have been conducted at the laboratories of the Westinghouse Airbrake Co., in Pittsburgh, have shown for the system the remarkable efficiency of 98 per cent. The average value for a series of eleven test runs was 88.4, which is still far above the average for the ordinary sliding gear arrangement. The lowest efficiency obtained was 72.5 per cent.

The accompanying diagram is intended to furnish a comparison of the operation of

efficiencies of 65, 72 and 85 per cent.; in the three cases. The two-speed Collins axle performance is figured on a basis of 98 per cent. efficiency for both speeds. The rapid rise of the acceleration curve in the case of the new system, of course, is due to its higher efficiency

#### Making Repairs With Portable Vulcanizers.

In repairing punctures with the aid of small portable vulcanizers the first requisite is absolute cleanliness. Gasolene should be used freely and the wetted section to be repaired thoroughly roughened with sandpaper. As soon as the last vestige of gas-

two or three minutes longer. In repairing cuts in outer casings the hole is cleaned thoroughly as above and filled nearly level with scraps of rubber. The vulcanizer must be left on these repairs for from 40 to 60 minutes, according to the depth of the cut. The tire should be left partly inflated on the rim in order that the vulcanizer may be clamped tightly, as otherwise the repair will be porous. Although perfectly satisfactory repairs of blow-outs have been made by amateurs, it is a difficult job and the better plan would be to entrust the work to some tire repair man.

#### Massachusetts Motorist's Cigar Lighter.

Instead of going to the trouble of trying to keep matches alight or of igniting a piece of gasolene-saturated waste with the magneto spark in order to get a light for his cigars, John H. Bragdon, of Haverhill, Mass., has rigged up an attachment to the steering post of his Franklin touring car which serves the purpose in wind or calm and is convenient and ever ready as well. The wires from the cigar lighter run to the switch that lights the car. The electric power is generated by a small dynamo which is clamped onto the transmission sleeve and driven by a belt from a small pulley. This dynamo charges a small storage battery contained in a box on the running board. To obtain a light, the switch is thrown, the current from the battery produces a jump spark which the wind cannot blow out.

#### For the Prevention of Cold Feet.

Robes with pockets in them which just fit the feet help to keep the feet warm during the winter, but may be found rather cumbersome, especially if a foot accelerator is used. If, however, some sort of a covering be made for the pedals that will prevent the feet from coming in contact with the metal, the discomfort of cold feet will be considerably reduced. Rubber pads which fit the pedals are of course the best things to use, though cork, if it can be obtained, is serviceable, and even wood is better than nothing.

#### To Unscrew Spark Plugs from Valve Cap.

On a number of engines the spark plugs are screwed into valve caps which in turn are screwed into the engine casting. It is a common fault with such construction that the plug and valve cap turn as one when it becomes necessary to remove a plug. One way of getting the plug out and leaving the valve cap undisturbed is first to tighten the plug until it slips a fraction of an inch. A quick jerk in the opposite direction will then loosen the plug and leave the valve cap tight. After the plug has been removed separately from the cap, it would be a good plan to avoid any such further difficulty of plugs sticking by applying a small amount of grease to the threads before replacing in the cap.

DIAGRAM SHOWING ACCELERATION WITH COLLINS CHANGE GEAR

the Collins with the ordinary three-speed sliding gear. It also is illustrative of the high power of acceleration which is attainable where a low transmission loss is encountered. The curves are based on the assumption that a speed of 60 miles an hour is obtained with a spur gear transmission in 30 seconds. One hundred horsepower, transmitted, in one case through the ordinary type of gear, and in the other through the Collins axle, develops the tractive forces shown on the diagram, figured at the rim of a 36 inch wheel, the engine speed being taken uniformly at 1,650 revolutions per minute.

The spur gear gives driving ratios of 9 to 1, 6 to 1, and 3 to 1, respectively, with

olene has evaporated, a thin coating of vulcanizing cement should be applied, allowed to dry for two or three minutes and followed by a second application. A piece of crude para rubber about half an inch larger all around than the puncture is pressed firmly over the hole, and the vulcanizer, which should have been heating during the previous operations, clamped tightly over the whole. The heat should not be permitted to get higher than 265 degrees Fahrenheit, or the surrounding portion of the tube may be overcured or scorched. From 10 to 15 minutes is the time usually necessary for perfect curing. If the patch looks brownish when the vulcanizer is taken off, it should be put on again and left

# Making Most of Motor Propelled Fire Engine

At the recent Budget Exposition of the City of New York, the exhibit of the fire department was graced by a placard bearing a short cost tabulation and this legend:

"Moral: All apparatus in the Fire Department should be auto-propelled."

The figures set forth that the automobile hose wagon now in service at Engine 72 had cost \$6,712 to install and \$85 to maintain during the year 1909. The standard hose wagon drawn by three horses represented an initial investment of \$2,954, and its annual upkeep represented an outlay of \$799.08.

The growing employment of self-propelled apparatus by fire departments throughout the country caused the International Association of Fire Engineers to devote considerable time to the subject at its annual convention held recently at Syracuse, N. Y. Among the several contributions to the program that presented by Chief Charles S. Allen, of the Trenton (N. J.) department was particularly instructive.

"The fire departments of this country are today confronted with the problem of choosing between the automobile and horse drawn fire apparatus," Chief Allen remarked. "The departure from the horse which has been the propelling power for so many years, and which has been considered the only safe and reliable means of hauling our apparatus does naturally cause a doubt in the average chief's mind as to the practicability of such a change; and still a greater doubt exists when we consider the proposition of substituting the gasoline motor, in place of steam power for the operation of our pumps. Yet notwithstanding our doubts, present indications point to a rapid change in this direction in the near future. Manufacturers of fire apparatus in this country have been watching carefully the development of the gasoline motor, for the express purpose of introducing this feature into the fire department service. A great deal of time and money has been expended in this direction, and fairly good results have been obtained thus far, but I feel safe in predicting still greater results in the near future. And while the manufacturers are doing this I feel that we as chiefs of departments have a duty to perform in this direction; I feel that we should view this matter in a broad and liberal light, not allowing preference or prejudice to sway us in what we believe to be our duty to the builder, and for the best interests of the fire service in general. They should have the benefit of our knowledge and our hearty support and co-operation in perfect-

ing and improving this type of automobile fire apparatus, which now seems designed to revolutionize the fire service of this country.

"The automobile fire engine as constructed today has without question many advantages over the horse drawn apparatus; and yet we find by experience that the automobile engine has some disadvantages that must not be overlooked in their future construction. In my opinion the first and most serious objection to the present type of automobile apparatus is the excessive weight of the load now being carried on pneumatic tires. The various makes of automobile engines now in use will weigh from 80 to 90 hundred loaded. This, in my judgment, is overloading the pneumatic tire and is a question to be seriously considered in the future. The desire of some departments to have the automobile engine equipped with large heavy chemical tanks in addition to its present load is wrong and should be discouraged in every case; as you cannot carry the entire equipment used at a fire on one piece of apparatus, and do it safely. And I might say such a combination does not work well, as the chemicals are wanted in front of the building, and the engine should be at the hydrant, connected and ready for immediate use should the chemicals fail. Therefore I do not recommend such a combination.

"The tire problem is one with which you are all familiar, and is subject to the same condition and danger as the ordinary automobile in use. I might say that during the three and a half years service with the automobile we have had but few failures from any cause whatever.

"Another proposition that is giving the manufacturers considerable anxiety is the solution of the pump problem. The various types now used on automobiles are not as satisfactory as we would like, and we must admit that the weight and space are two important factors to be considered in the construction of an automobile engine. The ideal pump for this work should be light and compact, of large capacity, and so geared to the motor that the power may be applied as direct as possible; and one requiring the least possible energy to operate, as under present conditions we find no spare energy when pumping up to full capacity. While our present pump has given us excellent service and no trouble, yet I feel that the present types of pumps used can, and will be, improved upon in the near future.

"The above subjects are merely matters that will have to be dealt with in future

construction, and the gradual development of the automobile engine.

"There is no question but that the automobile engine has many advantages over the horse drawn apparatus; and some that are worthy of consideration.

"The first to be considered is a comparative statement of companies using the two types of apparatus; and for your information I will state that two companies were selected for this purpose, one automobile company with a crew of seven men, the other an engine company with a crew of nine men, both companies located in the same district and doing the same work. The cost of the auto company including salaries, supplies and repairs for a period of ten months was \$5,921.60, while the cost of the engine company for salaries, supplies and repairs for the same period of time was \$9,015.21, or a saving of \$3,093.61 in favor of the automobile company.

"These figures tabulated show:  
Maintenance of engine company... \$885.41  
Maintenance of automobile company ..... 151.60

Total saving ..... \$733.81  
Salaries of engine company, 9 men. 8,129.80  
Salaries of automobile company, 7 men ..... 5,770.00

Total saving in salary ..... \$2,359.80  
Total cost engine company ..... 9,015.21  
Total cost automobile company.... 5,921.60

Saving in comparative cost of maintenance ..... \$3,093.61

"The difference in cost of maintenance, as you will note, is the employment of two less men on the automobile company and the cost of feeding, shoeing and caring of four or five horses of the engine company. In fact, when the automobile is idle there is no expense attached to it; while the engine company has a fixed charge of expense at all times. The saving of two men's salary is a large item of expense without impairing the efficiency of the company, and I might say that we get better results from seven men on the automobile than we do with nine on the engine company.

"Another good feature of the automobile is the despatch in reaching fires; this you all know is a very important factor; and I have no doubt that chiefs who are using the automobile as a conveyance have had this feature brought forcibly to their attention. The automobile in responding to a call in the busy or congested section of your city, and running at a speed of 15 or

20 miles an hour is always under absolute control, and is less liable to accident than the horse drawn apparatus going at a much reduced speed.

"Driving an automobile engine at high speed through your city does not pay, and the practice should be discouraged, as the small amount of time saved does not warrant the risk taken.

"Another good feature of the automobile engine is the efficient service rendered in the early stages of the fire; you are not delayed with low steam pressure, a poor fire, or an incompetent stoker, as frequently occurs with the engine; but as soon as the automobile is connected, and the water is turned on, in less than one minute you have the full capacity of your engine if you wish. The stream is just as good the first minute as it will be at any time of the fire; and we find it a decided advantage to have a stream that will cover an area of from 200 to 225 feet right at the beginning of a stubborn blaze.

"The automobile engine for traveling through snow and hill climbing is a decided success.

"During the past winter we had considerable snow in our section of the country, and all of our automobile apparatus was given a severe test in responding to calls, and I might say that we were able to go through snow drifts where four horses would not take the same load. In fact, the performance of the automobile in the snow was far beyond our expectations; and we have no hesitancy in saying that it is the only safe apparatus to use in snow.

"We have used in our city a Webb motor fire engine for the past ten months, which has given very good service. We have had tire trouble three times during that time defects that were due to manufacturer and were replaced free of charge. We had transmission gear trouble once, due to a defect that has since been corrected, and will not happen again. All other minor details were taken care of by the operator at slight expense. In expressing my opinion of the automobile engine I will say that present indications point to its use in fire departments in the near future, with many improvements no doubt over the present type, and I would therefore advise fire departments not to discard engines, but keep them all, and as soon as the opportunity offers put in one or two pieces of automobile apparatus, and give them a fair trial, and arrive at their own conclusion. The more departments using them the quicker we can determine their value in the fire service. We have given many demonstrations for the benefit of other cities, and shall continue to furnish such reliable information as we may have bearing on this subject, and hope to see the automobile engine perfected, and in general use, relieving the horse of his dangerous and arduous duties in the near future."

## FIRE WAGON FOR DOUBLE DUTY

Designed for Chief's Service but Equipped to Render "First Aid"—Sensible Compromise for Small Cities.

While the chief of the New York fire department travels to the seat of trouble in a great big motor car, with siren horn and loud tongued bell heralding his approach, his is purely a speed machine and one scarcely within the needs and revenues of smaller communities.

In Montgomery, Ala., for instance, they have effected a sensible compromise. The

period of three years without even having been removed from the rim. It was attached to a Locomobile demonstrating car used by a Chicago garage, the car itself having covered 58,000 miles in five years and with but one change of tires.

### Buses Again Declared "Commercial."

The contention of the Fifth Avenue Stage Coach Co. that the buses which it operates on the famous New York thoroughfare are commercial vehicles in the sense of the Callan law, was upheld by the Appellate Division of the New York State Supreme Court, at Albany, N. Y., in a decision rendered on November 16th. The decision was brief and did not contain a

DOUBLE DUTY FIRE CHIEF'S WAGON IN USE IN MONTGOMERY, ALA.

chief of that city's fire department has been furnished with a White gasoline runabout, and instead of being intended merely to hurry the chief to conflagrations it is designed and equipped also to render what may be termed "first aid," as the accompanying illustration serves to show.

The runabout is fitted with a rumble seat and thus provides room not only for the chief and his driver but for an extra fireman, the car being equipped with a couple of chemical fire extinguishers and other emergency fire-fighting apparatus which will permit the men to subdue a small flame before the horsedrawn apparatus is able to reach the scene.

### Chicago Reports Staggering Tire Record.

"High-score" tire records continue to pile up, and though the St. Louis record of 18,000 miles without reinflation is in a class by itself, Chicago has come to the front with a record that almost staggers belief—one of 28,000 miles service without a puncture, the tire, a Diamond, having been in constant use winter and summer for a

judicial opinion, merely affirming the decision of the lower courts. Under the regulations of the Callan law, commercial vehicles are taxable at the rate of \$5 per year, while passenger automobiles pay according to horsepower, which in the case of the Fifth avenue coaches would amount to a tax of \$15 per bus. The decision of the Appellate Court, however, has been appealed, as it is the intention of the Secretary of State to have the term "commercial vehicle" defined judicially.

### Way Found to Advertise Gasolene.

Gasolene is one of the substances in such general use that to advertise its sale—except by a lowering of price—in a manner designed to attract patronage appears so difficult as to be well-nigh impossible. In Phoenix, Ariz., however, a dealer has evolved a way to attain that end. He advertises that he will pay "a dollar a drop" for water found in his "guaranteed chamois-strained gasolene," and further offers to return their money to all dissatisfied purchasers.

**ARGENTINE AFFORDS OPENINGS**

**Visitor from Buenos Ayres Points them Out—Peculiarities of Trade in the South American Country.**

Motorists who are troubled with the "chauffeur problem" might find some of their difficulties lessened were conditions the same here as they are in Buenos Ayres. There the garage charges are made to include the salary of the chauffeur, his livery, all repairs except tires, gasoline, oil and garage space. The drivers, who are on call day or night, receive 150 pesos, or \$66 per month.

No less than \$6,000,000 worth of cars were imported for the Argentine market last year, and the business is reported as being in a lively condition and promising. Indeed, the situation is represented as being particularly favorable for the introduction of motor trucks, the country's real need of such vehicles being explained by E. A. Feibelman, an importer of Buenos Ayres, who is at present visiting New York City, in the course of a recent interview.

While European manufacturers already have secured a good hold in the introduction of pleasure cars, they have accomplished practically nothing as yet in securing the adoption of commercial vehicles. Yet there is an enormous field for the business wagon in connection with the wide industrial development which the Argentine Republic at present is undergoing. As Mr. Feibelman expresses the real opportunity, "the long stretches of territory, as yet uncovered by the railroads, except in specified directions, are subject wholly to horse transportation, and the truck can be used to tremendous advantage among the ranches or estancias in the carrying of hides, beef and grains."

"These ranches lie in all directions, hundreds of miles from railroads, and the products are transported in caravans, with 12 to 15 wagons hauled by from 18 to 22 horses each," he goes on to say. "These hauls average, according to weather, 15 to 20 miles daily, and a relay drove of horses, 250 to 300 strong, always precedes the caravan, making a total of upwards of 500 horses in the caravan. This is expensive business, for while horses are worth about \$40 each, under some conditions it costs as high as \$40 a month to feed them, and in all cases it is extravagant. Then they are grass fed, wholly, and consequently not strong enough to stand heavy work. In these long cross-country hauls the horses die in droves; in many instances they are beaten to death, and it is not uncommon for an entire caravan of horses to die off—sometimes 500 horses as a total. Losses always average 2 per cent. to 5 per cent.,

and 20 per cent to 25 per cent is all too common.

"The motor truck can obviate this, covering four times the horse run in a day. There are a few Benz trucks in operation down there, introduced by the progressive Germans, and it behooves American makers to get in early, else the truck business will be lost.

"Buenos Ayres has an area twice as large as Paris. The department stores have city deliveries 16 miles long, and electric machines would have a strong call. The gasoline truck would monopolize the country stretches where no power stations exist, some of the distances which they would have to cover taking in whole provinces where no railroad reaches. These ranches constitute the wealth of the country, which you can estimate from its banks holding the fourth largest gold reserve in the world.

"In the United States the railroads were followed by the colonists. In the Argentine Republic the railroads follow the colonists. Therefore, it is the province of the motor truck to open up the country and occupy relatively the position in development that the railroads occupy in the United States.

"Another thing, besides cost of feeding, that reacts against the horse is the high wages paid drivers, who receive \$1.75 to \$2.50 for driving inferior horses. The percentage that trucks can earn there is consequently higher than here.

"What the Americans require is an aggressive campaign, the maintenance of suitable garages and repair shops where rapid changes can be made. Heretofore American firms have come down with a chip on their shoulders demanding terms no South American firm could countenance. They would say they did not need to export anyway, and let it go at that. On the contrary, the Europeans, who are after the business, were prepared to extend the habitual credits, and consequently receive the favors.

"However, new conditions have arisen the past few months since the Government ordered three Dreadnaughts built in the United States. It has created a new confidence with us, and American goods are looked upon with more favor. If Americans will show the same readiness as Europeans, then there is a harvest to be reaped in South America.

"Last year we imported \$6,000,000 worth of automobiles, almost entirely from Europe. About 60 per cent. was Panhard business, the remainder being Renault, Delauney-Belleville, Napier, Fiat, Lancia, Benz and DeDion. Of the American machines, I recall seeing only Ford taxicabs and Packard pleasure cars. The Americans seem to delight in painting their cars a brilliant yellow, while we, of the Argentine Republic, like dark green and maroons.

"Demi limousines and laudaulets are in

favor, as the winters are not too cold, and these cars are readily converted into an open vehicle, being used this way in the day and closed for the opera at night. Many people own strings of cars, ten or fifteen in number, and their use is increasing, as the natives have enjoyed great wealth the past ten years.

"Some of the most up-to-date garages in the world are in Buenos Ayres, some with fireproof steel lockers, like a safe, in which you back your car at night and lock it up. In addition to the Panhard, the Mercedes and Fiat people have particularly fine garages and repair shops.

"Some idea of the extent the automobile is used may be gained by citing the fact that 22,000 licenses have been issued, the fee being 100 pesos, or about \$44 in American gold. Garage charges depend upon the size of the car and its horsepower, but average about 6,000 pesos, or \$2,800 gold. This charge includes salary of chauffeur, his livery, all repairs except tires, gasoline, oil and garage space. The chauffeurs are on tap day and night. Chauffeurs receive 150 pesos (\$66) per month.

"A large renting business is also done, and rented machines cost about \$4.40 per hour. If a machine is hired by the month the terms are 800 to 1,200 pesos, or \$350 to \$550. A new taxicab company is in process of formation which is in the field to buy 300 machines."

**Motor Cars for Political Campaigning.**

Although few candidates for office find it possible nowadays to dispense with the use of automobiles, not many will be likely to overlook its possibilities as a mode of quick travel, as shown by the record made by Congressman G. M. Hitchcock, candidate for the United States Senate and Congressman Latta, who, during the last political campaign, covered 1,00 miles in nine days. While this distance is not remarkable for an automobile to travel in nine days, the fact that the candidates made speeches, in duration up to three-quarters of an hour, in from seven to 13 towns a day in the 19 counties embracing the third congressional district of Iowa, makes apparent the record-breaking feature of the trip. Ed. Latta, son of the congressman, was at the wheel of the Stoddard-Dayton in which the campaign was made.

**For a Million Dollar Boulevard.**

Plans for a boulevard 200 feet wide and extending from the Queensboro Bridge, Long Island City, N. Y., via Thompson avenue, Hillside avenue and Jamaica to the southern limits of the borough of Queens have been filed by Nelson P. Lewis, chief engineer of the New York Board of Estimate. It is estimated that this work will cost \$1,000,000, 50 per cent. of which is to be paid by the city, 30 per cent by the borough of Queens and the remainder by the property holders along the proposed route.

## TO KEEP THE CAR'S DASH CLEAR

**Remy Produces a Line of Magneto Switches to Assist that Purpose—Several Types Are Offered.**

Doing its part to assist the general tendency to clear car dashes of encumbrances, the Remy Electric Co., Anderson, Ind., has brought out a line of kick switches to be used in connection with their well known magneto and which, as might be expected are well and handsomely made, and of suf-

is made as a kick switch only, and when installed is nearly flush with the dash. It is of brass throughout and of very good appearance. Both of these types are shown in the accompanying illustrations. The third, type B, is made with a hand key or kick pedal, and is compactly built for small or crowded dashes. Both types A and B are of metal, finished in black and brass, except so far as the hand key is concerned: it is of hard rubber. The kick pedal proper is of brass, the upper part having a sand blast finish and the lower part polished. Type C is of brass throughout.

All of these switches are provided with

loading causes undue distortion and that it throws the working parts of the car out of line. The gear ratio also probably is too high and the springs unsuitable, and either or both failure to climb hills and mechanical derangements, difficult to account for, are the natural result, and as a rule the owner or the chauffeur promptly proceeds to damn the car instead of placing the blame where it belongs.

### Sliding Door as a Show Window.

Combining the front of a garage into a show window and an entrance has been done by a garage owner whose quarters

REMY TYPE A (FRONT)

TYPE C, FRONT AND SIDE VIEWS

REMY TYPE A (SIDE)

ficient variety to meet practically any call which may arise.

One feature of these new switches is the ease with which they may be installed. All wires are cabled and each has a terminal clip, eliminating soldered connections. Each of the two cables of the dash kick switches is plainly marked in colors and connected to the corresponding color binding posts. The cables are equipped with a brass diverging device which holds each wire at the proper angle for connecting, and at the same time prevents fraying of the insulation.

Three types are built, one, type A, having a hand key or kick pedal, mounted upon a highly polished box and similar to the switch made in 1910. Another, type C

a hard rubber button for starting the motor on the spark when batteries are employed, and with a detachable key which, by its removal, renders the switch inoperative.

### Overloading Cause of Unsuspected Ills.

Gross overloading of a chassis is an evil which is not infrequent and in many cases both chassis maker and coach builder are blamed for what is really the fault of the owner. Some owners buy a light four or five passenger car, and after a time, replace the original body with a much heavier limousine or other closed pattern, while others make a practice of carrying too heavy a load in the smaller and lighter bodies, quite unconscious that this over-

did not permit each of the features to be arranged separately. The front is taken up entirely by two large windows, one of which slides by the other in the manner of a sliding door, leaving an opening through which the cars may be taken. The machines are run in upon two flanged planks, the ends of which are placed on the sill. The window is then closed and the cars left on exhibition near the front of the garage.

### To Straighten Bent Cotter Pins.

Cotter pins which have become bent through use or abuse may be returned to their normal condition quite easily by holding them upright on something solid and lightly tapping the ends of the "legs."

# Rambler

## 1911 Cars Now Ready

Rambler  
Sixty-five

THE 1911 Rambler is now ready and orders are being taken for early deliveries of all styles. The line includes landaulets, coupes, limousines, town cars, roadsters, toy tonneaus and five and seven-passenger touring cars with detachable fore doors. Details and construction alike for all: two sizes, forty-five and thirty-four horsepower. Forty-inch wheels on all seven-passenger open cars, thirty-six-inch wheels on all others. Seven-eighths elliptic springs and shock absorbers produce gratifying comfort. The offset crank shaft and straight-line drive enable you to travel through sand and up grades on high gear as slowly as ten miles an hour. That there is no need to rush the hard pulls is one of the charms of driving a Rambler.

## RECENT PATENTS.

969,512. Dry Cell. Amos N. Barron, Cleveland, and Walter G. Waitt, Fremont, Ohio, assignors to National Carbon Company, Cleveland, Ohio, a Corporation of New Jersey. Filed March 26, 1910. Serial No. 551,668.

1. A dry cell comprising a zinc cup having a bibulous lining, a carbon electrode and battery mix tightly packed in the lined cell around the electrode, the said bibulous lining extending across the top of the mix, a disk of material resting upon the said bibulous lining upon the top of the mix and surrounding the electrode, said disk comprising a top and bottom member of absorbent material, a corrugated member of absorbent material spacing them apart, and a seal in the cup on top of said disk.

969,893. Vaporizing Device. Abbot A. Low, Horseshoe, and Maurice J. Wohl and Harry Hertzberg, New York, N. Y., assignors to said Abbot A. Low. Filed June 16, 1908. Serial No. 438,787.

1. In an explosive engine, a vaporizing chamber, a vaporizing coil having a flat side positioned in said vaporizing chamber the plane of said flat side being inclined to the direction in which the fluid is injected means for injecting the fluid to be vaporized into said chamber and against the flat side of said coil, and means for heating said coil.

969,899. Protector for Automobiles, etc. Susan C. Partington, Buffalo, N. Y. Filed Jan. 18, 1909. Serial No. 472,837.

1. A protector for vehicles comprising a house having a doorway for the entrance and exit of a vehicle, a door pivoted at its lower end to the sill of the doorway to swing in a vertical plane, a cover movable over or away from the vehicle space, and means for causing said door to move said cover into and out of its operative position.

969,908. Pneumatic Tire Protector. Edwin Russel, Kansas City, Kan. Filed July 22, 1909. Serial No. 508,951.

1. A protector for tires, comprising, in combination, a series of shells substantially diamond shaped and having their longitudinal end portions of reduced thickness and having upraised corrugations centrally dividing said reduced thickness, said shells overlapping one another to the extent of said reduced portions, the overlapping portions constituting the longitudinal apexes of the diamond shaped shells, flexible means connecting the transverse ends of said shells to cause them to assume an arcuate curvature, and yoke means supplied at intervals to yoke the protector to a wheel.

969,929. Vehicle Rim. Martin L. Williams, South Bend, Ind. Filed Feb. 28, 1908. Serial No. 418,179.

1. In a vehicle wheel, the combination with a rim provided at one side with an annular outstanding flange, and at the opposite side with a plurality of spaced apart inturned lugs, a pair of endless tire retaining rings detachably mounted upon said rim, and confined against slipping off one side of the latter by said outstanding flange, and endless locking ring for preventing said detachable members from slipping off of the opposite side of said rim, said locking ring having a plurality of spaced apart outturned channel shaped flanges adapted to receive the inturned lugs of said rim, and means for preventing circumferential movement of said ring upon the rim.

969,930. Detachable Vehicle Rim. Martin L. Williams, South Bend, Ind. Filed Feb. 28, 1908. Serial No. 418,180.

1. In a vehicle wheel, the combination with an inner rim having an inclined bearing surface at one side thereof, a detachable outer rim supported at one side by said bearing surface, a wedge shaped locking ring having an inclined bearing surface supporting the other side of said outer rim, a downturned flange upon the outer edge of said locking ring, bayonet joint connections between the outer periphery of said inner rim and the opposed periphery of said locking ring comprising a plurality of spaced apart lugs upon the inner face of said locking ring, and co-operating recesses or slots upon the upper face of the stationary rim, said slots being open at one end to permit the entrance of said lugs, and means co-operating with the downturned flange of said locking ring to force the latter into position upon the inner rim.

969,941. Carburetter. Frederick John Cox, Kentish Town, London, England. Filed Nov. 29, 1907. Serial No. 404,306.

1. A carburetter consisting of a casing having an air inlet and a mixture outlet, an involute spiral surface within the casing, a jet from which a volatile liquid is discharged upon the said involute spiral surface, and means for rotating the spiral surface so as to cause the volatile liquid to gradually move toward the axis of the involute spiral surface substantially as described.

969,990. Speed Indicator for Motor Cars and Other Vehicles. Cuthbert Coates Smith, Twickenham, England. Filed April 2, 1910. Serial No. 552,999.

1. A speed indicator for motor cars and other vehicles, comprising a rotatably mounted body having numerals on its sides, a centrifugal governor device and means for operating it from the vehicle road wheel, a sleeve connected to the movable end of the governor and having a flange, cylindrical sectors arranged in parallel on the interior of the body and lying in the path of the flange on the governor sleeve and successively engageable thereby as the speed of the vehicle varies, whereby the indicator is intermittently rotated, substantially as described and for the purposes stated.

970,005. Demountable Tire. Valentine Wildner, Chicago, Ill. Filed Nov. 5, 1909. Serial No. 526,445.

1. The combination with a vehicle wheel and tire, of a supplemental rim to which the tire is attached split transversely to form ends which are movable to and from each other for expanding and contracting the rim on the wheel, a link connecting the ends of the rim and having a ring at one end, a cam operating in said ring to draw the ends of the rim together, a wall engaging one side of the ring to limit the throw of the parts in that direction, and a set-screw threaded in the rim and adapted to impinge against the other side of the ring, substantially as shown and for the purpose set forth.

970,034. Explosive Engine. Leef A. Frayer, Columbus, and William J. Miller, Springfield, Ohio, assignors, by mesne assignments, to The Kelly Motor Truck Company, Springfield, Ohio, a Corporation of Ohio. Filed Aug. 3, 1908. Serial No. 446,556.

1. In a hydrocarbon engine, the combination with a cylinder, of a jacket which

partially incloses said cylinder, an air conduit which communicates with said jacket at the top of the cylinder, said air jacket being closed with the exception of a few small openings at the bottom thereof, and a valve casing also surrounded by said air jacket, said air jacket having a number of openings formed in the wall thereof adjacent said valve casing.

970,126. Vehicle Wheel. Harry Scullin, St. Louis, Mo. Filed July 2, 1909. Serial No. 505,713.

A vehicle wheel composed essentially of rubber and differentially vulcanized from its tread to its hub.

970,136. Horn. Etienne Teste, Paris, France. Filed Dec. 2, 1908. Serial No. 465,661.

1. A horn, comprising a plurality of trumpets, a cylinder with which the trumpets are connected, a movably mounted distributor in the cylinder, an air forcing device connected with the cylinder, and means for intermittently operating the distributor from the air forcing device and simultaneously therewith admitting air from the said air forcing device to the cylinder.

970,297. Automobile Radiator. Charles G. Boeck, Jackson, Mich., assignor to Novelty Manufacturing Company, Jackson, Mich., assignor to Novelty Manufacturing Company, Jackson, Mich., a Corporation of Michigan. Filed Jan. 7, 1910. Serial No. 536,923.

1. A radiator comprising an assemblage of prismatic tubular air-flue sections having open rectangular ends, the same being placed immediately adjacent one another and pointed at their ends, the lateral faces of said elements being formed immediately of their flat-sided end portions with longitudinal recesses, and the opposed faces of adjacent elements having their said recesses staggered for intercommunication, thereby providing intervening sealed water-passages extending transversely of the air-flues.

970,328. Gearing. William O. Hancock, Orleans, Ind. Filed Nov. 30, 1909. Serial No. 530,699.

1. In a device of the kind described, a differential train including a driving gear and a driven gear, and means to drive either or both of said gears.

970,329. Tire Inflator. William R. Heck, Palmer, Neb., assignor of one-half to Adam F. Heck, Palmer, Neb. Filed March 28, 1910. Serial No. 552,030.

1. An air pump comprising a cylinder, a plunger working therein, a plunger stem comprising telescoping and slidably connected sections, one of said sections having a notch, a pivoted dog carried by the other section, and adapted to engage the notch for locking the sections together, a releasing device for the dog, governor controlled means for operating the releasing device, and means connected to the plunger stem for operating the pump.

970,390. Shock Absorber for Automobiles. Cristian Alfred Petersen, Laconia, N. H. Filed Nov. 22, 1909. Serial No. 529,457.

1. A shock absorber comprising a casing, a piston therein provided on opposite sides with cam-faced abutments arranged in break-joint order, two-throw cams carried by the casing and engaging the abutments, a shaft loosely keyed to the piston, means for rotating the shaft whereby to cause the coaction between the abutments and

the cams to impart a reciprocatory movement to the piston longitudinally of the shaft, and means for permitting passage of the fluid under gradually increasing resistance from one side to the other of the piston.

970,429. Carburetter for Internal Combustion Engines. Fitzwilliam Richard Davis, Kew Gardens, England. Filed July 15, 1909. Serial No. 507,818.

1. The combination of a heated mixing chamber provided with a fuel inlet, an eduction pipe and a hollow projecting valve casing communicating with said chamber and provided with air inlets intermediate of its ends, a rotatable sliding valve normally located in the outer end of said casing beyond said air inlets, a rotatably mounted sleeve passing through said casing and chamber, a reciprocating rod extending through said sleeve, a longitudinal slot in said sleeve, a pin operating in said slot and connected to said valve and rod, a governor for said rod, means for rotating said sleeve, throttling means controlling said fuel inlet and eduction pipe, and means co-operating between said throttling means and reciprocating rod, whereby the flow of fuel and air to the mixing chamber and the flow of gaseous mixture from the mixing chamber is controlled by the movement of said rod, substantially as described.

971,038. Carburetter. Edward J. Gulick, Mishawaka, Ind., assignor to The Simplex Motor Car Company, Mishawaka, Ind., a Corporation of Indiana. Filed May 4, 1907. Serial No. 371,840.

1. In a carburetter, the combination of a casing having branches for the intake of air

and for connection to the suction side of an engine, of a carburetting chamber situated between said branches, an annular choke tube within the walls of said carburetting chamber and having a beveled operating surface thereon, a spray plug in said carburetting chamber, said spray plug provided with a conical annular passage terminating opposite the beveled surface of the annular choke tube, a needle valve seated at the apex of said annular passage, and connected to said choke tube whereby the suction of said engine moves said choke tube and needle-valve relative to said spray plug to increase or decrease the amount of air and oil delivered to said engine, and means for returning said choke tube and needle-valve to their seated positions, substantially as described.

971,075. Draft Attachment for Motor Vehicles. Otto E. Ritzmann, Detroit, Mich., assignor to Peerless Auto Pull Co., Detroit, Mich., a Corporation of Michigan. Filed April 29, 1910. Serial No. 558,327.

1. The combination with the hub and drive wheel of a motor vehicle, of a plurality of sector plates embracing said hub and co-operating therewith to form a segmental winding drum, means for attaching the inner ends of the sector plates to the wheel, and means for clamping the outer ends of said plates to the hub.

971,100. Cushioned Vehicle Wheel. Maynard H. Aldridge, Plattsburg, N. Y. Filed Jan. 13, 1910. Serial No. 537,869.

1. In a wheel of the character described, a hub, an inner stationary rim, a series of bracing spokes to secure said rim to the hub, guide rings secured to the inner sides

of said spokes, said rings having formed therein oppositely disposed guide grooves, a series of cushion spokes slidably mounted in said inner stationary rim, an outer rim formed of a series of independent segmental sections each of which has a sliding interlocking engagement with the end of the next adjacent section, a tire arranged around said sectional rim, a pneumatic cushion arranged around said hub, a series of segmental cushion seats secured to the inner ends of said cushion spokes, guide lugs formed on the opposite edges of said seats and adapted to engage the grooves in said guide rings, pads arranged on the inner sides of said cushion seats and adapted to engage said pneumatic cushion whereby the cushion spokes are yieldingly held in position on the wheel.

971,246. Protector for Pneumatic Tires. Ole A. Britson, Brookings, S. D. Filed April 11, 1907. Serial No. 367,637.

A pneumatic tire having an outer protecting covering composed of layers of material, annular rows of rivets connecting the tread portion of the layers and arranged in staggered relation, said rivets having outer enlarged flattened heads disposed out of transverse alinement and on lines between each other, an annular series of rivets connecting the layers at each side of the tire and between the tread portion of the tire and rim of the wheel, said rivets having outer rounded heads of smaller diameter than the heads of the tread rivets, said round headed rivets being arranged in alined longitudinal and transverse rows in close relation to each other so as to form clusters of projections to protect the sides of the tire and layers from wear.

## Atlas Engine Works Plant

ANNUAL CAPACITY—  
20000 AUTO MOTORS

THE HYDRAULIC PRESSED STEEL CO., Pressed Steel Frames.

DETROIT CARRIAGE CO., Automobile Bodies.

ATLAS ENGINE WORKS, Automobile Motors.

ROGER B. McMULLEN, General Sales Agent, 115 Adams Street, Chicago, Ill.

### TO FILE SUPPLEMENTARY BRIEFS

**Court Gives Attorneys in Selden Appeal Cases Additional Opportunity—Ford's Final Request Causes a Flutter.**

Despite the fact that all of the attorneys involved previously had filed briefs of great length and that they talked during four days of last week, when the arguments in what are known as the Ford and Panhard appeals from the decision of the lower court sustaining the Selden patent were concluded on Friday last, 25th ult., the United States Court of Appeals for the Second Circuit, granted counsel ten days in which to file supplementary briefs.

The four days' argument necessarily was chiefly a review of the testimony, the chief endeavor on one side being to convince the court that the Selden engine was useless or one that never had been adequately worked, while the other side naturally held to the contrary view. The appellants also gently pictured Selden as a patent attorney who instead of insisting on his rights when the first automobiles made their appearance had lain in ambush, so to speak, until the industry had grown up, when he greedily pounced upon it. George B. Selden himself attended the last day's proceedings and heard himself depicted in this guise.

Perhaps the most excitement in the case occurred at the conclusion of the hearing, when the Ford counsel with delicious audacity asked the court to suspend the injunction against John Wanamaker—who is bracketed with the Ford Motor Co. in the litigation—in order that he (Wanamaker) might purchase 40 Ford delivery wagons. The request instantly caused a hubbub and brought all of the attorneys and most of the spectators to their feet. They crowded inside the rail close to the bench, several lawyers talking at once, the Selden representatives of course vigorously opposing the motion. When quiet was obtained the court denied the Ford request.

Pending the filing of the supplementary

briefs, the trunkloads of books and papers, the various charts and working models and the other and original exhibits—the latter stored at No. 45 Barclay street, New York—all of which had been employed to assist the argument, were ordered retained in the custody of the court.

### Stewart Licensed Dealers' New Secretary.

Charles A. Stewart has been elected general manager of the Licensed Automobile Dealers of New York City to succeed James M. Carples, who resigned the office to assume the management of the Daimler Import Co. Previously, Stewart was assistant educational director of the West Side Y. M. C. A. in New York in which capacity he had much to do with the automobile school which for several years has been successfully conducted by that organization.

### Jacobson-Brandow Terminates Agency.

The contract between the Pettingill-Andrews Co. of Boston and the Jacobson-Brandow Co., of Pittsfield, Mass., which gave to the former the exclusive sales agency for the Jacobson-Brandow ignition specialties, has been terminated and the Pittsfield company is rearranging its system of marketing its product. In the West it will be represented by H. C. Mills and W. D. Rockwell, who will make their headquarters in Detroit.

### To Build Gramm Trucks in Canada.

The Canadian Gramm Motor Truck Co. has been organized in Walkerville, Ont., and as its title indicates it will reproduce the American Gramm trucks on the other side of the border. Its officers are: H. W. Acason, president and general manager; F. H. Galusha, vice-president and superintendent, and J. K. Webster, secretary and treasurer.

### Two Wholesalers Depart for Paris Show.

Carl Kaufman, general manager of the Motor Car Equipment Co., and J. L. Gibney, of J. L. Gibney & Bro., of New York, sailed yesterday on the Mauretania to attend the Paris show. They went with eyes open for new things in accessories.

### HYDRAULIC TRANSMISSION COMING

**Bethlehem Steel Co. Developing Them Under Manly Patent—New West Virginia Company Also Secures License.**

That the Bethlehem Steel Co., Charles M. Schwab's giant property in Pennsylvania, has been licensed to manufacture the Manly drive and is developing that hydraulic transmission in sizes for application to trucks and taxicabs, became known only this week, when a Motor World's inquiry of the Manly Drive Co. concerning another matter served to disclose the more important news. The big steel company's license is all-inclusive and permits it to make the Manly transmission in all forms and for all purposes. In addition to the larger sizes for truck use, the Bethlehem people are working on transmissions in 15 and 25 horsepower sizes, and in fact already have produced some of the latter, but for application to battleship turrets and not automobiles. The 15 horsepower size will be designed for taxicab purposes, but probably it will not be ready until after the truck transmission has been perfected.

The American-Latrance Fire Engine Co., of Elmira, N. Y., already has produced a truck employing the Manly drive, one of them having been exhibited on the streets during the last New York show. A much improved vehicle is said will be disclosed during the forthcoming show season.

The promise of a pleasure car using the liquid drive is somewhat remote. The Remington Standard Motor Co., of Charleston, W. Va., which recently was incorporated with \$1,000,000 capital stock, and of which Emerson Brooks, the well known New Yorker, is first vice-president and general manager, has been licensed by the Manly company to use the transmission for both pleasure cars and trucks, but as the manufacture of the latter is the immediate purpose of the Remington Standard company, when if ever, the pleasure

## THE MOTOR WORLD

car will make its appearance is merely a matter for speculation.

The Manly drive is an application of the hydraulic principle. The driving end of the system consists of a multiple cylinder pump, which forces oil through a controlling valve to the one or more motor units through which the power is applied. The motors are similar in general construction to the pump, and derive their motion from the pressure of the oil. Such is the nature of the arrangement that the entire range of forward and reverse speeds and the braking effect may be secured by the manipulation of a single lever.

### Fatal Accident to an E-M-F Manager.

David Hunt, Jr., manager of manufacturing of the E-M-F Co. of Detroit, was instantly killed late Saturday evening last, 26th ult., near Yale, Mich., by the overturning of a car in which he was a passenger. He was one of a hunting party contained in two cars and was riding on the footboard while passing over a treacherously slippery stretch of clay road when the car skidded into the ditch; Hunt apparently jumped but fell backward and the car overturning fell upon him, breaking his neck. Charles Adams, superintendent of the E-M-F company, who drove the car, escaped with a wrenched back. Hunt had been a member of the E-M-F staff since last May, when he went to Detroit from Cleveland where he had been manager of a machinery and machine tool company. He was an expert in those wares. He was 35 years of age and a native of Boston, to which city his remains were taken for burial. He leaves a widow and daughter.

### Court Dismisses a Bankruptcy Petition.

Judge Hough, sitting in the United States Circuit Court in New York, has dismissed the petition in bankruptcy filed on September 29th last against the Carpenter-Kerlin Gear & Machine Co., makers of automobile gears at 77 White street, New York. The court's action was taken because the petitioning creditors failed to appear to offer evidence in support of their allegations of bankruptcy.

### Fiat's President Visits American Factories.

Chevalier G. Agnelli, president of the Italian Fiat company, accompanied by his son, E. Agnelli, and I. Marian, superintendent of the Fiat works, last month made a tour of a number of American factories under the guidance of E. Rand Hollander, of New York, who is a part of the American Fiat establishment. He sailed for home on November 29th.

### Winton Opens Branch in Kansas City.

The Winton Motor Carriage Co. has opened a branch in Kansas City, Mo., at 3328-30 Main street. Its manager is George Arbuckle, who has been in the Winton service for many years.

## INFRINGEMENT SAVES PATENT

### Peculiar Decision of British Court that Renders Mercedes Patents Valid—Illegal Use Proof of Manufacture.

Because they have been extensively infringed, paradoxical though it may appear, several patents owned by the German Mercedes company have been upheld in England, the establishment of their validity resulting from an attempt of Fiat Motors, Ltd., to have them invalidated under the provisions of the Patents and Design act of 1907. In consequence of this signal triumph of logic as viewed through the medium of the legal mind the owners of the patents now may proceed against the infringers.

By the terms of the law in question if "the patented article or process is manufactured or carried on exclusively or mainly outside the United Kingdom," the patent is rendered void. The Fiat people applied for the revocation of the entire group of Mercedes patents, the application being refused by the Comptroller's court mainly on the strength of the court's opinion that the manufacture could not be considered as carried on mainly abroad in view of the extent to which infringing products were built locally; in other words, it mattered not at all if the patentee had not worked the patents, so long as others did so. The case was appealed and in due season came before the High Court.

In the opinion of Mr. Justice Parker, presiding, the sub-section of the act was not concerned with what the patentee had or had not done, nor with the question of whether what had been done had been done with or without his consent. Nor should the comptroller inquire whether the manufacture at home had been carried on in derogation of the patentee's rights. The appeal was, therefore, dismissed and the patents remain in force.

The rights in question consist of seven British patents relating to the gridiron or grate method of change gear actuation, honeycomb radiators, water-cooled brakes, fan fly wheels and dished axles. On several different occasions threats that they might be enforced have caused flutters in the British industry where, as elsewhere, the principles involved are widely used.

### Chicago Dealers Sue Delinquent Builders.

Failure to fulfil the terms of a contract made between the Chicago Motor Car Co. and J. C. Robison & Co., builders and contractors, resulted last week in a jury verdict of \$36,000 in favor of the automobile concern. It appears from the evidence that on May 5, 1909, the Chicago Motor Car Co., the Packard agents in that city, entered into a contract with J. C. Robison &

Co. for the erection of a new building at Michigan avenue and 24th street, Chicago, Ill. On account of the failure of the contracting firm to prosecute the work to the satisfaction of the architect and the automobile dealers, the contract was canceled in the latter part of September, 1909, and the building was completed by another contractor on a percentage basis. The motor company then sued J. C. Robison & Co. and the Illinois Surety Co., which had furnished the bond for fulfilment of the contract, for the amount of extra cost, caused by the non-fulfilment of the contract specifications, and a Chicago jury sitting under Judge Dicker awarded, after a six weeks' trial, the amount of \$36,000 to the plaintiff, the length of the trial making it almost a celebrated case.

### Factory that Operated at a Loss.

That automobile manufacture is not always the short cut to ready money once more was exemplified by a report of T. J. Delahunt, receiver for the Rider-Lewis Motor Car Co., Anderson, Ind., which was filed a few days since in the Superior Court of that state. The report shows that the company had been operated at a loss from its beginning, having manufactured 250 cars at a cost of \$289,967 and sold them for \$240,876, a loss of \$49,090.

### Layman Leaves Orson Car to Others.

H. B. Layson, president and general manager of the Brightwood Motor Mfg. Co., of Springfield, Mass., has resigned those offices. The company makes the Orson car, which is said to represent the ideas of a number of New York moneyed men who hold stock in the company. W. K. Vanderbilt, Jr., and James Stillman are mentioned as being among the number.

### Two Branches Established in Fargo.

Fargo, N. D., has become a distributing point for at least two of Detroit's big manufacturers, the Ford Motor Co. and the Cadillac Motor Car Co., both of which have established branches in that city. The Ford establishment is in charge of C. F. Reynolds and the Cadillac branch in charge of H. J. Wolfer.

### To Produce Gas Engines in St. Louis.

The Lindell Motor Parts Mfg. Co., which is erecting a building at 3444 Lindell avenue, St. Louis, Mo., purposes producing gas engines, among other things. The structure is expected to be completed by December 1st.

### Hartford Jobbers to Erect Big Warehouse.

The Post & Lester Co., of Hartford, Conn., is making ready to erect a four-story brick warehouse and office building on Allyn street in that city, to better care for its extensive jobbing trade; the structure will measure 100 x 40 feet.

**EXCELSIOR IN CREDITORS' HANDS**

**Big Chicago Company, Cramped by Lack of Ready Cash, Transfers Control—Engine Making Proved Embarrassing.**

Not because it did not do enough business, but because it did too much, the Excelsior Supply Co., of Chicago, and with it the Excelsior Motor & Mfg. Co., which helped drain the supply company's resources, literally are in the hands of their creditors. The fact that the companies had over-reached themselves and had become embarrassed by lack of ready cash has been a matter of trade knowledge for several months, but until last week it was hoped that efforts that were making to bridge the gap would prove successful; then, however, it became apparent that the best interests of all concerned would be served by turning over the business to the creditors, who hastily were called into conference.

The investigation of the creditors' committee showed that during the past year the Excelsior Supply Co. had done a business of more than \$3,500,000, and that while the assets exceed the liabilities of \$1,000,000 by fully \$400,000, careful handling would be necessary to conserve and make the most of the situation. The offer of the Excelsior principals to turn over the control and direction of the business to the creditors was therefore accepted, the officers of the company placing their resignations at the disposal of the committee.

"It is evident that this case is a case for extension," is the statement subscribed to by a group of the larger creditors, whose claims aggregate \$650,000, "and we recommend to all creditors to join with us in accepting the Excelsior Supply Co.'s notes for the amount now due, with interest at 6 per cent. per annum, payable January 1, 1912. With this extension there would seem to be no occasion for alarm or concern."

The creditors' committee, which, according to the plan submitted, is to take the entire management and control, consists of: John F. Alvord, of the Standard Co., Excelsior Needle Co., and National Needle Co.; J. E. Maass, Corn Exchange National Bank of Chicago; G. E. Benson, National Tube Co.; F. E. Semal, Morgan & Wright, G & J Tire Co., Hartford Rubber Works Co. and Continental Caoutchouc Co.; F. L. Watters, Chicago Handle Bar Co.; C. C. Boynton, A. R. Mosler & Co.; W. E. Diehl, Corbin Screw Corporation.

The original business of the Excelsior Supply Co. was the sale of sewing machine supplies—not the machines themselves—which attained huge proportions; to it were successively added the manufacture of bicycles and motorcycles and the jobbing of

bicycle and automobile accessories, and in each respective field the company has been a factor to be reckoned with at all times. Last year, under the style the Excelsior Motor & Mfg. Co., it took up the manufacture of automobile engines, which involved such heavy outlays of cash and such large obligations that the other and firmly established and flourishing departments felt the drain and consequently were crippled.

**Stimulating Effects of the West.**

"Go West and be stimulated" may be said to constitute the advice to the faint-hearted and the skeptical given by all those resident east of the Mississippi who nowadays visit the great country that lies on the other shore. Automobile opinion radiates in all directions, they report with an accord that leaves no room for question. F. B. Stearns, head of the Cleveland company bearing his name; Windsor T. White, of the White Co., and J. I. Handley, vice-president of the United States Motor Co., are three of the big men of the trade who most recently have made "swings" around the West and who in substance join in giving the advice quoted. Crops are bountiful, and the farmers have money which they are anxious to spend and are spending in large wads for motor cars. Everyone and everything appears prosperous and no one is more prosperous or fuller of good cheer than the people engaged in the automobile business. Pessimism is unknown in the West, they all say.

**Franklin Partnership Becomes Corporation.**

The Franklin Automobile Co., of Syracuse, N. Y., which has been marketing the products of the H. H. Franklin Manufacturing Co., and which has existed as a co-partnership, has been incorporated, with authorized capitalization of \$400,000. The new corporation will take over all the business conducted by the co-partnership, which consisted of the Franklin branches, maintained in New York, Boston, Chicago, San Francisco, St. Louis, Cincinnati, Cleveland, Pittsburg, Buffalo, Rochester, Albany and other places. The incorporated company probably will be made exclusive distributors of Franklin automobiles. The principal stockholder is the H. H. Franklin Manufacturing Co. The members of the co-partnership were Herbert H. Franklin, John Wilkinson and Giles H. Stilwell, who with Frank A. Barton and Herbert H. Hess have become the directors of the corporation into which it has been transformed.

**Mead Begins Making Engines in Dayton.**

The Mead Engine Co. has commenced the manufacture of gasoline motors in Dayton, O., in temporary quarters on Second street. Later a two-story brick plant, 300 x 200 feet, for which plans already have been executed, will be erected on Mound street.

**STORROW HEADS GENERAL MOTORS**

**Eastern Banker Assumes Presidency but Will Step Down Later—Four Detroit Men are Made Directors.**

For the time being, James J. Storrow, of Boston, Mass., is the new president of the General Motors Co. He was chosen to fill the office at a meeting of the new board of directors held in New York on November 23d. Storrow is of the banking house of Lee, Higginson & Co., and was the man most active in arranging the details of the \$15,000,000 loan which Wall Street interests advanced to the General Motors Co. It is understood, however, that his election to the presidency of the company was merely a matter of expediency and that he will step down when the proper person is found.

At the same meeting W. C. Durant was re-elected vice-president and C. R. Hathaway secretary and treasurer. W. J. Mead, of the Olds Motor Works, also was made a vice-president. Both Hathaway and Mead were among those who were displaced as directors on the 15th ult. to make room for Wall Street men. The directorate was finally completed at last week's meeting, when four "dummies" who had been named on the 15th ult. retired from the board in favor of an equal number of Detroit men who previously had been selected by Messrs. Storrow and Albert Strauss, the latter the Seligman's representative, at a conference in that city. The Detroiters who all are well known in commercial and banking circles in Michigan, are as follows: Emory W. Clark, president of the Michigan Bankers' Association; M. J. Murphy, president of the Murphy Chair Co.; Thomas Neal, secretary of the Acme White Lead & Color Works, and Andrew H. Green, Jr., manager of the Solvay Process Co. Messrs. Clark, Murphy and Neal are directors in several Detroit banks, among them the First National, which has been disbursing the first instalment of the big loan that was made available. These gentlemen, with the following, constitute the new board: James N. Wallace, president of the Central Trust Co.; James J. Storrow, of Lee, Higginson & Co.; Albert Strauss, of J. & W. Seligman & Co.; Anthony N. Brady, W. C. Durant, N. L. Tilney and J. K. McClement, the latter of whom was in charge of the expert accounting involved in the huge transaction.

It is understood that the reorganization of General Motors' having been completed, its headquarters shortly will be removed from New York to Detroit, where most of its industrial interests are located. Meanwhile, however, W. H. Little, factory manager of the Buick Motor Co., has been transferred from Flint, Mich., to Vice-President Durant's office in New York.

## THE WEEK'S INCORPORATIONS.

Detroit, Mich.—Detroit Motor Truck Co., under Michigan laws, with \$5,000 capital.

Hartford, Conn.—Hartford Tire & Auto Repair Co., under Connecticut laws, with \$20,000 capital; to do general repair business.

Mobile, Ala.—Bienville Automobile & Garage Co., under Alabama laws, with \$2,000 capital; to operate a garage and livery service.

Cuero, Texas—Overland Garage Co., under Texas laws, with \$5,000 capital; to operate a garage. Corporators—E. C. Ivey, J. B. Young, E. E. Joseph.

Los Angeles, Cal.—National Motor Car Co., under California laws, with \$25,000 capital. Corporators—Earle Y. Boothe, A. M. Brown, J. D. Scouler.

Decatur, Ill.—Decatur Automobile Association, under Illinois laws, without capital. Corporators—William McGinley, C. A. Walmsley, J. M. Brownback.

Fairfield, Ia.—The Fairfield Co., under Iowa laws, with \$10,000 capital; to deal in automobiles. Corporators—Richard Fisher, George L. Dana, Ed. Gotfelty, H. Earl.

Wilmington, Del.—Courtney Tire & Rubber Co., under Delaware laws, with \$1,000,000 capital. Corporators—N. Akers, W. J. Maloney, M. C. Taylor, all of Wilmington, Del.

Bowling Green, Ohio—Bowling Green Garage Co., under Ohio laws, with \$10,000 capital; to maintain a garage and renting service. Corporators—A. E. Royer and others.

Pittsburg, Pa.—Dual-Impulse Motors Co., under Delaware laws, with \$100,000 capital. Corporators—F. C. Tygard, Pittsburg, and W. A. Loegler and C. H. Abbott, of Mt. Olivet, Pa.

Little Rock, Ark.—Tysinger Auto Supply Co., under Arkansas laws, with \$10,000 capital; to deal in supplies and accessories. Corporators—H. Tysinger, J. R. Vinson, J. H. Stanley.

Columbus, Ohio—Columbus Taxicab & Service Co., under Ohio laws, with \$25,000 capital; to operate a taxicab service. Corporators—J. G. Orr, C. M. Peters, B. D. Huggins, E. W. Huggins.

Chicago, Ill.—Sorter-Conway Co., under Illinois laws, with \$5,000 capital; to build automobiles, aeroplanes, vehicles and machinery. Corporators—P. Steele, P. F. O'Malley, Abe Lapine.

Chicago, Ill.—Townesley-Comstock Co., under Illinois laws, with \$25,000 capital; to manufacture automobiles. Corporators—L. E. Townesley, S. E. Comstock, E. F. Comstock, all of Chicago.

Philadelphia, Pa.—Progressive Motor Sales Co., under Delaware laws, with \$100,000 capital. Corporators—F. R. Hansell,

Philadelphia, and G. H. B. Martin and S. C. Seymour, Camden, N. J.

New Albany, Ind.—Brown Automobile & Electric Co., under Indiana laws, with \$3,000 capital; to deal in automobile accessories and supplies. Corporators—H. W. Brown, Otto C. Thompson, H. P. Brown.

Buffalo, N. Y.—Buffalo Motor Sales Co., under New York laws, with \$10,000 capital, fully paid in, to deal in automobiles. Corporators—Leon J. McCullough, John J. McCullough, Millard F. Tallmage.

Bridgeport, Conn.—Elm Auto Co., under Connecticut laws, with \$25,000 capital; to buy, sell and rent automobiles. Corporators—Thomas Morrissey, John Lewis Green, Willis S. Buckley, all of Bridgeport.

Buffalo, N. Y.—Frey Auto Supply Co., under New York laws, with \$25,000 capital; to deal in automobiles and accessories and to operate a garage. Corporators—J. W. Frey, A. Karl, J. A. Donaldson, all of Buffalo.

Lincoln, Neb.—Field Automobile Mfg. Co., under Nebraska laws, with \$200,000 capital; to manufacture and deal in motor vehicles. Corporators—W. T. Field, Charles E. Gibbs, Frank Farrell, P. E. Zimmer.

St. Louis, Mo.—Todd Automobile Supply Co., under Missouri laws, with \$30,000 capital; to manufacture and deal in automobiles and other motor vehicles. Corporators—J. V. Todd, Charles Peters, E. F. Gree.

Cleveland, Ohio—Auto Transit Co., under Ohio laws, with \$5,000 capital; to establish a renting and livery business. Corporators—Charlotte E. Griffin, Harry L. Byerly, Nettie M. Clevenger, A. G. Crosser, Clyde M. White.

Chicago, Ill.—French Auto Top & Supply Co., under Illinois laws, with \$10,000 capital; to manufacture automobile tops, shields and carriage covers. Corporators—E. C. Watson, Charles H. Pegler, James H. Christopher.

Buffalo, N. Y.—Victor Motor Truck Co., under New York laws, with \$250,000 capital; to manufacture and deal in automobiles, bicycles and accessories. Corporators—O. L. Neal, H. B. Clark, B. E. Neal, all of Buffalo.

Chicago, Ill.—Henry Motor Car Sales Co., under Illinois laws, with \$25,000 capital; to manufacture and deal in automobiles and accessories. Corporators—A. E. DeMange, C. F. Latimer, J. J. Maloney, of Bloomington, Ill.

Buffalo, N. Y.—Battery Emporiums, Inc., under New York laws, with \$50,000 capital; to deal in automobiles, parts and electrical devices for same. Corporators—T. P. Mainhard, F. A. Johnson, G. Rolston, all of Buffalo, N. Y.

Hudson, N. Y.—Hudson City Garage, Automobile & Motor Co., under New York

laws, with \$1,000 capital; to deal in automobiles. Corporators—Edward H. Lisk, Bertha E. Lisk, of Troy, N. Y., and Frank Powers, of Hudson.

New Brunswick, N. J.—Motor Sales Co. of New Jersey, under New Jersey laws, with \$25,000 capital; to deal in automobiles and supplies. Corporators—A. Greenbaum, A. Conquest, G. F. Reynolds, W. S. Higgins, of Perth Amboy.

Grand Rapids, Mich.—Lewis Supply Co., under Michigan laws, with \$5,000 capital; to manufacture automobile parts and metal specialties. Corporators—James M. Hynas, Richard, Rynier and Cornelius Shoemaker, and Clarence E. Lewis.

Windham, Conn.—E. P. Cheslow Co., under Connecticut laws, with \$20,000 capital; to buy and sell and rent automobiles and other vehicles. Corporators—Ernest P. Cheslow, Ernest P. Cheslow, Jr., Carrie O. Cheslow, Laura Cheslow.

St. Louis, Mo.—Woods Electric Vehicle Co., under Missouri laws, with \$2,500 capital; to maintain a garage for electric vehicles. Corporators—L. E. Burr, Thomas Clements, A. B. Schaffner, A. L. Schwartz, Nathan Frank, D. W. Noyles.

Chicago, Ill.—Columbia Garage Co., under Illinois laws, with \$5,000 capital; to operate a garage and renting service, and to deal in supplies, automobiles and accessories. Corporators—John R. Anderson, F. H. Anderson, John R. Anderson, Jr.

New York City, N. Y.—Motors, Engineering & Sales Co., under New York laws, with \$200,000 capital; to manufacture and deal in motor vehicles, engines, etc. Corporators—C. Griswold, W. S. Jewell, J. L. Breeze, Jr., all of New York City.

Indianapolis, Ind.—Willys-Overland Co. of Ohio, with total capital of \$6,000,000, admitted to do business in Indiana, with a capital of \$1,000,000; to manufacture and sell automobiles and parts. Corporators—J. N. Willys, I. Kinsey, W. H. Brown.

Newark, N. J.—Mackey Motor Co., under New Jersey laws, with \$300,000 capital; to manufacture automobiles, motor boats, motors and engines. Corporators—John C. Mackey, William G. Jerolemon, both of Newark, N. J., and Robert M. Bateman, of East Orange, N. J.

Jersey City, N. J.—Alden-Sampson Mfg. Co., under New Jersey laws, with \$2,500,000 capital; to manufacture automobiles, motors, cars, carriages, wagons, flying machines, etc. Corporators—K. K. McLaren Jersey City; H. E. Tobey, New York City; J. A. Dailey, Ossining, N. Y.; L. R. Jillson, New York City; W. R. Watson, Brooklyn, N. Y.

## Increases of Capital.

St. Louis, Mo.—Haynes Automobile Co. from \$5,000 to \$10,000.

Cleveland, Ohio—Roy Bains Auto Livery Co. from \$10,000 to \$25,000.

## IN THE RETAIL WORLD.

John D. and E. E. Coutlet, of Kansas City, Mo., have opened a repair shop and garage in the Cement building, Wichita, Kan.

The Wallace Automobile Co., Omaha, (Neb.) agent for the Stearns line, has moved from 24th street to 2203 Farnam street.

Frank B. Meade is building a big garage at 1917 E. 13th street, Cleveland, Ohio. The structure will be 60 x 160 feet, one story high, and will cost \$9,000.

Ground has been broken for a new garage on South Maple avenue, Greensburg, Pa. William H. and Maurice L. Rose will occupy it when it is completed.

At a cost of \$18,000 Clarkson Lindley is building a garage at 1518-1520 Hennepin avenue, Minneapolis, Minn. The building will be 44 x 100 feet with hard wood finish.

A. H. Lovelace has taken over the old Cadillac Garage, at 707 Front avenue, Seattle, Wash., and will continue the business in his own name. He will handle Winton cars.

Claire Kirk, A. Peterson, E. A. R. Lloyd and several other citizens of Mason City, Ia., have organized the North Iowa Motor Sales Co., and purchased the garage and business of J. L. Meredith, of that city.

In seeking judgment on a claim for \$550, George J. Magly has asked that a receiver be appointed for the Iroquois Garage Co., of Columbus, Ohio. Fred Luchtenberg is president and C. S. Beathard is secretary of the company.

Sanderson & Burghardt, who handle Firestone-Columbus cars, have leased the store formerly occupied by the Ford Motor Co., at 727 Main street, Buffalo, N. Y., while Edward Seeber has leased 704-706 Main street. Seeber sells Pierce-Arrows.

Operating under the name the Ford Motor Sales Co., a new concern this week will open its doors to the public of Rockford, Ill. W. Fletcher Barnes and his son, William Barnes, the men concerned in the enterprise, have the agency for the Ford car.

Under the style the Plymouth Motor Car Co., a new concern has been organized in Wilkes-Barre, Pa., to conduct a garage and repair shop. The garage proper faces Hanover street, while the salesrooms are a part of the same property facing Main street.

Frederick Conrad, of 1221 North Caroline street, Baltimore, Md., has purchased the property at 1516-1524 North Regester street for the sum of \$14,000, and will erect thereon a modern garage. The building will be of concrete and two stories in height.

J. B. Turner, of Sarasota, Fla., is building a garage and repair shop on Main street, under the incorporated name Sarasota Garage & Car Co. C. V. Swain, for

several years connected with the Interstate factory, will be manager of the establishment.

The Reo Pacific Co. is the style of a new concern which just has opened up in the St. James Hotel building on Van Ness avenue, San Francisco, Cal. As the name indicates, Reo cars will be handled by the company, the manager of which is Norman De Vaux.

The Centaur Motor Co. of Illinois, with headquarters at 1725 Michigan avenue, Chicago, has given up the agency for Oakland cars, and henceforth will act as distributor for the Abbott-Detroit line exclusively. A. M. Robbins is the president of the concern.

John T. Matchett and Edward McFarlan, of Brooklyn, N. Y., have gone into partnership to handle Marion cars in Brooklyn and Queens county, N. Y. For the purpose they have leased the building at 1289 Bedford avenue, formerly occupied by the Standard Auto Sales Co.

The Majestic Garage, at 18-20 Halsey street, Brooklyn, N. Y., has found its 26,000 feet of floor space inadequate and is building an addition three stories high and one hundred feet front on Bedford avenue. Bishop, McCormick & Bishop are the owners of the prosperous garage.

The Oriental Rubber Co., of 1140 Bedford avenue, Brooklyn, N. Y., has been appointed representative of the G & J Tire Co., Indianapolis, Ind., for Kings county, N. Y. Besides dealing in rubber tires, the Oriental company maintains one of the most complete repair shops in Greater New York.

Lewis Marsh and Thomas Markey, of Marshalltown, Ia., have formed a partnership under the title Marsh & Markey and will conduct a salesroom and garage at 65 West State street. The building which is in course of erection will be 50 x 100 feet, of brick and concrete, two stories high, and will cost \$10,000.

The Auburn Garage Co. has been organized in Auburn, N. Y., with I. F. Eastman, John Hill and V. S. Darling as directors. It has taken over the business of the Darling Automobile Co., and is building an addition to the garage, 40 x 50 feet, of concrete and brick construction. Reo and Maxwell cars are handled.

C. Reese Eaby, of Lancaster, Pa., has been appointed receiver for the National Automobile Co., of the same place, upon the petition of Ida Roth, owner of nine-tenths of the capital stock of the company. The petition states that the company is indebted to the amount of \$1,000, and that all its assets consist of claims which are not collectible.

Louisville, Ky., is undergoing a period of unprecedented building activity in the automobile line. Hite Bowman has opened salesrooms at Fourth avenue and Oak

street; the Yager Motor Car Co. has taken possession of its new building on Third avenue, near Breckenridge street; the Broadway Auto Co. has moved into its new salesrooms at Jackson street and Broadway; the Urwick Machinery & Supply Co. is preparing to show its Marmon line at Brook street and Broadway; the Louisville Automobile Co. is building a \$4,000 garage on Third avenue, and the Miller Auto Co. is adding a second story to its garage.

West Market street, Philadelphia, Pa., gradually is being transformed into a thriving automobile center. The latest firms to locate in that promising section are the Autocar Co., which is building a fireproof garage and service building at the southwest corner of Market and 23d street; the Bartlett Garage, which is going up at 21st and Market streets, and where the Woods Motor Vehicle Co. and the Waverley Co. will show their respective electrics; the Foss-Hughes Co., agents for the Pierce-Arrow cars, also will locate in the Bartlett building, and Locomobiles, which at present are exhibited at 245 North Broad street, are being transferred to Market street, adjoining the Autocar building.

## Recent Losses by Fire.

Atlanta, Ga.—Atlanta Taxicab Co., workshop destroyed; total loss, \$5,000.

Canton, Ohio—Charles White, garage and two cars destroyed; loss, \$6,000.

Saginaw, Mich.—Wiggins-Scollen Auto Co., store house burned; automobiles saved; loss, \$1,000.

San Francisco, Cal.—Frank Renstrom garage, Oak and Stanyon streets, burned; loss, \$10,000.

Los Angeles, Cal.—Plaza Machine Co., automobile repair shop, 523 North Main street, destroyed; loss, \$1,500.

Port Colburne, Ont.—T. E. Reeb & Sons' foundry and automobile supplies warehouse destroyed; loss, \$15,000; insurance, \$4,000. Incendiary origin.

## Changes Among Prominent Tradesmen.

A. A. Woodruff has been appointed superintendent of coach work of the Pierce-Arrow Motor Car Co., Buffalo, N. Y. Previously he was with the E. R. Thomas Motor Co., and before his connection with Thomas was in business for himself, practically his entire lifetime having been spent in high class carriage work.

J. L. Jordan has been appointed manager of the Goodyear Tire & Rubber Co.'s branch in Minneapolis. He succeeds F. W. Norton, who has been transferred to Chicago for duty in the office there.

## Metz Seeking Factory Site in Ohio.

Youngstown, Ohio, reports that the Metz Co., of Waltham, Mass., is seeking a factory site in that city. The local chamber of commerce has the matter in hand and will deal with it.

## THIS IS THE NEW 40 H.P.

**T**HIS is the latest gasoline-driven passenger car from the great White Factory—embodying the supreme effort of our splendid organization to produce a better motor car. Months were spent upon this design, and in addition to our own corps of engineers, the most eminent authorities on gasoline engine-building were consulted, both at home and abroad, to make certain that this new model should combine the most advanced thought.

It has the left hand drive, and within the limits of human fallibility, this car is produced as the best obtainable in the engineering and body building art of to-day. Being a totally different size, in designing this engine, there were no patterns to be saved, no economies to be effected and no advantages to be gained by following any precedent of our own or other factories. Therefore, having been so prodigal of time and money in the production of this car, it is with pride that we announce that it retains all the essential characteristics of former White Gasoline Construction—the cylinders are cast en bloc and the long stroke engine is continued. It is a striking tribute to our 30 horsepower gasoline car, that is only equalled by its remarkable performance from the standpoint of economy. The world's engineers have been unable to suggest any improvement in our engine—have been unable to produce a better gasoline-driven car, and so we have made a larger one. The five passenger, torpedo body selling at \$3,000.00 and the seven passenger, at \$3,200.00.

This car will be on display at all important shows, and at our branches in all important cities.

### Where Windshields are Required.

That motorists are not the sort of people who are afraid of a little fresh air is proclaimed by their right to the appellation, but that they are sufficiently human to shun and even to fear the discomfort and danger of draughts as well as the inconveniencing effects of strong winds the flourishing condition of the windshield business ably attests. But that the average windshield equipment by no means performs its duty in an absolutely satisfactory manner is an opinion readily confirmed even among the most red-blooded and lustiest members of the motoring clan. In fact, while protecting the chauffeur in a thorough and, to him, entirely satisfactory manner, the average dash screen itself is the cause of a considerable discomfort to those who occupy the rear seat of a car.

Despite the great amount of attention which has been paid to the subject it is by no means an offensive reflection upon

the manufacturers of such equipment that windshields shield only the occupants of the forward portion of the car. Yet it is a common experience that a vertical or inclined plane of restricted area is capable of creating only a relatively small eddy of still air when placed at right angles to a current of air; this fact is demonstrated in a hundred ways, in open trolley cars, on the bridge decks of ships, even on the lee side of small buildings. The only remarkable thing about it is that the single screen mounted on the dash ever should have been considered capable of rendering adequate protection for the entire body of the car.

While a few isolated attempts have been

### Why The Motor World.

Wichita, Kan., Nov. 21, 1910.

Motor World, New York, N. Y.

Gentlemen:—Enclosed find check for renewal of our subscription to the Motor World. We at present subscribe for no less than six automobile trade journals, and would rather do without all of the other five than to miss any one of the Motor World. Our reason for this is that we believe its editorial articles are absolutely uninfluenced by the advertising department and also for the reason that in the Motor World we often get news of vital interest to us almost always a week in advance of the others.

Wishing you continued success for the coming year, we are

Yours very truly,

The Wichita Automobile Co.,  
M. H. Schollenberger.

made to instal shields of the ordinary type on the back of the front seat the practice never has become general. One ambitious body builder also has had the initiative to propose the continuation of the back of the rear seat to a point above the passengers' heads, filling in the upper panels with glass, the object being the same. In general, however, absolutely nothing has been done in the way of protecting the occupants of rear seats from head winds, which, of course, are the most prevalent and annoying.

The heavy market for accessories and equipment of all sorts, the close competition among tradesmen, the peculiar readiness with which novelties may be introduced, all point to the probable commer-

cial success and relative freedom from risk of developing something along this line. While it would seem possible to develop a rear windshield along entirely new lines, relative success probably could be obtained by adapting the present forms to that use and providing suitable means for installation. In itself this would present no very formidable task; indeed it is surprising that it was not accomplished long ago.

### Developments of Lubrication Systems.

The present year has been notable for at least two important advances in lubrication theory as applied to automobile engines. One is recognition of the fact that the requirement for oil is not directly proportional to the speed of the crank shaft, the other is an appreciation of the importance of so designing an automatic circulating system that it may be used on the ordinary splash pan. Both considerations are worthy of close attention.

In a general way it may be supposed that doubling the speed of the motor will double its requirement for oil, but that such is not necessarily the case a moment's reflection will show. Within the cylinder the heat of the explosion serves to lap a portion of the oil off the upper wall surface, thus necessitating the renewal of the film at each stroke of the piston. In each of the ordinary bearings, those of the crank shaft, connecting rod wrist pins, a certain amount of oil is forced out at the ends of the journal. The oil consumption of the cams and of the valve gears is caused by the squeezing of the oil film from between the respective surfaces of the moving parts.

Considered independently it would appear that these several requirements must be very nearly proportional to the speed, save possibly that of the upper portion of the cylinder, where the greater heat of high speed running may be supposed to cause more rapid evaporation of the oil at high than at low speeds. But the effect of centrifugal force always enters into account, whether the system be of the simple splash order or one in which the centrifugal action is depended upon to ensure circulation. And it must be borne in mind that the loss of oil from all revolving surfaces increases as the square of the speed. Where splash is depended on for crank case circulation it also follows that less actual splashing occurs at each stroke, the lubricant vir-

tually being spread out in a film over the interior of the crank case.

To obviate this latter effect a number of designers are introducing troughs into which oil scoops on the crank arms dip at each stroke, provision being made to feed a continuous stream of oil into the troughs. In a few instances the position of the troughs may be altered, either by voluntary adjustment or automatically upon movement of the throttle lever, to cause the scoops to dip more deeply at high engine speeds than at low. Oil pump adjusting devices, variable feeds and hand pumps are more crude and less satisfactory arrangements that are used to increase the supply of lubricant when high speeds are to be maintained.

The other advance mentioned is equally important, because no matter how perfect a circulating system, it is liable to be incapacitated by a clogged strainer or duct, and, in rare instances, by a disabled pump. Even the installation of two pumps, as sometimes is done, cannot wholly obviate the risk. But if the system is properly designed, the crank case can be flooded in such an emergency and the engine run with a fair degree of success by the simple splash method. If the system be designed with this provision in mind its value will be considerably enhanced, while its working under normal conditions will be in no wise impaired.

#### **The Value of Deflecting Lamp Brackets.**

It is a perfectly safe assumption that every person who ever rode on the front seat of a motor car in an unknown country and on a dark night has wondered why the headlights are not made to deflect with the wheels, instead of illuminating the ditches and hedgerows at the outside of every turn encountered. That a fair proportion of such reflections have been turned to practical account in the invention of means for the accomplishment of this very object is evidenced by the granting of a considerable number of patents covering suitable devices as well as by the presence in the market of perhaps a dozen different flexible lamp brackets. What does seem a little difficult of understanding is that the use of systems of the sort is practically unknown on the road.

As to the use of lamp deflectors it may be objected that when taking turns at night the whole inclination is for the car to run

## COMING EVENTS

November 30-December 1, New York City—Annual meeting of American Automobile Association in Hotel Belmont.

December 1-3, Peoria, Ill.—First annual show of automobile dealers in the Coliseum.

December 3, Norfolk, Va.—Racemeet on old fair grounds track.

December 3-18, Paris, France—French Automobile Manufacturers' Salon in Grand Palais.

December 12-17, Los Angeles, Cal.—First annual "independent" show of Los Angeles Motor Car Dealers' Association at Shrine Auditorium.

December 24-31, Los Angeles, Cal.—Second annual show of Licensed Motor Car Dealers' Association of Los Angeles at Fiesta Park.

December 25-26, Los Angeles, Cal.—Twenty-four hours race at Motordrome.

December 31-January 7, New York City—"Independent" automobile show in Grand Central Palace.

January 2-7, New York City—Importers' automobile show in Hotel Astor.

January 7-14, New York City—Association of Licensed Automobile Manufacturers eleventh annual show in Madison Square Garden. Pleasure cars and accessories.

January 11-12, New York City—Annual meeting of the Society of Automobile Engineers.

January 13, New York City—Annual banquet of the Motor and Accessory Manufacturers at Waldorf-Astoria.

January 14-28, Philadelphia, Pa.—Annual show of Philadelphia Licensed Automobile Dealers' Association in Third Regiment Armory.

January 15-21, Milwaukee, Wis.—Milwaukee Automobile Dealers' Association's second annual show in the Auditorium.

January 16-21, New York City—Association of Licensed Automobile Manufacturers eleventh annual show in Madison Square

toward the outside, both through the difficulty of seeing the limits of the track and also as a result of the skidding tendency. But this contention is about as logical as many of the arguments against the use of left hand control for city use; it is the right hand side of the car that is most in danger on a country road—the driver hugs the right side at night and the ditch, too, is on that side, and it is the track toward which the front wheels are directed that it is most important to be able to see clearly.

As the ratio between production and de-

Garden. Second week devoted to commercial vehicles.

January 16-22, Detroit, Mich.—Detroit Automobile Dealers' Association's annual show in Wayne Pavilion.

January 18, New York City—Annual banquet of the Automobile Trade Credit Association.

January 28-February 4, Chicago, Ill.—National Association of Automobile Manufacturers' tenth annual national show in Coliseum. Pleasure cars and accessories only.

February 6-11, Buffalo, N. Y.—Annual show.

February 6-11, Chicago, Ill.—National Association of Automobile Manufacturers' tenth national show in Coliseum. Second week devoted to pleasure and commercial cars, motorcycles and accessories.

February 14-19, Dayton, Ohio—Second annual show in Memorial building.

February 15-21, Kansas City, Mo.—Fifth annual show of Kansas City Automobile Dealers' Association.

February 18-25, Minneapolis, Minn.—Minneapolis Automobile Show Association's annual show in National Guard Armory.

February 20-26, Omaha, Neb.—Third annual show of the Omaha Automobile Show Association in Auditorium.

February 24-27, New Orleans, La.—First annual show of New Orleans Automobile Club at Fair Grounds.

February 25-March 4, Toronto, Canada—Annual show under auspices of Ontario Motor League.

February 25-27, New Orleans, La.—New Orleans Automobile Club's annual Mardi Gras racemeet on Fair Grounds track.

March 4-11, Boston, Mass.—Boston Automobile Dealers' Association's annual show in Mechanics building.

March 7-11, Des Moines, Ia.—Third annual show of Des Moines Automobile Dealers' Association at the Coliseum.

March 15-18, Louisville, Ky.—Louisville Automobile Dealers' Association's annual show in First Regiment Armory.

mand decreases with the growth of the industry and competition likewise is increased the tendency among manufacturers to increase their standard equipment is destined to become even more pronounced than it is at present. Ultimately it may become necessary to go outside the realm of the ordinary line of equipment features in order to secure the impetus required to increase sales of cars that are in closely competing classes. Obviously the deflecting lamp bracket should prove a useful device to adopt with such an object in view.

**BRISCOE ON FOREIGN SITUATION**

**Returns from Abroad Full of Instructive Impressions—May Build Factory in Germany as Well as in England.**

Having completed the chief object of his visit, the formation of an English company, Benjamin Briscoe, president of the United States Motor Co., returned from abroad on Friday last, 25th inst. The English company, as already reported by the Motor World, is styled the United International Motors, Ltd., and pending manufacturing operations it already is displaying American-made Maxwell, Brush, Columbia, Stoddard-Dayton, Courier and Sampson cars in London salesrooms.

While most of his time was spent in London, Mr. Briscoe also visited the Continent, and as a result the establishment of a factory in Germany also is in contemplation. Naturally, Mr. Briscoe brought back a considerable fund of interesting observations and opinions.

"A shortage of cars, a great increase in taxicab building, a rapid development of the commercial vehicle, a general standardization of chassis, popularity of torpedo and closed-front bodies, a large demand for American built cars, especially the low and medium priced models, and a general tone of optimism," is the manner in which he summarizes the situation existing in Europe.

Mr. Briscoe states that the motor car industry abroad appears to be in an extremely prosperous condition; in England especially he found evidence on every hand that the industry is now in the era of its greatest prosperity.

"I was particularly interested in the development of the industry in England," remarked Mr. Briscoe, "because what occurred in the bicycle business seems to be repeating itself in the automobile trade; that, whereas the Englishman was slow in settling down to systematic production, when they did the progress of their manufacturing plants was steady and rapid. Apropos of the bicycle business in England, I am told that it has never been larger than it is today. There will be no less than 600,000 bicycles made there this year."

Mr. Briscoe declared that the Olympia show produced practically nothing new in mechanical design. He considered it more of a coach-builders' show than an exhibit of mechanical construction. Closed-front bodies are practically in such universal use that it seems to be impossible to sell a car in England or Europe which has not a body designed with both front and rear doors. The taste in bodies seems to run more to curves than is the case in America; in fact, to an American manufacturer, educated to

the straight-line body construction such as has prevailed here for the last few years, some of the English designs look antique and odd.

"We are so accustomed to big figures in the motor car industry, as in all other industries generally in our country," Mr. Briscoe continued, "that one has to be careful in his conversation while abroad so as not to appear to be bragging, for it is hard for the Englishman or the European to believe the actual figures of American automobile production.

"When I told some of the motor people that the United States Motor Co. was producing 15,000 Maxwells, 10,000 Brush cars, and 10,000 Stoddard-Daytons, Columbias and Alden-Sampsons per annum, or 35,000 in all, each year, they were at first inclined to doubt that any one concern could have the facilities for such an output; for the English and Continental system of manufacturing is so different from the American system as to make it appear almost incredible to them that the American figures could be reached.

"For instance, there are over 240 models of cars manufactured in Great Britain, which, reckoned on the basis of the sales made during 1909, makes an average of only 60 cars per model. It seems to be the ambition of the manufacturers over there to multiply their models into as great a variety as possible; in fact, some concerns seem to take pride in the fact that no two cars they make are alike. The confusion that this causes in the business readily can be imagined. Some of the manufacturers, however, have adopted the American system with notable success; in fact, the largest concern outside of America engaged in the manufacture of automobiles is managed by natives of America, who, however, have become practically dyed-in-the-wool Englishmen.

"To quote some figures as to the condition of the trade in England, France and Germany, the three countries that I visited, I had obtained for me from the Government Statistical Office copies of the automobile records. In England, for the year ending January 1st, 1910, there were sold 19,184 cars, 14,239 of which were English made cars. The average value of the English made car seems to be about \$1,900. This fact indicates what a limited conception the English manufacturer and people have of the ultimate universal use of the automobile, but the English people are fast becoming alive to the fact that the automobile spells economy, as the demand for medium priced cars seems to be growing much faster than the production, although there are several English manufacturers who are now preparing to meet this demand with cars selling at about \$1,000.

"In Germany, in 1909, there were about 8,000 cars sold and in France between 8,000 and 9,000. While, therefore, the number of cars sold in these three countries is only

about one-sixth of the total number sold in America, on account of the increased selling price per car the annual turn-over is nearly one-half what it is in America.

"The opinion that my investigations forced upon me is that no very large returns will follow the practice of placing with a European dealer a line of cars as they are made for American roads and American conditions, nor can the American manufacturer hope for any considerable volume of sales if the business is to be handled at long range.

"Our company having reached a point in the development of its factory facilities that are certainly vastly superior to anything in Europe, I think it is not presumptuous for us to believe that we can hold our own against all comers in the world's markets, provided we adapt our designs to fit European conditions. Our plants are certainly more thoroughly organized and more completely equipped and our methods and processes are more highly specialized and systematized, so that there is, to my mind, no question that a wide and growing market for our product can be obtained.

"In the main, however, the mechanical construction in the American cars is the same as foreign cars, and I think it now fairly can be said that they are more highly developed mechanically, being the result of a vastly greater experience of American over foreign makers, coming from the much larger annual outputs.

"The American manufacturers, therefore, undoubtedly can give the buyer a better mechanical product than the foreign makers and all that must be done is to bring the various types of mechanical construction in line with foreign demands; I would put it this way: American makers cannot hope to be successful in selling to the foreigner just what he, the manufacturer, wants to sell; he will have to make what the foreigner wants to buy.

"The United States Motor Co. proposes to adapt its foreign programs to this point, and as fortunately the ownership of the company is to a certain extent international, it will not have to combat to the fullest extent the jealousy and prejudice that attach to a purely alien concern. It is quite astonishing to an American to note the prejudice that seems to exist in England against American goods. The Englishmen call us cousins, and yet they seem to look with a good deal less prejudice upon goods made either in France, Germany or Italy than those that are manufactured in America.

"With the establishment by our company of an English factory in any event, and possibly one in Germany, and with the introduction of the system and specialization that is in vogue in our other factories, we have no doubt but that we will be able to make excellent headway in the securing of as much of the world's trade as we have a reasonable right to expect."

## ROCKETS HERALDED OAKLAND SHOW

And After "Unveiling" of Vanderbilt Cup, Show is Declared Open—First Display of 1911 Models.

To the thriving city of Oakland, Cal., belongs the credit of opening the show season of 1910-11, its exhibition, under the auspices of the Oakland Dealers' Association, running the whole of last week, 19th-26th ult., in Idora Park Pavilion. But while it may seem a bit early for the show season to open, particularly on the Coast, it is true, as always is the case, that the new products have been received long before they have been shown elsewhere, even in the immediate neighborhoods where they are produced. Therefore the Oakland show partook in all respects of the 1910-11 flavor and proved in regard to exhibits both a show in itself and a forecast of shows.

Very much on the traditional lines of a circus, the actual opening was preceded by a street parade in which several hundred cars participated, touring the business section of the city and proceeding out to the park, after being joined by a delegation of machines brought over from San Francisco for the purpose. Upon the arrival of the procession at the grounds five large, red and fiery rockets were sent up, which signalized the opening of the show and also indicated the precise instant at which Mayor Frank H. Mott, chairman of the show committee, began his formal address of welcome by pointing out that in point of numbers California ranks second in the list of automobile owning states. At the close of the speech the Vanderbilt Cup, loaned by the American Locomotive Co., its present holder, for the purpose of the show, was "unveiled" with befitting deliberation and ceremony.

The fifty-odd exhibitors who had space in the show mustered all told some 250 cars. Sixty different makes of pleasure vehicles were shown, four styles of commercial car, and five of electric. Nine exhibitors staged accessories. The pavilion was decorated with bunting and evergreens and illuminated by incandescent lamps hung in Japanese lanterns. Violating all precedent for shows of equal pretention, "Society Night" was omitted, the admission fee of 50 cents remaining the same throughout the week, despite the inviting commercial opportunity offered by Thanksgiving day. A list of the exhibits follows:

Pleasure cars: Pope-Hartford, Mitchell, Winton, Maxwell, Columbia, Knox, Stevens-Duryea, Cadillac, Reo, Chalmers, Hudson, Lozier, Studebaker, Flanders, E-M-F, Regal, Gase, Cartecar, Simplex, Great Western, Krit, Metz, Correja, Apperson, American, Overland, Kissel, Marion, Sun-

set, Corbin, Amplex, Moon, Michigan, Speedwell, Inter-State, Ford, Velie, Oldsmobile, Buick, Haynes, Palmer-Singer, Matheson, Columbus, Franklin, Ohio, Auto-car, Rambler, McFarlan Six, Black Crow, International, Cunningham, Oakland, Hupmobile, Stoddard-Dayton, Locomobile, Peerless, Everitt, Alco, Mercer, Thomas.

Electric vehicles: Detroit, Columbus, Studebaker, Baker, Babcock.

Commercial vehicles: Avery, Grabowsky, Gramm, Frayer-Miller.

Accessories: New York Lubricating Oil Co., Martland Tire Co., Standard Oil Co., Bosch Magneto Co., S. F. Bowser & Co., Weinstock & Nichols (successors Moore Motor Supply Co.), I. Steinman, P. Hulme, J. Bacon.

### Forcing Reduction of Taxicab Rates.

Having failed in their attempt to regulate taximeter cab rates in New York City, through the invalidation of their ordinance on the pretext that it discriminated against a majority of the operators, the aldermen are considering a more general plan of rate regulation. A bill introduced by Alderman Courtlandt Nicoll last Tuesday, 29th ult., provides for the revision of the rates imposed by all classes of public service vehicles, whether horse or motor propelled, and regardless of whether they are taximeter equipped. It also provides for the abolition of exclusive stand privileges. By the proposed scale, horse drawn cabs may be charged for at the rate of 30 cents for the first half mile or fraction, and 15 cents for each succeeding half mile or fraction. The initial charge for coaches is 50 cents, with 25 cents for each additional half mile. Motor cars may be hired for 25 cents initial charge and 15 cents each added half mile. For both classes of vehicles waiting time shall be charged at one dollar an hour, but no charge shall be made for stops not exceeding five minutes. Hourly rates, applying only to shopping and calling, and not including park driving nor driving more than five miles from the starting point, are \$1.50 for the first hour or fraction, and 50 cents for each additional hour or fraction thereof.

### New York Auctions Off Its Old Cars.

Five automobiles belonging to the Department of Finance of New York City were sold at public auction last week at the Brooklyn Bridge Garage, and brought but \$1,745. The original cost of the cars was \$18,000. Many of the cars showed the wear and tear of hard usage, and one, which seemed to have gone through many a "joy ride," was almost a complete wreck. The list of machines which were thus cheaply disposed of included: One six cylinder Thomas, model 1905, \$250; one Pierce-Arrow, model 1903, \$400; one Berliet, model 1903, \$525; one Locomobile, model 1904, \$265; one Cadillac (badly damaged), model 1909, \$305.

## "TO TAKE ROADS OUT OF POLITICS"

One Aim of New Highway Improvement Association—Federal and Railroad Officials Lead Movement.

Federal officials and officers of railroad companies constitute the backbone of the American Association for Highway Improvement which was organized last week at a meeting held at the Cosmos Club in Washington, D. C., at which James S. Harlan, of the Inter-State Commerce Commission acted as temporary chairman.

The officers chosen are as follows: President, Logan Waller Page, director of United States Office of Public Roads; vice-president, W. C. Brown, president of the New York Central railroad; treasurer, Lee McClung, United States Treasurer; secretary, J. R. Pennypacker, Jr., United States Office of Public Roads. Directors: Louis W. Hill, president Great Northern railroad, chairman; James McCrea, president of the Pennsylvania railroad; W. W. Finley, president Georgia Southern & Florida railroad; B. F. Yoakum, chairman of the Rock Island and Frisco Railway Systems; John M. Goodell, editor Engineering Record; Melville E. Stone, general manager of the Associated Press; R. D. Chapin, of Detroit, representing the National Association of Automobile Manufacturers; A. G. Spalding, of California; John A. Stewart, president New York State League of Republican Clubs; James S. Harlan, of Washington; Leonard Tufts, of Pinehurst, N. C.; Bryan Lathrop, of Chicago; George C. Diehl, of Buffalo, Engineer of Erie county, and John W. Jones, president Touring Club of America.

The main object of the association as defined by its constitution is "to harmonize and correlate all efforts for the improvement of public roads to the end that adequate and sufficient systems of road construction, administration and maintenance may be adopted in all the states." One of the aims of the organization is to "take the roads problem out of politics" and to install expert supervision under the direction of the United States Office of Public Roads in the construction and maintenance of the highways and to broaden the development of a continuous country wide system linking together the improved highways from state to state.

### How a Kansas Road Was Improved.

"Many hands make light work" was amply proven last week when 1,500 men turned out and built a road between Independence, Kan., and Coffeetown, 18 miles away, in one day. With the exception of spreading the oil, the road, which had been started at sunrise, was finished before night had fallen.

**RUNAWAYS ON GUTTENBERG TRACK**

**Tame Sport Marks Thanksgiving Meet on Old Horse Course—Ralph DePalma Has a Narrow Escape.**

There was a rather free and easy race-meet at the old Guttenberg (N. J.) mile track on Thursday last, 24th ult.—the track of odoriferous memory where once ponies pranced and caused the cry "They're

THE SHAKY GRANDSTAND AND THE CROWD AT THE "GUTT"

off at the Gutt!" to resound in scores of pool rooms in which its one-time owners were interested. They were automobiles, however, and not ponies that pranced on Thursday last, the meet being a privately promoted affair. The stands are rather decrepit, the track surface is full of soft spots and the rails which guarded it long since disappeared. As a result, a large part of the crowd which witnessed Thursday's racing gathered at the edge of the track and on the turns and ran across the course pretty much when and where it willed. But Providence was kind to the unthinking persons and no one was hurt.

Ralph DePalma, who with Robert Burman and Thomas Costello, was the star of the occasion, ran off the track in the 20 miles free-for-all when a steering knuckle broke on his Fiat, but he remained right side up and escaped injury. He was far in the lead at the time, and when he was forced to quit, D. C. Teetor (National) took up the running and won. He also accounted for the five miles. DePalma, however, won the ten miles free-for-all. Costello (Maxwell) took the event for cars up to 230 cubic inches and V. Wilhelm (Mitchell) the one for the 231-300 class in which the only other starter, Rouse (Pullman), was stopped by a broken axle. Burman did not compete, but earned his "bit" by giving an exhibition in his big Marquette-Buick. He drove ten miles in 9:57½. The sport was all of the runaway order; the winners sim-

ply took the lead and never relinquished it, except in the case of DePalma, whose accident contributed the only excitement. The summary:

Five miles, for cars up to 230 cubic inches displacement—Won by Costello, Maxwell; second, M. Basle, Abbott-Detroit; third, Wolverton, Maxwell. Time, 6:07.

Ten miles free-for-all—Won by DePalma, Fiat; second, D. C. Teetor, National; third, Beach, Buick. Time, 10:16¾.

Fifteen miles, for cars from 231 to 300

**OLDFIELD'S IMAGINATION WORKS**

**It Makes Him Fancy He is an Association  
—Will Get the Californians' Money  
Somehow or Other.**

Barney Oldfield, Jack Johnson's partner in the moving picture game and "hero" of the Virginia colored people's celebration, is now in Los Angeles in a dreadful frame of mind. After having the door slammed in his face in Atlanta, Ga., and having an action against the American Automobile Association, which had outlawed him, thrown out of court, he went to Shreveport, La., where he picked up some easy money, and then made tracks for the Pacific Coast, where he had a contract to collect some more of it. He was to exhibit himself at the Los Angeles Motordrome meet on Saturday last, but though he got the ear of the local newspaper reporters who wept tears over him, Barney was not permitted to "slip out of the grandstand" and tear around the track as was the case in Boston. He was ready to turn the trick, but instead he was shown the gate. Then deciding to imagine that he is his own association, he christened himself the Pacific Coast Motor Racing Association,

COSTELLO (MAXWELL) LEADING THE FIVE MILES RACE FOR SMALL CARS

cubic inches displacement—Won by V. Wilhelms, Mitchell; second, Rouse, Pullman. Time, 20:21½.

Ten miles exhibition by Robert Burman in Marquette-Buick. Time, 9:57½.

Twenty miles free-for-all—Won by D. C. Teetor, National; second, C. P. Whelan, Matheson; third, T. Costello, Maxwell. Time, 23:00.

Five miles, for cars from 301 to 600 cubic inches displacement—Won by Teetor, National; second, Rouse, Pullman; third, W. Burke, Pullman. Time, 5:32.

and as the owners of the Ascot Park dirt track apparently do not mind having their property outlawed and stigmatized, Oldfield is to be allowed to use it, and on December 10 and 11 he will give his first race-meet there. He is said to have broken away from "Bill" Pickens, his picturesque manager, and "Bill" took it so much to heart that he promptly took another partner—a wife. The man who is understood to have replaced Pickens in the Oldfield affections is J. Alex. Sloan, who also is on the "in bad" list.

**WELKER WINS HARRISBURG HONORS**

**Obtains Only Perfect Score in Two Days' Endurance Contest—Technical Examination Decides Other Awards.**

Of 21 contenders who started in the Harrisburg (Pa.) Automobile Club's fall endurance contest on November 21, ten finished the two days' struggle with perfect road records, but when the technical examination was completed but one, Herbert Welker, who drove a 40 horsepower Pullman, retained an unblemished score. But as there were no less than eight classes in the contest, there were honors enough to go around.

Although they are not vociferously proclaimed, the Harrisburg club's annual contests are not of the milk and water sort. As was the case in the present instance, the distances are satisfying and the roads traversed are of the sort that would not be selected by a tenderfoot. They penetrate some of the roughest and steepest districts lying among the rugged Pennsylvania mountains.

On the first day of last week's contest, the route was from Harrisburg to York, via Hanover, Hagerstown and Chambersburg, and back to Harrisburg, a distance of 170 miles. The second day's travel, November 22, also was over an out and home course leading through Lebanon, Pine Grove, Pottsville, Shamokin and Lykens, a distance of 188 miles.

The first day's run brought about the elimination of four cars, the most serious accident of the day being the overturning of the Firestone-Columbus, driven by H. F. Rasmussen. The Maxwell, piloted by H. E. Walls, quit because of oiler trouble and an accident to one of the occupants in the Interstate caused I. W. Dill to withdraw. The Velie, with P. W. Walker at the wheel, had carried only three persons, and was not allowed to finish, as the rules require four persons to be carried. Three of these cars, the Interstate, Maxwell and Velie, constituted the entire entry in the touring car class of division 4A, and their withdrawal left this class without competition. A. A. Miller, in a Crawford, skidded into a boulder, thereby sustaining a broken front axle, which cost him 2809 points and practically put him out of the contest, for although he made repairs he reached all controls nearly 12 hours late.

On the second day's run L. V. Fletcher, in a Kline Kar, skidded into a large boulder and broke some of his oil connections, necessitating his withdrawal, and Charles Barnes's Pullman collided with a wagon, thereby sustaining damage which cost 107 points. Of the remaining 16 who finished, 10 had perfect road scores, but after the technical examination, Welker (Pullman),

as stated, alone remained without a demerit.

In the \$1201-\$1600 class, the Reo, driven by McFarland and Kimmel, was penalized three points for a lost grease cup, a loose nut on the brake and a leak in the water pump. Wayne Davis at the wheel of an Everitt collided with a wagon and received 13 points for a broken fender and loose bolts in a wheel. W. G. Vandergriff's Kline Kar received two points and H. G. Kinginger's Warren-Detroit four points, and Andrew Redmond's Maxwell was given 17 points for time lost and the replacing of a battery wire.

In the touring car class of division 5A Roy Steins in a Pullman carried off the honors with only two demerits on technical examination. C. C. Farman's Kline-Kar was penalized 11 points for a broken fender and damage to the body caused by a collision. A broken rear axle housing and damaged wheel cost the Pullman driven by Ickes 38 points. The contestants in the runabout class of this division were equally unlucky, W. P. Sieg's Kline Kar receiving 26 points roads penalty and three points on technical examination for a bent fan which necessitated frequent stops for water. Groves's Pullman was debited 19 points for brakes.

Harold Smith in a Columbia was the only starter in the touring class of Division 6A and he finished with a perfect road score, but received three points on technical examination. The Pullman and Kline Kar, driven by Welker and Kline, respectively, in the runabout class of this division were the only cars in the contest to finish with a clean technical score. Kline, however, was penalized eight points for work done before leaving Harrisburg the second day. The summary:

**Division 3A, Class 1—Touring Cars, \$1201 to \$1600.**

	Road.	Tech.	Pen.	Total
McFarland, Reo .....	0	3	3	
Davis, Everitt .....	0	13	13	
Miller, Crawford .....	2804	5	2809	

**Division 3A, Class 2—Runabouts.**

-----------------------	---	---	---

**Division 6A, Class 2—Runabouts.**

Welker, Pullman .....	0	0	0
Kline, Kline-Kar .....	8	0	8

**Five Miles Matches Make a Racemeet.**

Although they are Philadelphians, Harvey Ringler and George Proud are the leading spirits in what is styled the South Jersey Motor Club, which on Thanksgiving Day, November 24, collected more than 1,000 admission fees at the Bridgton (N. J.) Driving Association's half-mile track, where the club held its first meet. Motorcycle racing was mixed with automobile sport, but as the latter all was of the "match race" variety, the spectacle of only two men in competition did not cause much excitement or many thrills. All of the events were five miles affairs. The summary:

Five miles, Harry Hunt, Buick, vs. George Reeves, Mitchell—Won by Hunt. Time, 8:01½.

Five miles, Joseph Parkin, Parkin, vs. Harvey Ringler, Pullman—Won by Parkin. Time, 7 minutes.

Five miles, Biddle, Mercedes, vs. McIntyre, Pullman—Won by Biddle. Time, 7:25.

Five miles, Blockman, Jackson, vs. Adee, Pullman—Won by Blockman. Time, 7:31½.

Five miles, Joseph Parkin, Parkin, vs. Blockman, Jackson—Won by Parkin. Time, 6:02½.

Five miles, Stowell, Buick, vs. Adee, Pullman—Declared no race. Stowell's time, 7:06½.

Five miles, Noel Flomey De Clos, Fiat, vs. Kelly, Mercedes—Declared no race.

**Witt and Cohen Collect Columbia's Coin.**

Frank Witt and Harry Cohen, the E-M-F cracks, were almost the whole show at the racemeet held on the fair grounds track, Columbia, S. C., Thanksgiving day, 24th ult. Only one event, the mile time trials, which were won by Rawls, Chalmers, escaped them. Witt captured the 50 miles whirl and the 15 miles handicap, and Cohen the five miles race. Etheredge, Maxwell, was the only other man to get "in the money." The most exciting occurrence of the day was provided by Edward Jenkins, E-M-F, who plowed through the fence in the 50 miles event. The summary:

Fifty miles—Won by Frank A. Witt, E-M-F; second, Etheredge, Maxwell; third, Harry Cohen, E-M-F. Time, 53:54.

Five miles—Won by Cohen, E-M-F; second, Witt, E-M-F; third, Etheredge, Maxwell. Time, 5:41.

One mile time trial—Won by Rawls, Chalmers; second, Witt, E-M-F; third, Cohen, E-M-F. Time, 1:01½.

Fifteen miles handicap—Won by Witt, E-M-F (scratch); second, Etheredge, Maxwell (1:47); third, Cohen, E-M-F (40 seconds). Time, 17:19.

**REFEREE ALONE KNOWS RESULTS**

**New York's Endurance Contest an Uncomfortable and Unsatisfying Affair—Vain Seeking for Information.**

The New York Automobile Trade Association held its endurance contest on Tuesday and Wednesday last, November 29th and 30th. That it was no joy ride is well known, but this really is about all that is known of it. Although this is the twentieth century, and New York is supposed to be up to the minute, that affair was so conducted that it added no plumes to the association's cap. Absolutely nothing is

road run pure and simple, there will be no technical examination.

Of 24 entrants, all save one started from Columbus Circle, New York, on Tuesday, despite wet roads and lowering skies, and a state of atmosphere that chilled to the bone. The starters were as follows:

Cars selling for \$800 and under—W. B. Young, Ford.

Cars selling from \$801 to \$1200—C. H. De Lamater, Mitchell; A. H. Day, Hudson.

Cars selling from \$1201 to \$1600—Roy Stains, Pullman; P. Haycock, Reo; P. G. Teabolt, Jr., Marion; J. Ross, Maxwell.

Cars selling from \$1601 to \$2000—Norman Gallatin, Pullman; R. Schmidt, Haynes.

Cars selling from \$2001 to \$3000—F. Hermance, National; W. C. Poertner, Na-

GENERAL VIEW AT THE START OF THE NEW YORK ENDURANCE RUN

known of or is obtainable regarding the scores or the contestants, not even the scores of the first day.

When the run finished the first night the man who was said to have the records was so tired and cold that he sought rest somewhere or other and he could not be located. Last night the referee, A. R. Pardington, who now is said to have the records in the case, hurried to Smithtown, L. I., also to obtain rest, and while Mr. Pardington may know what happened and what is the standing of the contestants, the information appears to be locked securely in his person. Last evening some of the newspaper reporters, anxious to give publicity to the affair, gathered at Columbus Circle, New York, and withstood the freezing blasts for an hour or more awaiting the arrival of the contestants, while others chased themselves from store to store and from garage to garage in an effort to discover someone who knew something about the contest. It finally was learned that the cars were checked out and scattered on arrival at the New Jersey ferryhouse. As it was a

tional; H. Harding, Stoddard-Dayton; W. H. Yule, Stoddard-Dayton; Herbert Welker, Pullman; Arthur Warren, Pope-Hartford; Chris. White, Babcock; T. Spear, Oldsmobile; H. H. Knepper, Corbin; A. Holtzmuller, Speedwell.

Cars selling from \$3001 to \$4000—M. Wagner, Columbia.

Cars selling for over \$4000—G. H. Wallace, Stearns.

The route for the first day was from New York to Danbury, Conn., and return, 136 miles. The roads were slippery and treacherous and, according to rumor, delays and penalizations were numerous, but all starters survived.

The second day's run was from Weehawken, N. J., to Newburgh, N. Y., and return, 139 miles. More mud, but not so much of it, was encountered, and the weather was even more chilling than on the first day. On this journey the only contenders that failed to finish were Holtzmuller, Speedwell, and Teabolt, Marion. Wallace, Stearns, however, did not check out in the morning.

**VARIETY AT NEW ORLEANS MEET**

**Slow Races and Fast Ones Distribute the Honors—Crowd on Track Cuts Short the Program.**

New Orleans, which is in Louisiana, had a varied program of automobile sport on the fair grounds track on November 27, speed races, "slow" races, match races and a speed judgment contest providing entertainment for drivers and spectators. In two of the novelty events the contestants were required to cover the quarter mile course in the greatest possible time, running on high gear, in one case slipping the clutch as much as they pleased and in the other without slipping the clutch. In the former "race," which was closed to four cylinder cars, Benzie, driving a Jackson, carried off the laurels, while in the latter a White steamer driven by Powell proved slower than the rest of the field, requiring 12 minutes 17 seconds to complete the quarter mile.

In the speed judgment contest the award was for covering five miles nearest to 10 minutes flat. Grabat, piloting a Great Western, proved the best judge by doing 10:00¾. A half-hour race went to Walker in his Marquette-Buick, after Monteleone in a Thomas had led for three-fourths of the distance. Walker covered 26¾ miles. After finishing, Walker and Younger, Marion, collided, but neither was hurt. The crowd, however, swarmed on the track and prevented one race from being run. The summary:

One-quarter mile slow race for four cylinder cars, operators keeping in high gear but slipping clutches as they pleased—Won by Benzie, Jackson; second, Shaw, Cartercar. Time, 8:21¾.

One-quarter mile slow race, free-for-all, operators keeping in high gear but not slipping clutches—Won by Powell, White steamer. Time, 12:07. Munson, Thomas Six, won in six cylinder class.

Two miles, for cars under 25 horsepower—Won by Joubert, Ford; second, Tuttle, Overland. Time, 2:30¾.

One mile special match race for fully equipped cars—Won by Sellers, Marmon; second, Costello, National. Time, 1:25¾.

Five miles, run in heats—First heat won by Walker, Marquette-Buick; time, 5:47¾. Second heat won by Spear, Jackson; time, 5:35. Final heat won by Spear, Jackson; second, Walker, Marquette-Buick. Time, 5:30.

Five miles speed judgment contest—Won by Grabat, Great Western. Time, 10:00¾.

Thirty minutes' race—Won by Walker, Marquette-Buick; distance, 26¾ miles. Second, Spear, Jackson; distance, 25¾ miles. Third, Monteleone, Thomas; distance 24½ miles.

## TETZLAFF'S DOUBLE WIN

Unknown Californian Springs Into Fame  
by Capturing Two Chief Races at Santa  
Monica Carnival—Course Proves  
Lightning Fast.

In California the climate's the thing. Any native son or adopted son and almost any railroad handbook will vouch for it; and, with or without vouchers, that it is a mighty fine quality of climate there is no doubting. The Californian who really is saturated with the climate of his delightful state will tell you, among other things, that it—the climate—is "faster" than the atmosphere of the rest of the United States; and, since Thursday last, November 24th, which was Thanksgiving day, he will point to the results of the Santa Monica road races as proof that he knows what he is talking about. If he is really bubbling with enthusiasm, he will come near to convincing you that not only is California air superior to all other air but that California possesses the fastest road race course in the universe.

The Santa Monica results are such as lend justification to the assertions. For one Theodore Tetzlaff—called "Teddy" for short and hitherto wholly unknown to fame—who drove a Lozier car, not only captured the two star events of the day but in the shorter of them, which went 151.506 miles, he maintained an average speed of 73.27 miles per hour, which quite eclipses any sustained pace previously recorded in America and is second only to the average of 74.3 miles per hour made by Nazzaro in the Floria cup race in Italy in 1908.

If one lingers long on the Santa Monica summary, however, it is there that he will find figures that make Nazzaro and Tetzlaff appear "small potatoes." In the last lap of the 231-300 race, McKeague is credited with making up more than three minutes on the man ahead of him and beating him home by more than three minutes. To accomplish this feat, McKeague, according to the figures, tripped lightly around the circuit of 8.4 miles in the more than phenomenal time of one minute and 53 seconds!

These Santa Monica road races really constituted a speed carnival. There were four of them, one for small cars—those up to 231 cubic inches, which was won by Earl Fancher in a Maxwell; one for cars from 231 to 300 cubic inches, in which the seeming victor was Clifford McKeague, who drove a Durocar, a California product; one for heavy stock cars, 301 to 600 cubic inches, and a free-for-all, both of which Tetzlaff placed to his credit. They called the free-

for-all "the Vanderbilt of the West," and not wholly without reason.

The competitors in the two small car races were sent off in company, but the two big car events were things apart and separate and distinct from each other, which is to say that one was finished before the other was started. Tetzlaff's glory thus was the greater; for after winning the 301-600 class and traveling the 151.506 miles in 124.10 minutes, or at the rate of 73.27 miles per hour, or 49 seconds per mile, he rested about 20 minutes and then in the same Lozier car started in the free-for-all and won it also, covering 202 miles in 169.59 minutes, a rate of 70.80 miles per hour or 50½ seconds per mile. Bert Dingley, driving a Pope-Hartford having a cubical capacity 154 inches less than the Lozier, shared some of the glory with Tetzlaff. Dingley, too, competed in both races and finished a good second in each despite aggravating delays due to tire trouble.

The Santa Monica carnival was more than a daybreak affair—it lasted all night. Santa Monica is near to Los Angeles and is situated by the sea, and therefore more readily lends itself to "highjinks." These "jinks" were of a varied and variegated order. Men who pursued the nimble penny provided all manner of entertainment for the revelers, the revel finally climaxing in setting a huge dancing pavilion afire and in binding and gagging a policeman who sought to interfere with the "fun." These revelers, however, constituted but an insignificant minority of the 75,000 people who witnessed the racing. The great crowd did not even put in an appearance until long after day had dawned and the small car races were finishing. It was the

battles of the big cars that attracted the multitude.

The small cars were sent away at 7 o'clock, a heavy fog preventing the earlier start that had been scheduled. There were but three starters in the "up to 231" class, Fancher in the Maxwell, Bobst in an Oakland and Fouch in a Staver-Chicago. The latter ran wide and struck the banking at a curve on the very first lap and was rendered hors de combat, and on the third lap Bobst, while leading, did likewise. Fancher therefore finished alone. He completed the distance, 101.004 miles in 102.31 minutes, a speed of 59.11 miles per hour.

The starters in the 231-300 class were C. H. Bigelow, Mercer; Clifford McKeague, Durocar; Clarence Smith, Maxwell; Ockerman, Petrel; Robt. Greer, Mitchell; Louis Nikrent, Buick, and George Clark, Cutting. Clark was eliminated almost immediately. He skidded and struck a hydrant on the first round and was seen no more. McKeague, in the native born and Fisk-tired Durocar, led at the end of the first lap—the course was a circuit of 8.4 miles—but on the next round Bigelow in the Mercer took command and the Durocar fell away back. The man in the Mercer ran like a scared deer and on the fourth lap was two minutes ahead of Greer (Mitchell), the second man. Nikrent (Buick) already had quit. Bigelow continued to gain until the ninth lap, when with victory in sight a cylinder cracked and forced him to stop at the repair pits. He restarted, but limped so badly that he was compelled to chuck it. Greer in the Mitchell then began to look dangerous, but on the tenth round stopped at the pits and in restarting stripped his reverse gear and thus lost his chance to

Monica, Cal., Thursday, November 24, 1910

-------	--------

triumph. With Greer and Bigelow out, Smith, in the Maxwell, went to the front, and as he was more than three minutes ahead of his nearest rival, McKeague (Durocar), and with but two laps to go, it did not seem that he could lose. But for the third time in the race apparent victory miscarried, but just how it did so it is difficult to decipher. Smith completed his last lap in 8:07, according to all reports, and yet was beaten out by McKeague, who, according to the same reports, finished his twelfth and last lap in one minute and 53 seconds, a manifest impossibility. Fred Wagner, who was "imported" from New York to start the races, it is claimed, failed to flag McKeague at the end of this miraculous round and the Californian made an extra circuit. But whether Wagner was the one who blundered is more than an open question.

With the small cars out of the way, the big crowd began to display real interest when the five "big fellows" lined up for the race for the 301-600 class. They were Tetzlaff, Lozier; Dingley, Pope-Hartford; Bruno Seibel, Franklin; Herbert Brown, Knox, and J. B. Ryall, Apperson. From the word "Go!" which was given at 9:50 a. m., the race was between Tetzlaff and Dingley. For six rounds, despite the Lozier's greater power, Dingley in the Pope-Hartford gave Tetzlaff all he wanted. They reeled off lap after lap in less than seven minutes, or 73 miles per hour, with seconds only between them; but on the seventh round tire trouble forced Dingley to stop at the pits. The tire change was made in lightning time, 38 seconds, but the delay enabled Tetzlaff to improve his already slight advantage. The furious pace

was maintained, Tetzlaff gradually drawing away, until the 12th lap, when he stopped at the pits to change a tire and Dingley appeared to have a chance to close up. But the Michelin tire men whipped off one tire and put on another in the wonderful time of 28.25 seconds—California claims it to be a "world's record"—and before Dingley hove in sight, Tetzlaff was off and in full cry again. And when Dingley did appear, he had two flat tires. It required two minutes to change them, and when the Pope man restarted he was a 100 to 1 chance. He appeared to have lost some of his ginger, and Tetzlaff drew further and further ahead, winning by nearly six minutes and completing the 151.50 miles in 124.10 minutes, a pace faster than which had been recorded but once in the annals of racing. While the Lozier and Pope drivers were engaged in their duel, only Seibel in the Franklin had continued to pursue them. He did consistent work and was still running when the race was stopped. Of the other two contenders, Ryall (Apperson) had gone down and out with valve trouble on the third lap, and Brown in the Knox had skidded into a tree on the sixth round.

After a short intermission, during which Tetzlaff, no longer unknown, was lionized, the big race, the free-for-all—the Vanderbilt of the West—was called. Tetzlaff and Dingley were among those who responded to the call; Ryall, too, had decided to try again. The new comers who lined up to do battle with them were Frank Dearborn, Fiat; Charles Soules, Isotta; Joe Nikrent, Knox; R. Kenwood, Ohio, and Van Valin, Only, the latter the single cylinder car with a five-inch bore and 10-inch stroke. The

previous battle between Tetzlaff and Dingley had whetted the public appetite, and with two foreign cars, bigger than any of the Americans, there was imparted an international flavor and there was promise of even more stirring times, although there were many who thought the Lozier and Pope-Hartford were too heated and "tired" to repeat. Tetzlaff, flushed with his new honors, at once took the lead, however, and held it for two laps, when both Dearborn in the Fiat and Dingley in the Pope headed him, but not for long. The Fiat had trouble and fell back to fourth place, while Tetzlaff repassed Dingley. His leadership was never thereafter seriously threatened. He won with nearly 15 minutes to spare. After the Fiat had recovered from its bad spell, Dearborn drove it like a demon. He flashed the seventh lap in 6:29, the fastest lap of the day, and at the rate of 78 miles per hour, but despite his furious pace he gained slowly. Tetzlaff and Dingley in their "tired" ears were "going some," too. It was not until the 12th lap, when Dingley stopped to change a broken valve, that Dearborn overtook him. It was on that round that the other foreign car, Soule's Isotta, quit with a broken connecting rod; on the 18th round, the Fiat itself succumbed to the same trouble. Valve trouble already had stopped Ryall's Apperson and Kenwood's Ohio was too far out of his class to figure seriously. Whether the Only car, with its big one lung, can raise a gallop was not demonstrated. On the very first lap it broke its connecting rod and was lost to sight. With both foreign cars disposed of and Tetzlaff away ahead, the only question was whether Nikrent's Knox could overtake Dingley's Pope. It was a much larger car and performed consistently, but it was not equal to the task and Dingley again followed Tetzlaff home, while Nikrent was still running two laps behind when the race was stopped. Both Dingley and Tetzlaff stopped only once for new tires. Tetzlaff's double victory was wildly acclaimed, his wife rushing out and hugging him enthusiastically while the crowd cheered and the cameras snapped.

The course had a "death turn" and an S curve, and though several of the cars skidded off the course at such points and despite the high speed at which they flew around the corners, no one was injured.

## Albany Sees Its First Automobile Race.

Two events made up the program of the first automobile racemeet that ever was run in Albany, N. Y. It occurred on Thanksgiving day, November 24, on Island Park track, and the greatest excitement was caused when the spectators swarmed on the track during the 15 miles race which was won by Walter Scherer, Simplex, after a good fight with Grounsell, Buick, in 20:28. The other race, also 15 miles, proved an easy victory for Westcott, Palmer-Singer, in 22:54. Dowery, Courier, was second.

## SWIFT GOING IN ENDURANCE RUN

Californians Require 27 Miles Pace for 48 Hours—Long Test for Trucks Also  
—The Final Results.

Incident to and immediately following the close of the first evening of the Oakland (Cal.) show on Saturday, 19th ult., an endurance contest for pleasure cars occurred, and on the following Thursday, 24th, an endurance run for trucks. Both events were under the auspices of the Oakland Automobile Dealers' Association and served more or less as show features, since the finishes of both occurred at Idora Park, where the show was in progress.

In the endurance run a Mitchell and a Velie car shared the honor of a perfect score. Of the 13 cars that started eight finished, the following contestants suffering penalization: Corbin, 3; Maxwell, 5; White, 5; Maxwell, 17; Buick, 18; Ford, 361; Moon, 762; Cartercar, 2,320. Other starters were the Winton Six, Reo and one electric, a Columbus.

The run, which was of the sealed bonnet, non-stop variety, covered a course of 54.6 miles through San Leandro to Haywards and return, the schedule requiring that the 1,300 miles and more be covered during the 48 hours of the contest, thus necessitating an average speed of a trifle over 27 miles an hour. The electric vehicles, for which a special class was created, were required to make only 15 laps, or 830 miles, at an average of 17 miles an hour.

The first car to come to grief was the Reo, which was forced to stop while on its fourth lap through failure of the ignition. Examination revealed that the insulation on a spark plug wire had burned through, and the car was withdrawn. The Cartercar, had the misfortune to be ditched during Saturday night, and emerged with a sadly battered wheel, and by the time a new wheel could be obtained four hours had been lost. The car was kept in the contest, however, and made up three of the four hours before the end of the contest. Other sufferers during the earlier stages of the contest were the Moon and Buick. The faults were minor ones in both cases and the delay was not serious. On the 18th lap the Ford car was halted after checking in, it being necessary to break the seals and raise the hood in order to remedy the difficulty.

The fastest lap of the contest was credited to the Winton car, driven by Manager Harry L. Owsney of the California branch, which covered the distance in one hour 13 minutes and 50 seconds. The Columbus electric went over the course 12 times during the 48 hours and recharged its battery at San Leandro.

The truck contest was conducted along

the usual lines, account being kept of the cost of fuel and oil, and a ton-mile cost figure being deduced from this and the net load carried. Nine non-commissioned army officers served as observers, thus lending a semi-official air to the event. The contest started from San Francisco over the San Jose road, returning from that point to Oakland. Eight hours and a quarter were allowed to cover the 100 miles of the course, penalties being assessed for all stops save those for tire repairs.

Five trucks achieved perfect technical scores, with the following operating costs per ton-mile of effective work: Gramm, 1.23 cents; Frayer-Miller, 1.36 cents; Autocar, 1.46 cents; White gasoline, 1.53 cents; Hart-Kraft, 6 cents. The remaining four vehicles were penalized, their costs, irrespective of road penalties, resulting as follows: Avery, 1.45 cents; Rapid, 1.78; Brush, 3.16; Cartercar, 4.75.

### Outlook's Idea of Motoring Philosophy.

While a number of clergymen, and others of less "saintly" occupation, are decrying against the increasing popularity of the automobile, and prophesying dire things on account of the extravagance shown by the American people in buying so many cars, there are others who look at this matter of automobile popularity in an entirely different way. The Outlook, of New York, in its November issue, contains a few words on the "Philosophy of Motoring" and comes to the conclusion that "what we want in this world is Life!"

"What gives the most life for the money is the best bargain," it says. "It is not necessarily scandalous that people should scrimp on houses and clothes in order to have more to spend on automobiles. There is nothing sacredly edifying about having more house than you need and sweating to maintain it. Neither is there so very much sanctification in store clothes. Usually every new luxury that we add to our apparatus of life increases the burdens that bend our backs; but this new luxury that goes by gasoline seems disposed to make a place for itself by crowding some of the other luxuries off. That shows spirit. If the automobile and the house are going to compete, give them both fair play and let the fittest survive."

### Marie Herself at Last Buys a Car.

Having exhausted her extensive vocabulary of denunciation of the "brutality," "selfishness," "vulgarity" and "Philistinism" of automobile owners, Marie Corelli, the novelist, has bought one herself. It is a powerful car capable of at least a mile a minute, and as Miss Corelli "has writ" that no automobile should be allowed to run faster than 12 miles an hour and should go much more slowly when passing through towns and villages, it is assumed that she has taken to automobiling to show motorists just how a racing car should be run.

## IMMENSITY OF GASOLENE OUTPUT

Statistics Showing the Enormous Expansion of the Industry—Great Growth During the Last Few Years.

As reflecting the tremendous growth of the automobile industry, besides indicating increased use of gasoline for other purposes of an industrial nature, it is explained that from 1903 to 1909 the output of this commodity was exactly doubled, while the output for the year 1910 is expected to show a considerable increase over that of last year. The total production of 1909 is given on good authority as 9,600,000 barrels of 50 gallons each, including the product of all refineries in this country, which, considering that only a few years ago gasoline was a by-product of illuminating oil manufacture and considered almost worthless, indicates the basis for the rumors of its supremacy in the field. At a conservative average figure, the first-hand value of the total production of gasoline and naphtha is given at \$48,000,000 for last year, based on an estimate of 10 cents per gallon.

That the demand for gasoline does not exceed that for the heavier illuminating oils, however, is shown by the figures for the production of crude petroleum for the same period, which amounted to 186,739,500 barrels of 42 gallons each. Only a small proportion of each barrel of crude oil is available in the form of gasoline, by far the greater part of it being converted by distillation into the illuminating oils. Hence it follows that the growing demand for gasoline is causing the oil producers more or less anxiety. Indirectly it may be said to have been instrumental in causing a drop of a cent and a half a gallon, or 75 cents a barrel for domestic distribution, while for export the decline has amounted to \$1 a barrel. Another factor which bears upon the situation is the existence of an "oil war" abroad, to which is attributed a sharp decline in the exports of illuminating oils.

As indicating the growing market for gasoline the production of crude oil and gasoline in the United States from 1900 to 1909, as furnished by the statistical department of the Standard Oil Co., is shown in the following table, expressed in millions of barrels:

Year	Crude Oil Millions of Barrels (42 Gallons)	Gasoline Millions of Barrels (50 Gallons)
1900	63.6	3.6
1901	69.4	4.1
1902	88.8	4.6
1903	100.5	4.8
1904	117.1	5.2
1905	134.7	6.0
1906	126.5	6.3
1907	166.1	6.8
1908	179.6	7.6
1909	186.7	9.6

## Work and Worth of the Gasolene Fire Engine

Lansing, Mich., which was one of the first cities in the United States to make use of the motor fire engine, has had such gratifying experience that the chief of the Lansing fire department, Hugo R. Delfs, believes that within three years there will not be a horse remaining in the service. He expressed the opinion at the recent

firemen. This made a weight of 8,000 pounds. We made the run over extremely bad roads (slush, ice and snow) in 28 minutes. On our arrival we found three two-story buildings on fire. We dipped into a small swale about 700 feet distant, and in a short time we had the fire under control. Had we to depend on loading a steam en-

pany arrived. This was an actual occurrence in our city, and I know of other cities that have had similar experiences, and I think this can be called effectiveness.

"You will hear the question 'Do the motors always start when an alarm comes in?' They certainly do. Lansing has yet to have the first failure of her motor appa-

THE MODERN FIRE ENGINE UP-TO-DATE.—FREMONT (OHIO) FIRE ENGINE WITH FISK REMOVABLE RIM EQUIPMENT

convention of the International Association of Fire Engineers, where he read an interesting "paper" dealing with the subject.

"In corresponding with the chiefs of different cities using automobile apparatus, I find they are all high in their praises, and all state there is no question about the adaptability of this kind of fire fighting apparatus to any department," he said. "I know this to be the case in my city—the automobile combination wagon fits perfectly, and is adaptable in every case, any time, any place and in all kinds of weather.

"On November 22, 1909, our city had a call for help from the village of Bath, Mich., 10½ miles distant from Lansing. We responded with our automobile fire engine taking 1,500 feet of 2½ inch hose and five

firemen. This made a weight of 8,000 pounds. We made the run over extremely bad roads (slush, ice and snow) in 28 minutes. On our arrival we found three two-story buildings on fire. We dipped into a small swale about 700 feet distant, and in a short time we had the fire under control. Had we to depend on loading a steam en-

gine on a railroad train, the fire would surely have wiped out the village. We made the return trip in 27 minutes. This, to me, clearly demonstrates adaptability.

"In commenting upon the efficiency of the automobile apparatus I can give a few comparisons which I think will thoroughly convince you of its effectiveness. Suppose you had a fire call 24 blocks from your fire station (equipped with a motor combination wagon); also suppose another company combination, horse drawn, 12 blocks from the fire, responds to this call. Imagine the automobile combination going by the horse drawn apparatus after they had traveled just six blocks, or half their distance, and then imagine a stream of water on the burning building and fire practically under control when the horse drawn com-

paratus to start, and with the exception of two accidents, has never failed to get to the scene of action. Accidents, I assure you, may happen to automobile apparatus just as well as to horse drawn apparatus, but I do maintain that accidents to automobile apparatus should not be as frequent as to horse drawn apparatus. My main reason is the perfect control one has of the automobile apparatus, and with the reports I have received from cities using automobile apparatus, I am convinced to a certainty that the automobile combination wagon is most efficient.

"Time is essential in getting to the scene of the fire, and one would imagine this would be compensation enough for any municipality, but municipalities are looking for economies as well, and there is an

economical feature to the motor fire apparatus. I will give you a report as to cost of maintenance since the day our city installed motor apparatus.

"The automobile fire engine, built by the Webb Motor Fire Apparatus Co., has a 60 horsepower, six cylinder motor (Olds), equipped with a rotary pump, with a capacity of 650 gallons per minute (plug pressure), carrying 1,000 feet of hose, axes, tools, suction pipes, etc., placed in service December 12, 1908, and during the 19½ months responded to 242 fire alarms traveling 367 miles, and to 35 exhibition and test runs traveling 69 miles; pumping at actual fires 29½ hours, and at exhibitions 5¾ minutes. Cost to maintain (for gasoline, cylinder oil, grease, spark plugs, recharging, storage batteries, etc.) was \$77.80 or 14 cents a day; and the cost inclusive of two accidents of \$296.77, was 64 cents a day. The tires, notwithstanding the fact they have been in service nearly 20 months, show no material wear and never had a blow-out or puncture.

"The automobile chemical (combination) wagon, placed in service November 22, 1909, was built by the Olds Motor Works, and has a 60 horsepower, six cylinder motor, with a chemical capacity of 120 gallons. It has responded to 141 fire alarms, traveling 226 miles, and to seven exhibition runs, traveling 20 miles, discharging 4,542 gallons of chemical. Cost of maintenance (for eight months), \$34.17, or 14 cents a day. The tires on this automobile are in excellent condition; they never have given any trouble whatever.

"The chief's car (Oldsmobile Special) has a 40 horsepower, four cylinder motor and was placed in service December 12, 1908, and during the 19½ months responded to 256 alarms, and was used for all other business connected with the department (visiting sub-stations daily, inspections, etc.) traveling 4,475 miles. Cost of maintenance (for gasoline, re-charging storage batteries, spark plugs, cylinder oil, tire repairs, etc.), \$168.15, or 29½ cents per day. Adding these three pieces for a period of 19½ months would mean a total of \$576.89. To accomplish the same work using horses, you would require eight horses, which cost to maintain (for oats, hay, bedding, veterinary bills, harness repairing and shoeing) about \$18 a month per horse, amounting in all to \$2,880, or a saving to the city of \$2,231.11 by using motor apparatus. We also save the salary of two drivers, one on the steam engine and one on the accompanying hose wagon, which would amount to approximately \$2,730. Out of the eight horses mentioned you would lose one by death, accident or unfit for service costing \$275, and this would nicely keep up your tire and repair bills. By summing all up we have a grand total in favor of the automobile apparatus of \$4,961.11. Think of a saving like this for a small city and what it would amount to in your larger cities,

and you cannot but agree with me that it is wonderfully economical.

"A word in regard to the purchasing of automobile fire apparatus: select only such machines as have sufficient horsepower, not less than 60 for combination wagons and chemicals, and not less than 90 for fire engines, or more if you can get it. The more horsepower you have the more efficient work your machine will accomplish. Also a word in regard to the chauffeurs who handle the automobile apparatus. Pick out men who have had large experience. This is one of the most essential things to have men of this kind. You cannot expect results by allowing a man to drive a car around the block and then say he is fit to drive automobile fire apparatus, and I maintain he should be the best that money can hire.

"Our city is so well pleased with her automobile apparatus that I can safely predict that we will have no horses in our departments within three years. Some months ago our city contracted with the Webb Motor Fire Apparatus Co., and the Olds Motor Works of our city for another automobile fire engine; capacity of pump to be 900 gallons, motor to be a 1911 model, 90 horsepower, six cylinder 5x6, which were delivered October 15th. With this new engine we are capable of delivering 900 gallons of water per minute (plug pressure) and this, it seems to me, is ample capacity for most any fire department.

"I firmly believe that automobile apparatus will take the place of the horse drawn apparatus, and when it becomes universally used that the enormous fire waste in the United States will be decreased materially. It is a subject of vast importance to the fire service of America."

At the convention in Syracuse, at which Mr. Delfs gave voice to these opinions and experiences, several other fire chiefs also substantiated his views. H. L. Marston, of Brockton, Mass., said that in his city last winter, a motor driven combination chemical wagon had given good service when the snow was 10 to 15 inches deep; it had been in service eight months, had answered 195 alarms, and the operating cost had been but \$30.25. The cost of up-keep had been nothing, as the wagon had required no repairs and the original tires still were in use. J. F. Runyon, chief of the Morris town (N. J.) fire department, pointed out another direction in which automobile apparatus prevents loss:

"It seems to me that with the advent of the automobile driven fire apparatus the automobile straight chemical engine should be more in evidence than it has ever been in the past," he said. "With such an engine you can get to a fire twice as quickly and thereby give twice as good service as with the horse drawn apparatus. We have an automobile chemical engine in our department, and our alarms have been almost double what they were in the past, and

even with such a condition our actual fire loss is just about one-half what it was with a lesser number of alarms. We have had a horse drawn chemical engine for about 15 years, but now we do much better with the automobile chemical engine, because we get there so much quicker. In our city we used to have considerable water loss at fires, but when you get there quickly with a chemical engine you can put it out and save that loss in many cases. I therefore think that with the automobile chemical engine you are better equipped than ever to prevent water loss at fires."

#### Accident to Car Assists Owner's Creditors.

That accidents and newspaper reports thereof sometimes have peculiar consequences was demonstrated last week when a touring car which had been wrecked and deserted in Montclair, N. J., was seized at the instigation of a New York publishing house which held a judgment against the owner, Bert A. Rich, of New York City, and which had been seeking to discover property on which it might levy. After the car had been seized, Rich informed the lawyer who had served the writ of attachment that there was a chattel mortgage in New York against the car which must be met first. The New Jersey seizure was proven legal, however, on the ground that chattel mortgage laws do not obtain where property has been transferred from the county in which the mortgage was issued.

#### Some Tall Roadways Planned in Texas.

Penetrating the heart of the 160,000-acre ranch owned by Charles P. Taft, brother of President Taft, a 150-mile automobile roadway is to be constructed from San Antonio to Corpus Christi, Texas. It is planned to make that part of the road which passes through the Taft ranch one of the finest automobile speedways in the country, as the land is almost level and will allow of an almost 30 miles straightaway. Tentative plans also are on foot for the construction of other automobile roads in this section, a 175 miles road between Corpus Christi down the Gulf coast to Brownsville being the most important of those contemplated.

#### Novice's First Trip Covers 8,000 Miles.

One of the most unusual long journeys ever made by an automobile was completed last week when George Harder, of Sacramento, Cal., arrived in San Francisco after having piloted a friction-driven Cartecar a distance of more than 8,000 miles. The trip was unusual in that Harder never had driven a car before he left the Cartecar factory in Pontiac, Mich., where he took delivery of his car; he learned to drive with the help of an assistant who accompanied him as far as Chicago only. At Chicago Harder was joined by two friends, and the party went sightseeing, making long detours on the way to the coast.

**WHITE GAS CAR WITH MORE POWER**

**Cleveland Company Launches Model of 40 Horsepower but Suggesting More—Other Details Same as the "30."**

While early announcements of the manufacturing plans of the White Co., of Cleveland, O., indicated a continuance of its former product without substantial changes, it was then stated that at about this time an additional model would be introduced which would extend the gasoline line and fulfil the requirements of those who demand a higher power range than the 30 horsepower model is capable of sat-

THE NEW WHITE 40 HORSEPOWER GASOLINE TOURING CAR

isfying. That model, which now is ready for marketing, proves to be in all visible characteristics a counterpart of the White "30," save that it is rated with ten more horsepower in its power plant and has a seven passenger body. That it will turn out to have a much more powerful motor than would ordinarily be expected from its builders, may be inferred from the early statements concerning it, in which it was described as of 40-60 horsepower.

As is the case in the other model, the engine is of the four cylinder "L" type, with valves located on one side, and has the 3 point suspension. Cooling is effected by means of a centrifugal pump circulating the water through the honeycomb radiator and the jackets. A Bosch high tension magneto supplies the current for the ignition. The motor is lubricated with oil forced by plunger pump to the main bearings, by splash to cylinder walls, wrist pins and connecting rod bearings.

A leather faced cone clutch and the selected type of transmission are employed, the latter allowing four speeds forward and one reverse. The transmission is located amidships. The rear axle is of the semi-floating type.

A channel section 5 1-16 x 1 3/4 x 3-16 inches of nickel steel forms the frame.

Semi-elliptic springs are used in front and three-quarter elliptic in the rear. On the front wheels of the seven passenger car 36 x 4 inch tires are used, and those on the rear are 36 x 4 1/2 inches, while the five

passenger car has tires 36 x 4 inches all around. The wheel base is 120 inches.

**Jack that Permits of Quick Work.**

Either the front or rear wheels of an automobile may be raised very quickly from the floor of a garage by the use of a jack very similar in character to that employed in most of the important road races. This jack is made of a piece of 3/4-inch pipe, bent into a U-shape to form the handle; the ends are slipped over two forgings similar in shape to bell cranks and attached to the axle supported by cast iron rollers at either end.

By simply placing the jaws under the axle and pressing the handle to the ground, the wheels are lifted and securely held

while the necessary work is being done. One or both of the wheels may be raised by using either one or both of the jaws, the leverage obtained with the use of a long handle making it comparatively easy to lift either end of the car. On account of its size it is not liable to be misplaced or carried away. Other than the rollers it has no moving parts.

**How to Keep Hub Caps Secure.**

Although hub caps of motor cars work off now and again, there are two ways of ensuring that they will not loosen when properly put on. If the cap screws up flush with the metal ring of the hub a small center punch hole at the point of contact will prevent it from coming unscrewed. If the cap overlaps the ring, drill a hole into the ring and in the cap tap out and place a small set screw that just comes flush with the cap. The screw hardly will be noticed, and will save trouble and expense later.

**Putting a Nut to Extemporized Use.**

When a nut has been lost and another of the same size is not at hand a temporary repair often may be made with a nut that is a trifle too large by hammering it till it is slightly oval.

**To Prevent Oil from Sticking to Tin.**

Before filling a tin measure with heavy oil, rinse it out with gasoline. This will prevent the oil from sticking to the sides.

**TREND TOWARD THE FIXED SPARK**

**Its Increasing Use Indicated at the London Show—How it Compares With Hand Controlled Ignition.**

That the fixed spark is gaining in favor appears to be indicated by the number of cars equipped with this form of ignition which were exhibited at the recent Olympia Show in London and by several converts in this country. At the Olympia no less than fifteen different makes of cars were equipped without a hand controlled spark.

As to whether or not it shall be the fixed or the manually controlled spark, there are so many directly opposite views that to adhere to any particular rule is almost out of the question.

The hand lever mounted upon the steering wheel of the average automobile is regarded by some manufacturers as unnecessary, as is often shown by its absence on at least one or more models of their cars; yet many practical men do not approve of the fixed spark because it often limits to some extent the number of revolutions or the control of an otherwise very satisfactory motor.

There are two reasons at least why the fixed system is advocated; one, that in a great many cases the driver is not capable or else he is too shiftless to handle the spark lever in the proper way; the other, that a magneto possesses inherent qualities of self-timing that render hand control unnecessary. In the first case, the type of a man at the steering wheel governs the design, and as manufacturers cater to varying classes of customers some of them take notice of the shiftless sort and of the unmechanical man to whom anything that is automatic and takes care of itself appeals strongly and is most desirable. The second reason is technical and lies in the fact that a magneto does, after a fashion, time itself, owing to the increased voltage given by a higher number of revolutions, causing a decrease in the firing lag and a proportionate increase in the time of the maximum explosive pressure.

It is less certain, however, that the range of timing possessed by the magneto necessarily synchronizes with the range of revolutions possessed by the motor. There is no cause to think that these ranges coincide as there is no connection between the two. Because of this doubt, mechanical timing seems desirable, although for commercial vehicle purposes the absence of the hand spark control lever appears to be preferred.

For the benefit of those who are not wholly familiar with the magneto construction it may be well to explain that the most common method of timing is to vary the

point at which the primary circuit is broken. This is accomplished by causing the stationary part of the circuit breaker to rock around the armature shaft. The difference between the fixed and the more general form of ignition, therefore, consists chiefly of the omission of the mechanism necessary to rock the timer. To this extent it is a mechanical simplification, involving no change in the electrical system while the motor is running at its normal speed. At extremely high or extremely low speeds, however, the fixed spark results in less satisfactory timing than is obtainable where the manual control is resorted to.

To permit the elimination of the manually controlled lever and yet allow the motor to run without the loss of any of its efficiency, some magnetos are made practically self-timing, affording mechanical timing of the spark, which can be adjusted to synchronize with the range of revolutions possessed by the engine, and requiring no action by the driver to produce the effect. A favored way of accomplishing this result is to have a fly ball governor, which alters the angular position of the armature in relation to its drive, thereby automatically retarding or advancing the current wave.

#### Why Valve Grinding Was Unsatisfactory.

"In grinding valves the other day," remarked the man who does his own repairing, "I had a rather funny experience. I had removed a valve and spring and was proceeding in the usual way, when, after one or two examinations of the valve, I noticed very little improvement in its general condition. An investigation showed the valve stem just touching the push rod and of course preventing the valve from seating. Hereafter when attempting such a job I will make sure that there is plenty of clearance between the valve stem and the push rod—both before and after the operation."

#### Continental Evolves a Non-Skid Tread.

Prevention of skidding in all weathers and on all sorts of road surfaces calls for such a variety of properties that it is extremely difficult to combine them all in a single form of tire surface, but in its new "Traxion" tread the Continental Caoutchouc Co., New York City, believes that that highly desirable feature, an all-season anti-skid tread at length has been achieved. The tread is constructed with a large number of integral rubber projections in the form of tapering disc-like protruberances which are arranged in staggered rows about the circumference of the casing. As the projections are molded into the tread itself, they can neither work loose nor tear out; nor are they subject to rapid wear. Their nature permits them to be used on dirt and macadam roads where steel-studded treads are prohibited, while their natural resilience gives them the necessary

yielding effect essential to securing a grip on hard and smooth surfaces where studded surfaces would be likely to slip. The corrugations grip in both directions, tending to secure ample traction as well as to pre-

vent skidding. The Traxion style of tread is produced in clincher and "Q. D." types and at a reasonable advance in price over plain tread casings, to cover the increased cost of manufacture.

#### Radiator Without Circulating Tubes.

Something new in radiator construction is contained in the Candler Special recently placed on the market by the Candler Radiator Co., Detroit, Mich., its novelty resting in the fact that instead of having circu-

lating tubes, vertical flows only are provided. Horizontal I-beam tubes, assembled to avoid leakages, are placed with the sides up and down and laid so that the core runs the depth of the casing, the ends forming the front and back of the radiator proper. The walls of the I-beam tubes form the vertical water passages, bringing the water in direct contact with the rad-

iating metal as the air rushes through the cores. Headers, or the metal used to form the bottom of the top tank and the top of the lower tank, have been done away with and the radiators are simply one rigid mass of steel which, the makers claim, lessens greatly the liability of leakage.

#### Carburetter Not Always at Fault.

The carburetter is blamed, often improperly, for the irregular running of an engine when the fault lies elsewhere. If the carburetter is doing its work, the better part of wisdom is to leave it alone, as in most cases tinkering with it will not help its efficiency. Until the other parts of a motor have been gone over thoroughly in the effort to locate trouble it is not of much use trying to tune up a motor by making changes in the carburetter.

The piston rings must be compression tight, the valves free in their guides and ground in their seats, the timing correct, the ignition generally in proper condition, the plugs in good order and their points set correctly. These conditions are necessary, particularly for ease of starting and slow, steady running. Misfiring on starting often is laid to an excess or lack of gasoline when the ignition is at fault. When the throttle is opened suddenly the feeble spark from a magneto which has been allowed to get out of order encounters the full compression, which opposes the passage of the spark. It is well to attend to the magnetos according to the manufacturers' directions as to the proper gap between the points, the correct setting of the high tension distributor and other parts liable to cause trouble.

To enable any carburetter to do its best work and give full flexibility to the motor, it is essential that the ignition be perfect throughout the whole range of engine revolutions.

#### Springs that Affect Seating of Valves.

Not all valve springs that are the same diameter throughout their length are equally square at both ends. A spring which is not true in this respect will cause a valve to seat unevenly, and the resultant loss of compression may be difficult to trace. This is especially true of the later model engines in which heavy springs are used. A steel square will detect any discrepancy at once.

#### When Tops Accentuate Small Noises.

A car which is slightly noisy when driven with the top down always will sound noisier when the top is raised. This is because the top when taut tends to "carry" and accentuate minor rattles and squeaks.

#### Filling Grease Cup in Cold Weather.

In cold weather stiff oil and grease should be heated somewhat, although not melted, to facilitate the filling of grease cups and spring oilers.

## Seeking a Cheaper Substitute for Gasolene

For the most part modern carburetter development has been directed toward the complete vaporization of the fuel, with the idea of delivering to the cylinders of the engine a thoroughly carburetted and perfectly homogeneous mixture. At the same time it is noteworthy that other views of the carburetter problem are entertained, one of the most important being that in which the retention of a portion of the fuel in globular form is deliberately contemplated. A noteworthy exponent of this rather original idea is Robert W. A. Brewer, the well-known English scientist, the particular theory in this instance being applied to the use of the heavier liquid fuels in conjunction with gasolene. Instead of attempting the complete vaporization of the entire liquid, only the lighter fractions are gasified, the remaining constituents being carried over in the globular form to be evaporated by the heat of the explosion and burned in an excess of air.

In seeking to render practicable the use of a heavier grade of fuel than commonly was employed for automobile propulsion, Mr. Brewer at first made some tests with paraffin and petrol as the commercial grades of kerosene and gasolene available in the British Isles are known to the trade. Special mixtures of various grades of oil were then tried and more or less successful results obtained, as was noted in these columns at the time. Continuing the experiments with great care, a number of important conclusions have been reached which are of particular interest chiefly as paving the way for future developments of direct importance to the motor world. In recounting these researches through the medium of the Autocar, Mr. Brewer renders some important observations bearing on the specific gravity question.

"Although the range of specific gravity may be over several points, it does not necessarily follow that the fractional distillation varies in like manner," he remarks. "Considering spirits now from the petroleum base, the various fractions come off at fairly regular intervals in the best known two brands, namely, the s.g. .710 and the s.g. .760. But, taking for instance Shell spirit and Shell Borneo spirit for comparison, we find that the first drop comes off the heavier at 6 degrees lower temperature than it does off the lighter, but that in certain stages the heavier spirit behaves somewhat more erratically, so that during its earlier distillation the temperatures are higher at which an equal fraction is distilled; but when about 70 per cent. of the whole has been distilled off the tem-

peratures at which the remaining fractions are distilled are somewhat lower in the heavier than in the lighter variety. Now if we are dependent upon the evaporation of the petrol alone we see that any spirit which distils completely between, say, 50 and 150 degrees Centigrade will behave in a similar manner under similar conditions, whatever its specific gravity may be. We find, however, that if we treat a petroleum through a larger range of distillation, and thereby obtain a spirit with a higher specific gravity than .760, viz., .780, we must come to temperatures considerably higher than 150 degrees Centigrade, and the resulting spirit will not behave exactly as the .760 spirit, owing to the presence of those particles which have a higher boiling point.

"Now, it is in order to deal successfully with the heavier particles in a motor fuel that mechanical action has to be applied, and it was in the case of the tests which were referred to in the earlier part of this article the mechanical action upon the paraffin which caused its possibility for combustion in the engine cylinder. The theory is that the heavier particles which do not readily evaporate are carried forward in the induction pipe in the form of a fine spray, and, assuming that the temperature does not fall in any part between the carburetter and the engine, these particles will be carried forward into the engine cylinders, and there rapidly compressed and ignited in the suspended form in the presence of a partially carburetted air.

"There is a limit as to the amount of suspended fuel which may be utilized in this manner, for we find that a point is reached when certain particles will be carried right through the engine system, and if the exhaust is trapped and condensed we find portions of unburnt fuel here which have been carried through in the manner indicated.

"Turning now to a totally different fuel, we will consider tar benzol. Now this fuel has a much smaller range of boiling points than either of those previously referred to, namely, between 50 and 150 degrees C. for 90 per cent. benzol. It is obvious, therefore, that a fuel with boiling points within these limits will be very volatile, and, as far as carburation is concerned, will give no trouble at all in the ordinary apparatus designed for petrol, with the exception, of course, that, owing to its higher specific gravity, namely, .875, a slight modification in the float chamber, such as the addition

sary in order to keep the petrol sufficiently high in the jet.

"There is one other property of these fuels which becomes very useful to notice in testing, and which has a direct bearing upon the fractional distillation, and that is the rate of evaporation of standard small specimens of these fuels under different conditions. The writer has made a practice of testing all these types of fuels by means of air currents of different velocities and temperatures passed over strips of white paper which are held against the light. It is then easy to see exactly when the particular fuel has completely disappeared as the light at that moment appears with equal intensity right across the paper in the nature of a grease spot photometer. In this manner the behavior of the petroleum spirits of specific gravity of .710 and .760 and the 90 per cent. benzol, as will be gathered from a perusal of the following table:

Evaporation Table.

Air Velocity	Temp. of Air.	Fuel.	Time of Evap.
Still .....	75° F.	A	85
		B	90
		C	75
200 ft. a minute..	80° F.	A	35
		B	38
		C	38
320 ft. a minute..	130° F.	A	25
		B	25
		C	30
460 ft. a minute..	145° F.	A	21
		B	20
		C	21

A = .715 s.g. Shell.

B = .760 s.g. Borneo.

C = .875 s.g. 90 per cent. Benzol.

"In order to anticipate what one might expect to obtain from different fuels of the same class, that is, produced from the same source, it is as well to compare them from a standard basis, and for this reason the

$E^V$

writer has constructed his ——— formula, 1,000 C.

so that this might be done, and, when this value is found for any particular fuel, it then becomes a fairly easy matter to deduct what one ought to find in practice as the fuel consumption for various car speeds. It does not necessarily follow that different fuels compare directly as to their values under this formula. That is to say, differences of speed are sometimes more marked, and the formula in some cases exaggerate the actual relative effects of certain fuels.

"Taking the heavier petrols now, the following table gives some results of the writer's experiments, and shows that the Borneo .760 spirit gives a greater all-round

efficiency in burning than does either the lighter or heavier spirit. This can be accounted for in the following way. The .760 spirit, as has been before shown, contains fractions which distill over the same range of temperature as the .710 spirit, but, owing to a greater percentage of carbon present in this spirit than in the lighter or American spirit, it is enabled to take up more air, and, owing to its greater weight, a gallon of the heavier contains more thermal units than the lighter spirit.

Commercial	.710	s.g.
Borneo	.760	
Borneo	.770	
Borneo	.780	
Pratt's	.710	1 vol. }
Paraffin	.810	1 vol. }
Benzol	.875	1 vol. }
Borneo	.760	1 vol. }
Benzol	.875	5 vols. }
Borneo	.760	2 vols. }
90 per cent. Benzol	.875	

"Going on to the next fuel, viz., s.g. .770, this was a mixture in equal proportions of the .760 and .780, and here, of course, we find traces of the heavier fractions contained in the .780. It is evident, therefore, that some of these heavier fractions were not consumed as readily as they might have been, and particularly was this noticeable when the engine was running at a slower speed, and, consequently, the mechanical action of the jet was less violent, and therefore did not break up the liquid into so fine a spray as was the case when running at a higher speed. This effect was even more marked when the .780 spirit was used alone; in fact, to such an extent that some of the steeper hills were only ascended with difficulty, the carburetter being without a hot jacket. Figures are shown in the table which give results of very lengthy experiments with mixtures like spirit and paraffin, which were referred to at the beginning of this article. It will be seen that the addition of the paraffin by equal volume increased the mileage per gallon from 18 to 19.5. This was, no doubt, due to the greater weight of mixture per gallon, but it was noticeable that there was a certain amount of waste owing to insufficient heat being applied to the carburetter, also to misfiring at certain engine speeds causing blowbacks in the carburetter, but the results generally were highly satisfactory for such a mixture.

"Following these experiments with fuels of the petroleum base, a number were carried out with the commercial 90 per cent. tar benzol in its ordinary state and also mixed with other fuels, such as alcohol and petrol. Now, with regard to the mixing of benzol and petrol, it is interesting to note what exactly occurs. To illustrate this, two bottles, each containing one of these fuels

at a temperature of 60 degrees F., may be taken, the temperature of the room at the time being 62 degrees F. Now, on pouring an ounce of petrol into a breaker its temperature at once rises to 62 degrees F. An ounce of benzol is now added—the temperature immediately drops to 56 degrees F.

"The whole body of the liquid at once becomes cloudy, and remains so for some ten minutes, the temperature meanwhile gradually rising to 59 degrees F. At this point the liquid commences to clear from

E = miles per gallon.	V = miles per hour.	C = gallons per hour.	Brew- er's equiva- lent.
18	21	1.17	6.8
20.5	22	1.07	9.35
19.5	22	1.13	8.4
19	19	1.0	6.9
19.5	20	1.03	7.6
22.0	20.0	0.91	9.7
25	20	0.8	12.5
26	20	0.77	13.6

the top downwards, and it is noticeable that the temperature of the cleared or upper portion is two degrees higher than that of the clouded portion. When the total mixture became cleared the temperature was again that of the room, i. e., 62 degrees, and apparently the mixture was homogeneous.

"The table gives results of tests, first of benzol and Borneo .760 spirit in equal proportions, and consequently with a large proportion of benzol and Borneo spirit, namely, five volumes to two. These show that, as the proportion of benzol is increased, there is a marked increase in the fuel efficiency, until we arrive at the point when pure 90 per cent. benzol is used. The results of the benzol tests were most satisfactory in every way, and no difficulty was found at any time in starting from cold, nor was there any difficulty in obtaining a very fairly satisfactory complete combustion. Naturally care has to be exercised in order to allow a sufficiency of air, but in the carburetter which the writer uses in his experiments there is an adjustable air inlet right at the top of the jet, which makes this quite a simple matter. Benzol contains about 150 grains of sulphur compounds per gallon, and the presence of this invariably produces an unpleasant odor in the liquid and in the exhaust gases to a very slight extent, and it is somewhat difficult to nullify it by the addition of an aromatic oil. Crude benzol contains 163,680 British thermal units of heat per gallon, as against 157,142 B. T. U. for petrol, and has an explosive range, when mixed with air, of from 2.7 to 6.3 per cent., as against 1.8 to 3.5 per cent. in the case of petrol.

"Referring again to the table, it would be as well to point out one instance of the adaptability of the formula which is em-

ployed; so, taking a factor of a certain fuel and equating it to ten, we have the following results, which agree very fairly with those which have been obtained in actual practice upon the open road with that particular value:

#### Speed and Fuel Consumption.

Fuel Factor = 10.

E = miles per gal.	V = average miles pr. hr.
16	39.0
17	34.7
18	30.9
19	27.8
20	25.0
21	22.7
22	20.6
23	18.9
24	17.4
25	16.0

"The factor ten which is employed in the working out of the above table is that which applies to the .760 Borneo spirit, and by adapting this method to any particular fuel the use of the system becomes apparent.

"Since the writer made these experiments, several others who are interested in the same subject have been experimenting or financing others to do so, and their results agree generally with those which have been here and in other technical journals set out from time to time under his name. The necessity for such work became apparent owing to the acute state of the petrol market, and it is owing to work such as this that a good deal of the stress has been removed, and that prices have been somewhat easier, as other fuels have been shown to be suitable for use for motor car purposes."

#### White to Try Gasolene-Steam Motors.

Working upon the theory that the limiting altitude to which aeroplanes can attain is determined by the working of the engine, it is stated that the White Company has undertaken the development of a combination gasolene and steam engine. As carburetter difficulty usually is experienced at very high altitudes because of the rarification of the atmosphere, it is understood that an attempt is being made to combine the principles of internal and external combustion in a form of duplex motor. Several Antoinette monoplanes were purchased in England some time ago and shipped to the Cleveland factory for experimental purposes, while Hubert Latham, the well-known birdman, is said to have been engaged to take part in the work.

#### Miller's Catalog in New Dress.

Charles E. Miller, the New York supplyman, has issued his 1911 advance catalog. It contains 114 pages describing and illustrating most of the varied line of accessories which he handles, and is characterized by a new and nifty cover in colors, depicting a scene in which motor car, motor boat, motorcycle and aeroplane are brought into happy proximity.

**MOTORS THAT LIGHTEN FARM WORK**

**Two Instances of How They Were Employed for the Purpose—Grind Corn and Saw Wood.**

While considerable effort is being expended in the development of a special type of motor tractor and portable power plant combined to perform the varied operations about the farm for which power is

fit is not only portable but self-propelling and applicable in a variety of different ways add considerably to its usefulness.

**Connecticut Produces 81-Year Old Motorist.**

Abram Cochran, of Elmer, N. J., the 80-year old motorist who claimed the "age honors" and who said he had been "looking for a man of his age who is operating a motor car, but had been unable to find one," can find the sought-for man in Hartford, Conn. He is C. S. Davidson, who

POWER ON THE FARM—DURVEA BUGGYAUT GRINDING CORN

required, for the needs of the average farmer possessed of everyday ingenuity, the ordinary motor car may be made to do multiple duty, the limit of its applicability usually being the limit of his genius. Instances in which the modern substitute for the horse has been put to work while its predecessor would have required to be resting in the stable are numerous, but two recent cases in point furnish the subjects for the accompanying illustrations.

In the first, the owner of a Durvea Buggyaut has applied it to the useful, if prosaic, task of grinding corn. The right rear wheel has been removed, the rig being firmly jacked up and braced against rolling, and a round belt run from the regular driving sheave on the end of the crank shaft to the portable mill on the barn floor. To set up the power plant in this fashion probably required fully five minutes!

In the other illustration the Oregonian possessor of a Brush runabout is engaged in the prosaic occupation of sawing wood, though in a more rapid as well as less picturesque fashion than ordinarily is conjured up by the expression. A simple device for clamping a belt pulley on the left rear wheel, the driving belt, the jack under the axle and the saw table are all the paraphernalia required to convert "everyman's car" into anybody's sawmill. That the out-

POWER ON THE FARM—BRUSH RUNABOUT SAWING WOOD

writes the Motor World that he is 81 years of age and has "operated and cared for his cars for the past six years." Mr. Davidson is a machinist and adds that the runabout he is now driving is better today than when he bought it three years ago.

**REMOVING RINGS FROM PISTONS**

**The Right Way to Go About It to Avoid Breakages—Importance of First Loosening the Rings.**

Careful use of a wooden mallet or a block of hard wood held against the part and struck lightly with a hammer will go far toward reducing the annoyance and expense of piston ring breakage incident to the overhauling of a motor. Many rules have been given for removing and replacing these rings, but none can be applied satisfactorily that does not provide for loosening the ring in its slot. Simply prying up the ends will not serve the purpose; as often as not, it will cause the ring to break.

After the ring has been loosened by tapping it on all sides in the manner indicated it may be removed by any one of several methods, usually with little difficulty.

A very quick and easy way to remove the rings from the piston is with the use of three pieces of tin or thin sheet metal, a screw driver, a hard wood block and a pair of ring tongs. The strips of tin should be cut according to the size of the piston, sufficiently long to be handled right. The ring tongs are similar to a pair of pliers except that they open instead of closing when the handles are pressed together, and

the biting ends are chisel shaped to allow being forced into the space where the ring is cut.

After the piston has soaked in kerosene, hammer the rings with a wooden block to loosen them in case they stick. Force the

ends of the tongs between the ends of the ring in the groove and carefully pry them apart. If they are stuck so tightly as to require the use of a screw driver, insert the latter under one end of the ring and when it has a good hold, twist the handle; this will raise the ring under which a piece of the sheet metal is placed. Use the screw driver to pry the ring further along, with the edge of the piston as a fulcrum, and put another metal strip under. Repeat this operation until the three strips are under the ring at about equal distances apart, when the ring should be free of the groove. After the first ring is removed, the rest will come harder, as they are apt to slip into the grooves of the others if the metal strips are not used. After the rings have

### TESTING FUELS FOR TRUCK USE

**Gasolene, Benzol and Alcohol Compared in French Subsidy Trials—Alcohol Fastest, Benzol More Economical.**

As affording an informing comparison between the relative performance of commercial vehicles using different fuels, the statistics of the tri-fuel contest of the French military authorities, held under the auspices of the Automobile Club of France, last summer, are particularly important. The result of the contest was that six makes of cars were added to the list of those subject to the government subsidy plan, where-

relatively low consumptions and high speeds, when judged by the standards of ordinary commercial practice in this country.

By the terms of the subsidy arrangement the owners of the approved makes of car will receive an initial subvention of something like \$600, and an annual allowance of \$200 for three years. The cars that are thus endorsed, as told in these columns at the time of the initial announcement of awards, are the De Dion Bouton, Peugeot, Delahaye, Panhard and Levassor, Berliet and Vinot and Deguingand. The particulars of the performances of each of the successful vehicles are given in the accompanying table, which has been converted to United States measure. As compared with

TABLE SHOWING RESULTS OF FRENCH MILITARY TRI-FUEL CONTEST FOR TRUCKS

been removed and thoroughly cleaned with kerosene, or repaired as the case requires, they may be replaced in the same manner.

#### Marmon Matters Attractively Presented.

Marmon records, Marmon trophies and many of the constructional details of "the easiest riding car in the world" form the basis of the latest literary effort of the Nordyke & Marmon Co., of Indianapolis, Ind., a handsomely printed 16-page pamphlet entitled "Why the Marmon?" In addition to statistics of the racing records made by Harroun and Dawson in the Marmon "32," splendid photographic illustrations of the trophies won by those drivers are shown, and there are enough of them and they are of such varying size and form as to lend even "picture book interest" to the brochure. The answer to the question which forms the caption of the booklet is to be found in the text, and the explanation doubtless will prove of value to all interested in automobiles whether for racing or for conservative touring.

by these owners will receive a regular revenue from the Ministry of War. The figures of the 16 winners, distributed among the half dozen manufacturers, which only just have come to light, reveal striking consistency, and a surprising agreement in the consumption of the three fuels used in the test.

Under the conditions of the trials the machines, under load, were driven a total of about 1,570 miles subject to standard endurance run restrictions. Gasolene and Benzol were used for portions of the route aggregating 560 miles in each case, respectively, while for the remaining 450 miles of the total distance carburetted alcohol was employed. By this means a standard method of comparison for the fuels was established, and at the same time the suitability of the various motors to work under varying fuel conditions also was demonstrated. The remarkable uniformity of the average results, both in respect to mileages per gallon of fuel and average rates of speed is none the less important than the

the results obtained by the unsuccessful competitors, it is important to note that in some instances the latter developed better fuel economy. In such cases, however, lower average rates of speed and smaller load-carrying capacity served to offset the advantage gained by the consumption of smaller quantities of fuel.

#### The Story of Selden Summarized.

Coming as it does at the time when the Selden patent case is nearing a final decision, a little booklet just issued by the Selden Motor Vehicle Co., of Rochester, N. Y., is of particularly timely interest. "The Story of Selden and the Selden Car," it is called, and it tells in a brief way of the life of George B. Selden, his ambitions, his experiments, his trials and the final realization of his prophecy made 30 years ago. A condensed description of the 1911 line of Selden cars, together with illustrations of two of the latest types and specifications of these and three others are included in the booklet.

# Road Improvement from the Expert Viewpoint

How vast is the work being accomplished in the improvement of highways in the United States is difficult for the layman to appreciate, more especially for the reason that his vision usually is confined to the relatively few miles of roads with which he has been personally familiar long enough to have witnessed the transformation. In reviewing the technicalities of the work that has been accomplished already, Major W. W. Crosby, of Baltimore, in a paper read before the recent Good Roads convention in St. Louis, indicated that the development has not been confined solely to the roads. The modern highway is the creation of the modern highway engineer, and while, as Major Crosby was ready to admit, some of the practices of the American engineers are not up to the best practice, in some others the road builders of this country are, to use his own words, "far ahead of the rest of the world."

"Since 1894, when the states of Massachusetts and New Jersey began their modern road construction, the development of such work in this country has been rapid," said this authority by way of historical outline. "New Jersey had first provided for state aid in highway improvement by an act passed in 1891, but this was inoperative from various causes until June, 1894, when work was begun. Connecticut began in 1895; Maryland in 1896; New York in 1898; and other states have followed from time to time until now, in 1910, over thirty are engaged in this work."

"When the work began in this country skilled highway engineers were scarce. Macadam quite naturally was the 'Mentor' of the engineers attempting highway work—his predecessors, Tresaguet and Telford, being overlooked."

"The Massachusetts authorities seemed to comprehend, perhaps most clearly, the principles laid down by Macadam and all their work has been based on these axioms. Of course, differing conditions, new machinery and varying requirements compelled some changes in the application of the principles, but the latter were as closely adhered to as possible under the conditions. The results show plainly that Massachusetts was particularly fortunate not only in the broadmindedness and farsightedness of her men in charge of the work, but also in the clearness with which they understood the principles at the bottom of macadam construction. . . .

"In the matter of culverts and bridges it was early recognized that the more permanent forms of construction were the more desirable from every point of view.

At that time reinforced concrete was scarcely known here. The attempt was made to use brick and stone masonry as far as possible, though considerable steel work seemed necessary in most cases of over four feet span, owing to the cost of masonry arches. With the advent of reinforced concrete the ability of the engineers to still further reduce the use of perishable steel trusses and girders was greatly increased, and the opportunity was immediately seized.

"At first in the use of concrete too little thought was given to the appearance of such structures. As their permanency impressed itself, and with the growing appreciation of the value of considering the aesthetic side of highway work, much improvement in the design of such structures has resulted. There is room, however, for further improvement, and the engineers of this country would do well to study the examples set in this matter by the foreign authorities."

"In the matter of road surface construction the best practice in the states is away in advance of the foreign. In the variety of materials used, in the development of methods for using the same, and in the recognition of the proper principles to be followed the engineers of the states can give points to the foreign engineers. So far as the writer knows there is but one item of construction on which we should pattern after foreign practice, and that is in the use of machinery."

"Owing to the diversity of our resources and conditions the American road surfaces built offer an immense variety of results. By no means all of them are satisfactory nor, undoubtedly, the best that could have been obtained by better methods. But the variety of materials and conditions has probably, in the short period of their use, interfered with, in many cases, a proper recognition of the best methods of use. Unwise conservatism and adherence to old practices, as well as rash and unjustifiable ignoring of well-established principles, have been naturally followed by failures or unsatisfactory results. The advent of a new material for use on the roads or the conception of a new method, perhaps induced by local conditions, has too often tempted highway authorities and even the younger highway engineers to ignore or abandon the proved principles underlying such work, and to rush after false gods to their own (or others) destruction. . . .

"Stone, broken by hand or by machinery, is probably the oldest and most universal of road surfacing materials. Certain well-developed principles have been established,

concerning its use in macadam, that ought to be so well recognized that their repetition would be trite and unnecessary. The writer regrets that such does not seem the case, and, therefore, feels impelled to state as follows:

"a. The macadam surfacing is but a roof, a wearing surface over the foundation, without which latter it cannot support a load, nor in which can it remedy defects of sustaining power. It is true that to some extent the macadam may effect a distribution over the foundation of the strains coming on the surface of the former, but in the design of the foundation great care should be had in allowing for such distribution."

"b. The macadam should be planned as, and built, separate and distinct from the foundation. Any merging or lack of distinctness between the two, except possibly in the cases of sandy or sand-gravelly foundation can only result in a weakening of the macadam without a corresponding increase in the strength of the foundation."

"c. The particles forming the macadam itself should be packed as closely as possible together. There should be an actual interlocking of the pieces of stone. No macadam is worthy of the name that does not contain this interlocking, and the more perfect the latter is the better will be the macadam. This necessarily means that, in the laying of the macadam, screening to prevent improper proportions or too great variation in the sizes of the pieces being used is required, as are also the spreading and compacting of the stone in layers of only such thickness as the roller can be relied upon to compact to the utmost; the exclusion of such an excess of fine or foreign material from the mass of broken stone as will prevent the proper compactness of the latter; the reduction of the voids in the mass of broken stone to the utmost possible minimum, and the after filling of those voids by finer material to complete the compactness of the mass."

"Only too often has the writer noticed in this country the ignoring of one or more of the principles expressed in the above paragraphs, but he has been impressed with the far more prevalent ignoring of them elsewhere, especially those principles mentioned under 'c.' Good results, where these latter have been ignored, are evidently not worse only because of the maintenance accorded after construction. That the cost of such maintenance could be materially reduced or that better results with the same maintenance could be secured by recognizing the principles mentioned has apparently been lost sight of, with the principles them-

selves, by the foreign engineers. No one who has the opportunity to examine carefully the foreign construction of road surfaces can fail to be impressed with its inferiority compared with that of the best of the states—as it has been styled ‘the McClintock Road.’

“The writer has been regretfully impressed with an apparent tendency, more especially perhaps among novices in road building and with suggested new materials, to ignore in their work the points referred to above. For instance, with the use of pitch compounds (bituminous cements) in road surfacing some sort of results can be secured even if the stone is not thoroughly compacted. Usually, however, as the more experienced engineer fully realizes, the absence of the proper interlocking quickly makes itself manifest—especially in cases where a short-lived cement has been used—and such a surface readily succumbs to severe strains. It of course takes some time frequently to demonstrate the expensiveness of inferior construction, and by that time often the same authorities that were responsible for such construction are chasing new butterflies. . . .

“Some localities are devoid of trap and local conditions may seem to compel the use of even a soft limestone. Undoubtedly this makes a better macadam than many other local stones, and its results may be improved by ‘reversing’ the courses, i. e., by using the No. 2’s in the first course and the No. 1’s in the second course as laid. The results, however, are even then usually inferior to those of the ordinary methods using suitable stone, though the ‘reversed’ macadam may be a locally satisfactory, and indeed necessary, makeshift.

“The writer has even ‘reversed’ excellent trap rock, where severe traffic conditions seemed to call for such a procedure, with satisfactory results by the addition of a bituminous cement. The main objections to a ‘reversed’ macadam are a resulting excessive roughness of surface in ordinary water-bound work, and a tendency of the macadam to ravel. Both of these can be largely overcome by the use of a suitable pitch in the surface. This reversal of the courses seems to violate another principle of ordinary macadam, namely:

“d. The sizes of the pieces of stone forming a course of macadam should be as large as practicable and, at the same time, no longer than will cause them to retain their position in the road despite the ordinary tendencies to dislodgment. The presence of a proper binder may justify the apparent violation.

“Macadam found that a one-inch cube was about the maximum that could be relied upon to retain its position in the road surface under the tilting tendencies of the loads and with the support of the adjacent pieces interlocked with it. It has, in our modern work, been demonstrated that the cementing action of the stone dust may aid

the interlocking somewhat, and under certain conditions considerably. In some cases even as large as the ‘three-inch size’ of soft limestones have done very well in the surface of the road because of their high cementing qualities. In fact, in any macadam, it seems desirable to use a stone whose dust has at least a certain cementing value (a makeshift is the addition of clay, before referred to). Especially is this true under modern traffic.

“Page has shown that the cementing powers of many rocks can be greatly increased by the use of limestone screenings with them, and this has greatly increased the number of available stones. There are many localities, however, where suitable stone is not available, and local conditions require substitutes of various kinds for macadam. Among such may be mentioned gravel, shells, marl, burnt clay, slag, coquina, etc. To the use of these, the principles of ordinary macadam operate in full. The application of these principles has not been as generally careful as might be wished. For instance, in the use of shells, frequently too much reliance has been placed on the mortar formed by the sand and shell dust to hold the shells themselves in place, and not enough compaction has been secured in the shells themselves to secure the best results from them.

“In many instances local conditions have caused the abandonment of macadam entirely and instead the use of block pavements, such as brick, or sheet pavements, such as asphalt mixtures, sand, clay, etc. Some experiments also have been tried with small blocks of both natural and artificial stone. While undoubtedly the variety of experiments has been much greater in this country, it cannot yet be said that all have been successes. Nor have all been failures, by any means. There is much hope for ultimate success in perhaps the majority of cases.

“For the greater part of the modern highway work in this country macadam can still be considered as a standard surfacing. The writer does not consider that macadam loses its character as much by the mere substitution of a bituminous cement for the mineral colloidal cement of earlier results. When, however, the before-mentioned principles of macadam are ignored, especially the one concerning the interlocking of the pieces of stone, he believes the resulting mass is no longer entitled to be called macadam.

Perhaps ‘bituminous concrete’ would apply to such a mass, whose main reliance for integrity under stress must then come from bituminous cement in the mass. If the cement happens to be and remains a strong one, the results may be satisfactory, and perhaps even more so than the best ordinary macadam could provide under the conditions. But they cannot ipse facto be as good even then as if the mass were a real macadam reinforced by the addition of

bitumen to its interstices. The writer believes that the truth of the above will soon be more widely recognized than it is at present, perhaps, and that instead of it being considered that ‘the macadam road is a thing of the past’ it will be acknowledged that properly built and cemented macadam has a greater future than ever before. In fact, until recently vitrified brick, sheet asphalt, and some other pavements were largely used to fill in the gap between ordinary macadam and stone blocks. With the development of a standard bituminous macadam their use is constantly becoming more limited and dependent upon favoring local conditions.

“Page has shown the horizontally shearing effect of the traffic so fatal to the life of ordinary macadam and it was quickly seen by engineers that successful resistance to such shear could be in many cases given to macadam by the addition of some form of bituminous cement. As a corollary, it was also quickly apparent that the supply of available materials for use in macadam was contemporaneously enlarged—another factor tending toward an increase in the use of macadam strengthened by a bituminous cement.

“The fact that under certain conditions the existence of a thin carpet of pitch and sand over the surface of the macadam seems desirable in no way lessens the requirements for proper macadam underneath, and the desirability for such a carpet generally is as yet by no means satisfactorily proved. However, it may be expected that valuable evidence will be forthcoming on this, as well as on numerous other points now in question, in the near future, and in the production of such evidence again the engineers of this country are leading by months, if not years. The ‘standardization’ pleaded for by a prominent English engineer in the spring of 1910 was actually begun a year earlier in the United States. Such standardization is undoubtedly the now most pressing consideration for us. We are at work upon the question in advance of the rest of the world and will undoubtedly soon accomplish conclusions of benefit to all.

“Highway engineering is no longer the work of a skilful, if ignorant, laborer; it has become an intricate science calling for deep thought and high art to meet successfully the demands on its followers. The engineers of this country have above all others responded successfully to these demands in greater variety and profusion of results. They have fallen behind on one point alone. We have not, as a whole, as yet, be it from lack of sufficient demand and opportunity; be it from lack of popular appreciation and support; or from even lack in ourselves of proper recognition of our duty, developed a system of maintenance—a regard for maintenance approaching the foreign or beginning to meet our needs.”

## "LEAGUE'S" CHARTER IN DANGER

Buffalo Institution Catches a Tartar in Pennsylvania—Testimony Taken by New York State Officials.

After pursuing an interesting course for several years, the so-called International Automobile League of Buffalo, N. Y., at last has been backed against the wall and is fighting for its existence. On the complaint of H. C. Smith, a Pennsylvanian who did not enjoy his dealings with the "league," proceedings have been instituted looking toward an annulment of its New York charter. Testimony in the case was taken at Albany last week, a number of tradesmen being called to give evidence.

The International Automobile League is one of the very numerous family of private partnerships and corporations which prefer to operate under such apparently unselfish and suggestively uncommercial titles and which make a business of selling stock or "subscriptions," the purchase of which is supposed to entitle the buyer to reduced prices on about everything the market affords. If they fulfilled even half of their promises most of the legitimate dealers and accessory houses would have to shut up shop. The Buffalo "league" has been particularly bold and particularly prolific of promises and printed matter, and on several occasions has been in hot water with its members because of failure to deliver goods according to its professions.

It long had operated under the style the International Automobile League, but some four months ago there was incorporated under the laws of New York the International Automobile League Tire & Rubber Co., capitalized at \$1,000,000, in which A. C. Bridwell, W. Priess and C. H. Bowe figured as the incorporators.

### Houpt Parts from the Houpt-Rockwell.

Harry S. Houpt, secretary and manager of the Harry S. Houpt Mfg. Co., makers

of the Houpt-Rockwell car, has resigned that office and retired entirely from the affairs of the company. The car which is made by the New Departure Mfg. Co., of Bristol, Conn., takes its name from Mr. Houpt and President Rockwell of the New Departure company, which controls the Houpt company.

### Field Going from Tires to Rambler Cars.

Harry E. Field, vice-president and general sales manager of the Hartford Rubber Works Co., has resigned those offices to become president of the Rambler Automobile Co. of New York; his resignation, however, will not become effective until January 1st next. The Rambler company is the eastern branch of the T. B. Jeffery Co., and his new duties will give Field the management of the Jeffery interests in all of the territory east of Buffalo and Pittsburg, including New England and the South Atlantic states. Field has been identified with the Hartford Rubber Works for some six years, his unusual ability as a branch manager causing him to be called to the factory, where also he made his mark. He has been close to President Anderson and to the officials of the Rubber Goods Mfg. Co., the parent company, and they are free in their expressions of good will and regret that Field is to go elsewhere. "You can say nothing too good of Field," is the way Mr. Anderson summarized the opinion. Field has traveled from Maine to California and consequently is widely known in every direction.

### Offer Made for Croxton-Keeton Assets.

The trustee of the bankrupt Croxton-Keeton Motor Car Co., Canton, Ohio, has been offered \$50,000 for all of the property and assets, except the cash in hand and in bank, the purchaser already having made a deposit of \$5,000 as a guarantee of good faith. The offer will be considered at a meeting of the creditors in Canton on Monday next, 12th inst., the call for the meeting having been issued by A. M. McCarthy, the referee in bankruptcy. It is likely that the bid will be accepted.

## RECEIVER TAKES CHARGE OF PARRY

Indianapolis Company Admits Its Insolvency and Court Acts Promptly—Failure was Not Unexpected.

The Parry Automobile Co., of Indianapolis, Ind., went into the hands of a receiver on Saturday last, 3d inst. The action was taken as the immediate result of a petition filed by the Webster & Parks Tool Co., whose claim amounted to \$327.15, but it was in no wise a surprise, as it was well known that the Parry company had been skating on thin ice for some time, and its failure had been expected and discounted in advance; in fact, Judge Carter, of the Superior Court, who at once named the Union Trust Co., of Indianapolis, as receiver, had been notified that the petition was to be filed and was awaiting it.

The Webster & Parks Tool Co.'s claim is but one of a large number of debts and was selected as the one most convenient to bring matters to a head. The petition alleged that the Parry company was in imminent danger of insolvency and the company was quick to admit the truth of the allegation. Its board of directors had met on Friday and agreed that the appointment of a receiver was the best way out of its troubles. Its liabilities are placed at about \$250,000; its assets are not stated.

The Parry Automobile Co. is capitalized at \$1,000,000, and was organized in July, 1909, and the fact that D. M. Parry, its moving spirit, long had been conspicuous in the buggy business and also had acted as president of the National Association of Manufacturers, served to give the automobile company quick recognition. It was not, however, Mr. Parry's first venture in the automobile industry. Previously he had been the chief figure in the Overland Automobile Co., which, however, became crippled when some of Parry's personal investments in traction and other enterprises turned out unfavorably. It was then

that John N. Willys and his associates threw themselves into the breach and by heroic work obtained control of the Overland company and not only saved it from going to smash but caused it to grow and flourish as it never had flourished before. When Mr. Parry caught his second breath he formed the Parry Automobile Co., and though it at one time employed as many as 600 men its health has been more apparent than real. Officially its failure is ascribed to the "general condition of the automobile business," but lack of ready cash, the cause of most embarrassments, is nearer to the real reason. An effort will be made to reorganize and continue the business.

#### Matlack Becomes Ajax-Grieb's Manager.

J. C. Matlack, one-time president of the International Rubber Co., and later vice-president and general manager of the Michelin Tire Co., which took over the International factory at Milltown, N. J., has been made secretary and general manager of the Ajax-Grieb Rubber Co., in which capacity he will greatly relieve President Grieb, who since Horace De Lisser resigned the general management and joined the United States Motor's staff, has been doing double duty. Matlack has had ripe experience not only in the tire business but in the automobile trade itself, having spent some time high up in the General Motors Co.

Before the motor car appeared on the scene he for years was prominently identified with the bicycle trade. He is a man of strong personality, as one of the stories related of him serves to indicate. At one time in his career he was supposed to be the one of the chief lieutenants of a captain or sub-captain of industry who was not only the "whole thing" but who left no doubt of it whenever discussion or question arose. Matlack stood that sort of thing until he could stand it no longer. He tendered his resignation orally and in somewhat unusual fashion.

"You don't need me here," he quietly remarked to the "whole thing" when that worthy one day was, as usual, brushing aside all opinions save his own. "All you want is a man to agree with you and you can get one for very much less than half my price."

#### Fire Excites the Thoroughfare Building.

The Thoroughfare building, at Broadway and 58th street, New York, which houses a large colony of automobile concerns and automobile workers, was full of excitement and smoke on Monday, 5th inst., when fire broke out in the shop of the Dorian Rim Co., on the ground floor. The flames were subdued, however, before much damage had resulted, the rim company, the Oakland Motor Car Co. and the Wheeler & Schebler branch being the chief sufferers.

## CANADA IS STILL GOING STRONG

Continues to Be Biggest Buyer of American Cars—October Another Month of General Export Gains.

Continuing the prolonged upward movement of automobile exports, the figures for October, 1910, show a gratifying increase over those for the same month of the preceding year, the number of exported cars being 539, valued at \$647,785, as against 338 cars, worth 439,326, an increase of \$208,459, or 47.4 per cent. The total for the ten months foots up \$11,191,638, as against \$6,622,626 for the corresponding period of 1909.

With the exception of Great Britain and France, gains were made in all of the Government's 12 geographical divisions during October. The greatest individual advance again was made in Canada, which took \$284,612 worth of cars, as against \$157,314 in the same month of 1909, a gain of 80.9 per cent. The greatest proportional increase, according to the table, is recorded in the exports to Germany, where \$23,250 worth of American cars were sold in October of this year, as compared with \$3,154 in the same month of 1909. This extraordinary gain of 635.9 per cent, however, is due to the fact that the shipments during October, 1909, were unusual in that but one car actually was sent there. The greatest bona fide gain, proportionately, is shown by British Oceania, which took \$79,219 worth during October, 1910, as against \$30,226 in the same month of 1909, an increase of 162.1 per cent.

The figures for the ten months ending October, 1910, show corresponding heavy gains over the same period of the preceding year, the increase, \$4,569,012, amounting to 68 per cent. With the sole exception of France, every one of the divisions took a greater number of cars than in 1909, Canada heading the list with total purchases of \$4,442,383, an increase of more than 100 per cent. Other Asia and Oceania record the greatest proportional gain, 227 per cent. The report in detail:

#### To Form New Independent Association.

According to the promoters of the Grand Central Palace show in New York, an organization of "independent" automobile manufacturers, to be styled the National Association of Motor Car Manufacturers, will be permanently organized next week. They say that a temporary organization was effected at a meeting held last month in Hotel Belmont, New York, but that no announcement was made because details were not then perfected. Part of the plan in view includes taking over the management of the Palace show, the fostering of independent trade bodies and the promotion of shows in the larger cities for the benefit of the independent local dealers. In general, it is expected that the new association will replace the American Motor Car Manufacturers' Association, which formally dissolved last February, when most of its members entered the Association of Licensed Automobile Manufacturers.

#### Tire Exports Now Attaining Importance.

In sympathy with the remarkable growth of automobile exports, the shipments of tires have attained sufficient volume to justify their inclusion in the Federal statistics, which for the four months from July to October last, inclusive, show the value of shipments to have been \$735,579, of which \$535,071 represented automobile tires. It was only in July last that the record of tire exports was separated from that of other rubber productions. During the month of October itself the tire shipments attained a value of \$107,257, of which \$103,788 represented automobile tires.

#### Fire Destroys New York Body Factory.

The carriage and automobile body factory of Charles Barry, at 154 East 57th street, New York, was destroyed by fire Thursday afternoon last, 1st inst. The loss is about \$50,000. The fire was caused by gasoline and the flames spread so quickly and were so fierce that several employees were cut off and two were injured in jumping from a window. Opposite the factory stands the Yorkville prison, and precautions were taken to prevent escapes.

**387 EXHIBITS FOR GARDEN SHOW**

**Space Found for Record-Breaking Number of Exhibitors—Who They Are and Where They Will be Located.**

Promising to break all records for Madison Square Garden automobile shows, the eleventh annual exhibition to be held there, under the auspices of the Association of Licensed Automobile Manufacturers, which will open on January 7th next, will reveal a 25 per cent. increase in the number of exhibitors and almost a 30 per cent. increase in floor space, as compared with the Garden show of last year. There will be a total of 387 exhibits in all, of which 67 will be devoted to complete cars and 320 to accessories and parts. In the exhibition of January 8-15, 1910, 43 displays of complete cars were staged and 267 of accessories—a total of 310. Changes in the arrangement of the Garden this year will render 100,000 square feet of floor space available, or 22,600 more than was necessary a year ago. Among the exhibitors will be found many new names, while for the first time the list of car manufacturers will include a majority of those who formerly were identified with the now defunct American Motor Car Manufacturers' Association. The complete list follows:

**Main Floor.**

1. F. B. Stearns Co.
2. E. R. Thomas Motor Co.
3. Olds Motor Works.
4. H. H. Franklin Mfg. Co.
5. Dayton Motor Car Co.
6. Oakland Motor Car Co.
7. Lozier Motor Co.
8. Elmore Mfg. Co.
9. Winton Motor Car Co.
10. Locomobile Co. of America.
11. Hudson Motor Car Co.
12. Mitchel-Lewis Motor Co.
13. Stevens-Duryea Co.
14. Packard Motor Car Co.
15. Buick Motor Co.
16. Cadillac Motor Car Co.
17. Willys-Overland Co.
18. Reo Motor Car Co.
19. Peerless Motor Car Co.
20. Pierce-Arrow Motor Car Co.
21. Chalmers Motor Co.
22. Maxwell-Briscoe Motor Co.
23. E-M-F Co.

**Exhibition Hall.**

50. Daimler Import Co.
51. Mercer Automobile Co.
52. Moon Motor Car Co.
53. Simplex Motor Car Co.
54. Corbin Motor Vehicle Corp.
55. Nordyke & Marmon Co.

**Elevated Platform.**

101. Knox Automobile Co.
102. American Motor Car Co.
103. Matheson Motor Car Co.
104. National Motor Veh. Co.
105. Selden Motor Veh. Co.
106. Buckeye Mfg. Co.
107. Moline Automobile Co.
108. Premier Motor Mfg. Co.

109. Pullman Motor Car Co.
110. Pope Mfg. Co.
111. Jackson Automobile Co.
112. Brush Runabout Co.
113. Hotchkiss Import Co.
114. Haynes Automobile Co.
115. Royal Tourist Car Co.
116. Metzger Motor Car Co.
117. Autocar Co.
118. Columbia Motor Car Co.
119. American Locomotive Co.
120. Garford Co.
121. Waltham Mfg. Co.

**Elevated Platform.**

122. Goodyear Tire & Rubber Co.
123. Whitney Mfg. Co.
124. Veeder Mfg. Co.
125. Hartford Rubber Wks. Co.
126. Badger Brass Mfg. Co.
127. B. F. Goodrich Co.
128. Diamond Rubber Co.
129. C. F. Splittdorf.
130. Gray & Davis.
131. G & J Tire Co.
132. Morgan & Wright.
133. National Carbon Co.
134. Light Mfg. & Foundry Co.
135. Baldwin Chain & Mfg. Co.
136. Phineas Jones & Co.
137. A. O. Smith Co.
138. National Tube Co.
139. Diamond Chain & Mfg. Co.
140. Jones Speedometer Co.
141. N. Y. & N. J. Lubricants Co.
142. C. A. Mezger, Inc.
143. Weed Chain Tire Grip Co.
144. Continental Rubber Wks.
145. Wheeler & Schebler.
146. Pennsylvania Rubber Co.
147. Remy Electric Co.
148. Consolidated Rubber Tire Co.
149. Randall-Faichney Co.
150. United States Light & Heating Co.
151. Republic Rubber Co.
152. Conn. Tel. & Elec. Co., Inc.
153. Chandler Co.
154. Columbia Nut & Bolt Co., Inc.
155. Coes Wrench Co.
156. Hartford Suspension Co.
157. Edmunds & Jones Mfg. Co.
- 157A. Adam Cooks Sons.
158. Morrison-Ricker Mfg. Co.
159. J. H. Lehman Mfg. Co.
161. Chas. E. Miller.
162. A. W. Harris Oil Co.
163. Standard Roller Bearing Co.
164. Firestone Tire & Rubber Co.
165. Oliver Mfg. Co.
166. Timken Roller Bearing Co.
167. Timken-Detroit Axle Co.
168. Pittsfield Spark Coil Co.
169. Spicer Mfg. Co.
170. Brown-Lipe Gear Co.
171. Swinehart Tire & Rubber Co.
172. Warner Instrument Co.
173. J. H. Williams & Co.
174. Kokomo Electric Co.
175. Warner Gear Co.
176. Standard Welding Co.
177. American Ball-Bearing Co.
178. Fisk Rubber Co.
179. A. R. Mosler & Co.
180. Gabriel Horn Mfg. Co.
181. Castle Lamp Co.
182. Joseph Dixon Crucible Co.
183. Valentine & Co.
184. Heinze Electric Company.
185. Vacuum Oil Company.
186. Briscoe Mfg. Co.
187. Wm. Cramp & Sons Ship & Eng. Bldg. Co.
189. R. E. Dietz Co.
190. Herz & Co.
191. S. F. Bowser & Co., Inc.
192. The Pantasote Co.
193. Springfield Metal Body Co.

**Balcony.**

201. Inter-State Automobile Co.
202. Ohio Motor Car Co.
203. Palmer & Singer Mfg. Co.
204. Kissel Motor Car Co.
205. Hupp Motor Car Co.
206. Chadwick Engineering Wks.
207. Speedwell Motor Car Co.
208. Regal Motor Car Co.
209. W. H. McIntyre Co.
210. Marquette Motor Co.
212. Pierce Motor Co.
213. Flandrau Motor Car Co.
215. Midland Motor Co.
217. Courier Car Co.
218. Simplex Automobile Co.
219. Atlas Motor Car Co.
221. Cartercar Company.

**Balcony.**

222. Ajax-Grieb Rubber Co.
223. Columbia Lubricants Co. of N. Y.
224. Bosch Magneto Company.
225. Michelin Tire Company.
226. Lovell-McConnell Mfg. Co.
227. Elec. Storage Battery Co.
228. Continental Caoutchouc Co.
229. Eiseemann Magneto Co.
230. Stewart & Clark Mfg. Co.
231. Empire Tire Co.
232. Thermoid Rubber Co.
233. Vesta Accumulator Co.
234. New Departure Mfg. Co.
235. Link-Belt Company.
236. Hoffercker Company.
237. Lebanon Steel Casting Co.
239. Apple Electric Co.
240. Turner Brass Works.
241. Auto Improvement Co.
242. American Ever Ready Co.
243. Stromberg Motor Devices Co.
244. Muncie Gear Works.
245. Gemmer Mfg. Co.
246. Excelsior Motor & Mfg. Co.
247. Warner Mfg. Co.
248. Motz Clincher Tire & Rubber Co.
249. Miller Rubber Co.
250. Livingston Radiator & Mfg. Co.
251. Star Rubber Co.
252. Royal Equipment Co.
253. Driggs-Seabury Ordnance Corp.
254. Cleveland Speed Indicator Co.
255. H. W. Johns-Manville Co.
256. Stein Double Cushion Tire Co.
257. Edison Storage Battery Co.
258. J. Ellwood Lee Co.
259. Cooks Standard Tool Co.
260. George A. Haws.
261. Homo Co. of America.
262. E. B. Van Wagner Mfg. Co.
263. Seamless Rubber Co.
264. R. T. Hardy Co.
265. L. C. Chase & Co.
266. National Coil Co.
267. J. H. Sager Co.
268. Auburn Auto Pump Co.
269. Briggs & Stratton Co.
270. C. A. Shaler Co.
271. C. Cowles & Co.
272. Gilbert Mfg. Co.
273. Noera Mfg. Co.
274. Globe Machine & Stamping Co.
275. Leather Tire Goods Co.
276. The Carpenter Steel Co.
277. Witherbee Igniter Co.

**Balcony.**

278. Batavia Rubber Co.
279. Manufacturers Foundry Co.
281. Atwater-Kent Mfg. Wks.
282. McCue Co.
283. Parker Motor Co.
284. Muncie Wheel Co.
285. Crucible Steel Co. of America.
286. Standard Thermometer Co.
287. Isaac G. Johnson & Co.
288. Russell Motor Axle Co.

291 Briggs Mfg. Co.  
 292 Stevens Mfg. Co.  
 293 Orlando W. Young.  
 294 Kellogg Mfg. Co.  
 295 Newark Rivet Works.

#### Concert Hall.

301 Sprague Umbrella Co.

#### Morgan Reorganization is Under Way.

The differences between Blake & Johnson, of Waterbury, Conn., and the R. L. Morgan Co., of Worcester, Mass., which led to the serving of an attachment on the latter and the placing of a keeper in its truck factory, have been amicably settled. The keeper, of course, has been removed and the plans of the Morgan company for reorganization and general expansion are now well under way.

The first step in this direction, as the Motor World stated two weeks ago, was the election of Clair Foster, of New York, to the presidency of the truck company, and it now is known that the rest of the make-up is as follows: Vice-president, Ralph L. Morgan; treasurer, Henry E. Whitcomb; secretary, Henry B. Leary, the latter of whom is a New York attorney. These gentlemen with the following compose the board of directors: Frederick Phillips, John H. Bradley and Thomas Greenwood, all of whom are identified with strong industrial institutions in Worcester.

While Carl H. Page, of New York, whose name reports linked with the reorganization of the Morgan company, is not a member of that corporation, it transpires that his firm, Carl H. Page & Co., has been appointed sole selling agent for the Morgan trucks.

#### Buick Fails to Oppose Big Judgment.

On Wednesday of last week, 30th ult., judgment for \$15,572.76 was entered in New York against the Buick Motor Co., of Flint, Mich., in favor of the Fuchs & Lang Mfg. Co., of New York. The papers in the case show that the amount represents unspecified merchandise delivered to the Buick company between July 23, 1910, and Sept. 29, 1910, for which that company refused to pay. Service was made at 103 Park avenue, New York, on Curtis R. Hatheway, as the representative of the Buick company, which failed to demur within the legal time limit of 20 days, and a special extension of the same period. Despite the fact that the judgment is in its favor, the Fuchs & Lang Mfg. Co. politely declined to give any information whatsoever regarding the transaction, when information was sought by the Motor World.

**In the Retail World.**

George W. Shoemaker & Co. is the style of a new firm in Gaston, Pa. It is located at Union Square and South Main street.

Charles Hildebrand, who conducted a garage in Green, Ia., has sold out to J. N. Neal, who will continue the business under his own name.

F. K. Barnes is building a garage on 1st street, Hopkinton, Ia., where he will install a renting service in addition to the sale of Overland cars.

At a cost of \$35,000 a garage is being built at the corner of Lansdowne and Franklin streets, Boston, Mass. It will be occupied by Seward & Crane.

Charles E. Bergstroem, of Worcester, Mass., is building a garage at the corner of Vine and Cherry streets. The structure will be of brick, one story high.

Charles Gardner, of York, Neb., has purchased the garage of L. M. Lincoln in the same town. He will establish a renting service in addition to doing general garage work.

Lundell & Johnson, owners of a garage in Taylor, Tex., have discontinued partnership. Arthur Lundell has bought out his partner, and will carry on the business under his own name.

Dr. A. O. Faulkner, of Lincoln, Neb., has purchased the property at 1428 N street for a consideration of \$10,000. He will erect thereon a fireproof garage for electric vehicles exclusively.

Thomas Maher and L. H. Honeywell, of Pittsburg, Pa., are building a garage in Plymouth, Pa. They will do business under the style of the Plymouth Motor Car Co., at 35 Hanover street.

Ground has been broken for a one-story, brick and concrete garage, to be erected at 331 West Main street, Louisville, Ky. The Urwick Machinery & Supply Co. will occupy it when it is complete.

The Binghamton Motor Car Co., of the New York town of the same name, moved into more commodious quarters on Water street on December 5th. Charles Hancock, Jr., is the man in charge.

Under the style the Imperial Motor Co., a new concern has been formed in Montreal, Canada. The headquarters of the company are at 709 Berthelet street, and are under the management of N. E. Blood.

The Ware Automobile Co. is the style of a new concern which has established a garage in Ware, Mass. Its headquarters are on Main street, while the garage itself is located on North street. W. C. Wiggin is the manager.

Work is about to commence on the new garage to be erected for Edward B. Reiley, Jr., and James M. Lynch, on Union street, Waterbury, Conn. It will be one story high, 140x37 feet, and will be constructed entirely of brick and steel.

Work has been started upon the garage which is to be erected at the northeast corner of Danforth avenue and the Boulevard, Jersey City, N. J., by George Wacker. The structure is 150x75 feet, of brick, and will cost, when completed, about \$18,000.

Dr. A. C. Moorehead, of Minneapolis, has purchased a large interest in the Electric Carriage & Battery Co., of the Flour City, two former stockholders retiring from active participation in business. The company sells Rauch & Lang electric, and has just opened a garage on Harmon place, near 12th street, where it will display electric-propelled trucks.

Captain F. W. Cole, who a few months ago bought out the Cadillac agency in San Francisco, Cal., and installed his son in the business by arranging for the Cole "30" agency, has purchased the entire business of the Pacific Motor Car Co., agents for the Stevens-Duryea cars. His partner was to have been A. B. Costigan, but the deal fell through, and Captain Cole bought the agency on his own account.

**Maytag-Mason Company is Reorganized.**

Following its removal to Waterloo, Ia., the Maytag-Mason Motor Car Co. has been almost wholly reorganized, a number of new men and considerable additional capital having entered into its affairs. The officers of the reorganized company are as follows: Senator F. L. Maytag, president; Elmer Maytag, secretary and treasurer; O. C. Patte, vice-president; E. B. Hunter, general manager; N. I. Taylor, sales and advertising manager; C. C. Butler, superintendent; William Doods, purchasing agent; C. C. Deeling, engineer. The company has just completed a new foundry, in which they purpose making parts for their own motors, and early next year will erect another building in which they will make their own bodies. In addition to its pleasure car, the Maytag-Mason people will also produce a light delivery wagon for the 1911 trade.

**To Produce Batteries in Los Angeles.**

The Standard Carbon Co. has been organized in Los Angeles, Cal., for the manufacture of the Western Ignitor dry-cell and the Greyhound multiple battery. W. L. Bassett and H. J. Nice, of Minneapolis, Minn., and Dr. Downing D. Nice, of Los Angeles, are the interested men. Their plant will be located at 1151 Stanford avenue.

**Vulcan Gear Works Moves to Pontiac.**

The plant of the Vulcan Gear Works has been removed from Detroit to Pontiac, Mich., some 25 miles distant. At Pontiac it occupies a large brick structure which is one of a group being erected for the Pontiac Motorcycle Co., the Pontiac Foundry Co. and the Pontiac Drop Forge Co., respectively.

**Changes Among Prominent Tradesmen.**

H. N. Powers has been appointed sales manager of the Columbia Nut & Bolt Co., Bridgeport, Conn. Previously he was connected with the Gould Storage Battery Co., of New York.

J. G. Vincent, formerly with the Burroughs Adding Machine Co., has become chief engineer of the Hudson Motor Car Co. of Detroit. While with the Burroughs company, Vincent served as superintendent of inventions.

C. H. Booth, manager of the E-M-F Co.'s No. 3 plant in Detroit, has been promoted to the post of manager of manufacturing of the entire works. He succeeded to the vacancy caused by the tragic death of David Hunt, Jr.

George R. Salzman has resigned the superintendency of the E. R. Thomas Motor Co.'s service department, in Buffalo, to become factory manager for the Simplex Motor Car Co., of Wishawaka, Ind., makers of the Amplex two-cycle car. He assumed his new duties December 1st.

C. W. Dickerson, formerly vice president of the Columbia Trust Co., of Middletown, Conn., and at one time president of the Sterling Cycle Works, of Kenosha, Wis.—the Sterling plant now forms part of the Rambler automobile factory—has become identified with the Timken-Detroit Axle Co.; he has assumed the office of assistant secretary.

**St. Louis Abandons Plan for Annual Show.**

Owing to the inability of the automobile dealers of St. Louis, Mo., to find a building sufficiently large to house the automobile show which was planned to be held in that city in February, the event has been called off. This was decided at a meeting of the St. Louis Automobile Manufacturers and Dealers' Association held last week; and though there was some talk of holding an open-air exhibition later in the year, it ended in conversation.

**Schwarzkopf Opens an Information Office.**

E. E. Schwarzkopf, who recently retired as president of Automobile Topics, Inc., has opened an office in the Buick building in New York. The sign on the door reads: "Automobile Information—Commercial and Technical;" "The Club Journal." The latter publication is the house organ of the Automobile Club of America, which Schwarzkopf edited and published "on the side" while actively identified with Automobile Topics.

**Bretz Removes to Fifty-Fourth Street.**

The J. S. Bretz Co., importer of F. & S. ball bearings, U. & H. magnetos and other productions, has removed from the Times building to Motor Hall, 250 West 54th street, New York. The change permits the company to combine its offices, laboratories and warerooms under the same roof.

## What Does It Cost to Operate a White?

What in your opinion would constitute the best motor car—what is the supreme test of an automobile? One man says one thing, another something else, but may not it all be summed up in "what does it cost to operate?" Doesn't economy in this direction fill all requirements? Surely the car which consistently and continuously costs less for up-keep in the hands of all owners and all drivers must be an expression of the best engineering science. Mechanically it is correct, for results are only obtained from right principles.

We offer the following extracts from hundreds of testimonials as the most indisputable proof of the remarkable performance of the White thirty horsepower gasoline car. From these facts, as supplied by the users, we believe you will be led to the motor car you want.

"I have averaged from 19 to 21 miles, in general touring, per gallon of gasoline, and this I consider extremely economical."

(Signed) W. E. CROFUT,  
The Forest City Rubber Co.

"The characteristics of your car which please me most are its quietness in operation, its extreme cleanliness and economy in up-keep and gasoline consumption."

(Signed) S. STERLING McMILLIN,  
The Marble & Shattuck Chair Company.

"I regard your motor as a marvel of simplicity and extremely economical in consumption of gasoline, in which respect it is probably not equalled by any of the same power."

(Signed) F. A. PEASE,  
The Pease Engineering Company.

"A short time ago I made a trip from Cleveland to Canton, by way of Brecksville, and return. This is a very hilly and sandy road and my running time was 22 miles an hour. To my surprise, I found that I had run that day 136 miles on 5¾ gallons of gasoline."

(Signed) J. P. HARRIS,  
The Cleveland Gas Appliance Co.

"My car has given me unqualified satisfaction in every way. I have been much impressed with the economy of both up-keep and gasoline consumption, as well as great flexibility of power."

(Signed) H. A. FULLER,  
The Bourne-Fuller Company.

"Last Sunday I rode 88 7-10 miles and used three gallons of gasoline, which is about the average consumption."

(Signed) B. SILVERSTEIN,  
Ohio Sample Furniture Company.

"When I calculate the miles per gallon over the entire mileage covered to date, which is something over three thousand miles, my gasoline consumption gives about 17 4-10 miles to the gallon."

(Signed) R. B. SHERIDAN,  
The Brown Hoisting Machinery Co.

"The fuel economy is very good, being an actual average of twenty miles per gallon running on country roads at an average speed of thirty to thirty-five miles."

(Signed) A. R. MacKNIGHT,  
The W. S. Tyler Company.

These men are prominent business men whose integrity and whose judgement must be respected in any community. Each letter represents a careful record of the operation of White cars.

Let us send you catalogue and the complete letters  
of these owners covering the features of the cars.

### Commercial Garage Requirements.

It is the experience of those who have given the matter much thought that the proper garaging of electric vehicles is a matter calling for the exercise of expert knowledge—mainly the knowledge acquired in the University of Hard Knocks. In his very suggestive presentation of the subject, which is printed in full elsewhere in these columns, C. L. Morgan expresses the opinion that success in this essential feature of the business application of the electric depends upon the wise selection of thoroughly competent employes, in resolutely distributing every particle of responsibility upon shoulders which are well able to support it. Granted that the upkeep of the vehicles is properly supervised operation under routine methods, becomes so simple that neither a high degree of intelligence nor skill are necessary.

While Mr. Morgan's conclusions all relate to the especial needs of the electric, the underlying principles apply with equal

force to the administration of an equipment of gasoline driven machines. Only, as the mechanism of the gas car is far more complicated and its proper care requires a higher degree of mechanical knowledge than the electric calls for, they should apply even more forcibly to the garaging of gasoline trucks.

As is true of all classes of machinery the maintenance question is of vital importance. The less its details are put on the shoulders of the operator the freer he is to engage in productive effort, and also the less his work depends upon skill and experience. In other words the simpler the duties of the operator the simpler the requirements of his office and the lower the wages he can command. The entire running cost of a well-equipped maintenance department thus can be saved out of the drivers' wages in a large establishment.

Because of this principle quite as much as by reason of economies in "overheads" and the advantages of conducting the repair department on a wholesale plan the large equipment is apt to prove more profitable than the small one. Indeed, close consideration of this factor will lead to a method of determining just where the line should be drawn between the public garaging of cars and the establishment of private garages.

### To Absorb Stresses in the Rear Axle.

Motorists who are familiar with the eccentricities of certain types of shabbily built shaft driven cars—as well as of some that are not so shabby—are accustomed to hear with absolute indifference the menacing clank, as of impending deadly peril, that occurs whenever the clutch is let in suddenly and sometimes when the car is rushed too hastily over a break in the road. On cars of the better class no such sounds are heard and none of the minor shocks that occasionally are felt on improperly designed machines commonly are experienced. But the fact remains that the underlying cause is present in both cases.

The trouble is with the arrangement of the rear axle with respect to the remainder of the mechanism. No matter what provision is made to render the anchorage of the axle flexible with respect to all natural movements it is possible to trace at least one form of shock against which no protection has been applied, sometimes several. For it must be borne in mind that the purpose of the rear axle system is ex-

ceedingly complex. First, it must carry the weight of the rear portion of the vehicle; second, it must take care of the traction load, or that which corresponds to the draw-bar pull of a locomotive; third, the torque load, which expresses the ability of the axle housing to resist a tendency to rotate in a direction opposite to that of the driving torque; fourth, the stresses due to the distribution of the driving effort within the axle structure.

The first three of these stresses are taken care of by independent means: the axle load by the springs, the traction either by the springs, a system of radius rods or by the torque tube or shaft housing, and the third by the torque bar or by the tube surrounding the driving shaft. But while due flexibility is provided in taking care of the axle and torque loads in most cases, the stresses which arise directly from shocks to the transmission at either end are resisted inflexibly. The result is that shocks due to sudden engagement of the clutch or to the wheels meeting obstacles must be met by unyielding metal, unless, of course, they are of sufficient magnitude to cause the wheels to slip. The consequence is that in cars of poor construction the effect of such shocks at once is manifest in the clanking of the torque bar and and the rattle of gears between which considerable lost motion exists. The quiet running of well-made cars does not prove the absence of these stresses.

While it is true to a limited extent that the spring cushioning of the torque bar in a measure serves to take care of shocks of this nature, owing to its ability to yield to sudden stress, it also is true that such yielding by no means removes from the gear teeth and driving shafts very considerable stresses which they ought not to be called upon to bear. That such stresses are multiplied by the action of the universal joints as a result of the movement of the chassis on the springs adds further complication.

The only apparent remedy for the difficulty is to insert a yielding medium somewhere in the transmission line to ease off such stresses. This may be done either by including a spring in the master clutch or in one of the propeller shaft joints or by making the shaft of a sufficiently flexible nature so that it will be subject to slight distortion under sudden excess of load. Both of these methods have been proposed at one time or another, though neither has been adopted at all generally.

**THE WEEK'S INCORPORATIONS.**

Detroit, Mich.—S. P. C. Motor Co., under Michigan laws, with \$50,000 capital.

Philadelphia, Pa.—Nance Motor Car Co., under Pennsylvania laws, with \$40,000 capital.

Harrisburg, Pa.—Ideal Motor Co., under Pennsylvania laws; to deal in automobiles. Corporators—George L. Merryman, John W. Shaffer.

Toledo, Ohio—Rossel Motor Car Co., under Ohio laws, with \$120,000 capital; to manufacture and deal in automobiles. Corporators—E. C. Rossel and others.

Denver, Col.—Western Marion Motor Co., under Colorado laws, with \$10,000 capital; to deal in automobiles. Corporators—A. E. Houghton, A. C. Lee and others, all of Denver.

Detroit, Mich.—Crowe Motor Co., under Michigan laws, with \$100,000 capital; to deal in automobiles. Corporators—Walter A. Crowe, Wm. McIntyre, Guy R. Price, all of Detroit.

Cleveland, Ohio—Quiggle Auto Co., under Ohio laws, with \$10,000 capital. Corporators—C. V. Quiggle, Samuel L. Henry, Charles S. Croskey, J. C. McMichael and E. M. Goodwin.

Wayne, Pa.—Hale-Knox Motor Co., under Pennsylvania laws, with \$13,000 capital; to deal in automobiles. Corporators—Philander C. Knox, Jr., Richard T. Tindle, of Valley Forge.

Jersey City, N. J.—DeHart Motor Car Co., under New Jersey laws, with \$10,000 capital; to manufacture automobiles. Corporators—William F. Ely, Frank J. Higgins, Rachel G. Butler.

Salt Lake City, Utah—Klaffki Novelty & Supply Co., under Utah laws, with \$3,000 capital; to deal in automobile accessories and supplies. Corporators—R. H. Klaffki, W. R. Martin, C. E. Jensen.

Branford, Conn.—I. & F. Motor Car Co., under Connecticut laws; to manufacture and deal in automobiles, parts, etc. Corporators—Charles Bunnell, Richard Bradley, H. F. Jordan and others.

Utica, N. Y.—Utica Electric Garage Co., under New York laws, with \$6,000 capital; to maintain a garage and automobile livery service. Corporators—Walter R. Schiller, Joseph A. Harding, Egmont G. Brewer.

Syracuse, N. Y.—Franklin Automobile Co., under New York laws, with \$400,000 capital; to manufacture, lease and deal in automobiles. Corporators—H. H. Franklin, J. Wilkinson, F. A. Barton, all of Syracuse.

Detroit, Mich.—Serviscar Motor Co., under Michigan laws, with \$10,000 capital, of which \$1,000 has been paid in; to deal in motor vehicles. Corporators—George C. Chene, George V. Pottle, Louis J. Hirschman, Frederick J. Nicholson, Louis V. Raulet.

**COMING EVENTS**

December 3-18, Paris, France—French Automobile Manufacturers' Salon in Grand Palais.

December 6-9, Indianapolis, Ind.—Convention of American Road Builders Association.

December 12-17, Los Angeles, Cal.—First annual "independent" show of Los Angeles Motor Car Dealers' Association at Shrine Auditorium.

December 24-31, Los Angeles, Cal.—Second annual show of Licensed Motor Car Dealers' Association of Los Angeles at Fiesta Park.

December 25-26, Los Angeles, Cal.—Twenty-four hours race at Motordrome.

December 31-January 7, New York City—"Independent"-automobile show in Grand Central Palace.

January 2-7, New York City—Importers' automobile show in Hotel Astor.

January 7-14, New York City—Association of Licensed Automobile Manufacturers eleventh annual show in Madison Square Garden. Pleasure cars and accessories.

January 11-12, New York City—Annual meeting of the Society of Automobile Engineers.

January 13, New York City—Annual banquet of the Motor and Accessory Manufacturers at Waldorf-Astoria.

January 14-28, Philadelphia, Pa.—Annual show of Philadelphia Licensed Automobile Dealers' Association in Third Regiment Armory.

January 15-21, Milwaukee, Wis.—Milwaukee Automobile Dealers' Association's second annual show in the Auditorium.

January 16-21, New York City—Association of Licensed Automobile Manufacturers eleventh annual show in Madison Square Garden. Second week devoted to commercial vehicles.

January 16-22, Detroit, Mich.—Detroit Automobile Dealers' Association's annual show in Wayne Pavilion.

January 18, New York City—Annual banquet of the Automobile Trade Credit Association.

Pekin, Ill.—Pekin Garage & Outing Co., under Illinois laws, with \$5,000 capital; to manufacture, rebuild, repair, buy, sell, rent and store automobiles. Corporators—Walter E. Green, Hermann Kaemmerling, William R. Kaemmerling, Gustav Kaemmerling.

New York City, N. Y.—Randerson Auto Parts Co., under New York laws, with \$25,000 capital; to operate a machine and repair shop, to manufacture and deal in

January 25-28, St. Paul, Minn.—First annual show of automobile dealers in Auditorium.

January 28-February 4, Chicago, Ill.—National Association of Automobile Manufacturers' tenth annual national show in Coliseum. Pleasure cars and accessories only.

February 6-11, Buffalo, N. Y.—Annual show.

February 6-11, Chicago, Ill.—National Association of Automobile Manufacturers' tenth national show in Coliseum. Second week devoted to pleasure and commercial cars, motorcycles and accessories.

February 13-18, Washington, D. C.—Second annual show in Convention hall.

February 14-19, Dayton, Ohio—Second annual show in Memorial building.

February 15-21, Kansas City, Mo.—Fifth annual show of Kansas City Automobile Dealers' Association.

February 18-25, Binghamton, N. Y.—Annual show.

February 18-25, Minneapolis, Minn.—Minneapolis Automobile Show Association's annual show in National Guard Armory.

February 20-25, Cincinnati, O.—Cincinnati Automobile Dealers' Association's show in Music Hall.

February 20-26, Omaha, Neb.—Third annual show of the Omaha Automobile Show Association in Auditorium.

February 24-27, New Orleans, La.—First annual show of New Orleans Automobile Club at Fair Grounds.

February 25-March 4, Toronto, Canada—Annual show under auspices of Ontario Motor League.

February 25-27, New Orleans, La.—New Orleans Automobile Club's annual Mardi Gras race meet on Fair Grounds track.

March 4-11, Boston, Mass.—Boston Automobile Dealers' Association's annual show in Mechanics building.

March 7-11, Des Moines, Ia.—Third annual show of Des Moines Automobile Dealers' Association at the Coliseum.

March 15-18, Louisville, Ky.—Louisville Automobile Dealers' Association's annual show in First Regiment Armory.

April 1-8, Montreal, Can.—Annual show in Coliseum.

parts and accessories. Corporators—J. F. Randerson, Albany; E. G. Trimper, R. P. Herrick, New York City.

Hoboken, N. J.—Prince Tire Co., under New Jersey laws, with \$25,000 capital; to deal in automobile and bicycle tires. Corporators—Paul M. Pelletreau, 3 Broad street, New York City; Walter C. Shoup, Tenth and Clinton streets, Hoboken, N. J.; John D. Prince, 34 East 42d street, New York City.

**PENNSYLVANIAN HEADS A. A. A.**

**Hooper Chosen President—West Gets Vice-Presidencies—Committees Enlarged and Much Business Transacted.**

Robert P. Hooper, who is engaged in the textile business in Philadelphia, Pa., was chosen president of the American Automobile Association at its annual meeting on Thursday last, 1st inst., which was held in Hotel Belmont, New York City. Previously, Mr. Hooper was first vice-president of the organization, and as he already had been slated for the higher office his election was largely a matter of course.

The West was somewhat insistent in its demands for more recognition, and as a result it was given four of the five vice-presidencies, the complete slate of officials elected being as follows:

FRANK M. JOYCE  
First Vice-President

**President—Robert P. Hooper, Pennsylvania.**

**First vice-president—Frank M. Joyce, Minnesota.**

**Second vice-president—F. C. Donald, Illinois.**

**Third vice-president—C. L. Bonifield, Ohio.**

**Fourth vice-president—F. G. Webb, New York.**

**Fifth vice-president—F. L. Baker, California.**

**Secretary—John N. Brooks, Connecticut.**

**Treasurer—H. A. Bonnell, New Jersey.**

**Executive committee—A. G. Batchelder, chairman; Lewis R. Speare, Massachusetts; A. H. Knoll, New York; J. P. Coghlin, Massachusetts; Frank G. Webb, New York; A. D. Converse, Massachusetts; H. L. Vail, Ohio; C. M. Robinson, Connecticut; M. C. Moore, Wisconsin; P. J. Walker, California; John Bancroft, Delaware; F. C. Battey, Georgia; Ralph W. Smith, Colorado; E. C. Smith, Vermont; David Beecroft, Illinois; Stedman Bent, Pennsylvania; C. H. Gillette, Connecticut; J. H. Edwards, New Jersey; Paul C. Wolff, Pennsylvania; Edwin S. George, Michigan; H.**

**M. Rowe, Maryland; James T. Drought, Wisconsin; C. A. Quigley, Utah; S. D. Capen, Missouri; Sam T. Atkinson, Virginia; H. L. Gordon, Ohio; Charles M. Doe, Rhode Island; F. E. Edwards, Illinois; A. E. Lerche, Massachusetts; S. A. Miles, N. A. A. M.; Alfred Reeves, A. L. A. M.**

The slate, as elected, was prepared by the nominating committee, composed of C. H. Gillette, Connecticut, chairman; F. E. Edwards, Illinois; George C. Diehl, New York; H. L. Vail, Ohio; J. H. Edwards,

ROBERT P. HOOPER  
President

New Jersey; Paul C. Wolff, Pennsylvania, and L. R. Speare, Massachusetts.

While there had been some idle talk regarding secession on the part of the Western states, it had no basis in fact. It arose from a desire which, strangely enough, found birth in Oklahoma, that the headquarters of the association be removed to Chicago. J. W. Densford, secretary of the Oklahoma Automobile Association, was the prime mover in the matter, and, apparently, a ready letter-writer, he caused his idea to circulate in the Western country. Densford himself was not present at last week's meeting, and it was chiefly the Ohio dele-

C. L. BONIFIELD  
Third Vice-President

gation—the same Ohio that objects to the passage of a federal registration law—that espoused the Oklahoma man's notions. As the West had been given the Glidden tour, the national track championships and the national road championships, most of the Westerners, however, became convinced that they had not been so badly treated.

The headquarters will remain in New York, but it was provided that the Connecticut charter of the A. A. A. be so changed that the annual meeting may be held in any city which the governing board may select.

President L. A. Speare opened the meeting, of course, and though he reported his plan for a national assembly it was not adopted as presented. Instead, it was voted that every club in the A. A. A. may send any number of delegates to the annual meeting, but that, regardless of the number of such delegates, each club shall have but one vote. It was also decided that proxies may be voted by representatives of the states from which they emanate.

The meeting altogether lasted two days, having commenced on Wednesday, November 30, which day, however, was devoted chiefly to the reading of annual reports.

New Hampshire and Idaho were added to the roll, bringing up the total membership to 34,946, which is distributed between

F. C. DONALD  
Second Vice-President

35 state bodies and 249 clubs. In addition there are 860 individual members. A year ago the total membership was 25,759.

The report of H. A. Bonnell, the treasurer, showed a balance on hand of \$9,423.70, with other assets soon to be available.

As the result of a communication from the Massachusetts Highway Commission, stating that two visiting motorists—one from Connecticut, the other from New York—who had been stopped for over-speeding in Duxbury, Mass., and had agreed subsequently to appear in court, but who failed to observe the legal summons forwarded to them by registered mail, it was unanimously voted that the national officers at once notify the state bodies in Connecticut and New York of the acts of their offending motorists and request that pressure be brought to bear to see that they observe the Massachusetts summons. It was also voted that all similar cases should call for the same action, and that all assistance possible should be given in the enforcement of equitable laws. Later Dr. H. M. Rowe, of Maryland, offered a resolution emphasizing his stand. The resolution calls upon the officers of states issuing

licenses to notify the executive officers of the A. A. A. of such offenses so that the association may take action through its various state bodies.

The matter of federal aid in the construction of highways also was discussed and the A. A. A. placed itself on record by adopting the following resolution:

Resolved, That this association emphatically endorse the principle of Federal aid in the construction of highways, and that it further endorse and urge upon each of the several states the permanent appointment of a commissioner or commissioners and the adoption of desirable highway laws and proper provisions for making the same effective.

S. M. Butler, chairman of the contest board, under whose administration the A. A. A.'s sporting rib has been transformed from gelatine to steel, indicated that the encouragement of amateurism now is occupying his thoughts. This was demonstrated by the adoption of the following resolution, which he himself offered:

Resolved, That the contest board call upon A. A. A. clubs to encourage amateur automobile competition by interesting their members in various forms of contests on road or track, or on courses properly prepared for such contests.

Incidentally, the various committees of the A. A. A. are to be very much enlarged, the meeting deciding that hereafter the various national boards—touring, good roads, legislative and contest—be increased by the addition of the chairman of all similar boards of A. A. A. clubs, the membership being of an automatic nature. Provision also was made for the election of executive committees to carry on the work of the boards within the discretion of the respective chairmen.

After his election, President Hooper announced the re-appointment of all of the present chairmen of the national boards, except that of the touring information board, on which Howard Longstreth of the Automobile Club of Philadelphia succeeds Powell Evans of the same club. The hold-overs are: Good roads, George C. Diehl; legislative, Charles Thaddeus Terry; contest, S. M. Butler. Retiring Chairman Evans was thanked for his efforts, which have extended over a period of three years. Robert Bruce will remain in charge of the headquarters touring information bureau.

The retiring president, L. R. Speare, of Massachusetts, during whose two terms the organization has doubled in membership and in influence, received a standing vote of thanks, and a committee was appointed to select a memento of his notable occupancy of the association's highest office.

In connection with forthcoming annual meetings, it was voted that a banquet should be held, the president being empowered to appoint a committee to take charge of such affairs.

Some fifty-odd delegates, representing 16 states, were present at the meeting, 20 other states being represented by proxies.

## "WIRELESSING" FROM MOTOR CAR

**Oregon Automobilists Try an Interesting Experiment and Prove Its Practicality—Results they Obtained.**

To the average individual the world over the theory of wireless telegraphy with its mathematics and abstruse reasoning means nothing—the actual working of the whole scheme means much. Years ago the theory of this branch of science was worked out

character and was almost devoid of incident, unless a race between two women may be so termed; most of the races were match affairs between local celebrities. The promoters of the meet failed to realize any profit on the venture and blamed the small attendance on the weather. The lack of entries was blamed on the poor condition of the antiquated half mile dirt track and the consequent hesitation of the drivers to take a chance on it. Motorcycle racing was mixed with the automobile sport but watches were scarce and half the events

OREGONIANS AND THE WIRELESS APPARATUS WITH WHICH THEY EXPERIMENTED

and wireless communication between land stations and ships or vice versa became an actual fact, but the problem of sending and receiving messages from moving vehicles on land was much slower of solution, and it remained for two Portland (Oregon) men, by name O. P. Guldmeier and E. P. Preble, to accomplish the task successfully.

In the test a small portable apparatus, weighing less than 30 pounds and operated by six dry cells, was installed in a stock seven passenger Speedwell automobile, this car being chosen because of the lack of vibration from the motor and its easy riding qualities. Ground connections were made through the frame of the car with a movable wire running from the hub to the tire chain grips. Five passengers were carried in addition to the operator and messages were sent to the office of a Portland newspaper.

### Women Allowed to Race at Norfolk.

Norfolk, Va., saw some automobile racing on Thursday, Friday and Saturday of last week, but it was of a rather indifferent

were not even timed. The summaries:

#### Thursday, December 1.

Ten miles, for cars costing under \$1,000—Won by Bryant, Flanders; second, Sheldon, Hupmobile. Time, 15.21.

Five miles, for cars of 600 inches and under—Won by Edwards, Maxwell; second, Dusenbury, Rambler. Time, 7:08.

Two miles match race, Miss J. M. Robinson vs. Mrs. Edward Allen—Won by Miss Robinson. No time taken.

Five miles novelty race—Won by Dusenbury, Rambler; second, Edwards, Maxwell.

#### Friday, December 2.

Ten miles match race, Bryant, Flanders, vs. Edwards, Maxwell—Won by Bryant. No time taken.

Ten miles handicap—Won by Allen, Brush (two miles); second, Sheldon, Hupmobile (scratch). No time taken.

#### Saturday, December 3.

Ten miles match race, Bryant, Flanders, vs. Edwards, Maxwell—Won by Bryant. Time, 13:20.

**J. NIKRENT STARS AT LOS ANGELES****He Gets Everything He Goes for and Does****74 Miles in an Hour—Electrical Timer****Decides Eyelash Finish.**

Joe Nikrent, driving a six cylinder Knox loaned by Barney Oldfield, was more than half the show at the Los Angeles Motordrome racemeet, November 27 and 28; he won every event for which he was entered. His performances included the shattering of two speedway records, first in the first hour of the two hours race, in which he hung up a new figure of 74 miles, thereby bettering the record of 73½ miles, and the other in the five miles race for stock cars of the 451-600 inch class, in which his time of 3:50¾ eclipsed the former record by 1½ seconds. The five miles race for cars up to 600 inches displacement was easy for Nikrent, who led all the way. Geo. Bobst pluckily chased him, but although he drove a game race in his Cutting he could not catch the flying Knox.

Finishing so close together that only the electrical timing device could evolve the winner, Louis Nikrent (Buick) and George Clark (Cutting) furnished a sensation in the five miles race for cars of from 231 to 300 cubic inches displacement. Nikrent took the lead at the start and up to the third mile appeared to have the race well in hand, but Clark in the Cutting then began to close up and kept at it steadily until at the finish only the width of a tire remained between his car and the Buick. It looked like a dead heat, but the electrical timer proved it otherwise. Nikrent's time was 4:31¾, Clark being a hundredth part of a second behind him.

Joe Nikrent ran away from the field in the five miles free-for-all, his time for the five laps being 3:55¾. His brother, Louis Nikrent, started well in a Buick, but soon abandoned the race, for the second time leaving Clark in the Cutting to capture second honors.

In the light car class, for cars up to 300 cubic inches displacement, George Bobst (Oakland) romped home as he liked, his time for the five miles being 4:41. J. Fuchs (Staver) was second.

The first hour of the two hours Motordrome Endurance Derby for the Los Angeles Pacific Trophy, in which there were 11 starters, was a walk-away for Joe Nikrent in the Knox. He took the lead at the crack of the pistol and never was headed, almost burning up the boards of the mile track as he reeled off miles at the rate of 48¾ seconds, doing 74 miles in the 60 minutes. Bruno Seibel in a Franklin rolled up 68 miles and finished second, seven miles ahead of Clark, who was third in a Cutting.

The five miles race in which Oldfield's record of 3:52½ went by the board, was the feature of the second day's racing. Cars up to 600 inches displacement were eligible, and Nikrent, driving the same car with which Oldfield made his record last April, raced home in front of the field with the tatters of Oldfield's record fluttering in his wake. His time was 3:50¾—1½ seconds better than Barney's best. Louis Nikrent was second in a Buick and the Cutting with George Clark at the wheel was third.

Louis Nikrent (Buick) won his second race of the meet in the five miles event for cars in the 301 to 450 class. After the second mile mark was passed Nikrent had things all his own way, and he finished 8¾ seconds ahead of McKay, who drove a Cutting. The Franklin with Seibel driving was third.

By evading his pursuers for three miles, Roger Stearns, driving the Ford with which he made his debut in the Los Angeles-Phoenix race, created excitement in the pursuit race open to cars up to 230 inches displacement. Eventually he was ousted from his position, however, and the race, went to Fuchs at the wheel of a Staver-Chicago. Bobst in the Oakland was second and Stearns (Ford) fourth.

Joe Nikrent again got in the limelight a little later in the day, the occasion being the five miles free-for-all handicap in which the cars were handicapped according to their performances in the previous races. Stearns in the Ford was the limit man with Fuchs (Staver-Chicago), Bobst (Oakland), McKeague (Duro), Clark (Cutting), Louis Nikrent (Buick) and Seibel (Franklin) strung out in this order between him and Joe Nikrent (Knox) on scratch. The lead alternated between Fuchs and Bobst until the last half of the last lap, when Joe Nikrent and the Knox rushed up and flashed across the tape 50 yards in front.

In the second hour of the Motordrome Endurance Derby Championship, the first half of which was run on the previous day, Nikrent in Oldfield's Knox again had things pretty much his own way, and made no attempt to better his world's record made in the first hour. He finished the second hour with 72 miles to his credit, and all the other contenders behind him, making 146 miles for the two hours. Clark in the Cutting was second, and won the award for the 231-300 inch class by making a total of 127 miles. Arthur Horine was third in a Parry with 113 miles to his credit, and Bruno Seibel drove his Franklin 95 miles and took the cash in the 301-450 inch class. The summaries:

**Saturday, November 26**

Five miles, for cars up to 600 cubic inches—Won by Joe Nikrent, Knox; second, Geo. Clark, Cutting. Time, 3:59.

Five miles, for cars 231 to 300 cubic inches—Won by Louis Nikrent, Buick; sec-

ond, J. D. McNey, Cutting; third C. McKeague, Duro. Time, 4:31¾.

Five miles free-for-all—Won by Joe Nikrent, Knox; second, Geo. Clark, Cutting. Time, 3:55¾.

Five miles, for cars 161 to 230 cubic inches—Won by Geo. Bobst, Oakland; second, J. Fuchs, Staver. Time, 4:41.

First hour of two hours' race—Won by Joe Nikrent, Knox; distance, 74 miles; second, B. Seibel, Franklin; distance, 68 miles; third, Clark, Cutting; distance, 61 miles

**Sunday, November 27.**

Five miles, for cars 451 to 600 cubic inches—Won by Joe Nikrent, Knox; second, Nikrent, Buick; third, Geo. D. Clark, Cutting. Time, 3:30¾.

Five miles, for cars 301 to 450 cubic inches—Won by Louis Nikrent, Buick; second, Clark, Cutting; third, Bruno Seibel, Franklin. Time, 4:18¾.

Five miles pursuit race, stock cars, 161 to 230 cubic inches—Won by Jos. Fuchs, Staver; second, Geo. Bobst, Oakland; third, Roger Stearns, Ford. Time, 4:34.

Five miles, free-for-all handicap—Won by Joe Nikrent, Knox (scratch); second, Fuchs, Staver; third, Geo. McKeague, Duro. Time, 4:54¾.

Second hour of two hours' race—Won by Joe Nikrent, Knox; distance, 146 miles; second, Clark, Cutting; distance, 127 miles; third, A. W. Horrine, Parry; distance, 113 miles.

**Prince Building Wood Track in Oakland.**

After considerable delay, the project for a motordrome track in the vicinity of Oakland, Cal., which long has been nourished by Jack Prince, professional track builder and promoter, at length has come to a head with the announcement that a 22-acre tract of land has been secured for the purpose at Elmhurst. The site has been taken on a three-year lease, and work on a \$30,000 structure already has commenced, the labor contracts calling for the completion of the wood track within three weeks from the date of beginning operations, while the grandstand and other accommodations are to be finished in season for the initial meet, which is scheduled for December 30th to January 1st, just before the Portola race. The track is to be an oval wooden saucer, entirely surrounded with seats and enclosing a smaller track intended solely for bicycle racing. Regular monthly meets are included in the promoters' program.

**Texas Club Indorses Oldfield's Suspension.**

The Dallas (Tex.) Automobile Club has adopted resolutions indorsing the American Automobile Association's suspension of Barney Oldfield. His "mixing" with the negro, Jack Johnson, in the moving picture fake gave the Texans a better idea of Oldfield's real measure and induced them to take action.

**MOTOR TRUCK "SAVES" A LIFE BOAT**

**It Enables Wellman's Craft, and the Cat, to Reach Boston in Time—Dilemma That Was Solved.**

When Jerome K. Jerome wrote "Three Men In a Boat" comparatively little was known of the science of ballooning, and little did that versatile writer dream that some day the place of the immortal Montmorency might be taken by a feline rival, and that even the boat itself, in which the adventure was to take place, would emulate that worthy dog when he "got his leg in the jam" and go up in the air.

MORGAN TRUCK HAULING WELLMAN'S LIFEBOAT ON THE ROAD FROM WORCESTER TO BOSTON

Yet that is exactly what happened to the lifeboat of Wellman's ill-fated airship "America"—that is, it went up in the air, and with it went a party of six men—to say nothing of the cat. Of course, it came down again, and since then it has been giving a round of "exhibition performances" at various progressive Eastern department stores. The cat went, too. Having been booked to open an engagement at the department store of R. H. White & Co., in Boston, on Monday morning last, the problem of moving this 27x6-foot lifeboat from Worcester, Mass., where it had been staged, to the former city in the interim between closing time on Saturday and opening time on Monday, presented itself.

Mr. Vaniman, who was the engineer of the big dirigible and also its designer and builder, had no difficulty in solving the problems of aerial navigation, but this time he as "up in the air" in another sense, and found it harder to get down than ever before. The boat could neither be shipped by express nor by freight; in the first place,

because of the prohibitive cost of an end-door car, and in the second, because of the short time at the disposal of the America's engineer.

It seemed that the jig was "up," too, but at the last minute C. H. Martin, sales manager for the R. L. Morgan Co., learning of the predicament, rushed into the breach with a five-ton Morgan truck. At 8 o'clock on Sunday morning the whole exhibit, consisting of three men, the lifeboat, scientific and nautical instruments, oars, sails, life preservers, provisions for six men for twenty days, and, last but not least, the mascot cat, "Trent," were loaded on the truck and the run to Boston made in four and one-half hours. Mr. Vaniman was elated, and it is stated that hereafter,

**GAS TANKS MUST BE STAMPED**

**Federal Government Issues New Ruling—Affects All Automobiles Transported on Passenger Boats.**

Because of an inquiry from a New York steamship company asking whether it may transport to Porto Rico on steamers carrying passengers, automobiles equipped with Prest-O-Lite tanks, filled with acetylene gas, the United States Department of Commerce and Labor has, through George Uhler, supervising inspector general, ruled that such tanks can be carried on such vessels only when they are of specified strength

when attempting an airship trip across the briny, he will rely on a motor truck as being the safest mode of travel.

**Theirate Farmer and the Joy Rider.**

One D. E. Wallace and two members of the fair sex, all of Detroit, Mich., indulged in a joy ride one night last week which, as so often is the case, ended disastrously for the people involved—and, incidentally, for the car—but in this case assumed an amusing and unusual aspect when a farmer upon whom Wallace had precipitated an unprovoked attack from the rear promptly retaliated by taking possession of the automobile and, supported by sympathizers, refusing to part with it until his claim for damage was satisfied. Wallace had thoughtlessly "borrowed" a friend's car and was returning home when he ran into a farm wagon driven by Joseph De Clerque, with the results chronicled. Wallace paid the irate farmer \$100 for damage to the wagon and later contributed \$25 to the cause of justice for exceeding the legal speed limit by "at least 10 miles."

which shall be stamped in the metal of the tank. The decision, which has been transmitted to all local inspectors, and which applies to ferry boats, as well as sea-going craft, is as follows:

"Under the provisions of Department decision dated March 17, 1903, acetylene may be transported on steamers carrying passengers only 'when contained in steel tanks of not less than 55,000 pounds tensile strength to square inch, and of sufficient thickness of steel to withstand pressure of 1,200 pounds to square inch, and charged with acetylene to a working pressure not exceeding 240 pounds to square inch, said tanks to be completely filled with asbestos disks, the porosity of which shall not exceed 80 per cent.'"

"A further condition is that the tanks containing acetylene are to be stamped with thickness and tensile strength of the material of which they are composed, also with the words 'Acetylene compressed into porous substance' together with name of firm or company by whom the tanks have been charged."

## RUBBER FOUND IN FENCE POSTS

Michigan Professor Penetrates Mexican Wilds and Discovers Remarkable Tree  
—Children Furnished First Clue.

They've discovered another substitute for rubber, and this new gum is so unlike the long line of previous discoveries that it was extracted even from a fence post, which two years before had ceased to be a proud tree in a Mexican forest. The newly discovered substitute is of the natural gum variety, and, as indicated, its habitat is in the virgin woods of Mexico, of many commercial promises, and its discoverer is Prof. John R. Allen, of the engineering department of the University of Michigan, at Ann Arbor, who was sent into the wilds by certain Detroit capitalists, whose identity still remains undisclosed.

Although the actual discovery was made more than two years ago, the news of its importance only just has seeped out through the columns of a Detroit newspaper. It is almost superfluous to add that enormous profits await the exploitation of the new gum. At present it may be produced for 17 cents a pound, and the markets of the world are represented as eagerly reaching out their grasping fingers for it at a figure modestly advanced to 75 cents a pound. Rubber, the Para kind that furnishes the name for the raw material which goes into automobile tires, is quoted to-day in New York at something like \$1.50 a pound, so it readily can be seen what the promoters of the new substitute have lost—potentially—by delaying the announcement of Prof. Allen's discovery. Only a few short months ago Para was selling for double its present prices.

The narrative that goes with the disclosure is interesting almost to the point of being romantic. It runs this way: Edward W. Mayo, of Durango, Mexico, an American who has lived in that entrancing country for 30 years, and long has been at the head of the Mexican Telegraph & Cable Co., tipped off the Detroit capitalists to the fact that he believed that a hitherto unknown rubber-bearing tree existed somewhere in Mexico. Just what the tree was, he could not say, and he was equally ignorant as to its exact whereabouts and prevalence. What he did know was that a traveler, returning from the interior, told of having been told of other persons who had seen small boys rolling some sort of a vegetable gum into little balls which they afterward stamped on to hear the noise.

And behold, the giant industry that may be engendered by the artless desire of these simple native children to make a noise! Mayo tipped off the Detroiters, and they promptly tipped off the profes-

sor, who tipped off Mrs. Allen and one Henry Campbell, of Detroit. The last-named trio formed the basis of an exploring expedition. At Durango the party was joined by Mayo and a Miss Kimball, and the expedition at once proceeded in search of the little children who rolled gum balls and then stepped on them.

Needless to add, the quest was rewarded with success. Not only were the children found, but the source of their fireless snap-crackers also was located. It is very important to note, however, that the tree that furnished the gum was not merely one of the long-familiar ones, from which chemists long have sought to extract something that could be used instead of rubber. It was a new tree; it had never been classified botanically nor exploited commercially. This much has seeped into the columns of the Detroit paper with the belated news of the discovery, as have also a few particulars as to its general characteristics.

As described, "it belongs to the nettle family; has the appearance of the horse chestnut tree, and its leaves and fruit cannot be handled with the bare hands, as the nettles burn the skin like a red-hot iron." In the absence of fuller particulars, it is impossible to proceed further with its identification, but it may be remarked that the tendency to "burn" or "sting" has been discovered in other proposed substitutes for the black and smoky chunks of gum that are rafted down the tributaries of the Amazon.

In due season Prof. Allen carried samples of the new-found gum to England, where it was analyzed by a number of "foremost experts," who, while declaring that they never had heard of the gum, pronounced it the nearest approach to real rubber ever found, and placed its value at nearly double that which the promoters had hesitatingly assigned to it.

Later one ton of the gum was shipped to England and refined in sufficient quantities to test its properties thoroughly, and as a result it is said to develop excellent strength in vulcanized form, although its resiliency is not as great as that of pure rubber. This is thought to be due to an excess of resin which it contains; but the experts state that when it has been put through a deresinating process, costing not over 3 cents a pound, it will be as desirable for all purposes as pure rubber from the trees of the dogbane family.

The gum-bearing trees were found at an altitude of 4,500 feet, and from that point down to sea level no less than three different varieties were found. The trees are said by the natives to live to be very old, these scions of the rubber-snapcracker makers also averring that the life of the trees is not shortened by repeated tapings, so long as they are allowed to rest two months between taps. The trees may be tapped and scored for five days running,

when they must be allowed to rest. Each tree six inches in diameter will yield a pound of gum each time it is tapped, while from five to seven pounds of gum are said to result from each tapping of the larger trees.

The trees are readily propagated from sprouts, while it is stated on the authority of Prof. Allen, the discoverer, that milk was obtained from a rubber-bearing tree that had been cut down and used as a fence post for two years. Like the latex of the true rubber trees, the milk flows freely from the cuts, but almost immediately coagulates upon exposure to the air.

The section where the discovery was made is on the west side of the Sierra Madre range, and is inhabited by Indians, who live in communities owning all of the land in common. Most of the grants date back to the time of King Carlos, in 1547. The inhabitants are in a near-starving condition, and will gladly work for 75 cents a day, Mexican money, their destitution having been brought about by a succession of poor crops. When the new Harriman railroad lines are completed, they will run within 60 miles of the region where the trees abound, so that neither labor nor transportation problems appear to be worrying the discoverer to any great extent.

It is probably essential also to mention the fact that Prof. Allen and his associates have secured concessions from the Mexican Government for a tract of some 800,000 acres of land right where the near-rubber trees grow thickest. Negotiations for further concessions are said to be under way.

### How Horses Add to Cost of Living.

While no small share of the high cost of living has been laid unhesitatingly at the door of the automobile industry, one thoughtful expert is prepared to show that instead of creating a waste of capital, automobile production is capable of creating a vast conservation to the community at large. He figures that the more general substitution of motor vehicles for horses in truck work in New York City alone, for example, would create a saving of \$18,000,000 to \$20,000,000 a year.

"A large percentage of the high cost of living is due to the unnecessary cost of trucking with horses," says the authority in question, who is Charles E. Stone, sales manager of the Alden Sampson Mfg. Co., of Pittsfield, Mass. According to Mr. Stone, \$156,000,000 is expended annually in New York on trucking alone, to say nothing of the wear and tear on pavements and the expense of keeping them clean. New York has 130,000 horses, and over half of them are hauling merchandise. The mere replacement of the horses with the requisite number of motor trucks, in Mr. Stone's opinion, would effect the enormous saving stated.

### WHEREIN SPARK COILS DIFFER

**The Vibrating and Non-Vibrating Types and the Sparks They Produce—Improvements in Coil Manufacture.**

By the design of the coil on the dash of an automobile, most persons who are at all interested in motor cars readily can distinguish whether it is of the vibrating or non-vibrating variety; but that considerable misconception exists regarding them is undoubted.

The type commonly known as the vibrating or trembler coil has a vibrating spring which, when the contact in the circuit is made, produces a buzzing sound, and, of course, this buzzing or trembling will not take place unless the contact is made. In all other respects the two types are alike, but the use of the trembler gives a difference of spark output.

All coils, of course, have a primary and secondary winding. The primary consists of an iron core made up of a bundle of soft iron wires, which are cut the same length, and all properly insulated, and about three layers of No. 20 or 22 copper wire insulated with a double covering of cotton. The most important part of the coil, however, is the secondary winding, and when it is realized that a current under pressure of from 10,000 to 20,000 volts is produced and made to circulate many times around, it is needless to say that the most careful arrangement and insulation of the turns is absolutely necessary to the success of the coil. The conventional manner in which a secondary is made is by winding a fine insulated wire in even layers over a paper tube just large enough to fit over the primary, the layers of wire being separated from each other by one or two layers of thin paper. The required number of layers is between 30 and 50, and when these are wound, the coil is immersed in a bath of melted wax for several hours. Owing to the compact manner in which the layers are wound, the wax does not always penetrate clear through to the center of the windings. This lack of penetration of the wax, which frequently left air spaces in the center of the winding recently has been overcome to a large extent by the employment of a vacuum impregnating process which consists of thoroughly drying and baking the winding in an oven in which a partial vacuum is created. An impregnating compound is then allowed to flow, under the pressure of the atmosphere or aided by a mechanical pump, into the oven.

Between the primary and secondary coils there is no metallic connection whatever. The current from the battery is received by the primary when the contact is made, and it continues to flow until the contact is broken. Only at the instant of the break

does the secondary circuit receive a current in a non-vibrating coil; the current rush passing through the secondary coil at this instant being so tense and of such high voltage that it leaps the gap between the points of the spark plug. A single break in the primary circuit induces enough current in the secondary to produce the resultant spark. The spark produced by a vibrating or trembler coil is a stream of rapid sparks caused by the make and breaks of the vibrator spring, while that made by the non-vibrating coil is a single spark.

#### Dixie Horn from New York House.

Embodying several new ideas, the Dixie horn has made its appearance on the market, with the backing of the big Western Electric Co. It is of the conventional bell or trumpet shape, and operated by an elec-

tro-magnet system. There are but two adjustments, both of which are securely locked; the tone is altered by a screw in the diaphragm. The latter is made rust proof and the magnets are insulated with a special moisture resisting compound. The horn may be mounted on metal parts without any danger of grounding the current, as the casing is completely insulated from the current carrying parts, also sufficiently protected.

The horn, manufactured by Edwards & Co., of New York, and marketed by the Western Electric Co., of New York and elsewhere, is designed to operate on four dry cells or a six-volt storage battery. Either the elbow or steering wheel button is furnished, together with operating cable. As the elbow button permits the horn to be operated while both hands and feet are free for the manipulation of wheel, levers or pedals, it is favored.

#### Columbus Catalog in Striking Colors.

In a striking red and gold and brown "overcoat" of stamped leather effect, the 1911 catalog of the Columbia Motor Car Co., of Hartford, Conn., which just has been issued, presents an attractive appearance which does not disappoint in its hint of interesting things inside. Two styles of Columbia gasoline cars are illustrated and described—the Mark 48, lot 5, which continues for the new season, with detailed refinements, the Columbia conceived in 1906, and a new higher-powered model, Mark 85, the constructional details, motors, chassis, etc., being satisfyingly pictured.

### ELECTRIC VEHICLES IN ENGLAND

**Although Current is Cheap and Conditions Favorable, Their Use is Limited—Market Worthy of Encouragement.**

Despite the small amount of attention which the electric vehicle has attracted in England, United States Consul Halstead, at Birmingham, is of the opinion that the field is not without promise, owing to the eagerness of the local central station people to develop the market for current, a condition which he thinks American manufacturers might turn to their advantage.

"It has been argued in England that the electric vehicle is not suitable because its use is practical only in the towns, it being very difficult to recharge the batteries in the country," says Consul Halstead. "This prejudice undoubtedly would be difficult to overcome, so it would appear unwise unhesitatingly to advise manufacturers of excellent electric automobiles in the United States to endeavor to cultivate the British market. Nevertheless an investigation of the field would, it seems, be worth while, provided such investigation were made by an expert. In favor of the electric automobile is the heavy tax on gasoline for motor purposes, and the fact that many of the electric supply stations in the United Kingdom are controlled by municipal authorities who are enterprising in their efforts to increase and extend the use of electricity.

"A British trade journal asserts that the simple, easily controlled electric vehicle in its own sphere is in many ways superior to the gasoline motor car and that if it were accorded anything like the same attention as the latter demands and receives it would be the rule rather than, as at present, the exception on the streets of British cities.

"One borough council in London is offering a rate of one cent per unit for a minimum annual consumption of 100,000 units taken at any one of the corporation's three electrical depots during certain hours, and this action may be traced to inquiries for a cheap supply for battery charges for omnibus and commercial vehicle purposes. A project for the construction of 50 electric drays and vans for hiring out to commercial firms is now on foot.

"It is quite certain that electric stations, whether controlled by municipal authorities or private companies, would be glad to make a suitable rate for electricity for batteries for electric vehicles provided there were any indication than in this way a larger demand for electrical supply would follow, particularly as batteries could be charged during the day and when the demand for electricity is so much less than early at night."

# Ignition Systems and Their Varied Effects

One of the most puzzling mysteries of misfiring in an ignition system which appears to be in perfectly good order may arise from cross induction between the high tension conductors, when they are arranged close together and enclosed in a single pipe. The effect is to cause a stray spark to occur in a cylinder which is just drawing in a fresh charge, thus causing back pressure and resulting in missing the next explosion. This bit of little-known information was imparted by C. F. Kettering, of the Dayton Engineering Laboratories Co., Dayton, O., in the course of a paper read before that company's annual salesmen's convention. While concerned mainly with the means of ignition and of the various means systems, leading up to a description of the Delco system made by the Dayton company, the paper affords a concise and unusually informing resume of the requirements of ignition and of the various means by which they are satisfied.

"When internal combustion engines were first introduced, the hot tube ignition was used. In this system the charge is ignited by means of a flame or heated surface. After this came the make and break system where an electric circuit is mechanically broken with the cylinder and the charge fired by the resulting arc. This system is used at present on most of the large stationary engines and a few automobiles. Lastly, came the jump spark system in which high tension current is made to jump across an air gap between two metal points. In order to obtain this high tension current from batteries, it was necessary to use an induction coil and the old form of Ruhmkorff coil was tried. This coil did its work fairly satisfactorily, but with an excessive drain on the batteries, and for this reason battery ignition fell into bad repute and the magneto was introduced," said Mr. Kettering in prefacing his subject.

"Ignition apparatus is often blamed for faults which rightly belong to the grade of fuel used, the carburetter, or the design of the engine," he continued. "It is an undisputed fact that the force with which a rifle discharges its bullet depends on the grade of powder used and the design of the barrel—that is, length and bore, etc., and not on the size of the cap used to ignite the powder. The ignition of the gas in the cylinder of an engine is a similar case, and the size of the spark has exactly the same effect as the size of the cap.

"The three essential things required for good ignition are, 1st—the spark, 2nd—the timing, and 3rd—the spark gap. The general systems now in use on automobiles

are as follows:—1st—the battery, 2nd—the double, 3rd—the dual and 4th—the magneto. Figure 1 shows a simple diagram of a jump spark battery system for a single cylinder engine. B is the battery, T—the timer, V—the vibrator coil and S—the spark plug. When the timer T closes the pri-

mary circuit there is always a small interval of time before the spark appears at the plug. This is called the lag of the spark and varies from .001 to .005 seconds. This may seem a very short space of time, but

in it the piston of a high speed automobile engine travels over a considerable distance. Take, for example, an engine running 1,800 revolutions per minute or 30 revolutions per second, then during .001 of a second

the crank pin will move through  $30 \times 360 \times .001 = 10.8^\circ$ , the angle A in Figure 2, and the piston will move from B to B'.

"With vibrating coils, the timer T sometimes breaks this primary current, as the vibrator is just as likely to be in contact at the time of this breaking as not. It is readily understood that if the timer should leave contact at the time the circuit is broken at the vibrator no spark would occur, but if it should occur when the vibrator contact is closed the spark would occur. This burns the timer and results in its being pitted and causes great mechanical wear. It is on account of this mechanical wear that roller type timers have generally been adopted, although from an electrical standpoint they are not so satisfactory, and they are not necessary when an ignition system is so built that there is no sparking at the timer contacts. The burning of the timer will cause irregular firing, because of the uncertainty of the primary contact.

"In addition to the electrical lag, there is another time element which enters into the ignition problem; it is called the firing constant and is the length of time between the point where the spark appears in the cylinder and the time when maximum pressure occurs. The maximum pressure in the cylinder of an engine should occur as soon after the piston passes dead center as possible. The angle through which the spark can appear at the plug and maximum power be obtained from the engine is called the critical angle. It is never more than  $10^\circ$  to  $15^\circ$ , and for accurate timing should be within  $5^\circ$ .

"The requirement for a good system of ignition is to get a cold engine to fire with a rare mixture and this is the only time where a hot spark is ever needed. The gasoline enters the cylinder in an atomized, rather than a vaporized condition, and some heat is needed at the terminals of the spark plug to vaporize a small quantity of the gasoline. This condition occurs only in starting a cold engine in winter, or with low gravity gasoline.

"One of the advertising methods used by magneto manufacturers is to show how long a spark their machine will give in the air, but this is no indication of what it will do when subjected to the pressure of a cylinder. For instance—a voltage that will give a  $\frac{1}{2}$ " spark in the air will give only 1-16" spark when subjected to a pressure of from 16 to 20 pounds. If the temperature of the gas is increased to from  $200^\circ$  to  $300^\circ$ , this same voltage will spark a 1-16" gap at a pressure of from 60 to 70 pounds. It is a fact that battery systems

use a wider spark gap than magneto systems, which is an advantage when firing lean mixtures.

"The resistance of the secondary of the induction coils varies from 500 to 7,000 ohms. After the spark gap breaks, the current that flows depends entirely upon this resistance. If the spark given by a magneto is examined with an oscillograph, it will be found to resemble the form shown in Figure 3. The peak of the curve will be a white streak and the part at the right will appear as yellow flame occurring from 10° to 15° later than the white streak, or after the explosion is over, and serves only to burn up the spark plugs. This is the flaming or caterpillar part of the spark so widely advertised by magneto manufacturers. The rate at which the explosion takes place is a spark gap factor depending on the width of the gap. The wider the gap, the quicker the explosion.

"In a magneto system, dead center is the latest place at which the explosion can take place. Under ordinary conditions an advance of about 30° can be obtained, but

speed. Pushing the lever beyond this point, the engine will run faster on the batteries than on the magneto, because they have greater advance. On account of their limited angle of spark variation, many magneto manufacturers advise the elimination of the spark advance lever and the use of a fixed point of ignition, speed variations being obtained by adjusting the throttle. When cranking an engine on magneto, there is considerable danger of its kicking back, owing to the fact that dead center is the latest spark obtainable, but the in-

ertia of the fly wheel is usually sufficient to carry the engine past dead center and avoid this.

"The necessity of using more than one spark gap is not important in automobile engines, but in the large producer gas engines it is one of vital importance, because producer gas is rather hard to ignite under any circumstances.

"On two-cycle engines the greater flexibility of the battery system is very useful, because all the regulation must be done by spark advance, and until the magneto gets a large angle of advance it will be at a decided disadvantage.

"Figure 5 shows the current waves obtained from a magneto, the reversal of the current occurring every half revolution. From this it can be seen that very little current is flowing half the time and the width of the peak wave is what determines the angle of advance the magneto can give. In the dual system, the same coils are used by both the battery and the magneto, and these coils usually take an excessive amount of current so that the life of the batteries is very short.

"The repairs on a magneto during a season are very apt to cost as much as the number of batteries necessary for battery ignition. A magneto will only run from 5,000 to 6,000 miles before it requires an overhauling, at which time the primary contacts usually need renewing, the roller on the timer is worn and the magnets require remagnetizing. Even the most expensive magnetos on the market will only run from 10,000 to 15,000 miles before they begin to show a very marked depreciation. A trip to the repairman will usually cost about \$10.00.

"A spark gap 3-64" is about the best to be used with lean mixtures. With the rich mixtures, a shorter spark gap is bet-

ter, because in this case the heat of the spark has some effect. A number of experiments have shown that the best results are obtained by connecting the positive side of the secondary to the frame of the machine and the negative to the high tension terminal of the plug—that is, by having the current flow from the frame to the plug. The heat intensity of a single spark is higher than that of a number of sparks such as are obtained from vibrator coils. With a single spark system the current required per spark decreases as the speed of the engine increases, about the same amount of energy being required for all speeds, except the very slow ones. An increase in the number of cells has the same effect as advancing the spark since the coils build up more quickly, but contacts are more liable to be burned with a large number of cells in series. A battery will operate satisfactorily so long as it shows three amperes.

"Misfiring is often caused by the static induction due to the high tension wires being run through the same pipe from the spark coil to the plug. When a high ten-

sion current is sent through one of these wires, it often induces a current in the others, which may cause a spark to be formed in one of the cylinders in which the charge is just being drawn in. This charge being under very light pressure ignites all the more easily, not only causing the engine to kick, but making it miss the next explosion. If braided wires are used, the braid often gets wet and this helps to carry this static charge more easily."

The Delco system, with which the remainder of Mr. Kettering's remarks were directly concerned, is of the single-spark order, and includes a special controlling relay, which causes the primary current to be interrupted and thereby produces a spark from the secondary windings of the induction coil or coils. The relay replaces the master vibrator of the synchronous spark system, and while ordinarily yielding but a single spark, may be made to vibrate rapidly upon pressing a starting button, thus delivering a continuous spark to the cylinders when it is desired to put the motor into action. The system is built with multiple unit non-vibrator coils, and, for use on 1911 cars, with a single coil unit. It is also adapted to be employed in conjunction with a magneto.

some manufacturers have obtained considerable more advance by shifting the pole pieces of the machine. With a battery system, as much advance and retard as desired can be had and it is usual to give 40° retard and 60° to 70° advance. The comparisons of the two systems is shown in Figure 4. Where the angles are laid out on the crank pin of the engine, A represents the angle of advance possible with a magneto, B that usually given with a battery, and C the angle of retard of the battery. This accounts for the well known fact observed in most of the dual and double systems that on shifting from battery to magneto the car will speed up. This is easily accounted for. One lever is used for the spark advance of both battery and magneto. By referring to Figure 4, it will be seen that the extreme position of this lever will correspond to dead center on the magneto and 40° retard on the battery. If the lever is in this position when the switch is thrown from battery to magneto, it will mean a spark advance of about 40° and the car will naturally speed up. This angle will be decreased as the lever is moved around until a point can be found where there is no advance and changing over will cause absolutely no effect in

**WHERE EVEN BEGGARS MAY RIDE**

**Detroit Provides Closed Cars for the Transportation of Their Kind—Two Months' Use Exceeds 12,000 Miles.**

The old, time-worn maxim that, "If wishes were horses beggars would ride," almost has become a reality in Detroit, where, following the supplanting of the horse in other fields, automobiles have been

have gone into this branch of municipal betterment to such an extent as has Detroit, where eight cars have been in use for the past two months, and have proved extremely satisfactory and economical in their operation.

The cars are 30 horsepower stock chassis with special bodies and Morgan & Wright tires. Seven of the cars are used in routine work, and during October and November they responded to 4,536 calls, aggregating a total of 12,589 miles. The eighth car is

**WHEN THE LAMP GLASS BREAKS**

**Its Replacement is Not Such a Difficult Task as May Appear—How it May be Accomplished.**

When replacement of a broken glass in a headlight is necessary, not every repair shop is equipped or knows how to perform the service, nor is the motorist himself often aware that with the aid of a

DETROIT'S FLEET OF MOTOR CARS IN WHICH BEGGARS AND OTHERS MAY RIDE—OFTTIMES AGAINST THEIR WILL

provided that beggars—and others whether merely impecunious or offenders of the general peace of that Michigan city—might ride. In other words, in order to have his wish gratified, a person with a desire for a joy ride, but without the necessary wherewithal, need only "start something." By the time he is well started, and before he has his second wind, a speedy, quiet, closed car, driven by a careful chauffeur in a neat blue uniform with gilt buttons, will be placed at his disposal. An equally neatly uniformed "footman" will hop from his seat beside the driver, and, with manners that would do credit to a Chesterfield, hand the gentleman of leisure or nimble fingers into the smooth-running municipal automobile.

The automobiles are operated by the police department of Detroit for police and ambulance duty in that city and its outlying sections. Of course, automobiles are used in many different departments of several cities of the United States, but few

styled "the flying squadron," and is reserved for special duty requiring greater speed than is necessary with the others. A record of its usefulness during the period from October 1st to December 1st shows a total of 750 miles covered in answer to 242 calls during the two months.

**Court Defines "Nerve Wrecking" Noise.**

On an appeal, Chief Justice Start, of the Minnesota Supreme Court, last week judicially defined the noise immediately following the cranking of an automobile as "nerve wrecking," and held a lower court in error for dismissing a suit for damages instituted by Miss Clara Fisher, of Elmwood, Minn., whose horse had been frightened and ran away as a consequence of the noise made by the motor in an automobile owned by John McGrath. The trial judge had dismissed the suit before it reached the jury on the ground that the evidence failed to show negligence on the part of the defendant.

simple steel glass cutter, obtainable in any hardware store for 15 cents, such repairs may be made at home with ordinary window glass of "double strength," which is also inexpensive; little time or skill is required.

With a pair of shears or a sharp knife cut from a piece of paper or cardboard a templet or pattern the exact size of the glass. Then place a piece of the window glass over the pattern and scratch the glass with the cutter in a circle of the diameter required. In this connection there is one precaution to be observed in using inexpensive glass cutters made of steel. The first cutting or scratching of the glass must be sufficient, for, unlike the diamond, the steel cutter dulls rapidly when it is used to retrace the first cut. One cutting with a very moderate amount of pressure will be all that is required, however, for double-strength glass will break readily with one cutting even on a circle of quite small diameter. After the circle is cut or

scratched, a pair of plyers can be used to advantage in breaking away the glass down to the mark.

The next and final step is to cut or scratch the glass along three parallel lines, so as to divide it into four parts of equal width. This is a very simple operation when a rule or something of the sort is used for a straight edge, and it is the secret of easy work in getting the glass in the frame. With the glass solid, it will be found very difficult indeed to get it in the frame without breaking, unless it has been cut so small as to be decidedly loose, in which case it will rattle and perhaps come out in the first rough running. When cut in sections, however, one piece can be put in at a time, beginning with the outside pieces in such a way as to get a good tight fit without much skill or effort. Moreover, with the glass in sections there is much more provision for expansion and contraction, and consequently less danger of breakage from this cause, and with the cuts running vertically, the appearance of the lamp is not injured.

#### Why Universal Joints Run Dry.

On a great many cars the lubricant of the universal joint, or joints, as the case may be, is insured by a leather boot, tightly laced and fastened to the propeller shaft by brass rings at each end which are tightened by means of small bolts and nuts. Should the lace become untied or broken or the boot slip out from under its fastenings or become split, centrifugal force will cause the grease in the boot to be thrown out and in a short time the joint will wear dry. The symptom of the condition is a slight but perfectly audible thump, usually more noticeable from the tonneau, and which is accentuated, not by the speed of the engine, but by the speed of the car. Occasionally a perfectly healthy-looking boot will temporarily allay suspicions, but a line of grease on the under side of the tonneau flooring more generally indicates the trouble. Most frequently the tightening rings are the offending members, especially on new cars, where, as soon as the grease has thoroughly permeated and softened the new leather, the boot slips out from under the retaining ring, with the resultant leakage of grease. In repacking the universal, care should be taken to see that the boot is absolutely tight, for where grease can get out road dirt and grit can get in.

#### Practice that Renders Restarting Easier.

Drawing in a big charge of gas by opening the throttle wide just before stopping the motor is a good practice, particularly during cold weather. The charge thus drawn in often will permit restarting on the spark or facilitate restarting in a measure, at least. The throttle should be opened after the spark is cut and while the engine is running.

## TO BREAK UP THE GLOBULES

University Professor Undertakes the Task  
—Designs a Carburetter to Serve the Purpose—How It Operates.

In the many varied methods of carburation, the chief difficulty with not a few of them seems to be that the gasoline does not vaporize completely and that a portion of the fuel enters the motor in globular form.

A method of relieving this difficulty has been devised by Professor W. Morgan, of Bristol (England) University, and a co-worker, E. B. Wood, in a carburetter which not only atomizes fuel as does the ordinary spray jet carburetter but also completely

vaporizes a portion of it. The manner in which this is accomplished, as shown in the accompanying illustration, is that a specially shaped tube, B, having a fine hole at its lower end and being quite open at the top permits a certain quantity of additional fuel to flow from the float-chamber into an annular space, C, which is kept hot by exhaust gases entering the jacket, D1, at D, and flowing out at D2; and that the fuel vapor formed in the annular chamber, C, is then free to pass by way of the passage, C1, direct into the branched intake-pipe. A steady flow of gasoline thus is able to reach the engine whenever it is running, whatever may be its speed and whatever may be the extent to which the throttle valve is open. The precise rate of flow depends only upon the size of the hole in the base of the tube, B, and the amount of air that passes with it depends primarily upon the area of the small exit orifice through the side of this tube into the heated chamber.

As far as concerns the relationship of the parts, the illustration is purely diagrammatic, being distorted to show more clearly the action and principle of the carburetter. The float feed chamber is shown at a considerable distance from the spray

jet, A, whereas in reality a short passage in the casting replaces the long external connecting pipe.

As to the air passage and the jet, A, there is nothing unusual as compared to other single jet carburetters. The air in passing up, sprays the fuel with it, and the two pass along together through the throttle valve at the top with the intake pipes. Immediately above the jet is a spiral mixer which tends to set up a swirling action, ensuring a more complete mixture of fuel and air.

#### Pierce-Arrow Catalog in Handsome Dress.

The Pierce-Arrow catalog for 1911 is out. That it is worthy of the name it bears goes almost without the saying. It is an edition de luxe, comprising a double cover of brown and gold, with the letter press profusely illustrated with illustrations in colors depicting the Pierce-Arrow cars in this country and abroad. The page illustrations, which really are pictures suitable for framing, show a limousine in the heart of a New York theater crowd, a touring car at a foreign aviation meet, a runabout on a stretch of country road, and a special touring landau in the foreground of a scene in picturesque Holland, while scattered through the pages are smaller but no less pleasing illustrations of the Pierce-Arrow car in service in the four quarters of the globe. Photographic reproductions of the different styles of bodies and of the chassis and parts which go to make up the assembled car show little departure from the original design, and except for a steady improvement in detail they remain the same. No lengthy technical description has been undertaken, but the writers of the catalog have succeeded admirably in placing before the motoring public in language most simple and easily understood such information as is generally deemed absolutely necessary to the intending purchaser or to the past owner. Tabulated by years, Pierce-Arrow records and awards in touring contests and reliability runs form an interesting conclusion to the volume.

#### Emergency Clamps For Broken Springs.

Usually it is the top leaf that is fractured when automobile springs break. Were the manners of injury more varied a repair kit would be somewhat complicated, but as it is the provision for an emergency, repair is very simple.

A small emergency clip and a strip of steel should be carried in the tool box. When a spring is broken, all that it is necessary to do is to loosen and tighten a few nuts in order to clamp everything together by placing the piece of steel over the break in the top leaf, and to set the emergency clamp on the outside of the break. The car then may be continued in service until the broken leaf can be replaced, which should be done as soon as possible.

## The Proper Garaging of Electric Vehicles

Characterizing electric current as the "hay and grain" of the electric vehicle, C. L. Morgan, manager of the maintenance department of the General Vehicle Co., Long Island City, sought to emphasize the importance of the garaging problem to the operator of commercial electrics in a paper read before the first regular monthly meeting of the Electric Vehicle Association of America, held in New York on Tuesday evening, 29th ult. Carrying out the metaphor to the requirement of an occasional figurative bran mash in the form of a tonic charge, he made it very plain that the operator who neglects the proper care of his electrics is as apt to receive unsatisfactory service as the man who fails to attend to the proper stabling of his work horses. "The Proper Garaging of Electric Vehicles" was the title of the paper.

That the garaging of the electric commercial is quite a different matter from the maintenance of an electric pleasure car is one of Mr. Morgan's points that already has been brought out by the Motor World. "The pleasure vehicle, as garaged by the owner, is satisfactorily established, and, where garaged publicly, is both a commercial and operating success," he remarked.

"The commercial machine, however, has at times been more or less unsatisfactory, because handled on the same basis as the pleasure car, and it is our province to point out, if we may, the pitfalls and bypaths, so that both the owner and the public garage man may take the road to success.

"Considering first the owner operating only a few cars. Shall he garage them himself or turn them over to a public establishment?

"In the larger cities if a satisfactory public garage is so situated as not to cause an excessive amount of dead or useless mileage, a greater success to the owner measured both financially and in continuity of service will probably be obtained by public garaging. The reason for this is that, with few exceptions, the small user cannot obtain a rate for current such as to save an amount sufficient to justify the expense of proper attention. The garage man usually purchases his current at a rate varying from two to three cents, while the owner pays two or three times as much.

"Special conditions naturally alter this statement. For instance, a concern which has an isolated plant of its own usually has a competent engineer, and the necessary charging current and attention can be furnished at little or no extra expense.

The same result will be obtained generally where the small user entirely replaces his horse by electrics, for he will save in space and general cost providing his stable man properly enters into the spirit of electric operation and follows without question the suggestions of the manufacturer.

"Broadly speaking, the owner who has no place for a garage or is not disposed to entirely change his method of transportation, should publicly garage his machines unless he has five or more. This remark is intended to apply particularly to Boston, Philadelphia, Chicago and New York. Granting that careful consideration indicates that the owner without any extraordinary expense may garage his machine himself, what are his problems and how will he obtain satisfactory results, both in operation and upkeep?

"It is presupposed that the space to be used for the garage is supplied with a reasonable amount of heat and light. This may seem like an unnecessary statement, but lack of one or the other has been the actual cause of inefficient service in so many instances that we may not overlook these two requirements.

"The equipment for either alternating current or direct current charging should be simplicity itself, and as near fool-proof as is possible, of a type adapted to the ordinary man and necessarily ruggedly constructed. Both types of boards are now well standardized, one of the large electric companies recently having brought out a new rectifier designed especially for commercial service and a great improvement over others.

Tool and equipment investment, except in larger garages, is exceedingly low. In nine cases out of ten, \$20 will cover both the tools and supplies which have to be purchased.

"The need for care in charging is really self-evident, for current is the hay and grain of the battery, and just as the stable man occasionally prescribes a bran mash or a change in feed for horse number so and so, so does the garage man handle his batteries, treating each with thought of what has been done to-day and what to-morrow calls for. A little extra attention to these actual operating conditions will show a marked increase in efficiency, meaning a decrease in the cost of current per mile. Take, for example, service such as an ambulance has to furnish. It is erratic, but seldom of great mileage, but must always be available. A change each time to full battery capacity is certainly a tremendous waste, so practice shows that an arbitrary restriction should be placed on the maxi-

mum charging voltage, or in some other line of work, Tuesday may always call for the maximum mileage, and precautions must then be taken to turn out the battery on Monday night with a charge of the greatest amount.

"To obtain continued success, there should be laid out an absolutely cast-iron program for inspection and adjustment, and some individual must be held personally responsible for the execution of this program.

"The system proposed will call for the strict following of the simple directions given by the manufacturer for charging, lubrication and adjustment, backed by a regular routine of inspection.

"This inspection is neither cumbersome nor expensive, if properly handled. Thirty minutes for a car is ample, and once established controllers are tried, fingers and connections tested, brakes examined for proper grip as well as freeness, motors opened, brushes tested, wheel bearings tried, chains and gears oiled and examined, lamp equipment tested, battery terminals cleaned and greased; in fact, every part from steering gear to motor is either found 'O. K.' or marked for attention.

"Probably the strongest way to present a routine of this kind will be to consider a specific instance; an equipment of three 2,000-pound vehicles, each working from 30 to 35 miles daily. Each night the caretaker, who is also responsible for three gas pleasure cars, handles his business as follows: The day's mileage for each machine is registered on the charging sheet, and followed by hourly readings of both amperes and volts for each machine. Every other night he carefully checks over one machine, lubricating steering knuckles, etc. At periods of one week, arranged to come on the alternate night to this lubricating and adjustment, one battery is removed and watered, and a record is kept, so that on every fourth watering, or once a month, the battery may be charged out of the vehicle, and at the end of the charge the gravity of each cell tested, and, if needed, equalized.

"This means that it is impossible for any excessive wear to occur on any truck or any low cells to develop without being noticed long before becoming serious, and it makes possible the leisurely ordering of the necessary replacement parts and the installation of the same.

"Parts which are active in the sense that they will be needed without question are carried in stock. They include chains, pinions, controller fingers, battery jars,

motor brushes and the like, but probably no more than \$50 worth all told. Furthermore, as both front and rear wheels are alike, it was deemed wise to purchase an extra rear wheel, without brake drum or sprocket spider. This wheel coming into service when tires need repair or replacement, it being interchangeable, either front or rear.

"It will readily be seen that actual time is needed nightly to maintain such a system, and to show the degree to which organization develops this in practice, let us cite the case of 26 machines which are actually cared for and kept in excellent physical condition by three workmen, one on during the day and two during the night. This does not include, of course, the washing nor painting, the latter being handled automatically, two machines always being out of commission, one in the paint shop and the other held as a reserve wagon.

"There is just one other routine operation which is not listed in the preceding program for 2,000-pound machines, and that is, the complete overhauling of each vehicle yearly, or at the end of 10,000 miles. A three and one-half or a five-ton truck should have a complete overhauling every 5,000 or 6,000 miles, this depending to a considerable extent, however, on the character of the driver and service, whether the vehicle is overdriven or overloaded. An arrangement of work and inspection such as this provides for everything except accidents.

"At the recent convention, Mr. Hayden Eames dwelt on one principle which is successful and of special interest at this time. A single vehicle is kept at the shipping platform of a small store, it is regularly charged and cared for by the night watchman, but to assure proper adjustment and battery care, this machine pays semi-monthly an overnight visit to a nearby garage, where the batteries at a purely nominal monthly rate are flushed or equalized, chains oiled and adjusted, etc.; or, in other words, this machine is intelligently left alone.

"Perhaps a word or two in regard to expert labor may not be amiss at this point. One of our most successful installations is that of a concern which entirely replaced its horse equipment, but which put the care and operation of their electric vehicles right up to the stable man. He needed no magnifying glass to read the handwriting on the wall, and immediately demanded of the manufacturer's expert the complete taking apart of a machine and the proper reassembly and adjustment. The whole of one Sunday, five or six years ago, was spent in this fashion. The next thing that he asked for were some written rules for handling those blame batteries. These rules were forthcoming, and to-day the only thing we hear from this equipment, which has nearly trebled in size, is an occasional

order for parts, and some of the highest records we have of service from both battery and chains have been made by this burly Irishman, who no longer has to get up in the middle of the night to attend to a sick horse.

"It can be positively stated that if the owner does not try to obtain daily the last mile possible from his batteries, that any man of ordinary intelligence can properly care for and successfully operate the modern electric vehicle. Those few cases which require expert advice can usually be traced to the owner's desire to work his machine to its utmost capacity or to a neglect of instruction.

"In large installations, as an adjunct to the garage proper, many schemes may be adopted for the betterment of service. These readily suggest themselves after actual records and data become available. One concern, operating both gas and electric trucks, pays a small monthly prize or bonus to the driver showing the best records, the most work at least cost. Another concern stipulates that a certain amount of goods must be handled, but pays a premium on everything done in excess, and, therefore, shows delivery records which some others in the same line of business would claim as impossible. It is well to remember that even a small amount as a bonus achieves wonders at times. Sixteen extra miles and a proportionate extra number of deliveries were obtained at a figure so low actually to appear laughable.

"Let us consider the pleasure garage man who at this time believes it is wise to add a few commercial vehicles, something which has not generally been a success, apparently because of lack of appreciation of what the power truck owner really wishes to purchase in the line of service. One example tells the whole story. The writer recently inspected three or four machines which had been kept for a number of months in a successful pleasure-car garage, and found every machine in need of adjustment or minor repair. On taking the proprietor to task, he stated he had received no orders from the owner to do such work, and added, 'There is so little money in the business that I think I'll throw the machines out.' Five minutes' conversation impressed on him that the owner wanted and would pay for continuous service, and that a failure of any part on the road could not be justified by the absence of repair bills at the garage. This same man is now handling his business in an up-to-date fashion, reporting to the owners the need for adjusting chains, the replacement of parts, etc., and has so won their confidence that in every case these orders are now obtained over the telephone, and his income increased at no expense of either time or nervous energy.

"The private owner often loses track of the great importance of accurate records.

He is purchasing mileage when he buys tires or batteries, but keeps no real data in regard to what is obtained, and is, therefore, unable to make true comparisons or investigation. How valuable data of this kind become is readily shown by reference to one concern who were overworking their machines, but who, after data were collected, reluctantly admitted that the last 10 per cent. of the business taken cost more than three times the amount it should and, as a matter of fact, was actually handled at a loss.

"The modern public garage for commercial vehicles of any type is handled on no different system than has been previously outlined. Still, let us emphasize the vital requirements by sketching briefly the organization and operation of a large and most successful electric commercial vehicle garage, that of the New York Transportation Co.

"An adequate system of inspection of vehicles and batteries is automatically carried on. Proper charging is attended to, and batteries are regularly flushed and equalized. A room is provided for drivers, and that is the only place where they are welcome, but to insure perfect co-operation and harmony, a system of drivers' complaints is in constant operation; a driver making out in duplicate his complaints. This is turned over to the night foreman, and later the driver is obliged to sign for the elimination of his kick, either because parts have been replaced or the adjustments made.

"The night inspectors, on finding work necessary within the next few days, report the same to the superintendent, who hands to the driver a slip requesting authority to make adjustments or needed repair. In nine cases out of ten, the driver is authorized to order such work, and as in the case of complaints, later certifies in duplicate to the work having been done.

"If the driver does not authorize the work, the necessary repair is at once called to the attention of the owner, with a brief explanation of the need for the same, with the result that it is ordered done, and finally certified to by the driver.

"These various duplicate records are attached to the monthly bill, eliminating once for all discussion regarding services rendered.

"In other words . . . success, whether it is of the individual care of a few machines or of the addition to the pleasure garage of a few commercial vehicles, or of the large public garage, that success is absolutely dependent upon and made by system, and this system differs in no essential, whether one or fifty machines are to be cared for, and that system is 'Inspection.' But . . . system alone will not produce, there must be the right-sized man back of everything, and, therefore, I repeat—select some individual and hold him responsible."

**CHALMERS'S BIG CONVENTION**

**Agents from Everywhere Gather at Detroit  
—Pleasure and Business Intermingled  
—Huge "Scare" at Banquet.**

One of the largest, if not the largest, of the many agents' conventions held in Detroit this year convened at the factory of the Chalmers Motor Co., the 28th, 29th and 30th ult. and 1st inst. More than 150

usual interchange of felicitations, with one or two surprises of an unusual character. One was the presentation to the company of an elaborate library lamp, destined for the directors' table, the gift being a tribute from the agents. Another was the presentation of a handsome tea service to Mrs. Chalmers. Of a totally different nature was the turmoil occasioned by the sudden entry of a number of newsboys bearing an "extra" edition of the "Chalmers Exhaust," in which flaring headlines proclaimed the

**ENGLAND'S FEAR OF INVASION**

**Increase of American Exports Causes It to  
Take an Acute Turn—Three American Consuls Proffer Advice.**

Recent activities of several American automobile manufacturers in preparing to expand their business in the British Isles have served to fan the long smoldering coals of distrust and antagonism in the

CHALMERS DEALERS AND SALESMEN GATHERED FOR THE ANNUAL CONVENTION

of the branch managers, dealers and salesmen who expound the Chalmers gospel were present, the territory represented stretching from the Hawaiian Islands to New York and from Winnipeg to the City of Mexico. The convention opened with a trip through the factory where the new models were inspected in the making and where methods of precision and production were studied at first hand. The more fruitful meetings, however, were those at which Hugh Chalmers and other speakers presented formal papers representing the essence of expert study of various problems connected with sales administration, garage and upkeep matters.

Between whiles the salesmen were wined and dined and otherwise entertained to their hearts' content, and as becomes the chosen guests of a great corporation that is privileged to entertain on a large scale but once a year. The crowning event on the social side of the program was the banquet, which concluded the session and at which a few invited guests, the mayor and mayor-elect of Detroit among them, were privileged to join the conventionites. This occasion was blessed, in addition to the

news of the burning of the factory, the assassination of the president and other catastrophies no less appalling, all of which were devoured none the less eagerly when it dawned that it was all a hoax.

**Seeking to Control Truck Contests.**

Apparently believing that there is a sufficient element of sport in truck contests to justify their promotion and control, the Motor Truck Competitive Association was temporarily organized in New York on Friday last, 17th inst. J. H. Hemstreet, who, with E. L. Ferguson, was engaged by William Randolph Hearst to conduct the New York American's recent truck contest, was elected chairman and Ferguson was promptly nominated for the chairmanship of the contest committee. E. A. Levy (Benz) was secretary of the meeting at which there was appointed a committee to draft a constitution and rules, which committee consists of C. E. Stone (U. S. Motor), F. B. Porter (Chase), R. F. Alcott (Knox) and G. Hartman (Hart-Kraft). The idea prevails that the organization shall be national in scope, with power to issue sanctions, enforce rules, etc.

bosom of the English industry into the flames of more or less acute fear.

An incidental effect of the scare has been to cause several watchful American consular representatives to take note of the hazard involved in injudicious exploitation and to issue warnings through the central bureau, at Washington, indicating the particular obstacles which must be overcome in establishing a lasting foothold in Great Britain. Consul Church Howe, at Manchester, views with considerable apprehension the mode of procedure of certain automobile salesman which "is being severely criticised" and suggests "that the methods to be adopted by them in the near future will not appeal to the British public." Two of the schemes to which objection has been taken he mentions in particular. One is an offer to renew at the end of twelve months the essential parts of every sixth car that is sold; the other holds out the bait of a new car for the purchaser who can show the biggest mileage for 12 months.

"To the English purchaser this form of advertising is not alluring," Consul Howe continues, "and the prospect for the cheap

type of American car, which is no doubt alluded to, is far from satisfactory. With careful and judicious handling, however, the situation should improve."

"It would be regrettable should the sales of the several American makes now on the market be curtailed in any way," further remarks the same authority. "The makers of these machines have had very uphill work to get their automobiles on the market here, and they have had to advertise very largely before seeing any actual return for their outlay."

Consul Albert Halstead, at Birmingham, is concerned over the same selling plan, which, he says it is reported, is involved in the distribution of 600 American cars which are to be imported. But he appears to be less fearful of the effect than his Manchester confrere. Indeed, he refers to a newspaper as quoting a leading manufacturer to the effect that "American cars should sell well" and as advising "British manufacturers to standardize a given type of car and push it for all it is worth, as is done in the United States." The Consul is of the opinion that "there certainly should be a market for a reasonably priced, well made, perfectly adjusted, dependable car of comparatively low horsepower, because of the heavier taxation upon higher powered cars." He continues more seriously:

"Now that this movement seems to have begun, it is highly important to impress upon American automobile manufacturers the absolute necessity of sending over only thoroughly tested cars of proven character, cars that in every sense will be creditable to the American industry. The experience with the shipment of bicycles some years since was such as to make the average Englishman somewhat doubtful of the quality and character of American automobiles."

"There is apparently a good opportunity for American automobiles here, but manufacturers should appreciate that with an original prejudice against them the greatest possible pains are necessary to overcome that prejudice or a promising field would to a considerable extent be lost."

Consul W. Stanley Hollis, at Dundee, however, probably strikes the keynote of the situation as viewed from the standpoint of the American manufacturer who is really anxious to secure a lasting position in the trade of Great Britain, when he refers to the dogged and thoroughly racial inability of the average Briton to understand how any foreign product possibly can begin to compete either in quality or price with home manufacture.

"Prices considerably lower than those for British-made cars of the same power and type now being offered in this market are quoted by American dealers, but it is to be feared that these moderate prices will not of themselves help much in securing a market here," he remarks, "for it is generally believed that the British-

made cars are sold as low as possible consistent with good workmanship and materials, and as it is the firm belief of practically everybody in this country that automobiles can be made much cheaper in this country than anywhere else. When an automobile is offered at a price considerable with a comparison of battery and magneto of the same power and type, the customer will very likely be slightly skeptical as to its quality and durability, and it is very unlikely that he can be convinced otherwise, especially if business is sought only through the medium of correspondence and the sending of catalogs and price lists."

#### Electric Pump for Tire Inflation.

To the growing family of automatic tire pumps, another, the Trojan, has been

added. It is, of course, designed to inflate tires "in no time at all" without the necessity of carrying the pump about, and is operated by a small electric motor, mounted upon the base with the pump; the power for the motor may be taken from any ordinary electric light socket. The equipment includes 15 feet of electric cord and 17 feet of air hose. The Trojan, which is made by the Dal Manufacturing Co., of Chicago, weighs about 90 pounds, and the makers claim that it will inflate four 36 x 5 inch tires to 90-100 pounds' pressure in from three to four minutes each, and that, with the use of an automatic safety valve, the pressure will not vary three pounds in any tire.

#### Home-Made Number Plates Cause Trouble.

Although it is hardly likely that the Fairfield Auto Co., of Bridgeport, Conn., had heard of the scheme of the motorist in Altona, Germany, who manufactured an imitation of the official license plate and who was acquitted on a technicality, its habit of painting its own number plates and putting them on its cars shows how "great minds run in the same channels." This rather reckless proceeding on the part of the automobile company last week resulted in its being haled before the Secretary of the state of Connecticut. The secretary wanted an explanation as to how such a large number of cars appeared on the roads of the state, bearing the number

132D in "home-made" figures upon sheets of tin. After considerable squabbling between the lawyers of the company and the policeman reporting the violation of the state automobile law, the secretary reserved decision. The company claimed that it had exhausted its set of six markers supplied by the state, and that it needed additional ones in a greater "hurry" than the state could or did furnish. So it simply went ahead and "did it"—that is to say, it painted its own markers.

#### Opportunity Lost for Chinese Trade.

"It is a matter of regret that at the first industrial exposition of China, now in progress here, American automobiles are represented by catalog only," writes A. W. Gilbert, American vice-consul at Nanking, China. "The two cars on exhibition (British and French) have been sold to local Chinese officials and are the first sales of motor cars to Chinese in this city. As there are very good roads here and pleasant drives it is only a matter of time before other sales will follow. These sales afford an excellent illustration of the results of competition between catalogs and an aggressive agency on the field. Furthermore, such an agency must be an American one. The most powerful Chinese official outside of Peking lives in this city, and consequently it is also the home of numerous minor officials and wealthy gentry, many of whom now own foreign carriages."

#### To Prevent Substitution of Oils.

If motorists made it a practice of destroying empty oil cans by stamping them before leaving them at a garage, their fraudulent refilling would be rendered impossible. Many manufacturers sell their oil in sealed cans, but the garage owner who is at all unscrupulous generally can dispose of dubious fluid by bringing the oil in a can already opened and bearing an old label. As the cans in the majority of cases are not returnable, there is no loss if they are destroyed when emptied. To discover whether or not the can is sealed and the original oil intact, a good scheme is to order the oil to take away as a reserve on the car.

#### The Cleaning of a Clogged Radiator.

When clogged with sediment a honeycomb radiator may be cleaned by taking a 10 per cent. solution of potash, heating it and pouring it while boiling into the detached radiator, after the pipes leading to and from the motor have been closed. The radiator should be turned upside down every hour for 10 or 12 hours, and the solution then be poured out from the same hole by which it was poured in. At the opposite end a hose with water under pressure should be attached, and a stream run through the radiator for several minutes.

**DEFINES RIGHTS OF PATENTEES**

**In Enjoining Others from Recharging  
Prest-O-Lite Tanks, Court Touches  
Many Points—Notable Decision.**

In a decision sustaining the patent covering the Prest-O-Lite system of lighting, and granting an injunction restraining the Autolux Co., Percyval C. Avery, et al, from recharging Prest-O-Lite tanks, Judge Quarles, sitting in the United States Circuit Court for the Eastern District of Wisconsin, has sketched in unusually graphic language the rights of a patentee. Although he points out that the tank itself is not patentable, the gas which it contains constitutes such an exclusive right, and he holds that not even the patentee's inability to fill orders, which inability may cause public inconvenience, justifies anyone else in recharging the tanks, and thereby infringing the monopoly granted by the patent. The decision, which is an important one and one that cannot fail to have a bearing on patent litigation generally, first sums up the evidence and then passes judgment, as follows:

The Prest-O-Lite Company, has established a uniform practice of giving in exchange for each empty gas tank of their make, a recharged standard Prest-O-Lite gas tank, and has established five agencies throughout the country. For the purpose of insisting upon this practice of exchange or recharging, and to protect its customers from badly filled and inefficient tanks, the Prest-O-Lite Company has since its organization sold these devices solely with the intent that they be returned when empty to the Prest-O-Lite Company for exchange, and that they should not be sold or used when filled with acetylene gas by any one other than the patentee or its licensee, the complainants herein. This purpose has always been understood and recognized in the trade, and generally acquiesced in. In order to bring fully to the attention of the users the terms and conditions under which these tanks were sold and exchanged, the Prest-O-Lite Company since the first day of June, 1907, has placed upon every one of these devices sold and exchanged, a metallic plate on which is engraved the following words:

"The Prest-O-Lite Gas Tank Co.  
(Serial No.) The Prest-O-Lite Co.,  
New York, Boston, Indianapolis, San  
Francisco, Toronto, Patented Dec.  
25, 1900, May 12, 1903.

Notice this device is sold and purchased for sale and use only when charged with gas by the undersigned. No license is granted to use or sell this device when charged by any one else and no license is granted to any one else to recharge this device. Any sale or use of this device when sold or used in violation of this condition and limited license will be considered as an infringement of Letters Patent of the United States under which this device is made and sold, and all parties so selling and using this device contrary to the terms of this limited license will be treated as infringers of said Letters

Patent and render themselves liable to suit for damages and injunction without further notice. This license is good so long as this plate remains upon the device. Any erasure or removal of this plate will be considered a violation of this license. A purchase is an acceptance of these conditions.

Agents and dealers are not authorized to vary this license.

The Commercial Acetylene Company.  
The Prest-O-Lite Co."

In addition to this notice of the nature of the rights in these tanks passed by their sale to the purchaser, the Prest-O-Lite Company has attached to each and every of these tanks a paper label containing in large letters substantially the same matter as that placed on the metallic plate.

Those conditions were well known to the defendants Avery and Burnham and their associates and the defendant corporation. The defendant Avery was one of the original officers and stockholders in the Prest-O-Lite Company, but severed his relations therewith for the purpose of establishing in the city of Milwaukee under the name and style of the "Avery Portable Lighting Company" an infringing plant for the manufacture and sale of certain infringing device, and by recharging said licensed device of the Prest-O-Lite Company, and until February 5th, 1909, said parties so connected with the Avery Portable Lighting Company were actively engaged in committing these infringing acts, and so continued until enjoined by an order of this court on final hearing from continuing to manufacture and sell the device known as the Autogas tank, or from committing any other infringing act. About this time Avery and his associates organized a new corporation under the name of the Auto Lux Manufacturing Company at Milwaukee, for the purpose, as claimed by complainants, of continuing the invasion of the rights of the complainant under the patents aforesaid, and commenced the manufacture of an apparatus known as a High Pressure Generator, which has been extensively used in recharging the Prest-O-Lite gas packages and other gas tanks used on automobiles.

Eleven such High Pressure Generators have been sold by defendants and installed in populous cities, where they have been used to fill the gas tanks of the Prest-O-Lite Company and others.

The showing made by the complainants on this application on its face presents two distinct legal aspects. The first rests on the patent alone for all necessary recharging of the Prest-O-Lite gas tank during the life of the patent; that any unlicensed person who charges such a tank with a super-saturated solution of acetylene gas for use or sale, is an infringer, and that whoever advises, aids or abets such tort is a contributory infringer; that no restriction by the patentee is necessary to re-enforce the sanction of the patent.

Second. The conditions imposed by the patentee forbidding any one aside from the patentee from recharging the gas tanks, are set up and insisted upon. The principle of law relied upon is that the patentee may withhold his device from the public entirely if he so elects, and therefore may impose such restrictions upon use or sale of the patented package as he may choose; that the purchaser or user who knows of such restriction is bound to comply therewith. To knowingly violate them is a tort, and whoever advises, abets or aids in such violation is a joint tort-feasor.

The contention of complainant is that defendants are guilty under either phase of

the law. It may be well to consider these two propositions separately.

To clarify the first proposition we must have in mind what the device is that is protected by the Claude & Hess patent. All along through the showing of defendants the idea crops out that one who has bought a patented gas tank owns the same absolutely, and may have the same recharged when and where he will. That is to say, that the legal effect of such purchase is to release the device from a monopoly. Now if the empty steel shell with its two valves be the physical embodiment of the patent, this contention would be entitled to consideration. A reference to the language of the Claude & Hess patents and to their history in the Patent Office, and the construction placed upon them by this court in 161 Fed. 907, should suffice to silence this contention. The "package," which is the patented product, consists not only of the steel tank, but of the internal equipment of a super-saturated solution of acetylene gas which is recognized as an essential part of the package. A long bitter fight was waged in the Patent Office on this very point, and the final conclusion was that the gaseous solution bore the same relation to the outer shell as the column of mercury bears to the glass stem and bulb of a thermometer. Indeed, it was conceded by the officials of the Patent Office that there was nothing patentable about the steel cylinder with two valves, each element, as well as the combination, was old. Therefore it is obvious that the exhausted steel cylinder is not the physical embodiment of the patent and has not been released from a monopoly, but in the natural order of things requires the renewal of the vital elements of the patent. This operation calls for the teachings of the patent, the same care, skill and inventive thought that are called into requisition when the tank received its initial charge. It follows, therefore, that whoever undertakes to recharge this tank for use or sale, is practicing the invention to all intents and purposes and is invading the monopoly. That this illicit business has grown to large proportions is convincingly shown by the affidavits submitted on both sides, and was established by the record in the suit of the present complainants against the Avery Portable Lighting Company. There can be little doubt from the facts here submitted that the High Pressure Generator of the defendants has been extensively employed in filling Prest-O-Lite tanks, with the knowledge and consent of the defendants; that such generators, eleven in number, have been established in the large cities of the country for the purpose of facilitating this illicit business. This is attested by the clamorous chorus of auto users who furnish affidavits here for the defendants, singing the praises of the defendants' generator as a panacea for all their troubles. Seventeen of these dependents admit being owners or users of one or more of the Prest-O-Lite tanks. The clear inference from the defendants' affidavits is that in the absence of the High Pressure Generator, these Prest-O-Lite tanks could not and would not have been recharged except through the agencies provided by the complainants. We shall see when we come to discuss the law that the defendants are contributory infringers under the first hypothesis.

The second proposition involves the legal efficacy of the conditions imposed by the patentee prohibiting use or sale of any such tank recharged by any other than the patentee. There would seem to be abundant reason why complainants should insist

upon this condition that is stamped on every tank conspicuously and brought to the attention of every user. It is dealing with a combination of chemical elements of high explosive nature calling for great care, skill and experience to ensure safety and efficiency in operation. The reputation of complainants is at stake on every one of its tanks that goes out to the public bearing its name. Such reputation is bound to suffer when one of its tanks explodes or falls below the standard of efficiency, but whether reasonable or unreasonable, the authorities seem to recognize the right of the patentee to insist upon a restriction of this kind, no one being bound to purchase or use the patented article if unwilling to abide by the conditions. No case exactly in point can be found, indeed no such case has heretofore arisen presenting the peculiar facts which make this a case of first instance. Numerous cases are cited where the patentee by a condition has insisted upon bringing within the monopoly some article or substance not covered by the patent. Such was

Dick vs. Milwaukee Office Specialty Co., 168 Fed. 930.

See also the following cases cited by complainant's counsel:

Tubular Rivet Co. vs. O'Brien, 93 Fed. 200. Aeolian Co. vs. Juelg Co., 155 Fed. 119. Rupp & Wittgenfeld Co. vs. Elliott, 131 Fed. 730.

The distinguishing feature of the instant case is that the patentee by condition merely insists upon the exclusive right to practice the invention, to control the elements that constitute the soul of the invention. The so-called condition is not broader than the prohibition of the patent. Viewed from any standpoint the requirement of the so-called condition is entitled to respect and obedience at the hands of every person having knowledge of such restrictions. In some way the patentee must have protection; otherwise it would result that the monopoly would practically expire with the exhaustion of the first charge of acetylene. At the end of thirty-four hours of steady burning when the first instalment of power has given out, any interloper may gain possession of the tank and practice the invention with impunity. This would work a mockery of the entire patent, and set at naught the patent laws which assume to grant a complete monopoly for seventeen years.

This case is *sui generis*, not to be confused with the case of a patented device which passes to the user completely equipped, calculated to discharge for an unlimited period of time a given function, until it breaks down or wears out. In the case of the gas tank it is within the contemplation of the parties, and inheres in the very nature of things, that within a short time, a matter of weeks or months, the package will become exhausted, and a recurrence to the teachings of the patent will be necessary to invigorate the tank for another period of usefulness. One of the gods of mythology was so constituted that at fixed periods he was obliged to recline on the earth from which he drew his supernatural power. The very theory of the patent is that each tank must oscillate between the vehicle upon which it serves to the charging plant upon which it depends. Thus the doctrine of repair, so urgently pressed upon us, is not applicable. There is no breakdown here. The return of the exhausted tank is not accidental, but normal, and whoever knowingly interferes with this process invades the monopoly. The attempt to bring this case within the doctrine of repair because complainants take

tribute in advance, is not entitled to serious consideration. The Government has left the matter of tribute entirely to the patentee and the public with whom he must deal. In the case of any ordinary sale of a machine, the patentee collects his entire tribute when the sale is made. He expects nothing more, as the transaction is complete.

It is said that the condition is matter of contract and binds only the purchaser who assents to the same. On the other hand, the theory is advanced that the condition stamped on the tank is like a covenant that runs with the land. Neither proposition is exact. The covenant runs with the land whether the later grantee has notice thereof or not; the record furnishing constructive notice. Here it is purely a question of notice. Any person having actual notice that such restrictions have been imposed is bound to observe them.

In *Bement vs. National Harrow Co.*, 186 U. S. 71, the court says: "The very object of these laws is monopoly, and the rule is, with a few exceptions, that any conditions which are not in their very nature illegal with regard to this kind of property, imposed by the patentee and agreed to by the licensee for the right to manufacture and use or sell the article, will be upheld by the courts. The fact that conditions in the contracts keep up the monopoly or fix prices, does not render them illegal."

That defendants have encouraged a wholesale violation of such reasonable condition and have furnished machinery to facilitate such violation, is established to my entire satisfaction.

But defendants insist that defendants are three removes from the user who oversteps his legal rights, and therefore they are not technically contributory infringers. An infringement is a tort, and it is a fixed principle in the law of torts that all who engage in its consummation are joint tortfeasors! There is no magic in the term contributory infringers which will avail the defendants. The following cases cited by complainant's counsel fairly indicate the lines of contributory infringement. Judge Seman in *Dick vs. Milwaukee Office Specialty Supply Co.*, 168 Fed. 930, approves and adopts the definition and reasoning of Judge Ray in a case with the same title found in 148 Fed. 427, where the Court says: "That such license restrictions are lawful, good, valid and binding in the case of patented machines and articles has been established by a long line of decisions. Also that one who knowingly and directly aids, abets and procures a violation of such license restriction is a contributory infringer of the patent." This legal doctrine is fortified by several later cases cited by complainant's attorneys.

In *Crown Cork and Seal Co. vs. Standard Brewery*, 174 Fed. 252, 259, the Court says: "If the defendants knowingly contribute to infringement of a patent by aiding a use beyond the limits of the license made by the patentee," they are contributory infringers.

See also *Goodyear Shoe Manufacturing Co. vs. Jackson*, 112 Fed. 146, cited by defendants.

The voluminous showing presented by the defendants consists mostly of a large number of affidavits from dealers and users of gas tanks used upon automobiles describing the enormous demand for these articles growing out of the phenomenal expansion of the automobile business, the utter inability of the complainants to supply sufficient tanks to meet this growing demand, and the great inconvenience of users who needed to have their tanks recharged promptly and were obliged to send their

exhausted tanks a long distance to reach any charging plant maintained by complainants; that the installation of the Auto-Lux generator of defendants was a great blessing, as it enabled such recharging to be expeditiously done at home. It is difficult to see how this showing furnishes any legal footing for the defendant. It would rather seem to emphasize and give color to the complainants' contention in two ways. First, because it depicts in strong light the wonderful commercial opportunity and temptation for one who is willing to break into the field and appropriate this business of recharging complainants' gas tank. Consumers were willing and eager to pay the price. Defendants were equal to the situation and proceeded under some early patents to construct a generator that would answer the purpose, and located them in populous centers where complainants had no recharging plant. This laid bare the secret spring that brought the High Pressure Generator into existence and accounted for their rapid distribution. It was a commercial enterprise, promising large profits, if the business of recharging these tanks of complainants could be diverted and maintained. It satisfactorily appears that defendants well knew that an evasion of the monopoly of complainants was involved, and that they were anxious in their contracts that purchasers assume responsibility for legal consequences. These matters were all talked over with the purchasers of the generators, which were in nearly every instance connected in some way with the auto business, and were entirely familiar with the methods pursued by the complainants in licensing their tanks, and the conditions that were imposed upon every purchaser, and all appear willing, under the advice of defendants, to take the chances of litigation.

Second. Such showing of affidavits gathered by defendants betrays the fact that such generators of defendants are being generally and regularly used to fill the Prest-O-Lite tanks. The fact that complainants were unable to furnish sufficient charged tanks to meet the demands of the public, furnished no legal excuse for the wholesale infringement. A similar excuse was presented in *Crown Cork & Seal Company vs. Standard Brewery*, 174 Fed. 253, 257, and was summarily brushed aside by the Court.

I am constrained to hold that the high pressure generator of defendants was built and sold to enable certain reliable men to to secure this illicit business of recharging the Prest-O-Lite tanks, the profit of such enterprise to be shared by the defendants. Trade conditions were peculiar, but trade conditions did not change the law nor the rights conferred by the Government upon the patentee.

The complainants are entitled to injunctive relief so far as may be necessary to protect and enforce the restrictions imposed upon the sale and use of tanks filled by any other than the patentee. The use or sale of the High-Pressure Generator for the purpose of recharging Prest-O-Lite tanks with acetylene gas must be prohibited.

I am inclined to include the Auto Gas tank. They have been adjudicated as infringing devices, and so remain unless their status was changed by negotiation and adjustment of the parties which wound up the litigation between the complainants and the Avery Portable Lighting Company.

The complainants' attorneys will prepare an injunctive order and submit the same to the defendants. The Court will hear the parties as to the framework of the order.

## Motoring and Its Relation to Health

The influence of the automobile upon the mind, the morals, and the physical being of those who use it presents questions of interest well worthy of study. Already more or less has been written concerning these topics. Its effects, however, upon the upper passages do not seem to have attracted serious attention, and yet offer opportunity for considerable investigation and comment, says Dr. D. Bryson Delavan in a paper read before the American Laryngological Association.

The automobile may affect both him who uses it and him who does not. The exposure to one who rides in an open vehicle may bring about effects which would not endanger the one riding in a limousine. The chauffeur may also be exposed to dangers peculiar to his position. As to the man who walks, it is his part to inhale the fumes which poison the atmosphere of our best avenues and to either be driven from his home by the noise of the automobiles or choked by the dust which is raised by them and blown in his direction.

If the experience of other occupations which are known to be injurious to the air passages is any criterion, it is time that we had undertaken to consider the influence of the automobile.

The factors which may work injury may be divided into two groups, namely, first, conditions relating to the air itself, and, second, impurities carried by or suspended in the air. The first includes temperature, air currents and air pressure; the second, dust and smoke. Sudden and violent changes of temperature are often encountered by the motorist. Exposure to strong draughts is also a common experience, the draughts being due to natural air currents or to the rapid motion of the car. Where the car is speeding in the face of a breeze the resulting increase of air pressure must be considerable.

Sudden change of temperature or rapid radiation of body heat due to exposure to air currents may cause chill, and, indirectly, the latter's well-known results upon the breathing apparatus. Increased atmospheric pressure, especially when combined with cold, must of necessity exert important influences upon the respiratory region, from the nasal cavities and their communicating passages to the ultimate vesicles of the lungs. A rate of 30 miles an hour constitutes a stiff breeze, while 60 miles represents a gale. These facts we know, and yet easily forget in the exhilaration of the ride.

Studies made with regard to the actual resistance of the air in speeding give in-

teresting results. It is stated that at speeds below 20 miles an hour the effect of wind resistance is too slight to be measurable. Considering surfaces at right angles to the normal plane of travel of the automobile, resistance begins to show at about 15 miles an hour. It increases slowly, reaching about  $2\frac{1}{2}$  pounds a square foot at 30 miles an hour. Higher speed results in rapidly increasing rate of resistance until at 60 miles an hour the pressure is about 13 pounds. At 90 miles it has increased to about 29 pounds.

If these observations are correct, air pressure in connection with the use of the automobile is not a negligible factor, especially when related to its influence upon the air passages. Of course, it must be remembered that the rate of pressure may be greatly increased by adding the force of a head-wind to the speed of the machine. Thus, a speed of 30 miles against a 20-mile breeze would create a 50-mile pressure. While there may be some conditions of the lungs in which exposure to a moderate increase of air pressure for a limited amount of time would be beneficial, there must be many cases in which great increase of pressure, or pressure long continued, would result in injury, even to a healthy lung. In certain pathological conditions, such, for example, as emphysema, the risk is obvious.

The second injurious factor is the impurities which may be inhaled with the inspired air. These consist of dust, of smoke, and of other matters, among which may be mentioned plant products and small insects. The deleterious effects of dust upon the air passages are obvious.

With regard to the equipment of the motorist, every conceivable appliance and convenience is provided for him. This is especially true of protections for the eye, which are supplied by the shops in great variety. In considering this, however, it at once appeals to one as strange that protection of the breathing apparatus against dust and severe winds seems to be neglected. I have searched many shops, but have never yet found a satisfactory respirator, nor do I know anything in recent scientific literature bearing upon the subject. Almost the single exception to this statement is the face guard used in racing, for protection against the wind. This is of simple pattern and construction, and for its purpose is said to be effective. It can hardly be entirely successful, however, in excluding dust. For the latter purpose none of the old-fashioned respirators, such as have been worn in London for many

years for protection against fog, nor those of the Morrell Mackenzie type, for preventing the inhalation of dust by emery grinders, stone workers, and the like, are satisfactory. The majority of those who attempt any protection at all are ladies, who use chiffon veils in which they envelop the entire head. This method, of course, offers a certain amount of relief to the air passages, but it can not be considered ideal.

The lack of attention which has been given to the subject of respirators would imply that dust is an unimportant factor. In regions where the roads are well cared for and properly oiled this is to some extent true. Any one who has seen automobile parties coming in after long runs in dry weather, through an open country, will remember the extent to which everything pertaining to the motor and its occupants has been covered with dust. This is especially true of many districts in Europe, where oiling of the roads is unknown, and where limestone or other comparatively soft material used in making the roads has furnished a fine powdery grit, which rises in dense clouds and penetrates everywhere.

The introduction of the wind shield has resulted in modifying the effect of wind currents with considerable success. Roe states that since it has been more generally used diseases of the nasal sinuses among automobilists have been distinctly less common.

Theoretically considered, the use of the automobile should be productive of a decided increase in the average of respiratory ills. Whether or not it has actually so resulted is a question. Taking up the causes of injury, we will first refer to chill. This may be acquired through unsuitable or insufficient clothing, or through clothing improperly applied. Not only should the body be protected, but the limbs should be carefully covered, especially in open motors. A coat, otherwise warm, may be cut too low in the collar. The idea that undue exposure of the neck and throat tends to strengthen the parts is a popular fallacy. No such custom prevails with the Eskimos and others of exposed life dwelling in cold latitudes. No part of the body would seem to demand more careful protection than that adjacent to the top of the sternum, where center the most important blood vessels of the body, many of them within short distances of the outer world. A coat which does not properly protect the throat is like a roofless house. Any one who has skated, or has sailed an ice-boat in very cold weather, or who has had experience in mountain climbing at high altitudes, will

readily understand this. In motoring, neither extreme cold nor great altitudes are necessary to bring about conditions which rapidly lower the body temperature. As with the neck so with the feet. Low shoes, unprotected ankles, and want of rugs may quickly work disaster. Some of the head coverings used are admirable. Others are exceedingly bad, comfort and safety being sacrificed to appearance, with no attempt to protect and shield the face and neck. The subject of proper underclothing must also be considered. The wearing of an abdominal band is considered by many experts a great protection against chill. It is easy to become chilled in an automobile when one enters it after leaving a warm room, even when well protected with clothing. Still worse to ride in an open machine in the country, fresh from an overheated train and with thin clothes.

Apparently the worst case is that of the chauffeur who, in the effort to replace a tire or repair some injury, works himself into profuse perspiration and then upon the driver's seat makes up lost time against a cold breeze. Such exposure should be prolific of throat and lung trouble. As a matter of fact, it does not seem to be. This may be accounted for by the youthful vigor and personal power of resistance of those who engage in the work of motor driving, as well as by the health-giving effects of a life of abstinence and of activity in the open air.

Having considered the above-mentioned factors, the next step would be to study their effects upon the upper air passages in healthy individuals.

To that end we have endeavored to make a collective investigation of the subject, and have taken the chauffeur as the basis of study, selecting him because, as a professional, he devotes a maximum amount of time to his work; because his position is more exposed than that of others; and because he may be supposed to represent a fair type of the average healthy individual. In order to gain the most reliable information possible we have interviewed the medical departments of four leading life insurance companies. All agree that the subject should be, and is being, investigated, but state that it has only lately come up, that nothing less than a large collection of statistics will be of value, and that the length of time which has elapsed since the matter was taken in hand is too short to admit of reliable deductions and final scientific results. As far as their observations have gone, up to the present time, none of them has been able to notice any special effect of the use of the automobile upon the upper air passages. One of the companies states that while the mortality rate is greater in these cases than with ordinary drivers of vehicles, this is owing to accident and not to disease, and has nothing to do with the real object of our investigation. It makes no extra rate for risk of illness to

chauffeurs. It aims to accept only chauffeurs of good standing and of temperate lives, and it believes that any special risks of illness to which they may be subjected are counterbalanced by the non-use of alcoholics and by the life in the open air. Another company regards the chauffeur as not inferior as a risk, and accepts him on equal terms with others of his general grade. A third agrees substantially with the above. In the case of the fourth company an excess rate of one-half of one per cent. was formerly charged chauffeurs. Lately, this excess has been removed and they are taken at the usual rates.

In short, the medical departments of these companies, the largest and most important in the country, have not found that chauffeurs are apparently more liable to the serious respiratory diseases which threaten life than are coachmen. Both, of course, are apt to suffer from pneumonia due to exposure, one of the few conditions likely to come to the notice of life insurance authorities.

In acute catarrhal conditions in general of the air passages motoring would seem to be contraindicated. In many subacute and chronic catarrhal conditions, however, it appears to be distinctly advantageous. In my own experience many such cases have been benefited, and more than one patient of long standing has been cured.

In bronchitis, asthma, and emphysema the rules which would obtain with regard to the avoidance of sudden changes of temperature and exposure to strong winds would be applicable to the use of the automobile.

The same may be said with regard to pulmonary tuberculosis. Several cases have been reported to me in which bronchial asthma, vasomotor coryza, and hay fever have been markedly relieved by it.

Good authorities, of course, interdict motoring in tuberculosis subjects whose temperature is above normal. In certain cases, particularly of the nervous, restless type, the mild stimulation of the circulation, deep-breathing, and lively mental diversion have been distinctly beneficial.

The advantages of the open car, also are not to be ignored. The entire freedom of the circulation of the air, even in cold weather, is stimulating and tonic to those vigorous enough to profit by it. Indeed, there are some who claim that they never take cold unless they ride in a closed car. Here, of course, the personal equation must settle the question.

In this connection attention should be called to the use of the wind shield. It is said that much greater immunity from respiratory troubles has been observed among professional drivers than was formerly the case. Before the introduction of the wind shield affections of the ear, the nasal sinuses, and the air passages in general seem to have been much more common than they are now.

The typical expression of countenance of the racing motorist is highly suggestive of mouth-breathing, a habit likely to add much to the risks under discussion.

In estimating its effect upon the air passages, therefore, the fact that the automobile may be either open, protected, or enclosed must be considered. No vehicle is more luxurious or, indeed, safer for those who are feeble and susceptible to the effect of cold, than a high-grade, well-appointed, modern car. With the windows properly arranged draughts can be prevented, and even the temperature can, to some degree, be controlled. Under such conditions an invalid might travel proper distances without injury and with highly beneficial results. To the same person a long ride in an open or a partly protected car might be attended with discomfort and followed by disaster. In advising a patient, therefore, it is necessary to specify the variety of car he should use and then instruct him as to the precautions necessary in his particular case.

Here, again, the personal equation becomes important. The same currents of air which would invigorate and strengthen a person in robust health might be harmful in conditions of disease of the air passages, as they are recognized to be in disorders of other parts.

In a paper recently presented in Philadelphia by Professor James Tyson on the effect of the use of the automobile upon the heart, Dr. Tyson maintains that many cases of cardiac diseases are markedly benefited, the fresh air, moderate exercise, gentle stimulation of the circulation, and mental diversion having an excellent influence.

So, in properly selected cases of respiratory trouble the patients thrive under it, owing to improved oxygenation and nutrition.

To sum up the matter, it would appear that under certain conditions and in certain cases the motorist may expose himself to positive risks. These risks may sometimes be modified or even removed by the use of proper precaution in the selection of a machine and by the exercise of wisdom in using it. Properly used in suitable cases, the automobile may be a valuable therapeutic agent.

These things being true, it is time that knowledge upon the subject had been obtained sufficient to enable us to warn the public of the possibilities of danger and to instruct it as to the best means of protection.

#### Stores Cars and Loans Money on Them.

Among Detroit's many automobile establishments is one which not merely buys, sells and stores cars, but which offers to advance money while they are in storage. No inkling is given of the extent to which the offer has been availed of nor whether the company has complied with the "pawn-brokers' regulations" of the state.

## GREAT SMITH STRIKES THE SHOALS

**Kansas Company in Hands of Receiver,  
After Court First Refuses to Act—  
Reorganization is Planned.**

In the belief that it will safeguard the interests of all creditors and permit of reorganization on a fair basis, the Smith Automobile Co., of Topeka, Kan., has been placed in the hands of a receiver, F. B. Clark, the secretary and manager of the company, being designated to fill that office.

As only some three months since the company, which manufactured the Great Smith car, gave notice to the Topeka public that unless local support was forthcoming it would be compelled to discontinue or to seek a more favorable location, its embarrassment is in no wise surprising. At that time some \$40,000 was pledged by the citizens of Topeka, but it evidently did not serve the purpose. It is stated that the assets more than equal the liabilities and that the receivership proceedings were instituted because of fear that minor creditors might precipitate matters.

When a petition filed by friendly merchandise creditors asking for the appointment of a receiver first was presented to Judge John C. Pollock, of the United States District Court, he declined to rule that the company was insolvent or to take action without agreement on the part of the Smith company. Several days later, however, this consent was waived and F. B. Clark appointed receiver, as stated.

### Electric Car Deal Pending in Toledo.

Negotiations are pending between the Milburn Wagon Works and the Ohio Electric Car Co., both of Toledo, Ohio, for a consolidation of their respective interests. The Milburn company, which is one of the oldest and largest manufacturers of farm wagons and buggies, has been making the bodies for the Ohio Electric vehicle, so that the concerns are well known one to

the other. The Ohio Electric Car Co. was formed in March of last year, but has not cut a very large figure in the automobile industry. A. M. Chesebrough is its president and J. B. Bell its secretary-treasurer.

### Anhut's Conception of "High Financing."

The Security Trust Co. of Detroit has been appointed trustee of the Barnes Motor Car Co., which recently went into bankruptcy. At the meeting at which this action was taken it came out that the Chatham (Ont.) plant of the company, which originally operated as the Anhut Motor Car Co., was worth but \$10,000, at a liberal valuation, although it was represented by stock to the value of \$50,000. In addition, there is a flaw in the title to the property. When John N. Anhut was putting his ideas of "high financing" into practice, the stock of the Anhut company was increased \$300,000 when the Canadian plant—which was never operated—was acquired.

### Wants Receiver in Order to Reorganize.

The board of directors of the Owosso Motor Co., of Owosso, Mich., has petitioned the court for the appointment of a receiver and the dissolution of the company, J. P. Waters, superintendent of the concern, being nominated for the receivership. This action, it is stated, is not for discontinuing the business but to permit of reorganization and "getting down to a solid basis." The manufacture of the Owosso wagon will continue without interruption.

### St. Louis Spring Company Goes Broke.

The Supplementary Spiral Spring Co., of St. Louis, Mo., has been adjudicated bankrupt, Walter D. Coles having been appointed referee in bankruptcy. He has called a meeting to occur on the 16th inst., when a trustee will be selected.

### Croxton-Keeton Seeks Its Discharge.

The Croxton-Keeton Motor Co., of Mason, Ohio, has filed its petition for discharge from bankruptcy. It will be heard in the United States District Court in Cleveland on January 28th.

## LIGHT ON "LEAGUE'S" CHARTER

**Action Seeking Its Forfeiture Brings Remarkable Disclosures—"Purchasing Agent" a New York Workman.**

Testimony in the proceedings instituted by John N. Schmidt, of York, Pa., to have the charter of the International Automobile League, of Buffalo, N. Y., forfeited, still is being taken, several hearings having been held by the attorney-general of New York at Albany.

The grounds on which Schmidt's application is based is that the Buffalo concern is attempting to do the business of a membership corporation under its charter as a commercial corporation. This charter, dated May 20, 1908, is a remarkable document and authorizes the so-called league, which is composed of A. C. Bidwell, William Priess and Charles H. Bowe, not merely to manufacture, buy and sell automobiles and tires, but to conduct any sort of mercantile business, from a delicatessen shop up; to print newspapers; to build and operate garages and any other buildings; to engage in a general contracting business and generally to do whatever its wily promoters willed.

The evidence presented showed how dismally the league's chief object—to put the automobile dealer out of business—had failed, more than 1,000 of the motorists who had given up \$10 each in the belief that it would enable them to buy goods at trade prices, having subscribed to statements that the league had failed to deliver goods that had been ordered. Not the least interesting information brought out showed a connection between the Buffalo concern and the sweet smelling Manhattan Storage Co., of New York, the owners of which have had an interesting career, and which after doing a peculiar "bargain" business in bicycle and automobile goods for years, is now engaged in the sale of second-hand cars. The ostensible "purchasing agent"

of the league proves to be a workman for this Manhattan Storage Co., from whose address it was discovered some time since accessories were being shipped to Buffalo.

When Schmidt filed his action seeking to have the league's charter canceled, the attorney general turned the matter over to Deputy Attorney General George A. Fisher, who has presided at the several hearings at the capitol. It is possible that a decision in the matter will be reached before the incoming administration assumes charge of the state's legal affairs on January 1st, but if this is not done the papers will be turned over to whoever succeeds Deputy Fisher. Hon. Danforth E. Ainsworth is attorney for the petitioner, and J. B. Corcoran appears for the respondent.

According to the testimony which has been taken the league advertises to furnish members with all automobile accessories, tires, tops, auto-meters, lubricants, lamps and anything else required; to have a string of garages across the country where every owner of an automobile, and a member of the league, may obtain care for his machine at cost. It also proposes to furnish lawyers to defend its members in legal actions and to place upon the market automobiles constructed by itself at 35 per cent. below the price to the trade. It also advertises that it will procure and furnish auto tires to its members at the same prices that manufacturers supply them to the dealers. It charges those who desire to join \$10 for each machine owned by them, and its application form states that it will furnish "labor, gasoline, tops, oils, tires, glass fronts, coils, timers, carburetors, repairing and vulcanizing of tires, generators, gas tanks, self-measuring pumps, shock absorbers, mufflers, drip pans, turntables, trunk racks, clocks, gas engines and all other accessories."

In the application blank this is also found, and it is regarded as significant, at least, "that it may be able to obtain dealers' prices."

Attorney Ainsworth has already filed with the deputy attorney general 1,000 letters from members of the league who have protested that they could not get their orders filled, while Attorney Corcoran has filed twenty-two affidavits from people who say they bought supplies at reduced prices.

At the hearing before the deputy attorney general, Mr. Ainsworth read one of the application blanks and said: "Whoever signs this application supposes that he thereby becomes a member of the International Automobile League; that is, he either becomes a member of this corporation or else it is a fraud. A 'member of a corporation' is defined in the statute. The term 'member' of a corporation shall include every person having a right to vote at a meeting of the corporation for the election of directors other than a person having a right to vote only upon a proxy.

Now a person who has a right to vote in a corporation is defined in Section 23 of the General Corporation Law, and includes only stockholders or those having proxies. So that, under the guise of a business corporation, created under the Business Corporation Law, this corporation is attempting to do the business of a membership corporation. If it wants to do the business it is seeking to do, it should do it under the Membership Corporation Law. I think that this proposition is elementary. The person who makes this application, either becomes a member of the corporation or he does not, and if he attempts to become a member of this corporation in this way, it is an illegal exercise of rights by the corporation. Now, I hardly think it will do to say that this is not a question of sufficient magnitude to arrest the attention of the attorney general. I shall show its extent by the evidence I shall introduce.

"A careful reading of the application blank discloses that they do not agree to furnish anything to anybody. There is no agreement in its application that they will furnish to members these things and there is no agreement that they will furnish them at any price—will furnish radiators and all other accessories that it may be able to obtain at dealers' prices."

"I have over 1,000 letters from members who are trying to get out of this corporation, who have returned their literature and say they no longer desired to be members of the corporation, and to them is attached the correspondence of this company to the effect that they must pay their back dues before they can leave the corporation."

Mr. Corcoran—"That is not anything unjust, is it?"

Mr. Ainsworth—"Yes, and the courts in the First Department have passed upon that kind of a contract as being a fraudulent contract, and under the circumstances of this case I make the charge that it is intended so to be, and I substantiate that charge I think by the correspondence which I have."

Mr. Ainsworth then produced a blank making application to be a director.

Mr. Ainsworth—"Now while the application for membership seems to imply that the holder may receive some advantage in the purchasing of automobile supplies, notwithstanding the fact that it does not contract that they will, they have assumed to create an impression among their members that supplies may be bought at a less price of them than can be bought in the market generally. They publish a circular in which they announce the prices at which Diamond tires, Goodrich tires, Morgan & Wright tires, Fisk tires and other tires may be purchased. I shall introduce in evidence many letters to the effect that people have ordered through them these particular kinds of tires and other supplies, and immediately they are met by

the proposition that some other kind of tire is just as good as that; that they are unable to procure that kind of a tire and that they don't furnish them. I have several hundred letters of that kind, and I have the correspondence which has been entered into between this corporation and Mr. Schmidt, the petitioner here."

Then Mr. Ainsworth read extracts from letters which had been received by Mr. Schmidt at his home in York, Pa. Mr. Schmidt sent an order to the value of \$59.58 and ordered among other things a Goodrich tire 34 x 4. In reply he received under date of August 24, 1909, the following:

"We have received a requisition from the home office to ship you casings and supplies and note that amongst which you require a Goodrich Q. D. Casing 34 x 3½ and also one 34 x 4. For the time being the Goodrich people are out of these particular casings and it may be three or four days before they have them in stock again. We desire to know if it will be perfectly satisfactory to you if we forward the Diamond casings instead. Kindly send your reply to A. V. Webb, purchasing agent, 1611 Broadway, New York City, and we would suggest that in the future, if you will address all your requisitions and supplies to this same address, that you will save considerable time, as when requisitions are sent to Buffalo they remain there a day or two and are then transferred to this department, this being the principal purchasing department of the league."

Mr. Ainsworth—"The A. V. Webb is a workman employed in a garage in New York known as the Manhattan Storage Company. He has no office and no place of business, but is a workman employed in a garage in that city, the scheme being (as we shall show by the correspondence) that a person send an order, as in this case, for a Goodrich tire and he tries to buy a Goodrich tire, and if not, they begin to see if they cannot substitute something else, and eventually it comes that they ask them to pay the costs of a Goodrich tire and take some other tire. It seems a little ridiculous to hold up this workman in a New York garage as the principal purchasing agent of this corporation with an income of \$300,000 from its members."

Then Mr. Ainsworth took up the matter of a circular issued by the league relative to the sale of Ford cars. He said: "Now for what it is worth, I don't know how much it is worth, but I propose to substantiate it by the Ford automobile people, I introduce the following circular signed by the International Automobile League and sent broadcast by them:

"Dear Sir—We have a large stock of these cars, brand new on hand, which we can sell to our members at the following prices, less 7½ per cent. discount: Ford, Model T. Touring Car, \$850; Ford, Model

(Continued on page 676.)

**A. L. A. M. BANQUET DURING SHOW**

**Trade's Big Organization Decides to Hold Such a Function—Honors for Pioneers and Innovations Promised.**

For the first time, the Association of Licensed Automobile Manufacturers will include a banquet in the round of functions that mark the New York show season. It will be held at the Hotel Astor during the first week of the show, on Thursday, January 12th, to be exact. At the banquet it is planned to recognize and do honor to some of the genuine pioneers of the industry, not merely those who had to do with the trade itself but those who by word, or pen, or projection contributed to its establishment. The speechmaking will be limited to three or four prominent men, but there will be introduced a number of innovations tending to enliven the proceedings, the nature of which can only be guessed at, but which, by implication, suggests Gridiron Club stunts.

In a measure, the banquet will take the place of the luncheon annually given by the late American Motor Car Manufacturers Association, but it is being projected on a much more elaborate scale. While it will be the first affair of the sort held by the A. L. A. M. during the show season, it will not be its first banquet, as last April it gave a function of the sort, which marked the first public occasion when most of the "lions" and the "lambs" born of the Selden patent situation lay down together, so to speak. The committee which handled that affair will promote the forthcoming one, viz.: H. B. Joy, chairman; Benjamin Briscoe, A. L. Pope, R. E. Olds and H. A. Lozier.

The dinner of the Society of Automobile Engineers also will occur on January 12th, but at the Automobile Club of America. The banquet of the Motor and Accessory Manufacturers is programmed for the next evening, the 13th, at the Hotel Waldorf-Astoria.

**Ohioans with "Owners' Garage" Scheme.**

The Imperial Motor Car Co., of Cincinnati, O., which has been incorporated with capital stock of \$150,000, purposes doing a garage and supply business and, it is stated, will endeavor to acquire several of the going establishments. The company's incorporation was preceded by the circulation of a prospectus painting the beauties of "auto owners' garages and supply houses.

**Clevelanders Buy an Excelsior Branch.**

The Cleveland Tool & Supply Co., of Cleveland, O., has purchased the Detroit branch and warehouse of the Excelsior Supply Co., at 29 Atwater street. The sale

carries with it the distributing agency for Shelby steel tubing. W. M. Roberts will remain in charge of the establishment as heretofore.

**Figures Show Big Company's Prosperity.**

Preceding the annual meeting of the United States Motor Co., which will occur in Jersey City on the 20th inst., President Briscoe has issued some preliminary figures which forecast the nature of the reports that will be rendered at the meeting of the big company.

"The volume of business done by this company for the three months August, September and October, 1910, was 57½ per cent. greater than for the corresponding period of 1909," he says. "On November 29 the cash balance of the United States Motor Co. and its affiliated companies was \$1,359,354. Contracts have already been closed with dealers which call for the delivery of 30,000 cars prior to August 1, 1911. Daily sales during November are considerably in excess of those for the same month last year."

**Locomobile Opens Branch in Washington.**

The Locomobile Co. of America has established a branch in Washington, D. C., at 1124 Connecticut avenue. It will be in charge of J. E. MacDonald and will be subsidiary to the Philadelphia branch, of which S. de B. Keim is manager. The Washington establishment will include salesrooms, garage and complete repair shops manned by experts from the Locomobile factory.

**Shurmeier Making More Room for Trucks.**

The Shurmeier Motor Car Co., which was organized in St. Paul, Minn., last spring, with \$200,000 capital stock, to manufacture trucks, has let contracts for the erection of a two-story addition, 50 x 200 feet, to its plant at University avenue and Griggs street. E. D. Dobson, formerly with the Packard company, has been engaged as factory superintendent.

**Wyckoff Heads Sioux City Dealers.**

At a meeting held last week, C. M. Wyckoff was elected president of the Sioux City (Ia.) Automobile Dealers' Association; George D. Cord, vice-president; Len Lesenich, secretary and treasurer, and J. W. Place, assistant secretary. The association also decided to hold its annual show February 27 to March 4.

**Three Visitors Here from Benz Factory.**

Charles Neumaier, director of the Benz plant at Mannheim, Germany, and George Diehl and Fritz Wuernall, of the Benz engineering staff, are in this country. The chief purpose of their visit is to confer with the American importers of the Benz car and incidentally to take a survey of the American situation.

**IMPORTS TAKE A SLUMPISH TURN**

**Record for October Shows Drop of More than 50 Per Cent.—Ten Months' Decrease Nearly \$900,000.**

As marking the continued decline of the demand for imported automobiles in this country, it is significant that only 59 foreign cars were imported during the month of October last, as compared with 144 during October, 1909. The total value of cars imported during the month was \$125,919, as against \$290,857, the average value per car thus having increased by a little over \$100. What is even more remarkable, the value of parts importations has dropped from \$84,084 last year, to \$23,409. France, the heaviest contributor for the month in question, sent over 30 cars, valued at \$63,704, as against 57, valued at \$110,385 a year ago, while the value of the United Kingdom's exports to the United States dropped from \$50,888 to \$9,821, only four cars being transplanted from British soil, as against 22. Italy, the second largest contributor, sent over 13 cars, as against 49. Germany more nearly held its own, with seven cars this year, as against nine last year. The total value of cars and parts imported for the ten months ending October was \$2,364,248, as compared with an aggregate of \$3,249,726 for the corresponding period of last year.

**Santa Ana Sees \$2,000,000 in Spring Tire.**

Out in Santa Ana, Cal., they are grooming another "revolutionizer" that is destined to turn the tire trade upside down and put the pneumatic tire out of business. It is a leather cover in which is artfully concealed "a series of springs interlaid with oil felt." Like the spring hub, spring tires of this sort have been "revolutionizing" the industry ever since Dunlop first pumped air into a rubber tube. I. O. Wilson, of Santa Ana, is the father of this latest device and his friends and neighbors think so well of it that it is stated in all seriousness that they are organizing a \$2,000,000 company to manufacture it.

**Trimming Company Acquires Big Plant.**

The American Auto Trimming Co., of Detroit, Mich., has leased the buildings in that city left vacant when the Hudson Motor Car Co. recently removed to its new plant and will take possession January 5. The main structure is 200 x 51 feet.

**Kirkham Forms an Airship Company.**

C. R. Kirkham, who recently retired as general manager of the Kirkham Motor Mfg. Co., of Bath, N. Y., has formed the Kirkham-Eells Aeroplane Co. in that village. He will continue to produce motors, but they will be of the aerial type.

## LIGHT ON "LEAGUE'S" CHARTER

(Continued from page 674-)

T. Roadster, \$825; Ford Taxicab, \$950; E-M-F, \$1,250. Yours truly,

'International Automobile League.'

Mr. Corcoran—"Order one of those and see how quick they will furnish it to you."

Mr. Ainsworth—"We will have the Ford people here to testify to that."

It was brought out that John C. Glade, proprietor of the Herald-Press at Depew, N. Y., made an investigation of the league's headquarters at Buffalo. He learned that it was a dingy place at the best in a small store. When Mr. Glade went to inquire about a certain tire a certain number was called up on the telephone and subsequent investigation showed that the telephone message went to a cook at some house.

Mr. Corcoran—"Who employed him?"

Mr. Ainsworth—"He was a detective; but it is none the less true because of that. I will produce that man."

Mr. Corcoran—"It is absurd. We are getting Goodrich tires and can get them now—any amount you want."

Judge Fisher—"You don't claim you can get them from the manufacturers?"

Mr. Corcoran—"No; we will stipulate that."

Judge Fisher—"You have to buy from some middleman?"

Mr. Corcoran—"We get them from their offices, at the same prices or better, than their dealers get."

William O. Rutherford, assistant to the second vice-president of the B. F. Goodrich Co., then took the stand. He was asked:

"Where were you located in 1909?"

Ans.—"I was in charge of the Buffalo branch."

"Did you prior to 1909 sell to the International Automobile League any of your products?"

"No."

"Had they communicated with you at any time during the years 1908 and 1909 with reference to the purchase of your products?"

"During the inception of their organization they made application for our prices, which we refused. We had no further communication from them."

On cross examination by Mr. Corcoran the witness was asked: "Now, why would not your company sell the International Automobile League—this corporation?"

"We consider them," replied the witness, "a disturbing factor in the trade, destroying and breaking down the interests of the legitimate dealer. Our policy of sales was mapped out to sell through the wholesale stores or the stores of those legitimately engaged in the business."

Other witnesses sworn were George Lewis Holmes, of the United Manufacturers, and Charles Clark, of Hartford, Conn. Briefs are to be filed later by both sides.

## THE MOTOR WORLD

## THE WEEK'S INCORPORATIONS.

Cleveland, Ohio.—Kraus Motor Sales Co., under Ohio laws, with \$5,000 capital. Corporators—E. F. Kraus and others.

Kansas City, Mo.—Cino Auto Co., under Missouri laws, with \$10,000 capital. Corporators—D. S. Rettig, A. D. Kirkpatrick, Wm. Lingle.

Rocky Ford, Col.—Rocky Ford Auto Co., under Colorado laws, with \$25,000 capital. Corporators—H. M. Ingraham, E. D. Manny, N. D. Ingraham.

Norwich, Conn.—B. L. Co., under Connecticut laws, with \$50,000 capital; to deal in automobile accessories. Corporators—Otto Bruenauer, B. F. Leavitt, E. W. Perkins.

Forest City, Ia.—Winnebago Auto Co., under Iowa laws, with \$10,000 capital; to deal in automobiles. Corporators—H. S. Sorenson, J. B. Giving, C. O. Martinson, P. J. Foeken.

Chicago, Ill.—Ames Motor Car Co., under Illinois laws, with \$25,000 capital; to do general automobile and manufacturing business. Corporators—Vincent Bendix, William Loomis, Matthew Mills.

Chicago, Ill.—Barton-Dayton Motor Co., under Illinois laws, with \$125,000 capital; to manufacture and sell automobiles and other motor vehicles. Corporators—W. C. Dayton, M. A. Dayton, E. S. Carr.

Philadelphia, Pa.—Kendel Motor Car Co., under Delaware laws, with \$500,000 capital; to manufacture and deal in automobiles. Corporators—C. F. Black, J. K. Allen, F. Mettler, of Philadelphia, Pa.

Providence, R. I.—Frank J. McCaw Co., under Rhode Island laws, with \$25,000 capital; to deal in automobiles, automobile accessories, aeroplanes, etc. Corporators—Frank J. McCaw, John J. Daly, A. T. Daly.

Walkerville, Ont., Can.—Gramm Motor Truck Co., under Canadian laws, with \$100,000 capital. Corporators—H. W. Aca-son, J. K. Webster, John W. Kerr, Frank T. Chapman, W. H. Rudd, of Walkerville.

New York City, N. Y.—Motor Safety Crank Co., under New York laws, with \$50,000 capital; to manufacture motors, engines and accessories. Corporators—M. G. Worth, F. A. Linn, G. Reif, all of New York.

Youngstown, Ohio.—Kelly Automobile Co., under Ohio laws, with \$15,000 capital; to deal in automobiles and other motor vehicles. Corporators—R. M. Kelly, Earl F. English, Anna B. Kelly, R. D. Gibson, W. T. Gibson.

New York City, N. Y.—Ward Motor Vehicle Co., under New York laws, with \$200,000 capital; to manufacture motors, engines, machinery, etc. Corporators—C. A. Ward, W. B. Ward, L. S. Kafer, all of New York City.

New York City, N. Y.—Automobile Safe-

ty Lamp Co., under New York laws, with \$500,000 capital; to manufacture devices for the prevention of accidents. Corporators—G. M. Barlach, W. G. Chittick, F. Knowles, New York City.

Washington, D. C.—S. & S. Shock Ab-Crank Co., under New York laws, with \$300,000 capital; to manufacture and deal in automobile accessories. Corporators—F. S. Smith, R. J. Beal, Jr., F. E. Smith, all of Washington, D. C.

Portland, Me.—International Rotary Motor Co., under Maine laws, with \$250,000 capital, of which nothing has been paid in; to manufacture and deal in engines and motors. Corporators—William Louis Merrill, R. Loring Merrill.

Indianapolis, Ind.—Ford Motor Co., a corporation of Michigan with a capital of \$2,000,000, admitted to do business in Indianapolis, under Indiana laws, with a capital of \$2,965. Corporators—Henry Ford, J. S. Gray, J. F. Dodge.

Salt Lake City, Utah—Excelsior Motor & Supply Co., under Utah laws, with \$50,000 capital; to manufacture and deal in automobile supplies. Corporators—H. J. Hayward, W. A. Williams, Fred Barnett, B. L. Kessler, H. O. Karr.

Chatham, Ont., Can.—Walker Motor Car Co., under Canadian laws, with \$200,000 capital. Corporators—Michael E. Delaney, Detroit, Mich.; W. J. Regan, Chandler M. Walker, of Walkerville, and John F. Mounte, of Chatham, Ont.

Los Angeles, Cal.—Maryland Garage Co., under California laws, with \$50,000 capital, of which \$500 has been paid in; to operate a garage and renting service. Corporators—Orlando Miller, L. R. Perhamus, P. Ingram, Elmer I. Moody.

Brooklyn, N. Y.—Tire Chain Patents Co., under New York laws, with \$25,000 capital; to manufacture non-skidding automobile chains, accessories, etc. Corporators—F. Cormack, Port Ewen; E. E. Holmes and A. W. Britton, New York City.

St. Louis, Mo.—McQuay-Norris Mfg. Co., under Missouri laws, with \$100,000 capital; to manufacture and deal in automobiles and machine supplies. Corporators—George S. Johnston, William K. Norris, Louis McQuay and others.

St. Louis, Mo.—Standard Casting Machine Co., under Missouri laws, with \$25,000 capital; to manufacture machines for the casting of aluminum, bronze, etc. Corporators—Martin Fellhauer, James M. Allen, E. M. Fellhauer, L. F. Allen.

Rochester, N. Y.—Flower City Automobile Co., under New York laws, with \$5,000 capital; to deal in automobiles and other motor vehicles. Corporators—George V. Kundolf, Irving F. Hoyt, August Kalofski, Thomas J. McGovern, all of Rochester.

## IN THE RETAIL WORLD.

McCormick & Marx have opened a garage and repair shop in Hudson, S. D.

The Brosius-Sesline Automobile Co., of Ft. Wayne, Ind., has filed a notice of change of name to Brosius-Hocker Automobile Co.

Plans have been filed for a new garage to cost \$2,000 by Alfred Crew, of Paterson, N. J. It is to be located at 643 East 17th street.

Under the style the Ozauke Auto Co. a new concern has opened its doors in Port Washington, Wis. Ford cars will be shown exclusively.

Felix Oglesby, who used to run a garage in Talladega, Ala., has turned to other less strenuous pursuits and sold his business to Gibson Stringer.

Maquoketa, Ia., although it has only about a couple of hundred inhabitants, soon will be possessed of a garage. Nicholas Francois is building it.

Probably because he has urgent business at the North Pole, Jack Frost has sold his automobile business in Emmett, Idaho. H. E. Anderson is the new owner.

M. A. Dozier, of the firm of Dozier & Co., Taylor, Tex., has purchased the interest of his partner, C. D. Patterson. He will continue the business in his own name.

Work has commenced on a new garage to be erected in Westfield, Mass. It is located at the corner of Franklin and Maple streets and will be managed by Charles C. White.

R. T. Mitchell, of Philadelphia, Pa., has purchased the property at the corner of Thirtieth street and Allegheny avenue, and will erect a large garage thereon. The lot is 150 x 225 feet.

W. J. Laubendorfer and E. D. Engelage have formed the L. & E. Auto Co. and located at 1249 Bedford avenue, Brooklyn, N. Y. They have the Long Island agency for the De Tamble cars.

C. L. Frith, of Topeka, Kans., has purchased the business of the North Topeka Motor Car Co., and will continue it in his own name, adding a renting service to the regular garage business.

Ground has been broken for a new garage in Ottawa, Illinois. It is to be occupied by the Ottawa Garage Co., and will be 46 x 120 feet, of brick and steel, and ready for occupancy by February next.

A. Montenegro and A. L. McCormick, both of Louisville, Ky., have formed the Hudson Motor Car Co., and opened a salesroom in that city. As the name indicates, they will specialize in Hudson cars.

L. A. Mitchell, of Jacksonville, Fla., has organized a new company under the style the Mitchell Motor Car Co., and will handle Brush runabouts. M. W. Velsey, of St. Louis, Mo., is the manager of the company.

The Pope-Hartford Garage is the title of a new establishment which has been opened as a salesroom and garage at 237 W. Washington street, Phoenix, Ariz. Hudson and Pope-Hartford cars are shown.

Located in one of the most advantageous parts of Philadelphia, Pa., the new Powelton Garage, at the corner of Lancaster avenue and 34th street, has just been opened to the public. G. Myers is the manager.

Seward & Crane is the style of a new concern which shortly will open up at the corner of Landsdowne and Franklin streets, Cambridge, Mass. Their garage covers 197 x 115 feet, and will cost when completed \$25,000.

The Otto Sales Co. is the style of a new concern which has opened up at 165 Huntington avenue, Boston, Mass., and which has the New England agency for the Otto car. N. C. Smith and C. L. Costello are the responsible men.

J. W. Bishop, J. C. Bishop and C. N. Griffin, of Alachua, have formed a partnership under the style the Rambler Automobile Co., and will open a salesroom in Jacksonville, Fla. Rambler cars are to be the chief stock in trade.

G. A. Knepper, of Bryan, Ohio, has purchased the garage and repair shop of Clarence Bishop, on North Main street, and will continue it in his own name. Bishop has joined the Bryan Hardware Co., whose automobile department he will manage.

W. E. Corby, one of the chief stockholders in the White Garage Co., of St. Louis, Mo., has sold his interest to F. L. Hendricks and Clemens A. Poole, the former taking the position as manager of the company. The headquarters of the company are at 5023 Delmar boulevard.

Under the management of Col. K. C. Pardee, a new metropolitan retail branch of the United States Motor Co. has been opened in that company's building at 7 West 61st street, New York City. Columbia and Maxwell cars form the whole of the automobiles on exhibition.

Organized with a capital of \$25,000, the Frank J. McCaw Co. has taken over the J. W. Bowman Co.'s Providence (R. I.) branch at 186 Washington street, of which Frank J. McCaw, the treasurer-manager, formerly was manager. He will continue to handle Stevens Duryea cars.

Kardell Brothers, who are the St. Louis (Mo.) agents for the Reo, Fal and Gramm cars and trucks, have incorporated their business under the style the Kardell Motor Car Co. Simultaneously, they opened new salesrooms at 4152-56 Olive street. H. F. Fahrenkrog is in charge of the pleasure vehicle department.

W. S. Jewell, former manager of the New York branch of the H. H. Franklin

Mfg. Co., has opened salesrooms at 250 West 54th street, New York City, where he will display Kelly motor trucks. He has the sole agency for New York and vicinity.

The Frank O. Renstrom Co., whose garage, on Stanyan street, San Francisco, Cal., was destroyed by fire a short time ago, now is located at the corner of Van Ness and Golden Gate avenues. The company is the Pacific representative for the Kline car.

Organized with the intention of marketing Metz runabouts in Cleveland, Ohio, a new company has established salesrooms at 1718 Crawford road, in the Forest City. It will do business under the style of the Mark Motor Car Co., with H. J. Mark as president and general manager.

The Omaha Tire Repair Co. is the style of a new concern which has been organized in the Nebraska city of that name. George T. Toozer is president, and Henry Nygaard is secretary. The headquarters of the company are at 2201 Farnam street.

Under the style the Albany Automobile Dealers' Association, a new association has been formed in Albany, N. Y. The object of the association is the mutual protection of dealers and the holding of automobile shows. J. P. A. Ketchum, C. D. Hakes, Joseph B. Taylor, W. N. Grunsel, J. B. Wood, C. S. Ransom and W. E. Foskett are the directors.

G. B. Jeffrey, of Cedar Rapids, Mich., has purchased an interest in the Des Moines Vulcanizing Co., at 420 West 8th street, Des Moines, Ia., of which his brother, W. B. Jeffrey, is president. He takes the place of L. D. Wohrer, who left the concern on account of bad health, and will take charge of the newly added automobile sales department. Regal cars are to be shown exclusively.

Hoping to add considerable revenue to its depleted treasury, the Roman Catholic Church of Corpus Christi, in West 121st street, New York City, is building a garage on the property in the rear of the church, facing on 122d street. The congregation will own the site and building, but the garage will be leased to Carlos P. Duque. It is to be 100 x 90 feet, with concrete floors and of fireproof construction, and will cost \$85,000.

## Recent Losses by Fire.

South Orange, N. J.—Walter F. Dormitzer, garage and one automobile burned. Loss \$8,000.

Decatur, Ala.—John Almond, garage and two automobiles destroyed. Loss estimated at \$10,000; partly covered by insurance.

New York City, N. Y.—Blue Sprocket Garage, Edward R. Hewitt, owner, 8 East 31st street, building and contents destroyed. Loss heavy; covered by \$41,000 insurance.

## Whose Judgment Will You Take?

**W**HOSE judgment will you take when selecting a car for your personal use? Do you understand mechanics?—does a gear cut from heat-treated chrome nickel steel look any different to you than one from malleable iron?—could you tell the difference? Does length of stroke or size of cylinders mean anything to you, unless backed by the performance of the cars in the hands of the owners? In the long run doesn't it really mean that you must trust someone? And wouldn't you better trust to the trained minds of our organization—to our engineers who have been studying these problems for years? Isn't the stability of a manufacturer of importance to you?—don't you need to know that he is going to be in business and make the guarantee of his car good?—don't you need to know his Dun and Bradstreet ratings?

The White Company has been building machines for service for fifty years or more—they have been building automobiles that endure for over ten years, and some of the first models may still be seen doing yeoman's service on the streets.

When we tell you that our gasoline models are the best we know how to build—that they will run more economically for you—that they will do all the things you expect of them, or of any car, regardless of price—isn't it fair to presume that we have tested the proposition and know something of what we speak? We are building cars for continuous service, and whether they be gasoline or steam driven, we are striving to produce the best. The performance of our cars in the hands of owners everywhere is your assurance that we have accomplished the result for which we have striven.

Let us send you literature which tells the intimate details; or better yet, let us demonstrate the cars themselves.

Single Copies (Postage Paid) . . . 10 Cents  
Foreign and Canadian Subscriptions . . . \$3.00  
Invariably in Advance.

Postage stamps will be accepted in payment for subscriptions, but not for advertisements. Checks, Drafts and Money Orders should be made payable to The Motor World Publishing Co.

General Agents: The American News Co., New York City, and its branches.

Change of advertisements is not guaranteed unless copy therefor is in hand on SATURDAY preceeding the date of publication.

Contributions concerning any subject of automobile interest are invited and, if acceptable, will be paid for; or, if unavailable, will be returned provided they are accompanied by return postage.

To Facilitate Matters All Communications  
Should Be Addressed to P. O. Box 649.

Cable Address, "MOTORWORLD," NEW YORK.

Entered as second-class matter at the New York Post Office, November, 1900.

NEW YORK, DECEMBER 15, 1910.

"In my travels, I've learned that there is one great difference between the Motor World and other automobile publications," a few days ago remarked a man high up in the parts and material trade whose duties take him into practically every factory in the industry. "The Motor World usually is open and in evidence in all of the places I visit, indicating that it is read; the other publications as often have not been removed from their wrappers, and not infrequently there are accumulations of several weeks' issues, all of them unopened and unread."

#### Automobiles for Public Service.

When the automobile was proven to be practicable, a line of development was forecast for it which never has been prosecuted to an extent approximating its real possibilities, i. e., the adoption of the motor car as an auxiliary to the handling of traffic by public service enterprises.

Street car lines as conducted in many cities are productive of no dividends, and not infrequently bring losses to the companies operating them. These lines nevertheless require as costly an equipment in rail and wire as the most profitable ones, and franchises often compel their operation when otherwise they would be discontinued.

As a substitute, automobiles with a sufficient passenger-carrying capacity would seem to meet all the needs, save much expense, and become an entirely satisfactory means of transportation to patrons. Doing away with wires and the necessity of tracks, they would enable companies to put lines into operation where now they are impossible or prohibited.

The carrying of passengers over specified routes could be undertaken even by persons with small capital. Only the edge of this development has been touched by the use of the taxicab. That people would come to rely on interurban or intervillage automobile lines, where electric and steam roads do not run, exactly as heretofore they have depended on horse drawn stages, scarcely admits of much argument.

#### Winter Proves Automobile Efficiency.

With the coming of the first snow is afforded what may be termed the demonstration of motor vehicle efficiency for the whole year. For while the initial snowfall invariably is the occasion for the stalling of numerous luckless automobile drivers, who venture into soft snow without chain grips on their tires and thereafter advertise their improvidence by racing their engines with mufflers cut out for more or less extended periods, in the majority of cases little trouble is experienced. Indeed, exceptions of this nature, while calling attention to the plight of the individual, by no means reflect any discredit on the motor vehicle as a class of traffic. Automobiles that become stalled in the snow invariably are pulled out by other automobiles, referring to city conditions, of course, while for every car that becomes disabled in this way another may be found that, under more skilful handling, is negotiating equally difficult conditions without delay.

Incidentally, the chauffeurs of experience are accumulating a store of experience that stands them in good stead when the critical season arrives. This applies equally to operators of passenger-carrying ma-

chines and trucks. The latter, in particular, are liable to become stranded unless they exercise the best of judgment and considerable ingenuity at times as well. A recent instance in point is illuminating. A large motor truck became stalled on Broadway in New York City, directly in front of one of the many establishments that, taken collectively, constitute "automobile row." The truck was empty and the solid rubber tires spun furiously over the hard-packed snow without obtaining the least amount of traction. After one or two futile attempts to get started, the driver pondered for a minute or two, and then, going into the store, presently reappeared with two or three heavy packing cases, which he trundled out and loaded on the truck immediately over the rear axle. With this "borrowed" load he was enabled to start without further delay, merely as a result of adding a little weight over the driving wheels.

The real strength of the automobile, when it comes to overcoming obstacles, is shown to best advantage, however, by comparison with the performance of horses under similar circumstances. Where the animals can obtain practically no footing the properly handled truck can proceed with safety, and where teamsters are obliged to carry only partial loads because of the adverse condition of the streets drivers of motor vehicles are able to haul full capacity. Indeed, the frequency with which the spectacle is seen of a motor car assisting a teamster who is stalled bears eloquent witness to the effectiveness of the newer form of transportation.

#### Salesmanship vs. Order Taking.

Each year the industry is approaching closer to the point where the distribution of its products will depend entirely upon the qualities of true salesmanship. It has not always been as difficult to sell automobiles as it is this year; it never will be as easy again. Many salesmen of the last few years owe their achievements and their prosperity not so much to their own efforts as to the impetuous condition of the business, but with the settling of conditions a process of elimination has been taking place; a process that still is in progress.

A recent incident that aptly illustrates the point occurred in a city of the Middle West that has reason to be proud of the success of more than one automobile con-

cern. There had been considerable talk of price cutting, and when the head of one organization widely known called in his selling staff one day the young men crowded close about him eager to know if they were to be permitted to share in the slaughter, to meet prices with prices.

"No!" he exclaimed with characteristic vehemence. "There will be no cutting in any way, shape or manner. We have been able to get along without it so far and we have had no trouble whatever, and we shall maintain the same policy in the future. And I want you all to remember," he added with emphasis none the less emphatic for being a little trite, "I want you to remember that you are salesmen, not mere order takers."

The average live automobile builder of the day is facing many serious problems, but none, perhaps, that is more vital to his future success than that of securing the right kind of material for his sales force and of developing it to such a point that it will find an outlet for his product without forcing him to resort to the bung-starting methods of the price-cutter. Anybody can sell cars that are listed below their real value or marketed without real listing—anybody can be clerk and take orders; but it takes a real salesman to sell real goods in real competition, and the market for real salesmen in the automobile industry is building up in direct ratio to the increase of production.

One day last week two small boys in New York coasted into a motor car. One of the lads is dead; the other is seriously injured. Presumably the sad mishap will figure in the list of "fatal accidents" that always is called up when legislators and professional "accelerators of public sentiment" seek to show that all owners of automobiles should be licensed and that their "right" to use the public roads should be rendered revocable.

If Barney Oldfield already has not substantially recognized the Los Angeles reporters for their valuable aid it is time he did so. Their spreadeagle efforts to make the outlawed partner of Jack Johnson appear a martyr and a savior of the white race are enough to make even a mule laugh. The Los Angeles papers must be queerly constituted or hard pressed for "copy" to stand for such guff.

## COMING EVENTS

December 12-17, Los Angeles, Cal.—First annual "independent" show of Los Angeles Motor Car Dealers' Association at Shrine Auditorium.

December 24-31, Los Angeles, Cal.—Second annual show of Licensed Motor Car Dealers' Association of Los Angeles at Fiesta Park.

December 25-26, Los Angeles, Cal.—Twenty-four hours race at Motordrome.

December 26, Lake Charles, La.—Race-meet on Fair Grounds track.

December 31-January 7, New York City—"Independent" automobile show in Grand Central Palace.

January 2, San Francisco, Cal.—Panama-Pacific road races.

January 2-7, New York City—Importers' automobile show in Hotel Astor.

January 7-14, New York City—Association of Licensed Automobile Manufacturers' eleventh annual show in Madison Square Garden. Pleasure cars and accessories.

January 10, New York City.—Meeting of executive committee of American Automobile Association.

January 11, New York City.—Meeting of executive committee of National Association of Automobile Manufacturers

January 11, New York City.—Meeting of the executive committee of the Association of Licensed Automobile Manufacturers.

January 11-12, New York City—Annual meeting of the Society of Automobile Engineers.

January 12, New York City.—Meeting of board of managers of the Association of Licensed Automobile Manufacturers.

January 13, New York City—Annual banquet of the Motor and Accessory Manufacturers at Waldorf-Astoria.

January 14-28, Philadelphia, Pa.—Annual January 14-21, Milwaukee, Wis.—Milwaukee Automobile Dealers' Association's second annual show in the Auditorium.

show of Philadelphia Licensed Automobile Dealers' Association in Third Regiment Armory.

January 16-21, New York City—Association of Licensed Automobile Manufacturers' eleventh annual show in Madison Square Garden. Second week devoted to commercial vehicles.

January 16-21, Detroit, Mich.—Detroit Automobile Dealers' Association's annual show in Wayne Pavilion.

January 18, New York City—Annual banquet of the Automobile Trade Credit Association.

January 25-28, St. Paul, Minn.—First annual show of automobile dealers in Auditorium.

January 28-February 4, Chicago, Ill.—National Association of Automobile Manufacturers' tenth annual national show in Coliseum. Pleasure cars and accessories only.

February 6-11, Chicago, Ill.—National Association of Automobile Manufacturers' tenth annual show in Coliseum. Pleasure and commercial cars, motorcycles and accessories.

February 6-11, Buffalo, N. Y.—Annual show.

February 13-18, Washington, D. C.—Second annual show in Convention hall.

February 14-18, Dayton, Ohio—Second annual show in Memorial building.

February 18-25, Binghamton, N. Y.—Annual show.

February 18-25, Minneapolis, Minn.—Minneapolis Automobile Show Association's annual show in National Guard Armory.

February 18-25, Newark, N. J.—New Jersey Automobile Exhibition Co.'s fourth annual show.

February 18-26, Brooklyn, N. Y.—First annual show of Brooklyn automobile dealers at 23d Regiment armory.

February 20, Cleveland, O.—Show in Central Armory.

February 20-25, Baltimore, Md.—Annual show in Fifth Regiment Armory.

February 20-25, Cincinnati, O.—Cincinnati Automobile Dealers' Association's show in Music Hall.

February 20-25, Omaha, Neb.—Third annual show of the Omaha Automobile Show Association in Auditorium.

February 24-27, New Orleans, La.—First annual show of New Orleans Automobile Club at Fair Grounds.

February 25-27, New Orleans, La.—New Orleans Automobile Club's annual Mardi Gras racemeet on Fair Grounds track.

February 25-March 4, Toronto, Canada—Annual show under auspices of Ontario Motor League.

February 27-March 4, Kansas City, Mo.—Fifth annual show of Kansas City Automobile Dealers' Association.

February 27-March 4, Sioux City, Ia.—Automobile Dealers' Association's annual show.

March 4-11, Boston, Mass.—Boston Automobile Dealers' Association's annual show in Mechanics building.

March 6-11, Dayton, Ohio—Dayton Automobile Club's show in Memorial building.

March 7-11, Des Moines, Ia.—Third annual show of Des Moines Automobile Dealers' Association at the Coliseum.

March 11-18, Cleveland, O.—Manufacturers and Dealers' Association's show in Central Armory.

March 18-25, Pittsburg, Pa.—Annual show in the Exposition Building.

**WHEN DEALERS' TAGS MAY BE USED**

**New York's Attorney-General Answers Question Affecting Second-Hand Cars—Spirit and Intent of the Law.**

Automobile dealers or manufacturers in New York State, when properly registered, upon the purchase of a properly registered car, may operate it under the regular dealer's registration, without having the individual registration of the car transferred, as would be necessary in the case of a car purchased by an individual. The only requirement in such a case is that the change of ownership be reported to the Secretary of State in the manner prescribed by the Callan law. This is indicated by a ruling issued by Attorney General O'Malley in response to a test question and clears up some doubt that had existed as to the proper procedure in such cases. The principle applies in particular to the purchase of second-hand cars, and indicates that, so long as they are of the style and type described by the dealer's registration they are properly included in the privileges which that registration carries.

The question submitted was:

"May a duly registered manufacturer or dealer, upon the purchase of a registered car, properly operate the same under regular dealer's license without further complying with the provisions of subdivision 8, above mentioned?"

"Subdivision 8 provides that upon the sale or transfer of a motor vehicle registered in accordance with the statute, the vendor shall immediately give notice of such sale, with the name and residence of the vendee, to the Secretary of State," says Attorney General O'Malley in rendering his opinion. "Section 284 of the act provides that every person, firm, association or corporation manufacturing or dealing in motor vehicles may, instead of registering each vehicle, make a verified application for a general distinctive number for all vehicles owned or controlled by such manufacturer or dealer, which application must contain a brief description of each style or type of vehicle dealt in.

"The first provision evidently is for the purpose of keeping a definite record of the name of the owner of each registered vehicle. The second provision gives a privilege to dealers to register all their vehicles under one number. In case a dealer or manufacturer purchases a duly registered vehicle, I see no reason why the spirit and also the letter of the law is not complied with if he thereafter operates that car under his dealer's number, provided the car is one of the style or type described in the application for the dealer's registration, and provided also the car is purchased

for resale or for the same purpose as those usually operated under dealer's or manufacturer's registration. In order to carry out the intent of the act, however, so that a complete register may be maintained of each separate vehicle, it is obvious that notice of the sale or transfer to the dealer should be given as provided in subdivision 8. With this qualification, therefore, my answer to your question is in the affirmative."

**Sliding Doors for One-Car Garages.**

Small garages that are built large enough to house one car only, necessarily must have a door that practically takes up an entire end of the building, and though in

many cases it is desirable to hang a roller door, the width of the garage does not permit a sufficient length of track upon which to hang the door in the usual manner.

A way in which this difficulty may be overcome is to make two smaller doors and hinge them together; one of them being fitted with rollers and run in an overhead track, as shown in the illustration. When the hinged door is opened and folded against the first door, both can be rolled back over a very short space.

**Truck Association Becomes Truck Club.**

After thinking it over for a week, the New Yorkers who formed themselves into the Motor Truck Competition Association with a view of controlling and regulating that form of competition, decided that it was rather a tall task, and accordingly adopted a new and more modest title, the Motor Truck Club. J. A. Hemstreet, a free lance promoter, is president F. B. Porter, who handles Chase trucks, is vice-president, and E. A. Leavy, publicity manager for an importing house, is secretary and treasurer. The club is talking of promoting a six days' truck contest from New York to Boston and return during the Madison Square Garden show next month.

**STANDARD OIL SHOWS AT WICHITA**

**Its Educational Exhibit a Feature at the Local Show—Snow on Opening Night but Success Follows.**

Owing to some hitch in the arrangements with the Weather Man, it snowed in Wichita, Kan., on the afternoon and evening of Monday, 5th inst., which was the opening day of the local automobile show. The consequence was that some of the exhibits were delayed and that a large proportion of the expected attendance failed to materialize. A brave hundred or so of eager visitors put in an appearance, however, and were well rewarded for their hardihood in facing the storm by the exhibition that had been staged by the local dealers. Later on in the week, with better weather conditions and all the stands filled, the show fully came up to expectations, especially during the three days of the Hardware and Implement Dealers' Association convention.

The show, which was held at 114-118 North Lawrence avenue, was staged by 17 exhibitors, who displayed some 30 cars, all but three of which were gasoline driven, the others being electric.

An instructive feature of the show which was much appreciated was the educational exhibit of the Standard Oil Co., which included a device for indicating the viscosity of different classes of oils by causing air bubbles to ascend through a series of vertical glass columns, each containing a sample of lubricant different from that in the others. The rate of movement of the bubbles of course served to indicate the relative viscosity of the samples. A polarine apparatus for producing very low temperatures also was shown for the purpose of demonstrating the non-freezing properties of a special grade of oil that is produced for use in cold climates. This exhibit is scheduled to follow the middle western show circuit.

The list of exhibitors and their wares follows: Wichita Automobile Co., Chalmers, Reo and Waverley electric; Case Automobile Co., Case; Jones Auto Exchange, Ford; Peru-Van Zandt, Westcott; Halladay Motor Co., Halladay; Cadillac Service Station, Cadillac and Detroit electric; John Kirkwood, Lexington; F. P. Kreikenbaum, Cartercar; Cole Motor Co., Cole; Goodin Motor and Truck Co., Johnson truck; Arnold Automobile Co., Auburn; Shattuck-George Iron Co., Overland; Fred L. Wright, Buick; Jones Sporting Goods Co., motorcycles and accessories; Standard Oil Co., lubricants; Hockaday Auto Supply Co., accessories; Shattuck-George Co., accessories; Central Cycle Co., motorcycles and supplies.

**NEW YORK AWARDS ARE ANNOUNCED**

**But No Scores Accompanied the Announcement—Those Who Obtained Awards in the Several Divisions.**

On Thursday last, one week after the conclusion of the New York Automobile Trade Association's two days' chilling endurance run, the results were made public—that is, the winners were announced. No scores accompanied the announcement, however, because, according to rumor, some of them would not look well in print; and as all of the competitors are friendly rivals and near neighbors, what's a little thing like a score sheet between friends, anyway?

The first prize for cars in division 1A of the runabout class was won by William B. Young, who drove a Ford. He was the only competitor in this division and received the Cumberland Hotel Trophy. A. M. Day, driving a Hudson, annexed the Swan & Finch trophy for cars in division 2A, and Roy Stains, who drove a Pullman, was returned the winner in division 3A. Stains got a silver trophy donated by the Dorian Rim Co., a Mitchell, driven by O. R. DeLamater, receiving the second prize in this division, a trophy offered by the Smith-Haines Co. A Pullman also proved winner in division 5A, N. Gallatin, who drove the car, receiving the silver G & J Tire trophy. E. A. Hall, driving a Matheson, won in division 6A, and will receive a special prize, to be given by the New York Automobile Trade Association.

In the touring car class there were no awards made in divisions 1A and 2A. J. Ross (Maxwell) won in division 3A, with P. Haycock (Reo) second. They received the silver trophy donated by O'Donnell's Restaurant and the W. C. P. Supply House trophy, respectively. First prize in division 4A, a handsome silver trophy donated by the Splitdorf Magneto Co., was won by R. Schmidt, who drove a Haynes. In division 5A a Corbin, driven by H. H. Knepper, was first, receiving the Goodyear Tire and Rubber Co. trophy, while the Diamond Tire Co. trophy, second prize in this division, went to W. C. Poertner, who drove a National. T. Spear (Oldsmobile) won the Stewart & Clark trophy for first place in division 6A, and the second prize, donated by the General Automobile Supply Co., went to M. Wagner at the wheel of a Columbia. The awards were made on Tuesday last at a luncheon held at the Automobile Club of America.

The positions of the cars in the order of their unspecified scores were as follows:

**Runabout Class.**

Division 1A—Wm. B. Young, Ford.  
Division 2A—A. M. Day, Hudson.

Division 3A—Roy Stains, Pullman; O. R. DeLamater, Mitchell.

Division 4A—No award.

Division 5A—N. Gallatin, Pullman.

Division 6A—E. A. Hall, Matheson.

**Touring Car Class.**

Divisions 1A and 2A—No awards.

Division 3A—J. Ross, Maxwell; P. Haycock, Reo.

Division 4A—R. Schmidt, Haynes; H. Welker, Pullman.

Division 5A—H. H. Knepper, Corbin; W. C. Poertner, National; F. Hermance, National; A. Holtzmüller, Speedwell; H. Yule, Stoddard-Dayton; Chris. White, Babcock.

Division 6A—T. Spear, Oldsmobile; M. Wagner, Columbia; A. Warren, Pope-Hartford.

**Frost Falls on Oldfield's Racemeet.**

Despite the fact that the Los Angeles reporters have devoted columns and "scare heads" to the cause of Barney Oldfield, and have portrayed that "outlaw" as a man deserving of a halo, only about 500 of the Los Angeles people who were said to be burning with desire to see Oldfield exhibit himself, were interested enough to attend the exhibition which was given on the dangerous Ascot Park track on Sunday last, 11th inst. The affair was to have been started the day before, but rain prevented. Oldfield is credited with driving a mile in 51½ seconds. He also won a five miles open race and finished second to A. Eugene Martin, who drove Oldfield's Knox, in a free-for-all handicap. Robert Kittle (Cutting) won an event for cars under 300 cubic inches. The other men who outlawed themselves by competing were Ben Kirscher (Darracq), who is regularly employed by Oldfield to promote close finishes; Harry Buckley (Pope-Toledo), and W. H. Foust (Winton). Leslie Henry figured as manager of the meet, but it is openly charged that he merely is a mask for Walter Hemple, who manages the Los Angeles Motordrome.

**Portola Becomes Panama-Pacific Race.**

The title of the Portola road race, which will be held in San Francisco and which finally has been set to occur on January 2, has been changed to the "Panama-Pacific road race," the change being made in deference to the general publicity campaign of the Panama Exposition, for which San Francisco is bidding so aggressively. The necessary permits have been secured. The course will be 10.91 miles in length, about one-half of the distance of the 1909 circuit. The principal prize will be the St. Francis trophy, which was given for the 300-mile race held at Tanforan last September. The present classification provides for three events—a light car race, which will go 98 miles; a heavy car race, of 153 miles, and a free-for-all, of 240 miles.

**LAWYER "GETS HIS DANDER UP"**

**Arrested for Speeding, He Attacks New York Law and May Force Decision of Much Discussed Point.**

Although the Callan automobile law of New York state has been in force for over four months, there still are being discovered twists and turns in it which seem to have escaped the eyes of the law makers and commentators. In the copy of the bill submitted by Assemblyman Callan during the last week of March, 1910, which included all the amendments and was supposed to show the exact wording of the law, Section 288 distinctly stipulated that only cities of the third class and incorporated villages were compelled to erect sign posts indicating the speed limits permitted within the borders of said incorporated communities, and just as distinctly exempted cities of the first and second class. Some time during the interval between the printing of the bill for final reading and the enacting of the same into law, on Monday, May 23d, the words "such city or village shall have placed conspicuously . . ." were changed into "each city or village . . ." thereby practically compelling New York and other cities of the first class to equip all highways leading into it with signs showing their speed regulations.

This important discovery was made when Arthur C. Train, special attorney-general in charge of the Queens county graft inquiry, was arrested in the Bronx for exceeding the legal speed limit. Attorney Train brought his legal learning to bear upon the case, with the unexpected and more or less unwelcome result mentioned.

While Mr. Train's line of defence mentioned other objections to the particular violation of which his own chauffeur was accused, his principal point involved the establishment of—or rather the failure to establish—the sign posts required by the Callan law. Magistrate Breen admitted that there existed a defect in this section of the law, but claimed that he and his fellow magistrates had discussed the matter thoroughly and had come to the conclusion that it would be too great an expense for the city to erect such sign posts on every road entering the limits of Greater New York. Mayor Gaynor also, when the matter was called to his attention, said the expense to the municipality would be too great to permit of the fulfilling of this particular demand of the Callan law.

In the opinion of some people the printing of "each" instead of "such" probably was due to a typographical error, and did not signify the intention of the framer of the law to shoulder New York with such an expense.

**DEMONSTRATING WITH A VENGEANCE**

**Merchant Puts Four Tons Extra Load on Truck to See What It Will Do—Overloading a Common Evil.**

Seldom does the prospective purchaser of a pleasure car ask that the car be made to do special "stunts," and when he does he usually is as lenient as possible. In the majority of cases he will leave the whole matter of the demonstration in the hands of the salesman, who picks his route and is thereby able to show the car to the best advantage. But when the same man contemplates the acquisition of a motor truck

builders have to contend—that of overloading. Unfortunately it is one that is not confined to demonstrations but frequently continues to shorten the life of the truck.

**Opening for American Cars in Norway.**

"After an investigation, I have no hesitancy in saying that this ought to make a good field for the sale of motor cars, if the business is carried on systematically and persistently," reports R. S. Rasmusen, American consul at Bergen, Norway.

"There are now only 15 automobiles in Bergen, and of these only one is of American make. It is not due to any lack of effort on the part of agents to sell machines that the number is so small, but rather to the lack of system and experience. There

**PRACTICES WHICH OFFEND PATRONS**

**Little Things that Have Caused Loss of Large Sales—Others that Have Alienated Good Will.**

They were talking of practices that offend purchasers and of the cast-iron, inflexible, high and mighty policies that prevail in some establishments.

"Do they pay?" remarked one of the party that was engaged in the discussion. "I confess I don't know, but I can recall two instances that show how they sometimes work. I know one man of wealth and position who placed an order for a \$4,000 car, specifying a particular body color. When the car arrived he called to pay for it and handed the check for \$4,000 to the manager of the establishment. 'There is an extra charge of \$30 for the special finish,' vouchsafed the manager as he eyed the fat check in his hand. 'But you booked my order at \$4,000,' responded the purchaser. 'The extra charge is always made; it is one of our company's fixed policies,' was the manager's reply. 'Let me have that check,' demanded the purchaser, who without another word tore up the piece of paper and walked out of the place.

"The other instance is as bad, if not worse. The purchaser in this case had ordered, and was about to take delivery of a \$3,000 car, when he decided that he wanted his initials painted on the doors. 'That will cost \$5 extra,' responded the salesman. 'Oh, no! it won't,' replied the buyer. 'You can keep the car.' And the dealer kept it, too."

"That salesman wasn't onto his job," volunteered another member of the party. "When I bought my car, I had a somewhat similar experience, but in slightly different form. I had not thought of putting a monogram on my doors; the salesman himself suggested it and in a tone that conveyed the impression that the monogram usually went with the car. I paid for the car and it was not until several days later—the first of the next month, in fact—that I received a bill for not only the painting of the monogram but for the gasoline with which the tank originally had been filled. It then was too late to kick, but before that firm gets any more of my money I'll think twice, maybe three times. A lot of people who are selling automobiles do not appear to realize that it is such little things as these that alienate good will and drive away customers. In most lines of business it is usual to give at least 2 per cent. for cash, and while it is not the custom in the automobile trade, it seems to me that such petty charges very readily and very properly may be made to serve as an offset."

"Yes; and there's another practice involving such charges that rub a man the

THREE-TON KISSEL TRUCK LOADED WITH SEVEN TONS OF POTATOES

some subtle change takes place in his mind and he delights in inventing herculean tasks for the truck to accomplish. That no test is considered too great is well illustrated by the experience of F. H. Morse, designer of the new Kissel truck, who recently was called from the Kissel factory in Hartford, Wis., to Chicago to demonstrate one of his three-ton trucks to the owner of a large commission house. The truck was backed up to a freight station, and while Morse's back was turned the vehicle was loaded with 93 sacks of potatoes of an average weight of 148½ pounds each, making a total of 13,800 pounds, which, with the weight of the three men added, totaled 300 pounds over the seven-ton mark. The fact that the three-ton truck successfully carried to its destination four tons more than its rated capacity pleased Morse as much as it did the commission merchant.

The incident aptly illustrates one of the more serious difficulties with which truck

are numerous wealthy people in Bergen and vicinity who can well afford to own cars, and there are many more who regard them as luxuries now who will be compelled to provide them as necessities in the near future.

"I have conferred with the agent who has sold nearly all the automobiles brought to Bergen relative to the introduction of American machines. Formerly he sold only German automobiles, but is open to engagements for American cars. He belongs to an old-established family of wealth and standing and possesses an indispensable qualification for this business, namely experience.

"The sale of automobiles in Norway will never assume the proportions per capita that it does in the United States, but there will undoubtedly be a large number of machines sold, and it is reasonable to suppose that they will be purchased from firms that have machines and representatives here."

wrong way," suggested a third member of the party. "I don't know how general it is, but I can speak from personal experience. It has to do with the subject of guarantees. When a man is seeking to purchase a car he never fails to hear a lot about guarantees and the policy of each manufacturer or dealer is 'taking care' of his customers. I was duly impressed with it when I got my car, but on two occasions during the course of a few months when small parts which wore unduly or which broke through no fault of my own, were replaced I did not fail to receive a bill for their replacement. When I kicked, the amounts were promptly charged off and the manager—it was a branch store—pleaded ignorance and apologized in a fashion that belied his professions. But I have a well defined suspicion that the policy prevails to get the money for taking such 'care' of customers, when it is possible to get it, and to 'apologize' when they put up very much of a kick, particularly as I am acquainted with others who 'enjoyed' the same experience at other establishments."

#### Motor Trucks to Compete with Railways.

With headquarters in Boston, the Boston and Suburban Electric Transfer Co. has been incorporated under the laws of Massachusetts, and has for its purpose the transferring, by means of motor trucks, of merchandise and other express matter between Boston and nearby towns. Couple-Gear electric trucks with trailers are to be used and while the initial venture will embrace only one route, that between Boston and Lynn, tentative plans include service to Malden, Medford, Charlestown, Chelsea, Cambridge, Waltham, Wollaston and Quincy. As it will be possible to load the trucks at the shipper's door and unload them at the door of the person to whom the goods are consigned, a saving of time and expense is anticipated over the existing methods of transportation, because of the single handling of goods necessary. The officers of the new company are: President, Frank D. Stranahan; secretary, George E. Coates; treasurer, William E. Eldridge, all of whom previously have been identified with the automobile industry. The other incorporators are George W. Gale, John A. Cousens, William E. Butler, Arthur B. Gilmore, Albert W. Lovett, Herbert W. Fairfield and Franklin H. Wentworth.

#### Railroad to Operate Motor Stage Lines.

In order to develop more fully the summer business in the White Mountain resorts of New England next year, the New York, New Haven & Hartford Railroad Co. has included in its plans for the operation of several automobile stage lines connecting with the Boston & Maine branch. This automobile service will reach for 70 miles, and will include the Fabyans, the Profile House and Bethlehem, N. H.

## HOW BEST TO PREVENT SKIDDING

Two Tire Manufacturers Offer Advice on the Subject—Their Recommendations, However, Are Not in Agreement.

In all communities which have been favored by snow falls during the past few days, motorists have revived the annual debate as to the proprieties of using tires of the plain and anti-skid types. Considering merely the merits of using plain and

MICHELIN ARRANGEMENT OF NON-SKIDS

anti-skid tires, and counting the possibility of employing from one to four tires of either type on various wheels, there are 16 different possible combinations. Where more than two types of tread are brought into the question it is obvious that the number of permutations and combinations is increased proportionately.

Fortunately for the welfare of such motorists as have not the leisure to determine the rights of the matter to their own satisfaction, some of the tire manufacturers have issued special instructions covering the use of anti-skid treads, although, as frequently happens with the prescriptions of different medical men, the rules are not

always uniform. In the case of the Michelin Tire Co., of Milltown, N. J., for example, the use of two Michelin anti-skid and two rubber tread tires is recommended as the ideal combination, provided that one of the anti-skids is used on the right front wheel and the other on the left rear wheel. The effect of this arrangement, it is explained, is to secure the gripping power of the anti-skids on wet or slippery surfaces, while the plain treads hold on hard, dry pavements; the effect applying both to the driving and steering of the vehicle.

In recommending the use of their "Nobby Tread" tires, on the other hand, Morgan & Wright, Detroit, Mich., urge the motorist not to apply them on alternate front and rear wheels, but always on opposite sides of the car. The reason assigned for this is that the gripping power of the nobbs is so great that when the brakes are applied the Nobby Tread takes about 90 per cent. of the strain of stopping. The same thing happens when making a turn, all the strain comes on one tire. "No combination of rubber or fabric could be devised which would stand up long under such usage," as is pointedly indicated.

#### How to Preserve Tires During Winter.

While substantially the same methods of caring for tires when in service obtain in the majority of cases, this is not so when the car is laid up for the winter. Always there is the difference of individual judgment, the weighing of details and the drawing of conclusions and the result is that everyone has his own pet theory as to the best course to pursue. The Firestone Tire & Rubber Co. advises that after the car has been jacked up, and if the tires are in almost perfect condition, they be partially deflated—just sufficiently to take the strain off the fabric, but not enough to allow the tube to collapse—and carefully wrapped to exclude light and kept away from heat. Where the tires are not in such good condition they should be removed from the rims, thoroughly cleaned of all foreign matter, repaired or retreaded as necessary and securely wrapped as in the first case. The rims also should receive attention and after any rust which has formed has been removed they may be polished with graphite or stove polish.

#### Resin for Brakes that Fail to Hold.

Brakes which fail to hold, particularly when this condition is caused by grease which has worked out of the differential housing and along the axle, may be made to hold temporarily by blowing a small quantity of pulverized resin in between the brake bands and the drums. Though this method is perfectly harmless to the brakes and their linings, it will not make a permanent repair and should only be relied on in case of emergency, and the brakes should be washed out at the first opportunity.

**MOTOR SLED BUILT FOR SPEED**

**Designed in France for a Russian Grand Duke—Employs Six Cylinder Engine and Turbine Air Propeller.**

For the past several years, due to the efforts of the Touring Club of France, automobile sleighs have been much more in evidence in that country than elsewhere, several satisfactory tests having been conducted. During the past twelve months one of the more or less distinguished dukes, attracted by this method of locomotion, has had built one of these self-propelled sleds, which is novel in that it is of unusual form

both the steering and driving done from the front wheel. This wheel is possessed of neither springs nor forks. The pressed steel chassis frame is dropped considerably for the part reserved for the driver's seat, and the two sections sweep upward and inward until they join in front. At this point the electric motor is carried, and the drive transmitted to the front wheel through encased gearing, a vertical propeller shaft with universal plunger joint at its base, and a bevel gear meshing engaging with the crown bevel on the wheel hub.

Current is supplied by batteries carried under the driver's seat. On one charge, 60 miles may be covered at an average speed of 12 miles an hour. The machines

**SOURCE OF MYSTERIOUS FIRES**

**"Static" Electricity Unsuspected, But Possible Cause of Inexplicable Conflagrations—Sparks from Finger Tips.**

While it has been known for some time that certain people are able to accumulate within their bodies, or rather in the skin of their bodies, a sufficient amount of "animal"—or static—electricity to cause a visible spark to be given off under especially favorable atmospheric conditions, no one hitherto has connected the discharge of such static sparks with the great number of "mysterious" fires occurring in garages.

SIX CYLINDER AIR PROPELLED MOTOR SLED DESIGNED FOR GRAND DUKE CYRIL OF RUSSIA

designed for high speed and is more of a "wind wagon" than a tractive vehicle. The particular noble who is responsible for it is Grand Duke Cyril of Russia.

As the illustration shows, the main frame and body work enclose the motor, tanks, steering control and seats. It is all reinforced, having two layers of material instead of one. The body of the sled is built to carry a turbine, in the specially formed funnel in the front, by which the sled is propelled. The motive power is furnished by a six cylinder Gregoire engine of 40 horsepower. Four wooden runners support the sleigh, the forward two serving to control the steering. Equipped with its motor of 40 horsepower, a speed of 100 kilometers an hour has been attained on ice. As it has a turbine drive, the sled can be run over soft snow.

**Electric Three-Wheeler Appears in Paris.**

One of the large department stores in Paris has a delivery system by which it distributes parcels by small electric automobiles having several unique features. They are three-wheeled machines, with

are designed to run in congested traffic where ordinary vehicles would be stopped. As the front wheel is of the caster type, the car can be turned with ease within its own length.

**Here's a Closed Car Without Doors.**

Whatever the limits of rationality may be in body construction it lies within the power of the British coach maker to exceed them. Thus, in the garage of one ardent motorist in the vicinity of London the torpedo body has given way to a doorless successor which has much the same lines as the torpedo, but is built as tight as the hull of a boat. As a gentle concession to the convenience of passengers, the designer of this peculiar creation has permitted a large chest to be placed on either running board, to which the owner and his guests may clamber from the running board, after straddling over into the cockpit interior. To enhance the marine effect the exterior of the body is ornamented by a longitudinal moulding running just below the rail, which is broadly suggestive of a shear strake.

powder mills, benzine establishments, chemical factories, etc. It seems, however, that a fire may well be started by such a static spark, entirely without the knowledge of the person responsible for it.

W. H. Tolman, one of the directors of the American Museum of Safety, is the author of the assertion and, as the result of a series of investigations, declares that when the temperature of the atmosphere surrounding such a susceptible person is just right, when the humidity has reached a certain degree and metallic objects of high conductivity are in close proximity, a spark will jump from the projecting finger, elbow or knee to such metallic conductor. Given the presence of gasoline vapor near the floor of a garage, where it is indiscernible to the olfactory organs, a spark jumping from knee or foot of such a "statically charged" person to a steam radiator or a water pipe may cause a most disastrous explosion, much to the mystification of the people present at the time, all of whom are able to swear that no "fire of any kind was in the room when the explosion occurred."

Commenting on the precautions to be

taken against such an occurrence, Mr. Tolman calls attention to the fact that a great deal of gasoline is permitted to spill over the floor of a garage, either by having the cans too full or by careless pouring of the liquid. This wasted gasoline evaporates in due time and lingers in the atmosphere close to the ground for a considerable time, mingling with the air and forming dangerous explosive mixtures. The strictest regulations as to smoking, dropping of matches upon the floor, etc., cannot obviate the possibility of static sparks being given off by any one of the dozen or more people continuously moving about in a big garage and igniting such explosive mixtures.

Mr. Tolman was moved to publish this bit of information by the recent factory fire in Newark, N. J., in which twenty-odd lives were lost. The fire was caused by the flaming of a can of gasoline which stood open in the shop, and the ignition is said to have been accomplished by a "static" spark, as no fire or flame of any kind existed in the room previous to the ignition of the gasoline.

While the peculiar possibilities of static electricity have been known for many years to scientists and to people who have had to do with electrical machinery, it has not been generally realized how dangerous these small sparks may become when conditions are favorable. It aptly is illustrated by a fairly well-known parlor trick which consists of lighting the gas by static electricity. All that is necessary is to shuffle one's feet rapidly a few times over a carpet, then to open the gas cock and hold a finger near the jet. A spark of from one-half to three-quarters inch long immediately will jump from the finger, and it is sufficient to light the gas. It seems odd that this familiar trick should not before this have been held responsible for fires and explosions, and it is not so remarkable that finally an explosion has been traced to its effect as that, with the great number of static sparks given off daily in chemical factories, powder houses and dry-cleaning establishments, where benzene and gasoline fumes continuously fill the air, there are not daily accidents solely due to this particular form of electricity.

It would be difficult to suggest a remedy which could be relied on to be effective against discharges of static electricity. There is little danger of visible sparks occurring except between the fingers, knuckles and other projecting parts of the body, on one side, and metallic conductors—usually water, gas or steam pipes—which lead into the open air or the ground, on the other side. Wherever such "conductors" do exist, however, the possibility of "spark-ing" is always present, and the only safety devices would consist in effective and proper ventilation, a ventilation which also includes the part of the atmosphere nearest the floor, where gasoline vapor usually lurks.

## THE MOTOR WORLD

### BRAKING WITH FLUID PRESSURE

**Radical System Originated Abroad—Designed for Application to Front Wheels but is Applicable to All.**

Among automobile designers one of the problems which has been receiving attention ever since motor cars first were put to practical use is that of brakes, and to the many systems now in use the Weight Patent Brake Co., of Bristol, England, has added another, which is quite radical in principle and for which several advantages are claimed.

CHASSIS EQUIPPED WITH WEIGHT BRAKES

The system, which is shown by the accompanying illustrations, embodies a brake on each of the road wheels, and the difficulties in devising a method that would not interfere with the steering in any way, and that would have the proper compensation, have been overcome by the adoption of fluid pressure for applying the brakes. The feature of the Weight system is that all the brakes are applied synchronously,

WEIGHT HYDRAULIC BRAKE IN DETAIL

the advantage of this arrangement being that it not only ensures an even pressure on each wheel, which is not always secured by the ordinary compensating device, but that it avoids the wear and tear due to the braking stress being thrown onto two tires only.

Oil is used as the fluid; it is contained in a small reservoir, about four inches square, provided with two main cylinders, the pistons of which are connected directly to the

brake pedal. When the latter is depressed the oil supply is automatically cut off from the reservoir and discharged into the smaller cylinders attached to the compound levers in the brake drums. Compensation or balancing of the brake action in the different drums is automatically secured by this fluid system, thereby applying the brake power smoothly. The disposition of the various parts is such that the brake shoes respond instantly to the slightest touch of the pedal. The device can be arranged for either four wheel brakes or brakes on the front wheels only.

The makers assert that this system has been thoroughly tested on a powerful car during the past year, and that for four months it was not necessary to add oil to the reservoir supply.

### Torque Rods and Their Purposes.

But a vague idea at the best is entertained by many motorists as to the torque rod, or tube, and its purpose. Not a few are unaware, for instance, that where the enclosed shaft is used, the enclosing tube serves the purpose of the more usual form of rod which takes the form of a metal bar attached firmly to the rear axle casting, and having the forward end flexibly supported on the frame, preferably in line with the center of the forward universal joint.

As to its purpose: in a shaft driven car an equal pressure is exerted in the opposite direction when the bevel pinion exerts a pressure upon the bevel gear in the rear axle. When the force is applied to drive the car ahead, it tends to react to turn the axle casing backwards. Some provision must be made to prevent the axle from turning over, in order to make the wheels turn, and the torque rod or tube serves the purpose of receiving and resisting this twisting or torque action in the rear axle. In some cars the springs and spring seats are allowed to do the work of the torque rod, but the added work and strain upon these parts generally is considered as undesirable save in light cars.

### To Prevent the Abuse of Engines.

To prevent abuse of the engine by "racing" when the low speed gears are engaged, the N. A. G. wagon, which was designed especially to take part in the subvention trials which are at present being carried on by the German government, is equipped with a special form of accelerator lock. While the high gears are in mesh the accelerator pedal is given its full range of motion, but when the low speed and reverse gears are being used the pedal is locked so that the driver cannot increase the speed beyond a certain safe maximum. The truck in question is fitted with a four cylinder motor of 130 by 160 millimeters cylinder dimensions, roughly 53-16 by 67-16 inches, developing 45 horsepower at 850 revolutions per minute.

# Theory and Practice of Front Wheel Brakes

Although American automobile manufacturers have found no occasion to modify the essentials of what loosely may be termed standard design during the past two or three years, the same cannot be said of the manufacturers of Great Britain. Where the Continental manufacturers formerly took the lead in the introduction of new features, it is to England that attention must now be turned for real novelty. In this connection three distinct and extremely promising innovations have gained sufficient prestige to become worthy of notice. They are the slide valve engine, the worm drive and the front wheel brake. In certain respects the latter development may be considered the most important of the three, more particularly for the reason that it represents the attempted solution of a problem pertaining essentially to the motor car as a mechanism distinct in its properties from all other machinery. The development also is important because it relates to such a very vital portion of the machine.

It is now more than a year since front wheel brakes were adopted as standard equipment of several well-known makes of car, and, therefore, a sufficient period of actual use may be supposed to have elapsed to warrant consideration of the system from the practical viewpoint. Furthermore, the slight increase in the use of the system, as revealed by the recent Olympia show, gives rise to a very natural question as to whether it is likely to become a general characteristic with British builders in the near future. As to this latter point, it is impossible to tell at the present time, but the eager discussion of the question by the local trade press at the present time indicates that a very general degree of interest has been aroused in it.

In this connection, after pointing out the serious nature of the consideration which must be given any innovation in design, the *Automotor Journal* remarks that due regard must be given to the fact that "the majority of manufacturers still studiously avoid adopting the principle. On the other hand," continues the same authority, "front wheel brakes are being assiduously developed by firms which have reputations, and it is therefore quite obvious from these considerations alone that unusually conflicting influences must be at work."

"We have, on the one hand, a small body of pioneers to whom the advantages of front wheel brakes appeal with such force as to make them determined to realize the merits of the system on their own cars. On the other side stand the great body of

constructors, who may be broadly divided into two classes—those whose business policy is to follow rather than to lead, and those whose reputations demand that they should have the best, but who honestly consider that front wheel brakes possess inherent disadvantages that overrule anything that can be said in their favor."

Reflecting the actual experience some of those who have driven cars equipped in this manner sufficiently to be well able to judge of the true merits of the system, a writer in the *Autocar* tritely expresses the opinion that they "have come to stay." This expert, who claims to have driven a car equipped with front wheel brakes no less than 15,000 miles during the past year, further expresses the enthusiastic opinion that "as their merits are recognized, their popularity will increase until the countershaft brake is altogether displaced," and he further ventures the prediction that the example of those concerns that already have adopted the system "will be followed by a very large number, if not the majority, in the course of the next year or so."

Answering the objections of some motorists that front wheel brakes have proved unsatisfactory through their liability to get out of adjustment, the same individual states that he has not found this to be the case, and is of the opinion that with proper care they are fully as reliable as brakes of the rear wheel or countershaft type. "For my own part," he says, "averaging 100 to 120 miles a day, I find that once a fortnight at the most my brakes need adjustment; I depend entirely on my front wheel brakes, because the other brake gives far less control over the car. But I oil the rocking arms, parts and levers every day, and the man who uses an oil can judiciously will never experience trouble with front wheel brakes. If oil be not used and the brake joints become rusty, then, of course, trouble will be experienced."

"One factor above all others," he thinks, "is making for the popularity of the front wheel brake; that is the immense saving in wear and tear on the tires. It is impossible to overestimate the advantages of front wheel braking in this direction, and the extra first cost of a car fitted with brakes of this description is more than repaid by the increased life of the tires. Front wheel braking is universally admitted to be the only real solution of the side-slip problem, obviating the necessity to a large extent for fitting costly steel-studded tires. In my experience tire mileage when the steel-studded variety are fitted is increased by something like 50 per cent."

Turning to the theoretical considerations involved in the principle of front braking, the *Automotor Journal* has the following to say:

"Front wheel brakes, inasmuch as this implies that the car has brakes on all four wheels, give a greater, possibly twice as great, retarding force that can be obtained from a car having brakes only on the back wheels. This is due to the fact that the retarding force is a function of the weight of the car, and that the part of the weight supported by the front wheels is ordinarily useless to assist in pulling up the car, although it is always active in making it more difficult to stop. When brakes are applied to every point at which the load is supported, then full advantage is taken of all the braking force available. For the same reason a railway train has brakes on the wheels of the coaches as well as on those of the locomotive."

"The next advantage of front wheel brakes is that they do not tend to aggravate side-slipping when applied while the car is being driven over greasy roads, whereas brakes on the rear wheels are notoriously bad in this respect. The reason for this difference is one that most people find a great difficulty in appreciating, and perhaps the best way of satisfying the mind on this problem is to make a little model chassis supported on two wheels and two legs. Placing such a model on a smooth board, tilted up at a sufficient angle to enable the model to run down hill, is all that is necessary to make the experiment. When the model is started wheels first it will seldom run straight, and will often turn completely round before it gets to the bottom of the slope. When started legs first, however, it will always continue a straight course in the direction of its original path. It is sufficiently obvious that the legs of the said model are equivalent to a pair of wheels locked by the brakes; when the model proceeds legs first it has front wheel brakes. The point to be observed about the behavior of this model is that the legs always continue to travel in the direction in which they are started, whether they happen to be in front or behind the wheels. In the first experiment it is the wheels that deviate from their true path; the legs, taken as a whole, go straight on. In a real motor car the state thus represented is side-slip. The rear wheels are supposed to be locked by the brakes on a greasy road, and the back part of the car tries to travel straight on under the impulse of its original momentum. . . . When the brakes are on the front wheels the front wheels go

straight on in the direction of the momentum of the car as a whole at the instant the wheels cease to revolve. On a straight road it may be presumed that this direction is more or less straight ahead—that is to say, the car as a whole will continue to travel a fairly true course down the road. A more important detail, however, is that the car continues to travel bonnet first because the rear wheels being still free to revolve, find their natural path in trailing after the front wheels."

Respecting some of the disadvantages of the system, the same authority continues:

"There is only one feature that is sufficiently disadvantageous in principle to lead many leading firms to disapprove of front wheel brakes, as such, quite apart from the pros and cons of their mechanical details. This disadvantage in question is, curiously enough, intimately associated with the second of the above-mentioned advantages. In the foregoing explanation of why front wheel brakes do not aggravate side slip, it will be remembered that we explained that any wheels when locked continue to go straight on in the line of their original momentum. This applies to front wheels equally well with the back wheels; in other words, the car loses steering power when the front wheels are locked, and if the front wheels are locked when an attempt is being made to negotiate a corner, the result is very likely to be disastrous. . . . It has sometimes been remarked that the skilful driver would meet this difficulty by temporarily releasing the brakes, and we have no doubt that a skilful driver would get his car out of danger by this means many times where another would fail, but the fact remains that the disadvantage in question constitutes a principle to which many of the leading automobile firms are at present most strongly opposed."

In developing the system numerous difficulties have been encountered, one mentioned in particular by this authority being the fact that no two brakes ever grip quite alike. This difficulty, he remarks, "has, of course, always been known as true in connection with rear-wheel brakes, and is the reason for the use of the so-called compensating mechanism which does not compensate at all for this particular trouble, although it may for other reasons be very useful."

"In frontwheel brakes the effect of the difference between the retarding force on one wheel and that on the other is more marked than in the case of back-wheel brakes, because the difference in question reacts upon the steering gear of the car and tends to upset the steering. In bad cases this can be exceedingly unpleasant and even dangerous in the hands of an incompetent driver, but it is not difficult to reduce the effect so that it is at any rate not seriously inconvenient."

"The principle method of doing this is to

adopt what is commonly known as center point or pivotal steering, a practice which has otherwise much to commend it whether front-wheel brakes are fitted or not. This consists of splaying the steering pivots, or splaying the road wheels, or splaying both members together, so that the axis of the steering pivot intersects the tire at its point of contact with the road. The wheel then occupies a plane that is tangential to the surface of an imaginary cone, of which the steering purposes, it merely turns upon its point of contact with the road, and does not roll round into a new position as is the case when the steering pivot and the wheel occupy parallel planes. The result of adopting this method of mounting the wheels is that the leverage between the point of contact with the road and the axis of the steering pivot is abolished, consequently the reactions from the road on the wheel cannot theoretically affect the steering of the car. In practice, however, it seems to be very difficult to eliminate this effect entirely by this means, though whether this is due to any inherent difficulty in getting an exact center point steering, or whether it is due to some other cause that is not yet properly appreciated, we are for the moment unable to say; the fact remains that this particular solution has not given entire satisfaction."

"There is, however, an alternative method of eliminating this leverage of reaction, and that is to mount the steering pivot itself right inside the hub of the wheel so that the steering pivot and the tire actually occupy the same plane. In this case there can be no doubt about the leverage being abolished, but this particular solution is also associated with one or two very interesting problems of its own. Thus, for example, it involves reversing the usual method of mounting the wheel, inasmuch as the wheel hub has to be fitted with the stub axle, while the member that is usually a stub axle is now a hollow tubular box into which the stub axle projection from the wheel is carried. The bearing box is carried by a steering pivot arranged tangentially to it. It will be observed, therefore, that the steering pivot and the axis of the wheel, although still at right angles, are no longer in the same plane."

"Another point to be observed is that this particular method of mounting the wheel does not lend itself very well to the use of artillery wheels because the center portion of the wheel is entirely cut away, and the spokes are only joined to the hub by the outside plate of the housing. In a wire wheel this point of weakness can be bridged by carrying the outside spokes right down to the hub cap itself, and there is no apparent reason why a wire wheel should not be made as strong in this form as any other."

Another question that has proved of considerable importance in connection with the mounting of front wheel brakes is that

of the additional strain upon the axle which they impose. As a recent contributor to the columns of the *Autocar* expresses it:

"On applying the brakes the wheels try to stop and the chassis tries to go on, with the consequent tendency to bend the axles backward in the horizontal plane between the swivels and the spring seats, and also with a tendency to twist the axles due to torsion set up by the brake shoes, on being applied, trying to hold the wheels to the axle. Front axles on cars fitted with front wheel brakes must therefore be designed in point of strength quite differently from the axles of those cars which are not (to their sorrow be it!) fitted with a modern device so greatly adding both to the pleasure and safety of motoring."

In conclusion, "the most important consideration of all, from the point of view of mechanical detail," again quoting the *Automotor Journal*, "is the manner in which provision is made for compensating the brake mechanism against interference from the flexibility of the front springs."

"It will be obvious that the brakes have to be actually applied from some point fixed to the frame, whereas the brakes themselves are carried on the road wheels, and are consequently always changing their position relative to the frame, due to the flexibility of the suspension. This is, of course, especially marked on uneven roads, and unless means are taken to provide against this rise and fall of the axle there is quite a liability for the brakes to jam themselves hard on or else to cause the brake pedal to reflect the jerky motion. . . . The point that will be found common to all front wheel brakes, and one that is as much a necessity in their successful operation as pivotal steering, is the actual control of the brake shoes from a point that is concentric with the axis of the steering pivot. From no other point but this can the brakes be properly operated for every position of the road wheels while steering, because even if the connection between the two members is maintained throughout the whole steering lock from any other point of application such an arrangement would almost necessarily result in a varying leverage, and consequently in an unsteady braking effect."

#### When Car Doors Commence to Rattle.

The slamming of automobile doors is a general practice which is prolific of many of the rattles which are prone to develop after a car has been in use for any considerable length of time. Most doors are arranged so as to close against small rubber buffers, which, from continually being hammered by the slamming of the doors, are flattened to a certain extent, allowing a fraction of an inch play at the catch. The slight rattle which results hardly would be apparent were it not for the sounding board effect of the body. There is one way to stop rattling, i. e., put in new pieces of rubber.

## PANHARD'S USE OF KNIGHT MOTOR

How Famous French Makers Employ Sliding Valve Principle—New Idea in Pump and Magneto Drive.

Some measure of renewed interest in the Knight type of engine, sometimes called valveless, has been inspired by reason of its recent adoption as a standard product by several well-known makers independent of the Daimler Motor Co., of Coventry, England, which was the first company to stand sponsor for the American inventor's system after he left this country. Among the new adherents perhaps none is better

The transmission and clutch also are lubricated from the same source of supply by means of the force pump.

For those who are not familiar with the Knight method of construction the accompanying illustrations will be of assistance. The general details of the lower part of the engine, the oil-pan, A, the main base, B, and the lower portion of the cylinders, D, are not materially different from those of the standard type of engine. The piston head, H, however, is cup shaped, as is the cylinder head, E, a spherical combustion chamber thus being formed.

Surrounding the piston, H, within the cylinder, D, are two cylindrical sleeves, N, N', which are a close running fit between the piston and cylinder and ex-

X2, once in every four strokes of the piston.

Special details of the system which are noteworthy as well as essential to its success are the construction of the cylinder head, the oiling distributing system, and also the arrangement of the auxiliaries. The head casting, E, which is removable, is so formed as to project some distance into the cylinder, thus forming a guide for the upper ends of the sleeves and also affording means for preventing the leakage of gas around the ends of the sleeves and into the ports. To assist in sealing the upper end of the cylinder the cylinder head is fitted with three packing rings, e.

The details of the oiling system can be seen to better advantage in the illustrations

END AND SIDE VIEWS OF KNIGHT-PANHARD ENGINE SHOWING ARRANGEMENT OF VALVES AND VALVE GEAR

known than the firm of Panhard & Levasor, which until its adoption of the Knight motor under license from the inventor was reckoned one of the most conservative concerns in the French branch of the automobile industry.

Although the establishment of the Panhard license was announced more than a year ago, it was not until the recent Olympia show, in London, that the first of the new cars made its appearance at a motor car exhibition. The same model, which is rated at 30 horsepower now is announced by the New York branch. The cylinder dimensions are 100 by 140 millimeters, or 4 by 5½ inches. The four cylinders are cast separately and in most respects the construction follows the plan of the Knight-Daimler engine pretty closely. One point of difference is in the oil circulation, which is accomplished by means of a force pump, with sight feed on the dash.

tend practically the full length of the latter. Each sleeve is provided with a rectangular port on each side. The ports n'1 and n'2, in the inner sleeve being equidistant from the end of the sleeve, while the ports n1 and n2, in the outer sleeve are spaced at different distances from the end. By means of heavy lugs, cast at the bases of the sleeves, and short connecting rods the sleeves are connected with the valve motion shaft, L. The arrangement can be seen at M, M', in both side and end sectional views of the motor. The cranks driving the two sleeves are placed at such an angle to each other and the position of the shaft with respect to the crank shaft is such that the two sleeve ports n1 and n'1 register opposite the inlet port from the carburetter, X1, once in every four strokes of the piston, while the exhaust ports in the sleeves, n2 and n'2, also register with the exhaust port leading to the manifold,

showing the individual parts. The outer and inner sleeves, here indicated at D and C, respectively, have helical grooves turned in their exterior surfaces. They also are drilled through at various points, as at 1, while the piston, P, has a number of large holes bored in its lower portion. The result is that as the sleeves move up and down over the very short travel prescribed by the connecting rods, K, L, the oil which is supplied by the splash of the cranks constantly is circulated between the sleeves, the cylinder walls and the piston. The general construction of the valve gear, as well as the respective forms of the cylinder head and the sleeves, are plainly shown in this illustration.

The valve gear is driven from the crank shaft by means of a silent chain, this being one of the novel features of the Knight construction, though one which also is coming into use abroad in motors of the

more conventional form. The water pump and magneto, contrary to ordinary practice, are driven from a special cross shaft, which derives its motion from the valve actuating shaft by means of spiral gears. In common with Panhard practice of several years' standing, the timing of the magneto is accomplished by swinging the apparatus bodily around its armature, instead of altering the relation of the armature with respect to the position of the crank shaft.

Although the motor is rated at 30 horsepower its maximum power output under test is said to run as high as 41.5 horsepower, at 1,300 revolutions per minute; the power at lower speeds ranging upward from 23.75, at 700 revolutions, to 33.5, at 1,000. A standard Panhard motor of the poppet valve type having the same bore

Mail service," and is designed to save time in foreign correspondence. At present a letter destined to London requires as much time to cross the continent as the passage across the ocean; or a manufacturer writing to Japan must mail the letter a week before the steamer sails from San Francisco or Vancouver. The Western Union Telegraph Co. has arranged for the use of its night letter and other telegraphic service in connection with outgoing ocean mails, so that this week of trans-continental time may be saved. Its New York office will receive telegrams from any part of the country destined for European addresses and will forward them in a sealed, especially addressed envelope by the first outgoing Atlantic steamship mail. The same plan will be followed in San Francisco, Seattle and Vancouver

Algeciras, which is across the bay from Gibraltar. The distance is 58 miles and roads fairly good but, with several hills, one with a grade of 16 per cent. Four or five cars will be used at first, not steamers, of 25 horsepower, to carry 10 passengers with at least 50 pounds of baggage each, and able to run the distance in four and a half hours, or about 15 miles an hour; and their price must not exceed \$3,500, including duty. The Consul had several interviews with the man in an endeavor to persuade him to purchase an American car instead of the Spanish-Swiss which he spoke of buying. His answer was that it was doubtful if the cars could be made in the United States and delivered here in time; but even if they could, he feared that an American car could not be used because, in case of breakage, it

SLEEVE VALVES AND GEAR OF KNIGHT-PANHARD MOTOR

UPPER PART OF CRANK CASE AND VALVE GEAR

but with only 130 millimeter stroke, instead of 140, is said to produce 19.0 horsepower at 700 revolutions, 25.75 at 1,000, and 39.75 at 1,300.

The general details of the new car follow closely the standards applied to the 35 horsepower six cylinder Panhard car. Multiple disc clutch, four speed change gear, semi-elliptical front springs and three-quarter elliptic rear and equalized rear wheel brakes, applied by means of thin steel ribbons, are familiar features. The chassis is made in two lengths of wheel base, namely 115 and 125 inches, according to body requirements, while an option also is furnished in the matter of final drive; either the propeller shaft or double chain systems being supplied, according to specification.

#### Letter-Telegrams for Foreign Mails.

Foreign mail wire service is an innovation in telegraphing which probably will prove almost as great a convenience as the recently instituted night-letter system, and now that the automobile export trade has attained huge proportions the service is of interest to automobile manufacturers as well as to the public in general. The innovation is to be styled the "Special Ocean

Mail service," and is designed to save time in foreign correspondence. At present a letter destined to London requires as much time to cross the continent as the passage across the ocean; or a manufacturer writing to Japan must mail the letter a week before the steamer sails from San Francisco or Vancouver.

This will enable correspondence to be dispatched from any part of the United States for an ocean mail within a few hours of sailing time. The only charge, in addition to the usual telegraph tolls to the ocean mail port, will be 5 cents for postage. Telegrams should bear the full mail address of the foreign correspondent for whom they are intended and marked "Care Ocean Mail, New York," or San Francisco, Seattle or Vancouver, as the case may be. No charge will be made for the address.

#### American Consuls' Lack of Knowledge.

Although the American Consul at Juarez, Spain, reports that there are 22 automobiles and two agents in that city of 50,000 inhabitants, he adds that there are "no stores where automobiles may be purchased," and that "it would not pay to have one." Both of the agents handle foreign cars, but are willing to represent American cars also; in fact, one of them, who understands the English language, is about to establish an automobile passenger service between San Fernando, a few miles from Juarez, and

would be impossible to wait for duplicate parts which must necessarily come from America.

Inquiries were made at once of the American consulates in Madrid, Barcelona, Paris and London as to whether any American automobile manufacturers had offices in Europe, and, although there are such offices or agencies in both London and Paris, the American Consular representatives are so poorly posted or so slightly interested in matters pertaining to the automobile situation that they could not supply the information.

#### Cars that are Called for in Scotland.

As indicating the spread in Great Britain of the demand for cars of medium power and price, United States Consul W. Stanley Hollis, at Dundee, Scotland, reports a preference in his district for cars of about 20 horsepower, selling at from \$1,500 to \$2,000 retail. While there is some local business, many purchasers prefer to go to London when seeking a new car, in order to get the benefit of the greater variety and also the possibility of picking up "bargains." There are at present 2,823 motor cars in the Dundee district, 37 motor trucks and 797 motorcycles.

**MOTOR TRUCK FROM MILWAUKEE**

**Double Friction Transmission a Conspicuous Feature—Large Wheels and Other Characteristics of the Utility.**

Milwaukee, famous for kegged products, for the transportation of which large trucks are desirable, has reason to believe that some of the fame will be shared by the "Utility" motor truck, the manufacture of which has been undertaken in the Wisconsin city by the Stephenson Motor Car Co. It is built in one and three ton sizes, the mechanical details of each being practically identical, the transmission of the

Forty per cent. carbon steel is used in the crankshaft and connecting rods, and the bearings are of Parsons white brass.

Cast in a single aluminum piece, the upper half of the crank case is light and at the same time very rigid, being reinforced by cross ribs. Box type supporting arms are cast integral, and contain breathers, the openings being protected by a knurled nut with a fine wire gauze cover. The lower half, also of aluminum, is bolted to the upper half, and contains the oil reservoir, with a drain cock in the bottom.

The motor is lubricated by means of a gear pump located on the outside of the lower half of the crank case. This pump forces the oil to a main duct cast integral with the case, from which it is distributed

the usual flywheel. These are connected by a forged shaft directly to the rear flange of the crankshaft of the motor. Both friction wheels run on roller bearings, and slide on ground and polished jack shafts by means of two arms operated in unison by the change speed lever. By the operation of the foot pedal one friction wheel is moved forward against the front driven disc and simultaneously the other is pressed against the rear disc, whereby both rear wheels are rotated in the same direction. To reverse the car, another foot pedal reverses the action of the friction wheels. All end thrust is distributed by the center equalizing bearing. As each friction wheel drives its respective road wheel, either wheel will pull the entire load independently should any occasion require. The drive is by side chains to the rear wheels.

Large wheels are employed; those on the one ton car are 40 inches and on the three ton car 42 inches in diameter. Solid rubber tires three and five inches in diameter equip the smaller and larger sizes respectively.

The brakes of the one ton car are internal expanding, 17¼ inches in diameter, with a 2½ inch face, and those of the three ton, internal, 20 x 4 inches.

Semi-elliptic springs are used in front, with a ¾ platform arrangement in the rear. A gear and segment type, 18 inches, and a screw type, 22 inches, are the steering wheels used on the two models respectively.

The one ton truck has a wheelbase of 110 inches, a body 108 inches in length, and it is capable of from 3 to 25 miles an hour. The wheelbase of the three ton truck is 136 inches, the body is 168 inches in length and the speed from 3 to 25 miles an hour.

**Premier Catalog Shows "Car of Quality."**

Dressed in gray and green, the new catalog of the Premier Motor Mfg. Co., Indianapolis, Ind., presents the case of the Premier cars in attractive fashion. The introduction, dealing with the policy to pursue when purchasing automobiles, is followed by full page photographic reproductions showing "The Car of Quality" in several body styles and two sizes of chassis—the 4-40 and the 6-60. These are supplemented by a number of large views of the motors and other partly assembled parts which make an especially interesting exhibit. Few alterations in the manufacture of these cars are noticeable, and except for a general refinement of design and such minor changes as have been suggested by experience, they remain the same as their predecessors. Conforming with an evident preference for the enclosed style of body, the touring cars and runabouts are so equipped, though the popular styles of open cars also are supplied. The catalog closes with an attractive layout of several views of the Premier car and some of the roads encountered during the 1910 Glidden tour.

UTILITY 45-50 HORSEPOWER THREE TON MOTOR TRUCK

double friction type, standing out as the most conspicuous feature of the truck's construction. Bodies are built to meet the varying demands.

A conventional "T" head type of motor with 4 cylinders, 4½ x 5 inches, and developing 30-35 horsepower, furnishes power for the one ton truck, while the three ton car is equipped with an engine of four cylinders, 4¾ x 5½ inches, which gives 45-50 horsepower. The magneto, carburetter and inlet are on the right hand side of the motor, with the exhaust and gear pumps on the left side. The placing of the valves on opposite sides is asserted to be a desirable feature in that their size is not limited because of restricted space. The "T" head is symmetrical, making a well balanced motor.

The cylinders are cast in pairs, with the water jackets cast integral and the cylinder heads reinforced by cross ribs. Each pair of cylinders is surmounted by a polished bronze head, which is detachable to facilitate the cleaning of the water jackets.

by means of copper tubes to the main bearings; then it flows through the hollow crankshaft to the big and small end bearings of the connecting rods. The pistons and cam shaft are provided with oil pockets and are fed by splash. On the exhaust side of the motor, an oil gauge indicates, by means of a float and a ball, the amount of oil in the case. The gauge is marked and when the oil is kept at this indicated level the makers claim that neither can the bearings burn out, nor can the motor emit smoke.

Ignition is furnished by a Splitdorf high tension magneto, and by plugs of the same manufacture.

Cooling of the motor is accomplished by water circulated by means of a bronze water pump. It is bolted on the crankcase and driven by a bevel gear from the cam shaft. A forced draught of air is maintained by means of a ball bearing fan, the blades of which are aluminum.

The double friction transmission employs two driven disks which take the place of

## ABOUT THAT "SOLID GASOLENE"

**Proves Not to be All that Fancy Pictured—What It is and How It May be Used—Some Day.**

Highly colored brain-pictures born of recently cabled reports of the advent abroad of a new form of "solidified petrol," or gasolene, and which induced visions of the motorist of the future carrying the fuel about in his pocket in chunks and which he could chuck into the carburetter whenever he wanted a little more speed from his car, will have to be toned down. For while there is a certain basis of fact in the reports, the project is not quite so rosy as it has been made appear. The so-called solid fuel in reality is a gelatinous substance in which gasolene, or any other petroleum distillate, is held in suspension after being subjected to a secret process. The fuel is vaporized in a special form of carburetter working on the general principle of the old-fashioned surface mixer, and besides offering certain advantages in economy is advocated chiefly for the additional safety which its use is said to involve.

According to English advices, the "solid" fuel is manufactured by adding  $1\frac{3}{4}$  per cent. of "steatite"—or more probably some compound of stearic acid bearing a similar name, not the mineral steatite—and alcohol to the fuel by a process which has been perfected by a Roumanian inventor. The resulting compound is described as a "stiff, white jelly, offering but little odor," in which the fuel is held in suspension in very minute cells. The fuel itself may be recovered by subjecting the jelly to pressure, though the commercial method employed in connection with motor vehicles is that of evaporation, as already indicated. In order to prevent loss, it is necessary to preserve the fuel in sealed tins, though such containers present no danger from leakage, such as may occur with liquid fuel. The use of the processed fuel is claimed to result in an economy of about 30 per cent. as compared with ordinary gasolene, while the cost of rendering it is about three cents per gallon.

### Spring that Eliminates Shackles.

As its contribution to the unceasing effort to add to the comfort of motoring, the Thomas Auxiliary Spring Works, Canistota, N. Y., is offering to the trade and public the Thomas auxiliary spring, shown by the illustration. While in some respects the device suggests other forms of supplementary springs, the Thomas invention is novel in that the usual spring shackles are eliminated by its use.

The spring proper is of steel, of the more or less familiar helical type. Six feet of

steel are used in the construction of the coil. It is claimed by the makers that this form of spring minimizes the vibration before it reaches the top, and that more jar is absorbed with less motion of the body than by the use of any other forms of springs.

As the illustration shows, the regular top leaf spring has the shackles removed. The feature of the spring is that the body hanger is bolted to the lever over the coil spring; the leaves are clipped together near the eye, also further in on the spring at the slotted hanger, this slot in the lever allowing for all elongation and take up, and does away with loose shackles.

It is also claimed for this auxiliary spring that no side sway is possible because

the hanger holding the coil is clipped firmly to the leaf springs; it cannot get out of shape because of its firm attachment; it absorbs the jar going down so that there is not as much reaction of upthrow; and that breakage is eliminated to a great extent.

### Hupp Expedition Now on the Ocean.

Joseph R. Drake, Thomas M. Hanlow and Tom Jones, who constitute the Hupmobile "export expedition" which left Detroit on November 3d, reached San Francisco on Monday last, 12th inst. Both the men and the Hupmobile touring car, in which they made the long, strenuous journey over plain, desert and mountain, were in prime condition and were accorded a hearty reception. Monday night the sturdy car was loaded into the hold of the steamship Manchuria and the next day the little party went aboard and now are nearing Honolulu, where their real missionary work will begin. After introducing and demonstrating the car in Hawaii, the "expedition" will set sail for the Fiji Islands, New Zealand and Australia, whence the way homeward will be traced via Europe.

### Where Not to Stop in Winter.

During the winter months particularly it is a bad practice to leave a car standing in a pool of water or a mud puddle. The fact that the water or mud may freeze to the tires and cause damage to them when the car is restarted never occurs to some motorists.

## RUSSIA A PROMISING MARKET

**Demand Likely to Develop into Generous Proportions, Says Consul Comer—Odd Objection to Vanadium Steel.**

In reporting that the Russian War Department is a large purchaser of automobiles for military use, Jacob E. Comer, American Consul at St. Petersburg, suggests that American manufacturers probably would find it very useful to have permanent agencies in Russia. Not only is the Government buying from time to time, but, Mr. Comer believes, the demands of private parties would more than justify such establishments.

"The automobile business is likely to develop into rather generous proportions in Russia," he says, "for two reasons: First, the fuel is cheaper and more plentiful than in any other European country; and, second, owing to the relative dearth of railways there is a need for other forms of communication between cities and villages, for postal and general transportation purposes, which automobiles are best adapted to fill.

"The sale of American cars in Russia is impeded by the general disposition in this country to consider American machines lighter, cheaper and less durable than those of European make; and this may be attributed to the fact that thus far only the lighter and less expensive of the American makes have been much in evidence here. A strong and heavy machine, able to stand usage upon difficult roads is the type that would meet with greatest success in the Russian market. The employment of vanadium steel by American automobile builders is a further handicap on their machines in Russia, since this variety of steel is almost unknown and untried in this country."

### Damage Possible to Deflated Tires.

When running with deflated tires on the rims, it goes without saying that there is danger of damaging the tire. In this condition the rubber is very soft and pliable and almost anything in the road with a point or edge sharp enough to penetrate the casing will attach itself to the tire. A recent example of injury possible to tires in this condition was shown when a deflated tire picked up a railroad spike.

### Annoying Rattle Caused by Muffler.

After a great deal of speculation as to its location, a very annoying rattle finally was found to be in the muffler. It was located by stopping the engine while coasting down a hill, the rattle ceasing immediately the engine was stopped. An investigation showed that some of the rivets holding a baffle plate in the muffler had dropped out allowing the plate to rattle.

## BUSES BUILT FOR RURAL USE

**Special Requirements Developing Distinct Type to Carry Passengers and Baggage—One Maker Meets the Demand.**

That the motor bus rapidly is supplanting the horse drawn vehicle on rural stage routes and bringing about the establishment of many new and longer routes, quickly is made apparent to all who leave the main lines of railroad travel, but comparatively few persons are aware of the types of vehicle which the new or sharpened demand has developed.

In order to be the best adapted to this

miles per hour, which is normal, although on good roads it will run 20 miles an hour. The wheelbase is 138 inches and the tread 68 inches. The tires are solid, 36 x 4½ in front, single, and 36 x 3½, twin, in the rear. The weight of the car is 6,500 pounds.

### How to Start Easily on the Magneto.

Though easy starting with the magneto depends to a certain extent on the adjustment of the carburetter, the secret usually is in having the proper sized gaps at the spark plugs. Any motor may be so adjusted that it can be started on the magneto. The fact that it will start without the assistance of the battery shows that it is more perfectly adjusted than when the battery is relied on and therefore is

MACK COMBINED PASSENGER AND BAGGAGE STAGE FOR RURAL LINES

work the rural bus must necessarily combine passenger and baggage carrying ability, and have separate compartments for each, and most of them combine these features, a good example of the sort being the bus here illustrated, which is manufactured by the Mack Bros. Motor Car Co., Allentown, Pa.

This bus is controlled from the right hand side, the entrance into the body, proper being at the center, between the driver's and the other front seat, and the platform entrance on the left. The seats inside are arranged longitudinally or crosswise, and, in cases where it is more desirable, the driving position is changed over to the left hand side, to allow the passengers to enter the platform from the right side. In the rear is a baggage rack with a loading space 48 x 60 inches. The size of the car is varied, to meet the requirements, from six to twelve passenger capacity and from 500 to 3,000 pounds freight carrying capacity.

The motor is a four cylinder, four cycle, vertical type, with cylinders 5½ x 6 inches, cast in pairs. The valves are located on one side. When the motor is running at 800 revolutions the speed of the car is 15

evidence that it will run more smoothly and powerfully when on the road where the magneto forms the source of ignition. A magneto wrench usually will be found in the tool equipment which accompanies new cars, and on this wrench there will be found a gauge for setting the auxiliary spark gap on the magneto. When this gauge is available the spark plug gaps should be adjusted to exactly this size, care being taken to see that all are precisely alike. If no gauge is included in the tool kit, adjust the gaps to 1-64 inch—no more, no less. If the throttle then is opened about one-quarter and the spark lever advanced to that point which previous experience has proven to be productive of the best results on level roads, the motor will start if it is "spun" over once or twice. The spark should not be retarded as is the case when starting with batteries, but should take place as nearly at the top of the stroke as possible in order to get the maximum efficiency of the magneto. A back kick need not be feared, as this danger is extremely rare when a magneto is used for starting, because by the time an explosion occurs enough energy will have been stored in the flywheel to offset this.

## CONCERNING COOLING SYSTEMS

**Advantages and Disadvantages Peculiar to Those in Vogue—How the Car Manufacturers Show Their Preference.**

There are advantages and disadvantages in both the thermo-syphon and the pump circulation of water in a motor, and, though to many manufacturers the former has features which make it more desirable to them for effecting the engine's cooling, the latter system has many adherents because of the points in its favor.

One of the first objections, if it may be so termed, to the thermo-syphon system is that it requires a slightly larger radiator, employing larger pipes, and connections, but as these constitute but a small item of first design and construction, its other points, and the fact that it requires practically no attention thereafter, renders the other consideration of small moment.

Thermo-syphon cooling generally is considered more efficient than cooling by pump, in a motor doing heavy duty, because while the pump causes the water to circulate at a speed in proportion to that of the motor, in the thermal, or gravity, system the rate of the flow of water is dependent upon the amount of heat generated by the motor. Maximum heat conditions prevail when a motor is laboring hard, as on a hill or under adverse running conditions, with the throttle wide open and the spark somewhat retarded, and, on such occasions, the water circulates much faster by the thermo-syphon system than with the use of the pump.

When a motor equipped with the pump system is stopped after a particularly, or even reasonably, hard run, the water immediately ceases to circulate, and if the stop is not extraordinarily long, the engine is much hotter than when it was stopped at first. In the gravity system the water continues to circulate, and thus cools the engine for the next run. The fact that the thermo-syphon circulation is a physical and not a mechanical system of cooling is another point in its favor.

On the other hand, however, the pump, either gear or centrifugal, is not only more economical to produce but has its advantages, the greatest, probably, that it is positive in action. It often is impossible to obtain other than dirty or muddy water with which to fill the radiator, and the sediment therein is very liable to cause the pipes or connections to become clogged. The positive circulation forces such water, and even dirt or small chips, through the pipes without stopping up the passages. The formation of air locks or steam pockets is an ordinary occurrence in radiators or pipes, but the forced flow of water by

pumps obviates all danger that might otherwise be caused by such obstructions.

Because neither the thermal nor the pump circulation has satisfied certain manufacturers on account of some of the shortcomings found in each system, a compromise of the two has been adopted in several instances. This compromise is a combination of the pump and the gravity principles, the centrifugal type of pump being the mechanical factor. The pump case is made much larger than ordinarily in order to allow the water to flow, whether or not the pump be inactive or rotating but slowly. The feature of this third system is that the water is circulated entirely by the pump until the motor becomes so hot that the water reaches the boiling point, when the thermal or gravity circulation begins to take place. The enlarged case about the pump permits the water to flow past the pump blades faster than they rotate or would circulate it mechanically. Thus the motor is cooled more efficiently than would be the case with the pump alone, and yet the advantages of a pump are retained.

How the cooling systems are viewed by the manufacturers is indicated by a total of 176 makers, representing the better known American cars of whom nearly 58 per cent. prefer the centrifugal pump system of cooling as evidenced by its presence on their product, and 12 per cent. the gear pump, while about 25 per cent. show a preference for the thermo-syphon and 6 per cent. use different systems on their differing models. Numerically they stand, 102 centrifugal, 41 thermo-syphon, 22 gear and 11 employing at least two systems.

#### Delivery Wagon in Compact Form.

With the object of catering to the needs of department stores, dry goods stores, milliners, grocers, laundries, and other classes of business that require a large number of quick deliveries during every business day, the Waverley Co., Indianapolis, Ind., has brought out a new form of delivery wagon, Model 83, which possesses several unusual features. Besides being lighter than many other electrics that are intended for a similar class of work, it is compactly and neatly designed, so that it can be handled readily in close traffic and maneuvered in narrow streets. Its relatively small size, together with its mechanical simplicity, also renders it perfectly adaptable to garaging in the shipping room of its owner, subject almost entirely to the attentions of the driver. Where a charging board is installed at the shipping platform, indeed, the machine may be kept at that point for the greater part of the time, only going to a regular garage occasionally for inspection and regulation.

The novel point about its construction is that it embodies the same form of transmission that is used in the Waverly pleasure cars. This system includes the use of a driving shaft running between the

reduction gears and the axle, not longitudinally of the vehicle, in the manner of the conventional propeller shaft, but at an acute angle to the axle. By this arrangement it is possible to bring the motor very close to the axle, thus making a very compact transmission, while ensuring perfect flexibility to the system under the ef-

fects of spring motion. The silence of operation and high degree of efficiency achieved by the system are attributed to the use of herringbone gears.

#### Mounting Dynamo on the Motor.

In order to provide means for mounting and driving generators for independent electric lighting systems which fast are coming into use, several American automobile designers are casting special brackets on engine bases and arranging for direct, positive drive. An instance in point is illustrated by the accompanying picture, which shows a 1911 style Speedwell motor on which is mounted a new Aplco slow speed dynamo, which is driven by the engine gearing. The torpedo car in which the power plant is intended to be installed

is equipped with convertible gas and oil lamps. The action of the lighting system, under the Aplco method or regulation, is entirely automatic regardless of the speed of the engine. The dynamo, which is shown in position, is made by the Apple Electric Co., Dayton, O.

In regard to the method of installing the dynamo on the engine, it will be observed that a special bracket has been cast on the left side of the engine in front, the dynamo

thus occupying a position which has been a general favorite with designers in placing the magneto. It is thus perfectly solid with the engine, is independent of all frame distortion and is kept in absolute alignment at all times. The drive is obtained by adding a special gear to the two-to-one group in front, which actuates the armature directly. As the gear is enclosed in the housing which protects the entire engine gear system it is unaffected by road dirt and dust and adequately lubricated.

#### Book for Draughtsmen and Designers.

One of the indirect benefits resulting from the introduction of the automobile into the curricula of technical institutions is the inevitable production of textbooks designed primarily for students' use, which, by the very nature of their origin and intended purpose are free from the commercial bias that taints so many of the handbooks and compendia that are thrust upon an unsuspecting public. The latest representative of the class of professional textbooks—to adopt a distinguishing term—just has appeared from the press of Longmans, Green and Co., London and New York, and is entitled, "The Practical Design of Motor Cars." The work, which is of 250 pages, demi-8vo., is by James Gunn, lecturer on motor car engineering at the Glasgow and West of Scotland Technical College. In a preface, written by Prof. A. L. Mellanby, D.Sc., it is explained that the volume is the outcome of the latter's work as a lecturer to students of motor car engineering.

The book is designed for the use of draughtsmen and designers, but also is of a sufficiently descriptive character to be of value to others who desire to inform themselves of the general technical requirements of the automobile. The various elements of the standard chassis are taken up in detail and considered from the analytical standpoint and with general, rather than specific, reference to current practice. The work is plentifully illustrated with original line drawings.

#### Telling the Warren-Detroit Story.

The Warren Motor Car Co., Detroit, Mich., has achieved a picturesque effect on the gray cover of its 1911 catalog by an embossed semi-conventional design of an automobile appearing over a rise in a broad road; three large trees tastefully placed lend a sketchy effect to the whole which is further enlightened by the name of the car—Warren-Detroit—which appears in gold. It is the sort of booklet that will delight the heart of the searcher after facts, whether he be an intending purchaser or not. The cuts which are exceptionally clear are tastefully enclosed in pale green borders and portray in addition to the many different parts which go to make up the chassis and motor, seven styles of pleasure cars and one commercial car, a new-comer—the Warren-Detroit delivery car.

## HELP FOR CARS THAT ARE STALLED

Engineering Device Readily Available and Far More Powerful than Block and Tackle—How to Use It.

Though ditches are necessary evils, mud and sand while hardly necessary are nevertheless evils, and all three on more than one occasion have proved the bane of the tourist. Ingenuity on the part of the motorist usually extricates the car, and where this fails he must fall back on the services of a horse or a team of mules.

A much better way for the man who tours far or who engages in strenuous contest is to carry and use a Duplex or Triplex block, a mechanism similar to the differential hoist commonly used in engineering

and in recent Glidden and other tours where the device has been used it has proved most valuable.

In addition to this important use on the road the Duplex block, which costs about \$20, and the somewhat more powerful Triplex block, which costs about a third more, can be used in the garage to lift out the motor or other heavy parts or to lift the body from the chassis without the props and underpinning necessary when the ordinary jack is used.

### Winter Warmth for Man and His Food.

"Although the average man is supposed to possess his quota of mother wit, did you ever notice that precious few motorists who suffer numbed fingers or chilled feet ever think of lifting the bonnets of their cars and permitting the heat of their motors to thaw them out?" queried an observant individual as he pointed to a chauff-

VIEW SHOWING HOW DIFFERENTIAL HOIST MAY BE USED ON STALLED CAR

and other work that requires the lifting of heavy weights. This device is a modern improvement on the block and tackle, and is much more compact and powerful. With a Triplex block, weighing about 40 pounds and requiring a comparatively small space in the equipment box, a single man can exert a pull of a ton—more than the effective pull of a team of horses. The Duplex block is slightly smaller and permits a pull equal to two-thirds of that realized with the larger device.

In using either of these blocks to haul a car out of a hole the *modus operandi* is as follows: A small iron bar is driven into the solid ground at a considerable angle and at a distance from the automobile. One end of the larger chain which accompanies the block is attached to the axle of the car and the block is attached to the bar by means of a ring which is slipped over the end. The strain which is put on the smaller chain by the operator is greatly multiplied, through the mechanism of the block, on the large chain, and in this way the car is slowly dragged out of the hole. The bar can be driven, the block hooked up and the car extracted from a deep ditch or hole in a very few minutes, by one man working without any assistance whatever,

four who was "flaying" his body with his hands and stamping the sidewalk with his feet in an effort to quicken circulation. "It is the same lack of wit that causes men to drink cold coffee at this time of the year or to eat cold picnic lunches during the summer when the hot motor supplies a ready means of warming both drink and food. I know one ingenious driver who has rigged a couple of holders inside the bonnet and who thus has warm soup or warm coffee in metal flasks at hand whenever he desires either."

### Skill Required in Replacing Cylinders.

Considerable skill and patience are required when replacing a cylinder over pistons because a great deal of difficulty often is experienced in starting the rings into the bore. If one man can lower the cylinder casting while another works the rings under the edge, little trouble will be experienced, but in cases where there is but one man to do the work, one of the best ways to get the rings in is by placing a piece of soft wire or extra strong cord around them. This will hold them in place until the upper edge slips into the bore, when as a matter of course the wire or cord is cut away.

## MOTORS AS SANITARY MEASURES

How Their Displacement of the Horse Will Assist Public Health—Extent of Horse Haulage.

To eradicate mosquitoes, dig a few ditches in the nearest swamp and pour crude oil on all stagnant water. This simple plan has been evolved and its success demonstrated only after many years of costly experiment and labor. There is an equally simple rule for ridding big cities of an even worse pest. It is: To eradicate the common house fly, substitute motor trucks and pleasure cars for horse drawn vehicles. The author of the rule, if not the originator of the plan, is Charles E. Stone, sales manager of the Alden Sampson Manufacturing Co., Pittsfield, Mass. The same authority recently was quoted to the effect that the substitution of motor vehicles for work horses in New York City alone would effect an annual saving of from \$18,000,000 to \$20,000,000. In the current issue of the *Co-Operator*, he sets forth his ideas concerning "The Freight Automobile and Its Mission" more in detail, and incidentally mentions the utility of the motor wagon as a fly eradicator.

"Up to a few years ago the statement that within a limited time the greater part of the country's merchandise hauling would be done by motor power, not by horses, was regarded in the light of a prophetic utterance, or, at least one in which the wish was parent to the thought," Mr. Stone remarks. "Since then those pioneers who, ever alert for improvement in service and greater economy in up-keep, adopted power transportation, have taught the business community valuable lessons, until even the late skeptic no longer closes his eyes to the certainty that power transportation is the next logical step.

"Horses represent a method of transportation so old that it was in vogue before the Christian era, and it is well that inventive genius has found a means of supplanting them," he continues. "The demands of business, health and humanity are driving us to adopt other methods of transportation, more suitable to the requirements of the twentieth century than that of the Pharaohs. The congestion of the business streets of our great cities is giving us all a great deal to think over—and the conditions on or near piers are even worse.

"A considerable share of the responsibility for the present high cost of living may with a good deal of justice be attributed to the cumbersome and expensive trucking. The cost of trucking in New York City alone amounts to \$156,000,000 annually, without considering the wear upon the pavements and the expense of attempting to keep them clean. There are in New

York City about 130,000 horses and over half of them are used in trucking. Even a partial superseding of the truck horse by the motor would involve a tremendous saving.

"True, in some country districts the horse has an enduring value. But the science of sanitation is confronted by the fact that in cities of this country there are nearly 4,500,000 horses and 200,000 mules. With all possible and reasonable precautions intended to keep the cities sanitary little progress can be made so long as such an army of quadrupeds parade in endless procession up and down the thoroughfares. The clouds of dust which sift above the pavements are not the wholesome earth of the fields, but are filled with germs and lingering death.

"To go further into details, the exit of the horse would mean the disappearance of the house fly, for it would remove its chief breeding source. It is apparent to all who have given study to the congestion of traffic in great cities, that some change in the methods of delivery must be introduced. The horse's board bill amounts to over \$14,500,000 a year in New York City. The 130,000 horses hitched to vehicles in the Empire City add a long and unnecessary line to the traffic parade. Counting eight feet from the dash-board to each horse's head, the animals take up 200 miles of the streets. And if, for example, these horses were all harnessed to the wagons, tandem fashion, 190 miles of horseflesh would pass before the first wagon appeared in sight; in other words, the first horse would be entering the city of Scranton, Pa., or Worcester, Mass., before the leading wagon pulled out of New York City.

"The past year has seen a very decided change of sentiment toward the adoption of the self-propelled vehicle, and New York can now boast of about 1,200 and Chicago of 612 freight automobiles, while throughout the country between 8,000 and 10,000 are in use."

#### Ideal Spot for Motoring in China.

Despite the fact that China popularly is supposed to be about the last country on earth, so far as motor cars are concerned, J. C. McNally, American consul at Tsingtau, reports that "there is no more ideal spot in the world for automobiles than Tsingtau." It has 50 or 60 miles of excellent roads extending along the ocean front and into the adjacent mountains, which roads are greatly used in the summer by persons spending their holidays at that famous Far Eastern resort.

Tsingtau, however, has only six automobiles, none of American make. While many persons speak of buying automobiles, the opportunity is so limited that they make the best of the situation and fall back on horse-drawn vehicles. Mr. McNally believes that a cheap car of known quality could be sold there, but suggests that the safest way to introduce the machines would

be to form a connection at Shanghai and sell from that point, as the freight charges between Shanghai and Tsingtau are low.

#### How Road Testers Lighten Their Work.

An automobile tester's job may not be a sinecure at this time of the year when the roads are frozen and "the wintry winds do blow," but it is not without its pleasurable side, at least in some portions of the country. In the vicinity of Toledo, Ohio, for instance, some of the Willys-Overland testers have taken to carrying guns and combining rabbit hunting with their work. The rabbits, which in many cases dart across the road in front of the rapidly

"When you are passing rapidly through the air in a motor car or an aeroplane this suffocating carbonic acid gas is pushed back into the lungs," he declares, "and only a little of it can get away, because of the wall of air pressing into the mouth. So it is 'rebreathed' and the result is carbonic acid gas poisoning, which produces a kind of narcotic sleep."

As breathing through the back of the head is not possible, it appears that in order to be immune from this new peril, the motorist must wear over the nose and mouth a contrivance of metal shaped like a U and having the ends extending backward to behind the ears in order that the

OVERLAND "TROUBLE HUNTERS" COMBINING PLEASURE WITH WORK

moving machines are shot while the cars still are in motion, and that some of the testers, at least, have good eyes as well as steady hands is attested by the accompanying illustration.

#### Foreign Physician Makes a "Discovery."

One of those unnamed physicians "prominent in British medical circles," who periodically break into print with more or less alarming discoveries, has found that many of the sudden and peculiar accidents to aviators and automobile race drivers are due, not to the "popular belief" that such catastrophes are caused by sudden heart failure, but to carbonic acid gas poisoning, "due to the pressure on the mouth set up by driving fast through the air and the consequent inability to expell the poisoned air which has already been breathed." As a matter of fact, practically all of such accidents have been due to derangements of machinery or tires, but a little thing like that does not feaze the English doctor who wants it known that "air once breathed is carbonic acid gas."

carbonic acid gas may find ready escape. Some consolation, however, is contained in the doctor's explanation that "one is not likely to come to grief from direct poisoning the first time he goes out, though in process of time a disease is produced," and that the danger to which he refers is greatest in winter, when, because of the complex mechanism of the lungs, it is not possible to inhale as great a quantity of air as during the summer.

#### Saving Money on Cars in Storage.

When a car is laid up for the winter, the motorist who is "wise" to the "tricks" of the insurance trade, cancels his policies covering liability, property damage, etc., the cancellation bringing with it the rebate of a tidy sum. In the spring when the car again is put in commission, entirely new policies of course are obtained. Insurance against fire is all that need be carried on a stored car and not infrequently if the place of storage is of the highly approved sort, a reduction in that rate is obtainable.

XXV.

New York, U. S. A., Thursday, December 22, 1910.

No. 12.

## RESTRICTIONS ON TRUCKS REMOVED

**New York Insurance Exchange Lifts Its Ban—Pier Owners Free to Permit Use of Gasolene Vehicles.**

If any owner or lessee of a New York pier desires to permit a motor truck or other gasolene vehicle on his property, he now is free to do so without invalidating or otherwise imperiling his insurance or without paying the extra 5 per cent. which heretofore has been expected from such pier owners as were willing to take the risk and pay for it.

For several years the National Association of Automobile Manufacturers, through its traffic manager, J. S. Marvin, has been bringing pressure to bear on the insurance companies to remove their restrictions, and as a result the New York Fire Insurance Exchange, at its regular monthly meeting on the 14th inst., finally lifted the ban; but at the same time it raised the base rate for piers from \$1.25 to \$1.60, except those "of superior or semi-fireproof construction, conforming to specifications for that class on file in the office of the Exchange." While all of the modern piers are in this class, the old piers still are in the majority, and will be affected by the advance in rate which, of course, more than offsets the amount saved by the rescinding of the extra 5 per cent.

Several of the piers have been paying this 5 per cent., but the greater number have executed the warranty which prohibited the use of gasolene vehicles on such properties. The nearest such vehicles have been permitted to encroach has been when taxicabs unloaded passengers on the bulkhead, and although trucks and all other automobiles no longer will entail penalties of any sort, it is stated in insurance circles that not all of the lessees purpose throwing open their piers. Such action remains purely optional on their part. The removal of the restrictions, however, is a big victory, and will prove a fillip for motor truckage.

The exact language in which the New York Fire Insurance Exchange lifted the ban is as follows:

"The base rate for piers is hereby advanced from \$1.25 to \$1.60, except that the base rate for piers of superior or semi-fireproof construction, conforming to specifications for that class on file in the office of the Exchange, shall remain \$1.25 as at present. The present counter advance on piers of 25 per cent. in certain portions of the Exchange territory and of 5 per cent. in other portions is hereby rescinded; and the present requirement for the inclusion of a charge of 5 per cent. in the card rates on structures and contents of piers the owners or lessees of which have not filed a warranty agreeing that vehicles propelled by the use of gasolene, naphtha, or other hydro-carbon oils will be permitted on their piers except when under shipment as freight, and then only with no gasolene, naphtha, etc., in their tanks, is hereby rescinded."

## Suit Against General Motors is Settled.

The suit of the Pontiac Buggy Co. against the General Motors Co. for \$85,000 which was instituted in September last was settled out of court last week. The amount involved represented the balance due of the purchase price of a building in Pontiac, Mich., sold by the Buggy company to the Oakland Motor Car Co., which later became a part of the General Motors organization. The latter endorsed the Oakland notes which were given for the building, and when they were not met the Buggy company brought action to recover the amount.

## Wetzel Takes Output of Hall Lamps.

In addition to the other products which he handles, Thomas J. Wetzel, of New York, will hereafter market the output of the C. M. Hall Lamp Co., of Detroit, in which he has been a director since its organization. Hall, who on January 1st will retire from the general management of the company bearing his name to join the staff of Claire L. Barnes & Co., will still retain an interest in it.

## UNTANGLING THOMAS'S AFFAIRS

**Creditors' Committee Reports Offer From Three Manufacturers—Briscoe Denies He's One of Them.**

Due to the efforts of a creditors' committee, of which W. H. Crosby is chairman, the E. R. Thomas Motor Co., of Buffalo, N. Y., apparently is in a fair way out of the troubles which have enmeshed it for several months past. Basing its report on statements contained in a confidential circular, a class journal recently reported that the Thomas Co. had "gone under," when, as a matter of fact, nothing of the sort had or has occurred; it had become heavily involved, and a creditors' committee was engaged in straightening out its affairs. Late last week this committee reported that "three experienced automobile manufacturers are contemplating financing the company," and submitted the conditions under which the financing would be undertaken. It promptly came out that Benjamin Briscoe and two of his colleagues in the United States Motor Co. were the three manufacturers concerned in the transaction, and when seen on Monday last by a Motor World man, Mr. Briscoe, after some diplomatic fencing, admitted that he had looked into the Thomas Company's affairs, but denied that either he personally or the United States Motor Co. contemplated financing or acquiring the Buffalo property. He said it did not fit into the United States Motor plans, and declared that the sum total of his interest in the matter had been to put the Thomas committee into touch with bankers who he thought might render the necessary support.

The plan submitted by the creditors' committee stated that the "three experienced automobile manufacturers" propose to acquire at par \$430,000 of the Thomas first preferred stock, for which they are to receive all of the company's common stock, paying the creditors 20 per cent. in cash,

and giving two notes for 40 per cent. each, the first maturing August 1, 1911, the other one year later, both drawing 6 per cent. interest. The three manufacturers also proposed to carry out contracts for material and supplies on hand or in progress of fulfillment.

The banking indebtedness of the Thomas Company amounted to more than \$600,000, but this has been paid by the sale of a large block of stock in the Chalmers Motor Co., which was held by Mr. Thomas personally. In return therefor the latter has agreed to accept three notes of \$100,000 each, payable on the first day of August, 1913, 1914 and 1915, and the balance in the preferred shares of the company. This would leave an indebtedness of about \$800,000 with a preferred stock issue of \$735,000 and a cash working capital amounting to \$300,000.

In submitting this plan to the general creditors, the committee stated that it would be carried out unless objection was made within five days, which time limit expired last night.

In large part, the Thomas Company's embarrassment is said to be due to its failure to charge off anything for depreciation of plant or equipment for a long term of years and to the carrying on its books of several large and hopeless losses, its assets and resources thus appearing much greater than really was the case, as the inventory of the creditors' committee quickly served to disclose.

#### Revere to Make Tires in Rhode Island.

The Revere Rubber Co., which is one of the units of the Rubber Goods Mfg. Co., and the one which produces the Continental tire, on Monday last filed articles of incorporation under the laws of Rhode Island, with capital stock of \$4,000,000. The incorporation is the first step toward the operation of a big new plant in Olneyville, R. I., which practically is a part of Providence. It is there that the tires will be made, but the present plant at Chelsea, Mass., will continue to be operated on other productions. The incorporators named in the application for the Rhode Island charter are: Judge James Harris, Walter S. Ballou, president of the Woonsocket (R. I.) Rubber Co., and Clarence H. Guild, treasurer of the same company.

#### United States Motor Re-Elects Directors.

At the annual meeting of the United States Motor Co., which occurred on Tuesday last, 20th inst., in Jersey City, the board of directors, fifteen in all, were re-elected. They are: Benjamin S. Briscoe, J. C. Brady, J. D. Maxwell, C. G. Stoddard, K. B. Schley, Frank Briscoe, Horace de Lisser, J. H. Edwards, R. Irvin, H. Lloyd, O. J. Mulford, W. H. Nuckols, R. A. Robinson, J. W. Wellington and C. Tucker. These directors will meet later and re-elect the officers.

## INSURANCE THAT FAILED TO FLOAT

**Big Name and \$1,000,000 Capitalization  
Served No Purpose—St. Louis Optimist  
Wants His Money Back.**

When the high sounding Automobile Insurance Co. of America was organized with \$1,000,000—in capital stock—in Indianapolis, Ind., last year, Orion S. Miller, of St. Louis, Mo., evidently had abiding faith in its ability to lasso, corral and otherwise secure oodles of "automobile money" and periodically to cut large luscious "melons." His faith was so great that after buying 250 shares of the \$10 stock, and paying 100 per cent. premium on them, he bought a second and larger dose to the extent of 2,250 shares and \$45,000. He is wiser now, the company's lasso having failed to capture the big game which it sought, and as it now seeks to transfer its assets to the Federal Union Security Co., also an Indiana corporation, Miller, in his increased wisdom, is endeavoring not only to prevent the transfer, but to get his money back. The story is an illuminating one of large plans that miscarried.

The Automobile Insurance Co. of America was incorporated October 27, 1909, with authorized capital stock of \$1,000,000, divided into shares of the par value of \$10 each, and with the names of D. M. Parry, the automobile and carriage manufacturer, and Senator Reed Smoot, of Utah, to help impress the public. Miller, in his application for a receiver and a restraining order, alleges that it was planned and partially carried out to sell each share of stock at \$20, using the amount received over and above par as a working surplus. Miller says he first paid \$20 a share for 250 shares, and later subscribed for 2,250 shares, paying \$23,750 in cash and \$21,250 in notes. He declares that other purchasers of stock paid in cash and by notes a total of about \$192,000 into the company's treasury.

October 18, 1910, when no more stock could be sold and it was found impossible to raise the necessary sum of \$300,000 before the company could transact business as an insurance company, it is alleged that the board of directors decided to sell the assets of the company to the Federal Union Surety Co., and that a contract of sale was made out.

Miller says that by this contract it was planned to transfer to the Federal Union Surety Co. ten shares of the automobile insurance company stock, for which the shareholders had paid at least \$200, for one share of the capital stock of the Federal Union Surety Co., of a par value of \$100, but in reality worth \$70, thereby giving the automobile insurance company stockholders \$35 for every \$100 they had invested.

The plaintiff asserts this would entail a loss of \$32,500 to him, and over \$100,000 to other stockholders. He therefore not only has applied to the Superior Court in Indianapolis for the appointment of a receiver and restraining order to prevent the carrying out of the transfer of the property to the Federal Union Surety Co., but also asks that the subscriptions he made for capital stock, and the notes he gave therefor be canceled and declared void. He asks a judgment of \$75,000 against the automobile insurance company and Charles W. Clark & Co.

The defendants to the suit are the Automobile Insurance Co. of America, David M. Parry, William P. Bidgood, T. C. Search, Joseph D. Cotton and Reed Smoot, directors; Edgar E. Hendee, selling agent; Charles W. Clark, of Charles W. Clark & Co., fiscal agent, and the Federal Union Surety Co.

After hearing the evidence presented, Judge Collier, of the Superior Court, on Tuesday, December 20, appointed John M. Hall receiver of the Automobile Insurance Co. of America, and fixed his bond at \$100,000. The assets to be turned over to the receiver amount approximately to \$22,000 in cash, \$81,000 in mortgages and \$55,000 in subscription notes.

#### Pickard Brothers May Leave Brockton.

Frankly admitting that it is handicapped by lack of capital, and stating that it has received flattering offers to go elsewhere, the Pickard Bros. Motor Car Co., of Brockton, Mass., has let it be known that unless local support is forthcoming it probably will leave Brockton. The Pickard brothers have been building cars in a small way for several years, but only a few weeks since incorporated their business with capital stock of \$150,000. They now desire to sell \$50,000 worth of the stock which they say will enable them to double their output of two or three cars per week, and permit them to meet orders in hand. The Brockton Board of Trade and the Brockton Merchants' Association met the Pickards, and, after listening to their statements, appointed a committee with a view of keeping the industry in Brockton.

#### Receiver Seeks to Operate Parry Plant.

The Union Trust Co., receiver of the Parry Automobile Co., of Indianapolis, has filed a petition in the Superior Court, asking authority to operate the factory until the creditors of the company can perfect reorganization plans and take the company out of the hands of the receiver, a creditors' committee having undertaken that task. To provide funds the receiver suggests that any expenses incurred in the continuation of the business become a first lien on the assets of the company, and that whatever money is advanced by the receiver be returned out of the first proceeds of the factory after payment of the court costs.

**GENERAL MOTORS MAKES SHOWING****Banking Interests Issue Statement Giving Impressive Figures—How the \$15,000,000 Loan Is Handled.**

For the first time since Wall Street interests advanced the loan of \$15,000,000 to the General Motor Co. and took a mortgage on its assets and assumed practical direction of its affairs, a statement of the \$60,000,000 company's condition has been issued. On their face the figures show that its net profits for the year ending September 30, 1910, were \$10,266,322.27, and that its total assets are \$37,770,363. The statement is in the form of a printed circular issued "for the benefit of investors," and is in no wise a detailed one, but the bankers point out that the year's profits are sufficient to meet more than eleven times the interest on the \$15,000,000 note issue and two-thirds of the principal. The statement really comprises a report of financial conditions rendered by W. C. Durant, vice president of General Motors, based on an audit made by Marwick, Mitchell & Co., chartered accountants, as of September 30.

In both sets of figures the proceeds of the note issue are included in the assets, and thus swell them to the extent of \$15,000,000, but the note issue for this sum does not appear in the liabilities. When Mr. Mitchell, of the accounting firm, was asked to explain this apparently great inconsistency, he explained that the published statements were not to be construed as a trial balance sheet, but merely as a guide to show investors the extent of the security behind the big note issue. "In placing the liabilities at \$14,225,105.23," he said in substance, "the accountants did not include the \$15,000,000 of notes issued or to be issued, in order more plainly to show the equity which would guarantee the notes—the security which would guard prospective investors. While the notes themselves are not included in the liabilities of the companies, the proceeds to be obtained from their sale were included in the assets, and although these facts are fully stated in parentheses in the text of the table, their exclusion from the liabilities tends to create a favorable first impression upon the prospective investor, which naturally is the object of a prospectus sent out by banking houses interested in sale of such shares."

The published circular makes known that the bankers have formed a finance committee to control the finances of the company. It is composed of Emory W. Clark, A. H. Green, Jr., M. J. Murphy and Thomas Neal, the four Detroit men, who last month were added to the board of directors; W. C. Durant, of Flint; James J. Storrow, representing Lee, Higginson & Co., and Albert Strauss, representing the Seligmans.

**GENERAL MOTORS' STATEMENT OF CONDITION.  
REPORT OF AUDIT BY CHARTERED ACCOUNTANTS**

Since September 30, 1910, the company has received the proceeds of \$15,000,000 6% First Lien Five Year Gold Notes which it has issued and has paid off certain contingent liabilities, amounting to \$600,000, referred to in our previous letter to you, thereby completing the purchase of the stock of one of the Subsidiary Companies and, in addition, releasing and receiving back into the Treasury \$600,000 of its own preferred stock which had been pledged in connection with the transaction.

Adjusting the figures as audited by us September 30, so as to take into account the proceeds of the sale of the First Lien Notes and the discharge of the contingent liabilities above referred to, the position of the Companies would be, briefly, as follows:

**Assets and Liabilities.**

	June 30, 1910	September 30, 1910
Interest of the General Motors Co. in the Gross Assets of the Subsidiary Companies specified in Mr. W. C. Durant's letter to you of even date, based upon its proportionate stockholdings in these Companies:		
Fixed Assets (Real Estate, Plants, Equipment, etc., at cost, less depreciation) .....	\$12,127,000.00	\$13,216,260.81
Current and Working Assets (inventories at cost, receivables and cash, the September figures also including proceeds of \$15,000,000 of notes, as above explained) .....	24,541,000.00	38,372,598.82
Miscellaneous Investments .....	252,000.00	406,609.13
	<u>\$36,920,000.00</u>	<u>\$51,995,468.76</u>
Liabilities of the General Motors Co. either directly or through said Subsidiary Companies (the September figures including settlement of \$600,000 contingent liability above referred to, but excluding First Lien Notes) .....	\$14,312,000.00	\$14,225,105.23
Equity of the General Motors Co. in the Net Assets of said Subsidiary Companies .....	<u>\$22,608,000.00</u>	<u>\$37,770,363.53</u>

After setting aside sufficient cash to pay all bank loans and matured obligations of the Company and said Subsidiaries, the Companies should have about \$3,000,000 of cash on hand.

**Profits.**

	Previously estimated	Now ascertained
General Motors Co.'s proportion of the profits of the Subsidiary Companies, based upon its present stockholdings in these companies for the year 1908-1909...	\$8,844,600.00	\$9,257,151.88
General Motors Co.'s proportion of the profits of the Subsidiary Companies, based upon its present stockholdings in these Companies for the year ending September 30, 1910.....	10,485,000.00	10,266,322.27

The net profits above stated represent profits which would normally be available for payment of dividends, all ordinary operating and administrative expenses having been duly provided for. Both in arriving at the above valuation of the assets and in computing the profits earned, due provision has been made for depreciation on the various plants, over \$1,000,000 having been set aside therefor in the two years now reported upon.

The accountants add that in arriving at the valuation of assets nothing has been included for "good will, agreements, etc.," nor is any account taken of investments other than motor car properties, which other investments are carried at a book value of \$7,663,939.90.

**VICE-PRESIDENT'S REPORT OF FINANCIAL CONDITION**

Vice-President Durant's report of "Financial Condition" states:

The gross sales of the Subsidiary Companies of the General Motors Company during the year ending October 1, 1909, were approximately \$34,000,000, and for the year ending October 1, 1910, were approximately \$58,500,000. The equity of General Motors Company in the net profits of its Subsidiary Companies amounted to \$9,257,151 in the year 1908-09, and \$10,266,322 in the year ending September 30, 1910.

The General Motors Company has received the proceeds of the issue of \$15,000,000 First Lien Notes, and from these will discharge all its outstanding indebtedness and that of its subsidiary motor-manufacturing Companies (except current operating accounts), and will then have about \$3,000,000 in cash on hand.

These \$15,000,000 notes are represented by the following assets, based upon audit of Messrs. Marwick, Mitchell & Co., as of September 30, 1910:

Real Estate, Plants and Equipment of Subsidiary Companies valued (at cost less depreciation) at.....	\$13,216,260.81
Miscellaneous Investments .....	406,609.13
Net Current and Working Assets:	
Inventories at cost, receivables, and cash, including proceeds of these notes.....	\$38,372,598.82
Less all liabilities, except these notes.....	14,225,105.23
	<u>24,147,493.59</u>

Total Assets..... \$37,770,363.53

For purposes of comparison I have limited the above statement to those assets dealt with in Messrs. Marwick, Mitchell & Company's report to you of even date and have omitted other assets having a book value of \$7,663,939.90.

The present working capital of the Company and its Subsidiaries is sufficient for an output equal to that of last year.

## THE WEEK'S INCORPORATIONS.

Bay City, Mich.—General Auto & Supply Co., under Michigan laws, with \$2,000 capital.

Pittsburg, Pa.—Liberty Auto Tire & Supply Co., under Pennsylvania laws, with \$10,000 capital.

Waterloo, Ia.—Roy Cushman Co., under Iowa laws, with \$10,000 capital; to buy, sell, rent and exchange old and new automobiles.

Cincinnati, Ohio—Imperial Motor Car Co., under Ohio laws, with \$150,000 capital; to own and operate garages, to deal in automobiles and accessories.

Cleveland, Ohio—Hewitt Motor Truck Co., under Ohio laws, with \$10,000 capital. Corporators—W. C. Malin, J. H. Price, M. J. Scott, E. G. Guthrew.

Detroit, Mich.—Ideal Commercial Car Co., under Michigan laws, with \$10,000 capital. Corporators—J. C. and R. B. Sage, T. C. and I. L. Creighton.

Chicago, Ill.—Ohio Electric Vehicle Co., under Illinois laws, with \$2,500 capital. Corporators—William G. Wise, Herman P. Vichorn, Worth E. Gaylor.

Boston, Mass.—Globe Auto Top Mfg. Co., under Massachusetts laws, with \$5,000 capital. Corporators—Jacob A. Goodman, John R. Hughes, Samuel Goldstein.

Coshocton, Ohio—Vickers Motor Co., under Ohio laws, with \$25,000 capital; to deal in automobiles. Corporators—Eugene McMaster, W. C. Myers, C. B. Vickers.

Detroit, Mich.—Morgan Mfg. Co., under Michigan laws, with \$10,000 capital; to manufacture and deal in motor vehicles. Corporators—H. S. Morgan, C. S. Morgan.

Detroit, Mich.—Chief Motor Co., under Michigan laws; to manufacture, and deal in automobiles. Corporators—Francis A. Mueller, Thomas J. Atkinson, Jere F. Oundy.

Bluffton, Ind.—Grove Garage Co., under Indiana laws, with \$6,000 capital; to maintain a garage and renting service. Corporators—H. L. Norris, O. E. Shafer, W. B. Grove.

Louisville, Ky.—McCormick-Montenegro Co., under Kentucky laws, with \$6,000 capital; to deal in automobiles. Corporators—A. L. McCormick, A. Montenegro, R. Montenegro.

Portland, Ore.—Schacht Motor Car Co., under Oregon laws, with \$20,000 capital; to deal in automobiles. Corporators—Giles W. Brown, Charles Carothers, Mabel E. Brown.

Detroit, Mich.—Thelma Motor Works, under Michigan laws, with \$11,000 capital; to manufacture gas engines. Corporators—Alfred Robinson, M. Sullivan, Dufton Sullivan.

El Paso, Tex.—Western Motor Supply Co., under Texas laws, with \$6,000 capital;

to deal in automobile supplies. Corporators—P. J. Savage, George W. Kennedy, John T. Fletcher.

Los Angeles, Cal.—Kissel Automobile Co., under California laws, with \$5,000 capital; to deal in automobiles. Corporators—P. R. Rix, Alma Menzel, G. A. Kissel and others.

Cincinnati, Ohio—Jungclas Automobile Co., under Ohio laws, with \$10,000 capital; to buy, sell and rent automobiles. Corporators—William C., Edward H., Carrie and Edna Jungclas.

Boston, Mass.—Basile Automobile Co., under Massachusetts laws, with \$150,000 capital; to deal in automobiles. Corporators—G. S. Pines, W. S. Baer, E. R. Newman, all of Chicago.

Richmond, Va.—Merchants' Motor Delivery Co., under Virginia laws, with \$25,000 maximum, \$5,000 minimum capital; to operate a motor package transfer for the city of Richmond, Va.

Los Angeles, Cal.—California Motor Co., under California laws, with \$10,000 capital; to operate and deal in automobiles. Corporators—A. D. McLaughlin, E. W. Freeman, R. A. Richardson.

Dubuque, Ia.—Dubuque Auto & Garage Co., under Iowa laws, with \$75,000 capital; to maintain a garage and renting service. Corporators—B. J. Schwind, G. A. Eulberg, H. J. Kalp, F. G. Becker.

Detroit, Mich.—Endurance Tire Co., under Michigan laws, with \$150,000 capital. Corporators—Howard Hodgson, Edward Pokorny, Joseph L. Schlund, George D. Reid, Arthur H. Britton.

Chicago, Ill.—Multi Mfg. Co., under Illinois laws, with \$100,000 capital; to manufacture and deal in automobiles, parts and accessories. Corporators—George W. Beyers, M. M. Freiberg, H. A. Caperton.

Chicago, Ill.—Chicago Taxi Co., under Illinois laws, with \$50,000 capital; to do general automobile and garage business and operate taxicabs. Corporators—William J. Candlish, A. B. McCord, F. Benjamin.

Yonkers, N. Y.—Standard Motor Express Co., under New York laws, with \$15,000 capital; to operate a motor express delivery service. Corporators—Richard Helmers, William P. McGuire, Robert L. Coles.

East Orange, N. J.—Recording Speedometer Sales Co., under New Jersey laws, with \$125,000 capital; to manufacture recording instruments. Corporators—H. H. Picking, C. O. Geyer, F. T. Ruggles, East Orange, N. J.

New York City, N. Y.—The F. & M. Specialty Co., under New York laws, with \$50,000 capital; to manufacture and sell self-propelled vehicles, etc., engines, etc. Corporators—R. V. Fitzgerald, Newark, N. J.;

O. S. McFarland and G. Colvin, of New York City.

New York City, N. Y.—Safety Tire Co., under New York laws, with \$50,000 capital; to manufacture tires for automobiles and bicycles. Corporators—R. H. Schenck, W. E. Holloway, of New York City; O. R. Van Vechten, of Tompkinsville, S. I.

New London, Conn.—Pennsylvania Oil Co., of New London, under Connecticut laws, with \$10,000 capital to manufacture lubricating oils and to conduct automobile business. Corporators—John B. Carleton, F. A. McCreery, William Weiner.

Providence, R. I.—Curtis-Young Co., Inc., under Rhode Island laws, with \$10,000 capital; to maintain a garage and automobile salesroom. Corporators—Frank L. Young, George W. Curtis, Arthur P. Young, William L. Curtis, all of Boston, Mass.

Pittsburg, Pa.—Winterton Mfg. Co., under Pennsylvania laws, with \$5,000 capital; to manufacture and deal in automobiles and other motor vehicles. Corporators—E. Z. Wainwright, Jr., Willard G. Bratton, J. G. McQuillan, A. D. Griffith, all of Pittsburg.

Aspinwall, Pa.—Aspinwall Automobile & Garage Co., under Pennsylvania laws, with \$7,500 capital; to deal in automobiles and maintain a garage. Corporators—W. C. Tibbey, Sharpsburg; G. B. Fehr, C. A. Philips, W. E. Cole, W. W. Dyer, J. Walter Beever and J. L. Shakely, Aspinwall, Pa.

## Increases and Decreases of Capital.

Toledo, Ohio.—Ohio Electric Car Co., from \$75,000 to \$100,000.

Chicago, Ill.—Chicago Overland Sales Co., from \$2,000 to \$5,000.

Detroit, Mich.—Russell Motor Axle Co., from \$100,000 to \$150,000.

St. Louis, Mo.—Autogenous Welding Devices Co. from \$5,000 to \$10,000.

Detroit, Mich.—Detroit Gear & Machine Co., from \$100,000 to \$150,000.

Oklahoma City, Okla.—Buick Oklahoma Auto Co., name amended to McClelland-Gentry Motor Co., and capital decreased from \$20,000 to \$10,000.

## Recent Losses by Fire.

Snyder, Tex.—Snyder Garage damaged; two cars destroyed. Loss, \$3,000.

Spokane, Wash.—Cadillac Garage, 707 Front avenue, burned. Loss, \$10,000.

Portland, Ore.—Harrison Auto Livery Co., two automobiles burned. Loss, \$3,000.

New York City, N. Y.—Henry A. Stone, 707 St. Nicholas avenue; car burned. Loss, \$7,500; insurance, \$1,000.

Pittsburg, Pa.—Neville-Fifth Automobile Co., 609 Neville street; garage and fifteen automobiles destroyed. Loss, \$40,000. Caused by short circuiting of electric light system in garage.

**In the Retail World.**

The Childress-Brush Motor Co., of Dallas, Tex., has filed a certificate of dissolution.

C. E. Gunsilus has purchased the Neitert Garage in Rockwell City, Ia., and will continue the business in his own name.

The Gode Brothers Garage in New Braunfels, Tex., has been sold to A. F. Moeller, who will add a renting service.

The Motor Vehicle Co. has opened salesrooms on North Capitol avenue, Indianapolis, Ind. B. M. Wylie is in charge of it.

A new salesroom and garage has been opened at 68 South Main street, Phillipsburg, N. J., by the G. W. Shoemaker Motor Co.

The Regal Garage Co. is a new concern which just has opened up at 1227 Sprague avenue, Spokane, Wash. W. H. Preston is the manager.

The Motor Accessories Co., a newly organized company of Indianapolis, Ind., soon will be ready for business at 323 North Pennsylvania street.

The East Side Automobile Co., of Portland, Ore., has been reorganized and Dr. G. T. Watts elected president of the concern. Edward Suitor is the new manager.

Otto Kootz, formerly connected with the Studebaker advertising department, has obtained the Michigan State agency for Premier cars. He will open sales rooms in Detroit and Grand Rapids.

Under the style the Marion Automobile Co., a new concern has just been formed in Omaha, Neb., to take over the business of the Van Brunt Automobile Co. C. W. McDonald is the manager.

McDonald & Lofland, owners of a garage at 70 Benedict avenue, Norwalk, O., have moved their business to the building formerly occupied by the C. F. Jackson Co.'s garage at 6-8 East Seminary street.

The Irving Garage, Washington, D. C., of which Irving C. Barber, Edwin Hellier and Gordon Gregg are the proprietors, filed a petition in voluntary bankruptcy in the Supreme Court on December 10. The combined assets of the three individual owners amount to \$238.48, while their liabilities exceed \$3,300.

The Corlew-Coughlin Motor Co., of Boston, Mass., has been petitioned into involuntary bankruptcy at the instance of three creditors whose claims aggregate \$7,432. It is alleged in the petition that the company made an assignment for the benefit of its creditors on August 19 last, to Wallace Wilson, of Boston.

Combining their respective businesses, A. Anderson and B. Tilghman, Palatka (Fla.) agents for the Rambler and Ford cars, respectively, have formed a partnership under the style of Anderson & Tilghman, with headquarters in the Athletic building on Front street. They will handle several

makes of cars in addition to the Ford and Rambler lines.

L. H. Simmons, Frank Herbst and other residents of Wilmington, Del., are endeavoring to bring about the consolidation of all the garages in that city, two of which, the Wilmington Auto Co. and the Wilmington Motor Car Co., will form the basis of the proposed merger. A prospectus outlining a \$30,000 company designed to carry out the plans has been issued.

The Gibson Automobile Co., of Indianapolis, Ind., has filed in the Superior Court of Indiana a petition for a receiver for the Auto Sales Co. The petitioner, which is also a creditor, alleges that the Sales company is insolvent and has been obliged to quit business, and asks the receivership for the purpose of marshaling the assets for the purpose of applying them on the indebtedness.

The Franco-American Auto Supply Co., of Chicago, Ill., has asked for a receiver for Merriman Brothers, of that city. As creditors of the defendants, an injunction is asked to prevent foreclosures of mortgages which are said to exist upon certain of the firm's assets, and it is also asked that all creditors be restrained from prosecuting suits for collection of debt against Merriman Brothers.

A petition in voluntary bankruptcy has been filed by Clifford P. Chamberlin and William L. Chamberlin, doing business under the name the Linwood Garage, at 3233 Troost avenue, Kansas City, Mo. Their joint liabilities are \$170,150, with no assets. The Chamberlins left the Linwood Garage on November 18th, after operating it for a year; they were formerly brokers in Hamilton, Ohio. A. O. Brooks now is operating the garage.

The Motor Sales Co. of Oklahoma City, has been organized in that western town and has taken over the business of the White Garage Co. The headquarters of the new concern are at 318-320 West First street and will house White gasoline and steam cars and the Peerless line. J. E. Crawford, of Oklahoma City, is president; Wayne Ward, of New York City, is vice-president and general manager, and Dave Murray, also of New York, is treasurer.

W. S. Jewell, former manager of the H. H. Franklin Mfg. Co.'s New York branch, who recently obtained the agency for the Kelly trucks, has formed a company under the style the Motors Engineering & Sales Co., with headquarters at 250 West 54th street. He is the vice-president and sales manager of the new company, while the other officers are: Chester Griswold, president, who is also a director of J. G. White & Co., and connected with several other large corporations, and James L. Breece, Jr., who is the secretary and superintendent.

**Changes Among Prominent Tradesmen.**

Virgil Oldberg, formerly president of the Oldberg Mfg. Co., makers of mufflers, etc., has been appointed manager of what is styled the technical department of the Regal Motor Car Co., of Detroit. The department is a new one and will work in conjunction with the repair and trouble department. It will give advice to Regal owners, supply them with extra parts and generally endeavor to render them service. Oldberg is an engineer graduate of Cornell, and in addition to being an inventor, served a term as an instructor at Cornell.

Henry Knott, for the past three years with the Frank Seaman Advertising Agency, of New York, has been appointed advertising manager of the E-M-F Co., and, of course, will make his headquarters in Detroit. In addition to having the intricacies of advertising at his finger tips, having managed the campaigns of the American Tobacco Co. and the Rock Island Railroad, Knott's versatility has shown itself in the writing of a play in which Mary Shaw starred, and in lectures delivered at universities on literary subjects.

**Endurance Tire Appears in Detroit.**

The Endurance Tire Co., of Detroit, capitalized at \$150,000, which has been organized under the laws of Michigan, has for its object the production of a solid rubber tire invented by Howard Hodgson, which is claimed to be "more resilient than air." The tire is formed of rubber sections held by a steel case, a hoop of steel supporting the tire with a 3/4-inch air space between the hoop and the rim. In addition to Hodgson and his attorney, Edward Pokorny, the men interested in the venture are Joseph L. Schlund, George D. Reid and Arthur H. Britton.

**New Men to Operate Detroit-Dearborn.**

At the public sale of the assets of the bankrupt Detroit-Dearborn Motor Co., in Detroit on Thursday last, 16th inst., the property brought \$14,800. It was bid in at that price by Vernon C. Fry, who will head a new company that will operate the plant and at once begin to turn out cars.

**Conflict of Trade Banquets Avoided.**

The Society of Automobile Engineers has moved up the date of its banquet in New York from January 12 to January 11. The conflict with the banquet of the Association of Licensed Automobile Manufacturers, which also had been fixed for the 12th, thus is avoided.

**Fisher Prepares to Build Closed Bodies.**

The Fisher Closed Body Co. has let contracts for the erection of a three-story brick factory on Oakland street, between Trombley and Piquette streets, in Detroit. It will cost about \$15,000.

## If You Could Go Through Our Factory

**T**O go through our factory—to see just how carefully each part of our cars are built is often a liberal education in itself. To stand before the great heat-treating furnaces and see how the grain of chrome nickel steel is made finer, closer and tougher is something—to take a cold-chisel and blacksmith hammer and try to cut a tooth out of a gear so treated, without success, and you begin to understand what “well built” means in the White Factory. Heretofore, the technical terms we used to tell you how good the materials were, appealed to you as mere words, but in the presence of this demonstration even a tyro knows the thing is well done. One gets more insight into quality in a moment than in much reading of technical descriptions.

This is but one of the refinements everywhere present in the White construction. Four forward speeds in transmission work is just as superior to three speeds as our heat-treated steels are to ordinary steels. So careful is the White construction that even American castings are not satisfactory, and our cylinder castings are imported from France, where they make them a few at a time and get them just right. All these things mean life for the car—continued satisfactory service for its owner, and such a car is cheaper—regardless of its price, because up-keep and repairs are the big items in automobile operation. The White is economical—every owner can prove it.

May we send you catalogue or owners' testimonials?

**The White**  **Company**

Single Copies (Postage Paid) . . . 10 Cents  
Foreign and Canadian Subscriptions . . . \$3.00  
Invariably in Advance.

Postage Stamps will be accepted in payment for subscriptions, but not for advertisements. Checks, Drafts and Money Orders should be made payable to The Motor World Publishing Co.

General Agents: The American News Co., New York City, and its branches.

Change of advertisements is not guaranteed unless copy therefor is in hand on SATURDAY preceeding the date of publication.

Contributions concerning any subject of automobile interest are invited and, if acceptable, will be paid for; or, if unavailable, will be returned provided they are accompanied by return postage.

To Facilitate Matters All Communications  
Should Be Addressed to P. O. Box 649.

Cable Address, "MOTORWORLD," NEW YORK.

Entered as second-class matter at the New York Post Office, November, 1900.

NEW YORK, DECEMBER 22, 1910.

"I would thank you to hereafter mail the Motor World to my office instead of to my home as at present. I find it too valuable an asset in my business to run the chance of losing a copy now and then, which has sometimes been the case when mail is addressed to my residence."—W. Stafford Banks, Los Angeles, Cal.

#### Amenities of Commercial Strife.

Although commercial competition too often is viewed in the light "Every man for himself; the devil take the hindmost," the practice which has prevailed in the automobile industry of late is significant of a changing spirit of the times. Although competitive strife is fierce, the idea that it is a part of such competition to try to put the "other fellow" out of business or to jump on him when he goes lame has received some agreeable shocks.

The manner in which creditors' committees have gone to the assistance of em-

barrassed concerns and effected or sought to effect reorganization and aided the cripples to again get on their feet, and the manner in which creditors generally and even rivals have extended helping hands cannot but excite remark. Of course, it may be argued that such assistance is of a selfish nature, inasmuch as the creditors desire to obtain 100 cents on the dollar, but it is fairly well known that in not a few instances some of the creditors who actively have given themselves to the cause of uplifting their lame brothers have devoted far more time and energy to it than their claims were worth. The same time and energy would have earned far more profit if expended in other directions. And although the selfish motive usually may inspire such action, it is known that civic pride several times has been the cause of it—pride born of desire to avert failure in the city or the industry, or both, with which the particular individual is identified.

#### The Promise of Front-Wheel Brakes.

It is practically certain that in due season the subject of front-wheel brakes will be agitated with more or less earnestness in this country. In England, where the system originated, there already are several makers who are committed to the use of brakes on all four wheels, while there is promise that before another year others will have joined the movement. At the Paris Salon several cars were on view which mounted braking equipments of the sort, and at least one in which the brakes are hydraulically operated and hence are perfectly balanced. That American manufacturers sooner or later will come to view the front-wheel brake as a possible addition to standard equipment practically is a foregone conclusion.

Admitting that it is a troublesome mechanical problem to install brakes on the front wheels in such a way that they will not interfere with ease of steering and not be affected by spring movement, and of reinforcing the front axle in such a way that it will be able successfully to withstand the added stresses which the brakes involve, there are two strong points in favor of the system. One point is that when the brakes are applied to all four wheels, the entire weight of the vehicle may be utilized in securing the retarding effort, instead of only that portion of the weight that is con-

centrated on the rear wheels. This has the effect of distributing the abrading effect of braking stresses over four tires instead of two, and likewise of relieving the stresses on the braking mechanism from lever or pedal to bands. The other point is that braking four wheels instead of two has a very material influence in reducing skidding tendencies, and so renders the car equipped in this fashion much easier and safer to drive than one which is braked on the rear wheels only.

Whether the advantages gained by using four brakes on four wheels are destined to prove sufficient to warrant the expense of revising manufacturing methods sufficiently to incorporate the front brakes is a matter for the individual manufacturer to determine. Certainly until the movement takes root in this country there is no occasion for immediate concern, particularly insofar as the light and medium or low-priced car is concerned. There is one connection, however, in which it would seem extremely important, if not obligatory, for the maker to study the question very carefully; that is in connection with the development of the motor truck.

As far as the business vehicle is concerned, the requirements of style, whether in body construction or in mechanical design, are hardly to be considered. What is demanded is effective service at low cost. For the business wagon efficient brakes are, if anything, more essential than they are on cars of the pleasure type. With the possibilities of less expert handling, abnormal loading, infrequent attention and improper adjustment against which the builder of commercial vehicles must contend, it is necessary to carry safeguards to lengths which, under other conditions, would be considered extreme. Regarded in this light, it would appear that the advantages of the front-wheel brake cannot safely be ignored, at least by the makers who aim successfully to cater to the business man's trade.

#### The Wrong Way to Obtain Reciprocity.

It would seem that the usually admirable New Jersey Automobile and Motor Club is in the way of weakening a very just and worthy cause by its withdrawal from the Associated Clubs of New Jersey, and thereby severing of its connection with the American Automobile Association. What is required most of all in accomplishing

needed reforms in automobile legislation is unity of effort among all motorists, particularly among those who are interested in questions of moment. In its own strength the New Jersey club has gone about it the wrong way, and the chances of gaining inter-state reciprocity for which it so splendidly stands and for which it was hoped all New Jersey clubs would stand are considerably reduced by the spectacle of jarring factions on the motorists' side.

If, as is claimed, the second largest organization in the Three A's and one holding over 60 per cent. of the membership of the state body is unable to have its own way in the associated clubs, there must be something wrong within the club itself. If so, its efforts, independent of the state and national body, cannot be expected to count for much. Instead of creating a new factor in the legislative muddle, the club, which is vigorous and undoubtedly well-intentioned as well as numerically strong, should find means of gaining its points with the state association first of all. Thereafter there would be good reason to expect substantial accomplishment in making a public stand as a solid and unanimous body. Two struggling elements in the conflict, one a nominal power lacking support, and the other a strong faction without recognition and in rebellion, cannot be expected to make much headway under the conditions which usually obtain at Trenton when the legislature is in session. The situation is one calculated to make the Hon. "Joe" Frelinghuysen grin and rub his hands for very glee.

Although by those in authority it usually strenuously is insisted that the registration fee is not a tax, some one in the office of the Secretary of State of New York knows the truth when he sees it. In the "Owners' Renewal Applications," that just have been issued, the fee is denominated a tax, the word "Tax" being printed in letters so large as to overshadow everything else on the application form.

During the present year 10 fatal accidents have occurred at railway grade crossings in one small Michigan city. As long as the preservation of human life is considered less desirable than the payment of dividends, the average probably will be maintained and the public highways of America will continue to be perilous.

## COMING EVENTS

December 24-31, Los Angeles, Cal.—Second annual show of Licensed Motor Car Dealers' Association of Los Angeles at Fiesta Park.

December 25, Mexico City, Mexico.—Mexico-Pueblo road race.

December 26, Lake Charles, La.—Race-meet on Fair Grounds track.

December 31-January 7, New York City—"Independent" automobile show in Grand Central Palace.

January 2, San Francisco, Cal.—Panama-Pacific road races.

January 2-7, New York City—Importers' automobile show in Hotel Astor.

January 7-14, New York City—Association of Licensed Automobile Manufacturers' eleventh annual show in Madison Square Garden. Pleasure cars and accessories.

January 10, New York City.—Meeting of executive committee of American Automobile Association.

January 11, New York City.—Meeting of executive committee of National Association of Automobile Manufacturers.

January 11, New York City.—Meeting of the executive committee of the Association of Licensed Automobile Manufacturers.

January 11-12, New York City—Annual meeting of the Society of Automobile Engineers.

January 12, New York City.—Meeting of board of managers of the Association of Licensed Automobile Manufacturers.

January 13, New York City—Annual banquet of the Motor and Accessory Manufacturers at Waldorf-Astoria.

January 14-21, Milwaukee, Wis.—Milwaukee Automobile Dealers' Association's second annual show in the Auditorium.

January 14-28, Philadelphia, Pa.—Annual show of Philadelphia Licensed Automobile Dealers' Association in Third Regiment Armory.

January 16-21, New York City—Association of Licensed Automobile Manufacturers' eleventh annual show in Madison Square Garden. Second week devoted to commercial vehicles.

January 16-21, Detroit, Mich.—Detroit Automobile Dealers' Association's annual show in Wayne Pavilion.

January 18, New York City—Annual banquet of the Automobile Trade Credit Association.

January 25-28, St. Paul, Minn.—First annual show of automobile dealers in Auditorium.

January 28-February 4, Chicago, Ill.—National Association of Automobile Manufacturers' tenth annual national show in

Coliseum. Pleasure cars and accessories only.

February 6-11, Chicago, Ill.—National Association of Automobile Manufacturers' tenth national show in Coliseum. Pleasure and commercial cars, motorcycles and accessories.

February 6-11, Buffalo, N. Y.—Annual show.

February 13-18, Washington, D. C.—Second annual show in Convention hall.

February 13-18, Winnipeg, Canada.—Winnipeg Motor Trades Association's show.

February 14-18, Dayton, Ohio—Second annual show in Memorial building.

February 18-25, Binghamton, N. Y.—Annual show.

February 18-25, Minneapolis, Minn.—Minneapolis Automobile Show Association's annual show in National Guard Armory.

February 18-25, Newark, N. J.—New Jersey Automobile Exhibition Co.'s fourth annual show.

February 18-26, Brooklyn, N. Y.—First annual show of Brooklyn automobile dealers at 23d Regiment armory.

February 20, Cleveland, O.—Show in Central Armory.

February 20-25, Baltimore, Md.—Annual show in Fifth Regiment Armory.

February 20-25, Cincinnati, O.—Cincinnati Automobile Dealers' Association's show in Music Hall.

February 20-25, Omaha, Neb.—Third annual show of the Omaha Automobile Show Association in Auditorium.

February 24-27, New Orleans, La.—First annual show of New Orleans Automobile Club at Fair Grounds.

February 25-27, New Orleans, La.—New Orleans Automobile Club's annual Mardi Gras race-meet on Fair Grounds track.

February 25-March 4, Toronto, Canada—Annual show under auspices of Ontario Motor League.

February 27-March 4, Kansas City, Mo.—Fifth annual show of Kansas City Automobile Dealers' Association.

February 27-March 4, Sioux City, Ia.—Automobile Dealers' Association's annual show.

March 4-11, Boston, Mass.—Boston Automobile Dealers' Association's annual show in Mechanics building.

March 6-11, Dayton, Ohio—Dayton Automobile Club's show in Memorial building.

March 7-11, Des Moines, Ia.—Third annual show of Des Moines Automobile Dealers' Association at the Coliseum.

March 11-18, Cleveland, O.—Manufacturers and Dealers' Association's show in Central Armory.

March 18-25, Pittsburg, Pa.—Annual show in the Exposition Building.

## REVOLUTIONARY IGNITION SYSTEM

**Combines Both High and Low Tension Properties—Gives Two Sparks in One—How It Does So.**

For some little time it has been known in inner-trade circles that a new ignition system, embodying exceedingly radical features, was in existence, and that it soon was to be launched by a company of unusual financial strength, considering the nature of the product. It was not until this week, however, that the details of the L-H-L system, as it is called, became available for publication. Combining some of the properties of both the high and low tension systems, it represents an application to ignition of certain well-known electrical principles, which hitherto have not been applied to this purpose. Its particular advantage is that a very hot spark is produced, which not only is superior to that developed by the make-and-break system, but is free from the mechanical complications which are involved in that system.

In a sense the system may be said to be a composite of the high and low tension arrangements. In respect to the generation of current, its commutation and the general construction of the spark plug, the system closely resembles the ordinary jump spark arrangement. The actual result, so far as ignition is concerned, however, is a low tension spark, and, therefore, one of high heat value.

The essential features of the system are a source of primary current, which may be either a magneto, a generator or a set of batteries; a "disruptive discharge" coil, a condenser and a distributor. The principle involved is that a high-tension or disruptive discharge has the effect of breaking down the resistance of a dielectric or non-conducting medium—in this case, the gap of the plug—through which it takes place. Instead of transforming the entire primary into a high frequency, high-tension, alternating current, as is done with the ordinary jump-spark system, only a portion of the energy is so converted, the remainder being shunted around the coil and discharged across the gap of the plug. The result is a combination spark, or rather, two independent and simultaneous discharges.

By way of explaining the apparent paradox it may be said that there is nothing either novel or peculiar about the simultaneous occurrence of two, or even more, electrical impulses in a single medium. The ether is constantly being agitated—to employ a figurative expression—by electrical waves, such as are produced by wireless systems and by other means; yet ordinarily without mutual interference, a single tele-

graph wire may be used for the transmission of several messages at the same time, while in other electrical work the use of a single conductor for more than one current by no means is unknown. The application of the same principle to discharge across a gap has been proposed before with the same general object, though its employment in a commercial way is entirely new.

The coil employed in the system in question contains but a few turns of relatively large wire, and no core. The high frequency current produced at the coil is discharged across the gap with extreme accuracy, but with practically no heat. The accompanying low-tension current, otherwise would not be of sufficiently high potential to bridge the gap. Under the reduced resistance caused by the high-tension discharge, however, it is enabled to do so. It is this portion of the discharge, or spark, that causes the intense heat which is the particularly strong point of the system.

The L-H-L system is the invention of Dow B. Hughes, formerly employed in the laboratories of the Edison Storage Battery Co. The system has been perfected with the financial support of Dr. Harry A. Lawton, of Warren, Ohio, the sole rights being controlled by the J. H. Lehman Manufacturing Co., of New York City, which already has completed its principal manufacturing and distributing arrangements. The system will be on public exhibition for the first time at the forthcoming show in Madison Square Garden, New York.

### Reduced Rates to New York Show.

As the American Automobile Association again will hold a convention during the Madison Square Garden show in New York, reduced railroad rates will be available for many of those persons who purpose attending that function, the Trunk Line Association already having granted a fare and three-fifths on the certificate plan, and other passenger associations having the matter under consideration.

The trunk-line territory embraces New York State, east of Buffalo, Niagara Falls and Salamanca; New Jersey and Pennsylvania, east of and including Erie. Oil City and Pittsburg; Delaware, Maryland, District of Columbia, Virginia and West Virginia, east of and including Wheeling, Parkersburg and Huntington.

Going tickets will be purchasable not earlier than January 5, and not later than January 11. Return tickets will be available up to and including January 20; and the validating will be done in Madison Square Garden, January 10, 11, 12 and 13.

### To Make Lamp Lighters in Massachusetts.

The Champion Igniter Co. has been formed in Hudson, Mass. It purposes producing the Koehler headlight igniter.

## WHEN GARAGE OWNERS ARE LIABLE

**Highest Court of France Holds Them for Damages Caused by Drivers They Furnish—Points Involved.**

Automobile owners of France, and more particularly the proprietors of French garages, are all stirred up over a decision of the Cour de Cassation, the highest court of the country, in fixing the responsibilities of an accident caused by a chauffeur. The facts in the case were as follows: A retired merchant bought a small runabout, and as he understood nothing whatsoever about its operation, he made an arrangement with the owner of the garage in which he stored the car to supply him with a competent chauffeur every time he desired to go out in his automobile. One day, while he was being driven along the boulevards, an accident happened, and the automobile owner was sued for damages arising therefrom, under a section of the French automobile law, which holds the owner of a car responsible for damages caused by it. The particular phase of this case had not been provided for in the law, and a legal battle ensued.

The lower courts held that inasmuch as the owner of the car did not understand anything of mechanics, he was incapable of giving directions as to the proper operation of the vehicle. All he could do and did do was to order the chauffeur to drive along certain streets to certain places, leaving the manner of driving and the speed chosen completely to the good judgment of the chauffeur. The chauffeur being in the service of the garage, as far as his mechanical abilities were concerned, therefore, represented the garage owner, and the latter was held liable for the damage caused by his employee. The court held that it was the duty of such a garage owner to supply only chauffeurs who were competent, careful and trustworthy to those of his clients who demanded such service; if, therefore, an accident happened, it was distinctly the fault of the garage owner. On final appeal to the Cour de Cassation this decision was affirmed, and the garage owner sentenced to pay all damages and costs.

In the affirmation of the lower courts, the Cour de Cassation laid emphasis upon the fact that the owner of the car did not interfere in any way with the mechanical end of the operation of the car, and, therefore, could not be blamed for anything the chauffeur did with the machinery, or any accidents resulting from carelessness in steering, etc. The contention of the defense that the automobile owner was responsible insofar as he could have objected to the employment of the chauffeur, and asked for one more competent, was over-

ruled, the court deciding that the owner was perfectly right in assuming that only a first-class, competent chauffeur was to be furnished him, without taking the trouble of personally investigating the abilities of the driver.

#### To Prevent Corrosion of Storage Batteries.

Though the majority of storage batteries now placed on the market are practically free from the corrosion usually a part of the product turned out by earlier manufacturers, there still are some which, through faulty design, or improper handling, are subject to the life-shortening trouble. The action set up on the plates of a storage battery by the acid liberates a certain amount of gas which must be allowed to escape, and for this purpose vents are left in each cell. The continual jolting of the car causes some of the acid to be plashed up through the vents and it gets on the terminals causing corrosion. If this corrosion is allowed to take place for any length of time it will spread and cause a partial short circuit, which, while scarcely appreciable, will shorten the useful life of the battery. As there is no kind of vent which will preclude the possibility of some of the acid getting out, the only way left to stop the corrosion is to prevent the acid from getting on the terminals by coating them with something which will resist its action. Ordinary vaseline may be used for this purpose, just sufficient to make the terminals greasy being put on. Another method is to coat the terminals with a solution made by dissolving a small quantity of celluloid in acetone. Everything but the actual contact points may be covered with this solution, which will harden in a short time and preserve everything it covers.

#### Simple Solder for Aluminum.

There are several methods by which aluminum may be soldered, among them the use of equal parts of zinc and tin. Absolute cleanliness is necessary in applying it, and for this reason all surfaces in the neighborhood of the part to be treated must be thoroughly cleaned. The solder must be heated to a temperature that will melt sulphur, and some of it rubbed over the parts to be soldered, then proceed with the soldering in the ordinary way. It is well to run a little tin over the whole job as a final precaution.

#### How Adjustment May Affect Spark Plugs.

No matter how much care may be taken in adjusting the porcelain body of a spark plug by the hexagonal nut, the points of the plug are very liable to be affected. The consequent turning of the center point will cause either a misfire or a complete failure of the spark, and no explosion would result. Therefore, after a plug has been adjusted, the points should be examined to see that they are set correctly.

## RADICAL TYPE OF STEERING GEAR

**Avoids Use of Worm and Sector and is Claimed to Eliminate Backlash—Baldwin Making It.**

Steering gears, more particularly the Brown patent steering gear, have been added to the productions of the Baldwin Chain & Manufacturing Co., of Worcester, Mass. The Brown invention is a wide departure from the usual gear, and the makers claim for it that it overcomes a great and very prevalent fault, the development of "back-lash." Usually the thrusts are taken by a worm and sector, a gear and pinion,

FIG. 1—SHOWING GEAR ASSEMBLED

or similar device, where only line contact is available, whereas the novelty of the Brown lies in the means employed to replace line contact with broad, flat and circular surfaces so arranged that any force applied to the ball lever will react on these surfaces, and also in so arranging the parts that a correct degree of reversibility or locking may be obtained.

As may be seen in the accompanying illustrations, Fig. 1 is a general view of the

FIG. 2—SHOWING GEAR DISASSEMBLED

gear in which the parts are shown assembled except that the cover is removed showing the working parts in neutral position.

Referring to the cut "D" is the casing or housing which is secured to chassis or sub-frame. "C" is the eccentric piece (revolvable) in casing through an angle of 160 degrees. "B" are check pieces which revolve in and with the eccentric piece "C." "A" is the ball lever shaft to which is secured the

usual ball lever. The eccentric piece "C" is operated through a gear and pinion (not shown) by the usual steering wheel. As the steering wheel is revolved either to right or left, a corresponding movement is given to the eccentric and check pieces. These check pieces contact with the projection shown on the ball lever shaft "A" and it follows that any movement of the hand wheel will give a relative motion to the lever shaft; and as the ball lever is secured to this shaft, motion is transferred through the usual connection to the front wheels.

The degree of locking or irreversibility desired is secured by a proper location of the check pieces relative to the center of the eccentric piece "C"—the nearer the check pieces are to the center the greater the locking effect. The parts can be so arranged that an absolutely uniform motion may be transmitted from the hand wheel through the working parts to the ball lever.

The parts subjected to heavy shocks and wear are provided with extremely large wearing surfaces, and the teeth of the gear and pinions are almost entirely relieved from the constant hammering effect which is taking place when the car is in motion.

#### Winter Care of the Steering Gear.

During the winter the steering gear of a car which is undergoing constant use requires to be given more frequent inspection than at other seasons of the year. The reason is that soft snow imposes stresses upon the front wheels, which are more severe than those commonly encountered either in soft mud or sand, while the snow strains are continuous instead of intermittent as are those imposed by mud or sand. On this account the joints of the connections are far more likely to work loose in winter than in summer, while bent and broken rods or knuckles also are more likely to occur.

#### To Facilitate Replacing of Tight Shoes.

When replacing a tight shoe on a rim it often is difficult to replace the last few inches of the bead. This is particularly true if an internal shield is being used to protect a weak place in the tire. If, however, the tube is slightly inflated when as much of the shoe is put on as is possible, and the tire gently lowered to the ground until the obdurate side is pressed, the weight of the car invariably gets the tire in position. Care should be taken not to injure the inner tube.

#### Nail That Cannot Be Pulled Out.

One of the many prolific residents of France has devised a nail that, once it has been driven into place, resists all efforts to pull it. The point of the nail is slit through its center nearly two-thirds the distance to the head, like a cotter pin, and as the nail is driven, the two parts curl into the wood.

## Paris Show Brilliant But Unproductive

First Exhibition Held by the Manufacturers Themselves and First With Uniform Decorations—Several New Sliding Valve Motors and Many Low-powered Six Cylinder Engines but Few Startling Developments in Evidence.

GENERAL VIEW OF PARIS SALON IN THE GRAND PALAIS

Shorn of some of its former glory, and inaugurated under a new management, the Paris Salon, of 1910, which closed on the 18th inst., was altogether a different Salon from the last, which was held two years ago. Nothing of the sort held in Paris could, in the nature of things, be anything but spectacular, and the present show is striking and in many respects characteristic. But the uniform system of decoration adopted had the effect of breaking up the vista of the Grand Palais, and in itself was more or less confusing.

In order to understand the situation it is necessary to recall the circumstances which led to the discontinuance of the Salon by the old management and the omission of the 1909 show. Until the present

exhibition the shows have been managed by the *Chambre Syndicale de l'Automobile*, which, insofar as profits were concerned, was another name for the *Automobile Club of France*. As far as the expense of decoration were involved, however, the *Chambre Syndicale* may be said to have been composed principally of the manufacturers, inasmuch as the club shared none of this heavy cost. This was substantially the situation during the lean years of 1907 and 1908, and was the underlying cause of a split between the club and manufacturers, when the *Chambre Syndicale des Constructeurs d'Automobiles* was organized.

It was proposed by the new body to conduct the future Salons without the assistance of the automobile club, and, by adopt-

ing a uniform scheme of decoration to eliminate the rivalry which, in the past, had caused the more prosperous makers to expend vast sums in the embellishment of their stands. Unfortunately, however, the automobile club had an option on the Grand Palais for 1909, and the outcome was that the new organization declared a boycott on the proposed Salon of that year and rendered it a practical impossibility. Although it was the twelfth Paris Salon, therefore, the present exhibition was the first to be held by the manufacturers themselves, and the first to be staged with a uniform plan of decoration.

The show itself, also, was lacking in one of the features that, in the past, has rendered it the show of shows. In common

with all shows of the day, but to a more notable degree, it lacked the element of extreme novelty, not to say freakishness, both in cars, bodies and accessories. The rare imagination of the French was apparent in many instances, it is true, but not to its former extent. For the most part the exhibits were rather conventional in their nature, and sweeping trends were lacking. There were 350 stands, or less, 125 which were occupied by exhibitors of cars. The accessory and components exhibits, which composed the remainder, for the most part were those of the established manufacturers and dealers who showed more or less standard wares. But two American makes of cars were in evidence, namely, the Mitchell and Ford.

If the show may be said to have developed anything in the way of mechanical tendency, it is in the so-called "valveless" motor—which is not a valveless motor at all, but one having either sliding or rotary valves instead of those of the common or poppet type. There were practically a

PANHARD "VALVELESS" MODEL

of two eccentric shafts. In the new CoterEAU motor a single sleeve likewise is deemed sufficient, but instead of being made to travel up and down the cylinder bore, as

is made to register alternately with the inlet and exhaust openings. The Sizaire et Naudin, formerly distinguished as a light voiturette with a huge, single-cylinder motor, now is built in the form of a light and more conventional machine, and is equipped with a motor of the "valveless" type.

Among the engines which reveal more radical departures from precedent, perhaps none attracted more attention than the Henriod, partly, it is to be inferred, for the reason that its constructor in the past has distinguished himself by several unfettered flights of fancy in the way of novel design. In this case, however, there is nothing irrational about his achievement, which is, nevertheless, distinctly radical. It is, in brief, a form of rotary valve which is broadly suggestive of the Corliss steam engine gear. That is to say, the valve itself is a D-section, though revolving in circular bearings, the flat side of the "D" serving to uncover the single port in the cylinder wall and to open communication with

CURIOUS BODY CONSTRUCTION OF 120 HORSEPOWER PIPE "CONNING TOWER" BODY ON GREGOIRE CHASSIS

dozen different motors of this class to be seen, including one or two that were shown in the balconies and also including the Panhard, Mercedes and English Daimler cars, which are equipped with variations of the Knight engine.

Several of the engines which fall within the valveless classification appear to have been designed by followers of Knight, yet each of them has peculiarities all its own. For example in the Roland-Pilain, but one sliding sleeve is employed, instead of two, as in the Knight engine, the motor otherwise resembling the Knight in many respects. Incidentally it may be mentioned that the Roland-Pilain car, in which was mounted a six-cylinder motor of the type in question, was further distinguished by an equipment of hydraulic brakes which were applied to all four road wheels.

In the case of the motor shown by Mustad et Fils, the valve construction was equivalent to a single sleeve split in half vertically. Each half sleeve carrying a suitable port opening, as in the Knight engine, is actuated independently from one

is done in the case of the valve systems previously mentioned, the valve sleeve is merely caused to revolve in a suitable recess which is formed in the cylinder wall. The single port opening in its surface thus

the intake or exhaust at the proper instant of the cycle. Unlike the Corliss valve, however, it does not oscillate, but revolves. Hence by placing one of the passages above and the other below the valve chamber, the single member is made to serve both the inlet and exhaust. A commendable point in the design is that the port is placed somewhat below the upper end of the piston travel in the cylinder, so that the valve is relieved of excessive pressure during the beginning of the firing stroke.

The Boissier motor, likewise is furnished with a form of rotary valve, termed a distributor, in this instance, which is mounted above the cylinders and which, as it is carried in ball bearings, offers very little frictional resistance. Owing to the relatively large size of the distributor and its casing, the motor is given a curious and rather top-heavy appearance, which is not in the least relieved by the vertical motion shaft and the housing for the helical gears by which the distributor is actuated. Still another motor of the rotary valve type is the Ballo, in which the valves are of hemispherical

ISOTTA FRONT WHEEL BRAKES

formation and oscillate, instead of rotating. Their movement is brought about by cam action, the valve motion shaft and cams being enclosed in a housing above the cylin-

and causing a portion of it to revolve in the cylinder in addition to its reciprocating motion. A helical groove is formed in the outer part which leads from the base to a point just below the head, where a hole is cored through to a couple of ports in the head proper. The intake and exhaust ports, of course, are located in the lower part of the cylinder.

As a matter of fact, the piston is formed in two parts, the inner of which carries the true piston head, is connected to the crank shaft by means of the usual wrist pin and connecting rod, and does the work of driving. The secondary part is a surrounding sleeve, in which the helical groove

16 horsepower, and has a bore and stroke of 66 by 12 millimeters, or roughly, 2½ by 5 inches; and the Delahaye, which is rated at 18-24 horsepower, and has its cylinders

BALLOT HEMISPHERICAL VALVE MOTOR

BOISSIER WITH CYLINDRICAL VALVE

BRASIER'S NEAT BLOCK MOTOR

ders, which is of peculiar and characteristic shape.

By all odds the most original, not to say freakish, design to be found was that of the Broc motor, in which the effects of a sliding valve and a rotary valve are achieved after a most curious fashion. The distribution is effected by the simple expedient of converting the piston itself into a valve

HENRIOD VALVE CONSTRUCTION

is formed, and which is rotated by means of a bevel gear on the lower end of a tubular shaft which telescopes the connecting rod and is driven by a stationary bevel gear attached to one of the crank webs. As the piston reciprocates, the outer or valve portion is reciprocated with it and also is rotated to effect the distribution. Thus the motor is valveless only so long as the outer portion of the piston is by courtesy considered a part of this piston and not a valve.

Among other points observed at the show was the apparently growing inclination of the French builders, as well as those of other Continental countries, to construct cars well within what is broadly termed the medium-powered class. Particularly noteworthy at this time, indeed, are the numerous cars of 16 to 30 horsepower nominal rating and especially those of somewhere about 20 horsepower. The block method of casting continues to grow in popularity, and not a few six-cylinder motors of relatively low power now are made in this fashion. Among such may be enumerated the Delage, which is rated at

HENRIOD MODIFIED CORLISS VALVES

THE NEW COTTERAT "VALVELESS"

SIZAIRE ET NAUDIN BLOCK MOTOR

arranged in V form, in two groups of three but all cast together, the cylinder dimensions being 75 by 120 millimeters, or 3 by 4 13-16 inches. Other small six-cylinder motors, but those in which the cylinders are cast in pairs or in blocks of three, are the 17-20 Mors, 16 Motobloc, 20 horsepower Darracq—a worm-driven model, it may be explained—15 horsepower Clement-Bayard.

## FOUR OF THE STRIKING NOVELTIES EXHIBITED AT THE PARIS SHOW

GOBRON RUNABOUT WITH CHAUFFEUR'S SEAT INSIDE SCUTTLE DASH

ELABORATE ROTHSCCHILD "OBUS" BODY ON FIAT CHASSIS

RENAULT UNIVERSAL JOINT HOUSING AND SERVICE BRAKE

RENAULT REAR AXLE MOUNTING WITH UNDERSLUNG SPRINGS

and 12 horsepower Delaunay-Belleville. the latter has cylinder dimensions of 72 by 120 millimeters, or about  $2\frac{7}{8}$  by 4 13-16 inches.

ISOTTA LEATHER DISK UNIVERSAL JOINT CONSTRUCTION

Two marked effects of the new style construction, which is expressed in the popular form of block motor, also are beginning to be apparent in other types as well. One is the desire to secure a "clean" engine by stowing away the auxiliaries as neatly as possible and relieving the exterior of the cylinders of any needless protruberances. The other is to extend the stroke. While abnormally long strokes by no means are the rule, they are also by no means uncommon, while the general tendency seems to be to increase the bore-to-stroke ratio.

Another observation was the periodical decline of the voiturette, which again appears to be passing into obscurity after a season of renewed popularity. The bulk of the European trade appears to be in cars of the medium class all through, and though closed cars continue to gain in popularity, the favorite styles are those in which the entire vehicle is enclosed, whether they afford accommodation for two or more passengers. The torpedo styles of touring car and runabout have come into vogue, and the influence of torpedo patterns is seen in many forms of closed cars.

A remarkable instance in point is that of a Gregoire car, which is built on thoroughly approved marine lines, with a ridiculously small body superstructure mounted in the center in close semblance to the conning tower of a submarine. Another remarkable achievement of the body-maker's art is the 120 horsepower Pipe, the front of which slopes from a point immediately above the driver's head to the dash, thus giving the machine the appearance of having just come through some dire catastro-

phe in which its front portion had been sadly crushed. A body which is far more appealing, if somewhat less striking in its appearance, is the Fiat "obus," which is

ment type, as distinguished from many of the newer bodies, in which there is but a single door on either side and no dividing partition between the front and back seat spaces.

Among various individual body refinements may be mentioned one particular runabout body, mounted on a Gobron chassis, which is provided with a deep scuttle dash. Under ordinary circumstances there is nothing to indicate that the dash is in any way extraordinary. But when it is desired to carry a chauffeur, one side of the scuttle may be removed, disclosing a neat folding side seat into which a small or medium-sized chauffeur may be squeezed without serious inconvenience, and where he will be handy in case a tire goes down or the engine becomes obdurate.

Ventilated dashes for the enclosed torpedo bodies, electric lights built into the dash or the front of the hood, after a fashion introduced by at least one maker in this country last year, separate spring suspension for the radiator and brass covers for the joints in the steering connections are novel and interesting details that were to be observed on various cars.

The general details of transmissions and other chassis features reveal few striking changes in the new designs. Universal joint construction in many instances has been revised with the idea of obtaining better durability and freedom from wear, and in this connection the Isotta-Fraschini uni-

a Rothschild creation, and which besides being of the most sumptuous order, is built with an eye to cleanliness and freedom from unnecessary windage.

LATIL 24 HORSEPOWER FORE CARRIAGE FOR COMMERCIAL VEHICLES

The Gregoire "aviator" body is strictly a double coach, and has much the same effect as would be secured by mounting two sedan or coupe bodies on the same chassis. Needless to add, it is of the two-compartment

type, as distinguished from many of the newer bodies, in which there is but a single door on either side and no dividing partition between the front and back seat spaces. The Isotta-Fraschini universal is particularly noteworthy. It consists of nothing more complicated than a disk of stiff leather which forms the sole connection between the flanges of the driving and driven members of the joint. Be-

sides allowing perfect flexibility and small resistance, this device has the advantage of being absolutely noiseless.

The new type universals on the latest Renault designs are housed in a neat aluminum casing. The rear springs of the new chassis shown at the Salon are of the three-quarter elliptical pattern, but with the lower or semi-elliptical members slung beneath the axle, thus affording a very low center of gravity. Three-quarter elliptic suspensions, by the way, are growing in popularity.

Shaft drive is employed almost exclusively, as is magneto ignition. Thermo-syphon cooling likewise is becoming exceedingly popular, while automatic self-contained engine oiling systems are the rule.

brought out during the examination of witnesses for the defense that the taxicab in which Mrs. Kupfer rode and through the carelessness of the driver on which she alleges to have received scars and other serious injuries, did not belong to the New York Taxicab Co. at all, but to a rival company. And not only is this rival company said to have painted its cabs in the exact red shade of the N. Y. T. vehicles—so cleverly, in fact, that starters employed by the N. Y. T. Co. have on occasions given the signal to the rival cabs—but it is even claimed by the defense that the rivals were so tricky as to tap the wires leading to the N. Y. T. Co. and to send out their own cabs on calls intended for the regu-

lis, and to possess a high degree of resiliency and strength. As the various layers of paper are not saturated with a hardening glue, which would cause the resulting material to become stiff and unyielding, but are impregnated with a resin which remains pliable, it yields to the inequalities of the road surface quite as readily as the outer shoe of a rubber tire. The papier-mache tires are said to be as durable as those made of fabric and rubber, while their cost is but a fraction of the same.

#### Ceylon Inaugurates Rubber Auction Sales.

According to W. C. Magelssen, the American consul at Colombo, the first auction

TWO TRIM BLOCK MOTORS—25 HORSEPOWER FOUR CYLINDER ISOTTA AND 20 HORSEPOWER FIAT SIX

In addition to the Sizaire et Naudin change gear, which is of unique construction and mounted on the rear axle, one other peculiar axle-mounted change gear was in evidence—that of the Miolans car, in which the speed changes are effected by causing a single driving pinion to mesh with one or another of three sets of teeth on the large driven gear, the teeth, naturally, being of peculiar formation in order to render this combination possible. But one friction drive was in evidence, that of the Curicum, which employs the two-disk principle.

#### Tricks in the Taxicab Trade, Too.

That there are "more things 'tween the red sides of a New York taxicab, than are dreamt of in the average user's philosophy"—to paraphrase the immortal bard from the banks of the Avon—was brought out in a suit for damages instituted by Mrs. Annie J. Kupfer, of 14 East 60th street, New York City, against the New York Taxicab Co. The hearing took place before Justice Morrell and a jury in Part IV of the Supreme Court of New York, and it was

labeled "reds." And it was the tell-tale registration number on the wrecked cab which gave the scheme away, for this near-red cab bore a license tag, the number on which did not correspond to any in the possession of the New York Taxicab Co. Despite this ingenious defense, the jury held the New York Taxicab Co. responsible for the accident and awarded Mrs. Kupfer \$400 damages.

#### Automobile Tires From Papier-Mache.

Finding that car wheels made from papier-mache possess great strength and a remarkable ability to withstand sudden shocks, French engineers have just placed on the market an automobile tire shoe made exclusively from paper. It consists of a number of thin, unglazed sheets of paper, cut into proper shape and laid one upon the other, which are impregnated with certain resinous substances and then subjected to enormous pressure. The resulting tire shoe, modeled over a form and snugly fitting over inner tubes of the corresponding size, is said to be absolutely impervious to water, weak acids and alkali-

sale of rubber ever held in Ceylon occurred on November 4 last, when 22 tons were offered for sale.

"The chief factor which has led to the inauguration of the rubber sales is the convenient position of Colombo in relation to the big consuming countries," says Consul Magelssen in his report. "Buyers in these countries already find it convenient to come direct to Colombo for their supplies, and it is interesting to note that by far the largest bidder at the first sale buys chiefly for the United States. Public sales of rubber will be conducted weekly, and it is anticipated that the new departure will meet with the same success as has attended the tea auctions which have been a fixture in Ceylon for many years.

"There are at present 12,000 bearing acres of rubber in Ceylon, while 185,000 acres have been planted. A local writer has estimated that 220,000 acres will be the maximum area planted with rubber in this island and that, with 140 trees to the acre and 1½ pounds yield per annum, this will give an export of 20,000 tons by 1920. The 1909 exports amounted to 681 tons."

**FRANKLIN DEVELOPS A NEW BODY**

**Of the Torpedo Type, It Differs Greatly in Its General Design—Fenders Also of Original Pattern.**

Distinctly original features are embodied in a new torpedo type of car which has been recently built by the H. H. Franklin Manufacturing Co., of Syracuse, N. Y. As may be seen in the accompanying illustration, the new model is characterized by lines quite unusual in automobile construction.

The lines of the body instead of running from the top of the rear seat forward on

inches in size. The wheelbase is 123 inches and the weight 2,750 pounds.

**Rival Truck Dealers Getting Together.**

Steps looking toward the amalgamation of Boston's two associations, of motor truck dealers, the Boston Motor Truck Dealers' Association and the Commercial Motor Vehicle Dealers' Association of Boston, have been taken by both sides since it has been settled that there will be no separate exhibition of motor trucks and that these vehicles are to be shown in the Boston automobile show in February, which was one of the chief causes which led the Boston trade to split into two parts. At recent meetings of both associations, committees were appointed and given instruc-

FRANKLIN'S DEVELOPMENT OF THE CLOSED-FRONT BODY

a straight line to the dash, drop in a sweeping curve and run forward in an upward slope to a wide scuttle dash. The back of the car, which has almost square corners, is a contrast to the familiar rounded back. The hood, after the design of 1911 Franklin bonnets, starts from the level of the chassis frame in front, sloping upward and back to the dash, its lines bending in a wide angle just above the first cylinder. The forward mudguard begins at the running board and slants upward in a straight line to a point above the back of the wheel where it runs ahead again in a straight line to the front of the car. The rear fender is constructed similarly, but the rising part is slightly curved. None of these fenders are flanged. An English Burbank top of the four-bow type is used, having two bows in front, one vertical and one horizontal.

The chassis is the same as that of the 1911 model D torpedo phaeton. The motor develops 38 horsepower, is air cooled, and has six cylinders, 4 x 4 inches, cast separately. Three speeds forward and one reverse are secured in the selective transmission. "Q. D." tires, 36 x 4½ inches are used on the front wheels, while 37 x 5 inches are used on the rear. Both the front and rear springs are full elliptic and 40 x 1¼

tions to meet the committee from the other association and reach, if possible, some common ground upon which all the truck interests of the city can unite. The committee from the Commercial Motor Vehicle Dealers' Association consists of L. B. Butler, agent for the Rapid; G. P. Dennett, of the D. P. Nichols Co., agent for the Frayer-Miller and A. B. Cummer, manager of the Boston branch of the Autocar Co. The committee of the Boston Motor Truck Dealers' Association consists of Arthur P. Underhill, agent for the Knox; A. B. Henley, manager of the truck department of the D. P. Nichols Co., agent for the Frayer-Miller, and J. H. McAlman, agent for the Stearns and Columbia. These conciliation committees will meet and will report back to their respective associations next week, when it is hoped that some mutual agreement will have been reached.

**Demand for Front Doors Becomes General.**

According to trade reports, the call for closed-front touring cars has become so general as to cause some embarrassment in not a few factories. Many dealers are insisting that front doors be applied to even the low-priced cars, and in a number of instances refused to accept other deliveries.

**TWO-CYCLES AND THE THROTTLE**

**Duryea Takes Issue With Kettering—Claims They Are Responsive and Offers to Prove It, Too.**

That two-cycle engines, when properly designed, are responsive to throttle control in almost the same way as motors of the four-cycle type is a fact that is not generally appreciated by those whose experience has been chiefly with machines of the latter order. In defense of this point Charles E. Duryea, the veteran inventor and automobile manufacturer, takes exception to a remark made by C. F. Kettering in a discussion of the ignition problem printed in these columns. The latter advocated the use of a battery system for two-cycle engines "because all the regulation must be done by spark advance." It is to this expression that Mr. Duryea objects.

"I know it is often assumed that the two-cycle engine is less flexible than the four-cycle, and that in the case of engines built for a fixed speed, as is the usual boat engine, this is true," he remarks. "But that it is an inherent defect I deny," he goes on to assert, "and if Mr. Kettering, or any other non-believer, will favor me with a visit I will set the spark well forward and do all sorts of stunts on the high gear, from climbing 14 per cent. grades to following a funeral procession or bouncing over our rough roads as fast as he wants to go in a short base, solid tired rig; controlling absolutely by the throttle, just as nicely as any four-cycle.

"Do not understand from this that juggling the spark is not proper on a two-cycle. The spark should be set according to the speed, but that 'all regulation must be done by it' certainly is wrong.

"As to comparing magneto and battery on the two-cycle, I use battery and a single spark device. But the hot magneto spark cannot be beaten if one is willing to carry the extra moving parts."

**When Reverse Gear Will Help Up Hill.**

The hill climbing ability of a car is a quality which always does not show itself to advantage, particularly in cases when the motor is in bad repair as regards compression or mixture, or if, as in many cars of the roadster type, a gravity feed tank is set so low and the supply of fuel so nearly depleted that the gas will not run to the carburetter. If the machine is stuck then it is well to turn the car around and go up hill on the reverse. As in nearly every car the reverse is geared lower than the first speed, the motor in such cases has more pulling power than when the car is going forward. If stuck, on account of the low level of gasoline in the tank, reversing the car obviously overcomes the difficulty.

## FOR INCREASED SPEED IN NEW YORK

Another Ordinance Designed to Alter Absurd Limit—District Attorney Favorable and Adoption Likely.

Once more an ordinance to increase the rate of speed at which vehicles legally may be driven on the streets of New York is pending before the board of aldermen. It was introduced on Tuesday last, 20th inst., by Alderman Johnson, and as it has the support of District Attorney Whitman, its chances of adoption seem fairly good.

The ordinance provides that automobiles shall not be operated in streets less than 150 wide at a greater rate of speed than 15 miles an hour, and in streets wider than 150 feet at a rate to exceed 20 miles an hour. The repeal of the law limiting the speed to eight miles an hour in congested districts is provided for, and the vehicles of the Police and Fire Departments, ambulances, trolley cars, United States mail wagons and railway-repair wagons are exempt from the limit.

In voicing his opinion of the new measure, District Attorney Whitman has said that inasmuch as the Police Department has never made arrests for speeding, even when the State law was 10 miles an hour, unless the vehicle was traveling at least 15 miles an hour, and that the average speed of automobiles on Fifth avenue has been found to be 16 miles an hour, he thinks that the ordinance would be a benefit to the city, and indeed that it is necessary to relieve the congestion of traffic and permit its proper regulation. The present speed limit of eight miles an hour in congested districts is not and never can be enforced, and long has been a standing joke.

For nearly 20 years periodical efforts have been made to increase the limit, but always without success. In the heyday of the bicycle and since the automobile came into extended use, ordinances have been offered and public hearings held, but invariably the West End Taxpayers' Association, or other similar organizations, have raised a loud voice of protest, and had sufficient influence to defeat the object sought.

The proposed ordinance which is in the form of an amendment to sections 454 to 457 inclusive of the Code of Ordinance, is as follows:

**Speed of Vehicles**—The following rates of speed through the streets of the city shall not be exceeded, that is: No person shall operate in the public highways of the City of New York, where the buildings fronting thereon are less than 150 feet apart, any bicycle, tricycle, velocipede, motorcycle, motor tricycle, motor delivery wagon, vehicle drawn by horses or other animals, or any motor vehicle, however propelled or constructed, at a greater rate of speed than one mile in four minutes.

But where the buildings fronting on such highway are more than 150 feet apart, no person shall operate any such vehicle at any rate of speed which is greater than one mile in three minutes. Provided that nothing in this article shall apply to the apparatus and wagons of the Police and Fire Departments, nor to any ambulance, traction engine, road roller, emergency repair wagon of street railroads or other public service corporations, or such vehicles as run only on rails and tracks, nor to vehicles carrying the United States mail.

No person shall in the places mentioned in the foregoing section operate any vehicle across any street or avenue going north or south or upon approaching or crossing any bridge, dam or steep descent, or around or upon any turn or curve at a greater rate of speed than one mile in ten minutes.

Any person violating any provision of this or the foregoing section shall be punished by a fine of not more than \$100, or imprisonment for not more than thirty days, or by both such fine and imprisonment.

All complaints for any violation of this article shall be made to and shall be heard and determined by any City Magistrate of the City of New York.

Nothing in this article contained shall be so construed as to limit or impair the jurisdiction and authority of any City Magistrate to hold to answer or discharge any person charged before him with a violation of Section 287, of Chapter 374 of the Laws of 1910, or of any of the sections or provisions of said chapter.

Articles II. and IX. of the Code of Ordinances of the City of New York in force on January 1, 1906, are hereby expressly repealed.

### How Car Washing Affected the Magneto.

"I had quite a time getting my engine to run properly one morning last week," remarked the all-the-year motorist. "I had gone early to the garage, where the car is housed, and after going through the usual preliminaries started the motor. It ran for about 10 seconds on two cylinders, hit three, back-fired and died. I tried it again with almost the same result, only she ran a little longer this time. Then I raised the hood and started a 'personally conducted.' Everything looked good to me, and I started her again, but this time I left the hood up and found my trouble. My hood is like any number of others with vents in their sides and the fool washer in the garage, being accustomed to turning the hose over the hoods of the other cars in the garage, none of which have vents in them, had done the same to mine and flooded the magneto. Most of the water had evaporated by the time I got there in the morning, just sufficient remaining to be invisible to a cursory glance and still enough to short circuit a couple of the high-tension leads. The washer got a call and I got a magneto cover. Since then I have had no trouble from this source, although a somewhat similar experience was caused by rain being sucked in through the radiator by the fan and thrown over the plugs and wires. The effect was almost the same as in the former case."

## OLDFIELD'S CREW IS RULED OFF

All Who Had to Do with Los Angeles Meet Are Punished—Norfolk Offenders Also Suspended.

The Barney Oldfield outlaw meet, held at Los Angeles on December 11, has brought its penalty, though it proves hardly as severe as was generally expected that it would be. Although he has repeatedly defied the organization, at a meeting of the Contest Board of the American Automobile Association on Wednesday, 20th inst, the heretofore indefinite suspension of Oldfield was changed to a definite suspension covering a period of only 12 months, to and including January 1, 1912. Also included in the suspension are Oldfield's 200 horsepower Benz, the Prince Henry Benz, the Vanderbilt Darracq and the six-cylinder Knox which were entered and were used at that time. J. Alex. Sloane, Oldfield's manager, and Leslie Henry, the alleged manager of the meet of the so-called Pacific Coast Motor Racing Association, likewise were placed under the 12 months' ban, as was the Ascot Park Track on which the meet was held.

All others who had to do with the affair were given the same 12 months dose, viz: Charles F. Stamps, L. R. Mellus and W. Gray, who acted as officials, and the following drivers and cars: J. R. Kittle and Louis Arms (Cutting 30), Williams (Los Angeles agent for the Petrel), Henry Koch (Durocar), William Carlson (Winton Six), W. H. Faust (Winton Six), Henry Butley (Pope-Toledo, 1905), E. H. Betchel (Parry) and Condit (Los Angeles agent for the Staver-Chicago).

The only exception to the rule was George H. Clark, who drove Oldfield's six-cylinder Knox, who, it transpires, competed under a fake name. He masqueraded as E. Z. Martin, and as a result he has been shelved until January 1, 1913.

At the same meeting the A. A. A. contest board also meted out punishment to all who had to do with the sanctioned race-meet at Norfolk, Va., on December 1, 2 and 3, at which women were allowed to compete. J. E. (Jack) Sheldon, who promoted the affair and who also competed, was suspended until January 1, 1912, as also were Louis S. Hallowell (American), George Edwards (Maxwell and Rambler), Edward Allen (Brush), and the Coburn Motor Car Co., and Bryant, who drove the company's Flanders car.

### Los Angeles 24 Hours' Race is Off.

The 24 hours' race which was scheduled to occur on the Los Angeles Motordrome on Christmas day has been declared off. Lack of entries caused the abandonment of the grind.

**"FREE WHEEL" FOR DYNAMO DRIVE**

**Novel Features of C. A. V. Lighting System Eliminates Cut-Outs—Special Windings to Give Constant Voltage.**

Upon two things which already are quite well known to motorists, depend the success of a complete electric lighting plant on an automobile if the lights are entirely to replace those furnished by acetylene and oil; the first necessity is a dynamo which will furnish a constant current, independent of the speed of the motor; the second, that the accumulators should be charged and discharged automatically. The attainment of simplicity is another important point, as is automatic action, and the driver should not be required to cut in or cut out the dynamo to prevent it from acting as a motor and drawing current from the battery when it is running at low speed.

The provision usually adopted to meet the first problem has been a regulating device, sometimes in the form of a speed governor and sometimes an electrically actuated voltage regulator; while the second objective usually has been taken care of by automatic cut-out devices, the result being somewhat complicated mechanisms. The leading systems developed by the manufacturers specializing in this branch of the automobile industry also are reasonably familiar, which is to say that it is known that the extent to which the ideal working conditions have been approached varies greatly, but the progress made during the last year or two is so particularly marked that the prospect of electric lighting becoming a well-nigh universal feature is exceedingly promising.

Among the pioneer firms in the British field are C. A. Vanderwell & Co., of London, who have been making electric lamps for vehicles for several years and which just has brought out a new variable speed dynamo which is distinguished by the entire absence of speed or voltage regulation in the ordinary sense.

The new system is known as the C. A. V. and it is unlike any other system in use, in that the principle of the dynamo construction insures practically constant voltage over a great range of speed without the slightest mechanical intervention. The elimination of anything in the way of an automatic switch, which has been used heretofore to prevent draining the battery, has been accomplished by the simple expedient of providing the dynamo itself with a "free-wheel," or ratchet coupling, which allows it to continue running, but as a motor instead of a generator, when the engine speed falls enough to cause a reversal of current flow between the generator and battery. At such times its con-

sumption of current is exceedingly small, as the armature turns idly in its bearings, and it is thought that the energy used in this way is more than compensated by the saving in mechanical and electrical complication over any of the various other systems.

Without some such provision, of course, the battery rapidly would be wasted. At very low engine speeds, it may be explained, the voltage generated by the dynamo would be lower than that of the battery, even with a machine giving a substantially constant current at higher rates of revolution. Under such conditions current would flow from the battery to the dynamo, instead of from the dynamo to the battery. The dynamo thus would act as a motor, and instead of generating cur-

SHOWING PRINCIPLES OF C. A. V. SYSTEM

rent itself it would absorb current from the battery and would tend to drive the engine. The ordinary way of providing for this contingency, of course, is to interpose some form of cutout switch which will open the circuit when the engine speed falls below a certain minimum, and close it when the speed again increases.

The C. A. V. method, as already indicated, overruns its drive at such times, the motor effect employing only such energy as is necessary to overcome the friction of the armature bearings. One admitted drawback to the arrangement is that, should the engine be stopped without cutting off the ignition, the dynamo motor would go on running indefinitely. This is not considered a serious disadvantage, however, inasmuch as the only effect would be to discontinue, is to permit the armature shaft to charge the battery at a slow rate, the

charge being immediately replaced when the engine again was started.

The distinctive portion of the system is the method of winding the dynamo, which is applied in a manner which is, so far as is known, entirely original in its details. Briefly, the field is composed of four poles, two of which are wound and two unwound. The armature is so arranged that certain coils constantly are being short-circuited, the result being to cause a partial suppression of the natural magnetizing effect of the field. As this counter magnetization is proportional to the speed of the armature, as is the natural tendency of the field to increase, the two effects are counterbalanced and the voltage output is rendered substantially constant within a wide speed range. So close is the automatic regulation attained by the means that it is said that from 1,500 to 4,000 revolutions per minute the output will vary barely one volt, the range being from five to six volts.

As to the general construction of the dynamo, the accompanying illustrations indicate it somewhat in detail. There are four magnetic poles, as just mentioned, two "ordinary" poles, N1 and S1, and two "subsidiary" poles, N and S, as they are termed. The windings, which are connected in parallel with the armature, excite the latter in the usual manner. The armature is drum-wound and the windings the helically staggered, so that those immediately under the subsidiary pole-pieces are in communication with the brushes on the commutator ring, the magnetic flux from their two windings passing diametrically from one subsidiary pole to the other, and, dividing right and left, returning through the frame of the machine, as indicated by the dotted lines. A good idea of the precise manner in which these poles are arranged is given in the illustrations, showing the relative form and positions of the different principal elements of the machine.

As may be seen, the collecting brushes are so wide that they continually cover two of the commutator sections, thereby short-circuiting certain coils, which in the diagrammatic illustration may be distinguished by eight large black dots immediately under the poles N and S. Instead of being in a neutral, non-magnetic zone, as in the case of the ordinary dynamo, these short-circuited coils are situated in a region of great magnetic activity, as they are cutting the lines of force produced by the subsidiary coils, N1 and S1. The short-circuit currents produced by these coils "cross-magnetize" the armature, and set up a magnetic flux at right angles to that of the subsidiary poles, which effect is greatly enhanced by the presence of the unwound ordinary poles.

As a result, instead of pursuing the normal path, traced by the fine dotted lines in the illustration, and passing from one subsidiary pole to the other through the

armature, the previously existing magnetic flux is distorted and passes only half way through the armature and turns aside, as shown by the thicker dotted lines, thus having a quadrantal path. As the speed of the engine increases this change of flow takes place gradually.

While this effect is being accomplished, another force is at work, for the coils of the armature which are not short-circuited are producing current in the usual way, this being collected by the brushes and delivered either to the batteries or the lamps, as the case may be. A magnetizing reaction is also possessed by this working current, which directly opposes the magnetization of the subsidiary poles, and, as the

minerals being instantly visible and accessible by removing the cover on the front. The fuse, its purpose already described, is of the spring-clip pattern. For the two smaller types of dynamos for use on small cars, a less expensive form of rotary controlling switch is provided. This has positions for lights on with the engine running, or stopped, and also an "off" position. With this switch the lights are either all in use or all out, but it forms an effective and cheap means of control for use where the refinements of the more complete switchboards are not needed.

By the use of special cables, all joints are avoided in the wiring system, these cables running from each component di-

furthermore, being differently colored to assist in tracing through the various circuits.

In connection with this system there is another useful fitting in the form of a chassis terminal board, for use on cars with interior lights. It is fixed to the chassis, the leads from the switchboard being attached to one side and the wires for the interior lamps to the other. In case it is desired to remove the body from the chassis, it is necessary only to release the conductors at one side of the board, the major part of the wiring system remaining undisturbed.

The C. A. V. line includes three standard sizes of dynamo, and with certain differences in winding constitute five distinct models. The smallest has a weight of about 16 pounds and is supplied to give its 5 amperes at 4 volts or at 6 volts, according to whether it is to be used for small car work or for cars of practically as low power that do not need very powerful headlights. An intermediate size weighs 22 pounds and gives its 5 amperes at 12 volts. This is intended for ordinary touring cars with powerful headlights, together with the usual smaller lamps. The larger model, weighing 32 to 33 pounds, is wound to give the same output as the intermediate, but at crankshaft speed, instead of 50 per cent. faster, and also is wound to develop 8 or 10 amperes when driven at the same speed as the intermediate model.

#### Paris Introduces Disinfecting Vehicles.

Traveling disinfecting "chambers" recently have been introduced in Paris by the French Public Health Department, and are used by the sanitary authorities in dealing with infectious diseases. Each "chamber" consists of a standard automobile chassis upon which is mounted a large box-like body which is divided into two compartments, the larger of which is for the reception of clothing, mattresses, pieces of furniture and other objects which may have become germ infected. The smaller compartment is beneath the larger, and contains the apparatus by which the formalin vapor used in fumigating is generated. A third compartment underneath the chauffeur's seat serves to hold the special germ-resisting clothes which the sanitary officers use when working.

#### Regal Adds a "40" to Its Line.

The Regal Motor Car Co., of Detroit, has added a 40 horsepower model to its line; it lists at \$1,750. The newcomer is substantially an enlargement of the Regal "30." The dimensions of its four-cylinder motor are  $4\frac{1}{2} \times 5$  inches; its wheel base is 123 inches. In respect to mechanical details it importantly differs from the "30" chiefly in that in the latter the clutch is held in engagement by one large spring, while in the new "40" three small springs serve the purpose.

VIEWS SHOWING MECHANICAL CONSTRUCTION OF C. A. V. GENERATOR

demagnetizing reactions increase in proportion to the speed, the natural tendency of the output of current to increase with the speed is directly opposed, the result being the generation of a sensibly constant current.

A peculiar feature of a dynamo constructed in this way is that it will tend to run equally well in either direction if symmetrically constructed, and also that the current will not be reversed when the direction of rotation is altered. In the automobile type, however, this peculiarity is of no particular value. A fuse is introduced in the field magnet circuit, this precaution being taken on account of the fact that if at any time the dynamo were to be run at speed with no battery or lamps in circuit there would be a risk of overloading the field windings and even of burning them. As far as operation is concerned, it is merely necessary to operate a single switch connecting the dynamo with the battery.

Except for the lamps and their connecting wires, the switchboard is the remaining factor in the system, as shown in one of the illustrations. It contains all the necessary switches and instruments, including a voltmeter and an ammeter, there being separate switches for the dynamo, both headlights, both side lights and tail light, and a plug socket for connecting an inspection lamp. There are no hidden connections, all the conductors and ter-

rect, to separate terminals on the board. The conductors are of original design and are of flexible armored form, the wires being insulated by a special medium from which the use of rubber is eliminated. The protective armor consists of a single wire

THE C. A. V. SWITCHBOARD

wound spirally around the cable from end to end. Thus it is not only extremely flexible, but is more than able to resist any mechanical friction which it is liable to experience, while the insulation is such that any number of wires may be enclosed in the one protective covering, each cable,

## TWO NEW INTER-STATE MODELS

More Power and Several Marked Departures in One of Them—Line Now Comprises Seven Models.

Incorporating many of the well-known features of the Inter-State "40," two new models have been added to the extensive line of the Inter-State Automobile Co., of Muncie, Ind. The most striking departure from their product as heretofore is a new 50 horsepower torpedo type touring car, model 35, which has a seating capacity of seven passengers, and sells for \$2,700. This car is fitted with the popular front doors, and has exceedingly ample accommodations. For use as a five-passenger car, the two adjustable seats may be removed and

INTER-STATE 40 HORSEPOWER TORPEDO TOURING CAR

the body outline is such that the car presents no unwieldy or clumsy appearance.

The other new car, model 34-A, is a 40 horsepower, five-passenger torpedo, selling for \$2,000. A neat scuttle dash, aprons between the running board, fenders and frame, rear spring hanger covers and a straight line effect are the features of the body design. The levers are placed inside the body and all latches are concealed.

Other models included in the line for the coming season are: 30-A, a five-passenger touring car, \$1,750; 32-A, a single-rumble roadster, \$1,750; 33-A, a double-rumble roadster, \$1,750; 34, a four-passenger torpedo, \$2,000; 31-A, a four-passenger small tonneau, \$1,750.

The new model 35, the 50 horsepower car, differs mechanically from the other models in that the motor is of the "T" head instead of the "L" head type; also in that a new form of transmission is used instead of the type which was original with the Inter-State and was somewhat out of the ordinary.

The motor is cast in pairs with cylinders  $4\frac{3}{4} \times 5\frac{1}{2}$  inches, and the inlet and exhaust valves are located on opposite sides. The

valves, which are extra large,  $2\frac{3}{4}$  inches in diameter, are very accessible, and they can be rotated easily by a brace from above. A new feature also is the exact meshing of the timing gears, which is obtained by the use of eccentric cam and pump shaft bushings. The three-point suspension is used in the hanging of the motor.

Reliable ignition is assured by the use of two separate and distinct systems on all models. One consists of dry batteries, a four-unit coil with timer and separate plugs. The second consists of an imported U. and H. high-tension magneto, in connection with another set of spark plugs. The magneto is supported on one side of the crank case and connected to a gear-driven shaft, driving also the two pumps.

Departing from their usual method of lubrication in this 50 horsepower model, a gear pump of the distributing type is used.

This provides a positive and equal flow of oil to the three main bearings. The overflow from these bearings runs into the splash compartments of an oil pan, and the oil is splashed and picked up by pockets on the connecting rods, distributed over the connecting rod and cam-shaft bearings and the walls of the cylinders.

The system of lubrication of the 40 horsepower differs somewhat from the "50," in that it is accomplished by means of a constant level-splash system, actuated by a gear-driven pump located on the crank case between the pump and magneto. The pump forces the oil from the reservoir, which has a two-gallon capacity, to the bearing surfaces, the excess returning by gravity to the reservoir. A sight feed on the dash indicates the amount of oil flowing. This system of lubricating is not only very simple and accessible, but very efficient and positive in operation.

Water forced by a gear-driven centrifugal pump through a cellular radiator and the jackets effects the cooling of the motor in all models. There are but two hose connections, and the system is so designed that each cylinder receives a uni-

form quantity of water. A belt-driven fan forces air through the radiator and over the motor.

The most radical departure from the familiar Inter-State chassis, except in respect to motors, is the transmission in the new model "35." Instead of adhering to their usual form where the gearset, clutch and tongue tube are formed integral and supported at the forward end only, as in the other models, the clutch and transmission housing are supported by a three-point suspension which obviates strains that might be transmitted from the frame. An added cross member to the frame supports the rear of the housing, as the front is supported, and the universal joint of the propeller shaft, together with the tongue-tube yoke, which is hinged. The transmission and clutch are of unit construction, but larger in size than those in the other models. The sliding-gear type allows three speeds forward and one reverse. The clutch is multiple disk, having bronze disks with 32-cork inserts placed between disks of hardened steel. These are of a large size and provide ample wearing surfaces. The engagement is gradual, easy and positive.

The 40 horsepower transmission and clutch are the familiar Inter-State unit type, and, as heretofore, are contained in a single case with separate compartments, permitting the use of different oils suited to either the clutch or gear sets. The construction is very substantial and access easily gained to all parts. The transmission is of the selective type, allowing three speeds and reverse. The gears are made of chrome-vanadium steel and are of extra heavy pitch, having five pitch teeth. Any unintentional passing through the neutral position when shifting the gears is obviated by the use of a double locking device to hold them and the levers in position. The clutch is an improved cork insert design, operating in oil in a separate compartment of the transmission case. A ball thrust employed between the clutch and throw-out fork and collar obviates the wearing of these parts.

A rear axle of the full-floating type is provided for model 35, with adjusting sleeves and thrust bearings for adjusting the drive gears which are very accessible. Imported annular bearings are used throughout the construction. The pinion shaft is mounted in the rear axle differential housing to insure perfect alignment. The entire differential may be removed through the opening in the rear of the housing. The torque tube eliminates the necessity of distance or torsion rods or bars.

At the front of the frame a taper-in is made to provide for turning the car in a small space, and, over the rear axle, the members of the frame are raised to allow a more free action of the springs and to bring the body nearer to the ground.

Both the emergency and service brakes

INTER-STATE 40 HORSEPOWER ENGINE

THE NEW 50 HORSEPOWER INTER-STATE MOTOR

are of the internal expanding type on this new model, the brake bands of the service brakes being  $16 \times 2\frac{1}{4}$  inches on the face, and the bands of the emergency brakes being  $12 \times 2\frac{3}{4}$  inches on the face, and both are made of vanadium steel.

The front axle on this model is a one-piece drop forging. Steering knuckles are mounted on case-hardened bolts, and they are provided with a ball-thrust bearing to make turning easier. Springs,  $40 \times 2$  inches, of semi-elliptic pattern, are used in front,

while the rear springs are three-quarter elliptic,  $48 \times 2$  inches.

The other new model, 34-A, a 40 horsepower, five-passenger torpedo, is constructed with details similar to the more familiar models, 30-A, 31-A, 32-A, 33-A and 34, all having the "L" type motor, with cylinders  $4\frac{1}{2} \times 5$  inches, cast in pairs, with valves on one side.

A semi-floating rear axle is used in these models, and is mounted on Hyatt bearings. The transmission is bolted direct to

the propeller-shaft housing, making it a unit with the rear axle.

The service brakes are of the internal expanding type, operated by a foot pedal, the emergency brakes by a hand lever.

An I-beam type front axle is drop forged from high-grade steel, and the steering knuckles and arms are of vanadium steel.

All tires on the models of 40 horsepower are  $34 \times 4$  inches, with wheelbase 118 inches.

A worm and sector, irreversible type of steering gear is used on all "40" models.

## SKILFUL DRIVING EARNS REWARDS

Minneapolis Chauffeur Wins Winton's Up-Keep Contest—Tall Mileage at Trifling Cost.

The "ghost" raised by a certain gentleman who was heard to remark that "one chauffeur can bankrupt two bankers and often makes more than his employer ever did," has been "laid" for good and all, and hereafter that gentleman's remarks will be taken cum grano salis. Even though the "ghost," which represents the supposedly high cost of maintaining an automobile, exists chiefly in the mind of the average

received fourth prize—\$150—his 17,130 miles having cost his employer nothing for repairs.

Other drivers in the "no-expense" class were Charles E. Rice, driver for L. T. Peterson, of Youngstown, Ohio; John T. Wilson, driver for W. B. Martin, of Cleveland, Ohio; Michael Stone, driver for H. M. Cheney, of Toledo, Ohio, and William G. Hyatt, driver for S. S. Booth, of Los Angeles, Cal., each of whom received \$100, which represents sixth, seventh, eighth and ninth prizes, which were won with 15,790 miles, 14,847 miles, 14,059 miles and 13,526 miles, respectively. The fifth prize, also \$100, was won by John J. Boyce, who drove the car owned by Isaac Bacharach, of Atlantic City, N. J., 17,390 miles at a

A. C. LEONARD, WINNER OF THE WINTON UPKEEP CONTEST

motorist, such fancies must vanish before the upkeep record of the ten drivers of Winton cars, who, between April 1 and November 30 of this year, drove their employers' cars an aggregate of 165,909.9 miles at a total repair expense of \$6.96, and thereby earned the "Christmas money," which the Winton Co. annually dispenses for the ten best records made during that time.

A. C. Leonard, driver for W. T. Bonnell, of Minneapolis, Minn., was the most successful of the ten in keeping down the expense of upkeep; he drove 21,127 miles during the period at a total repair cost of \$1.40, and received the first prize—\$1,000. Particularly notable is the record made by G. W. Butler, driver for J. E. Denny, of Chicago, who received the second prize—\$500. Butler won the 1909 contest, and finished ninth in 1908, his total of 41,173 miles in these three years with the same car representing an outlay of 30 cents for repairs, the expense being incurred this year when he drove 19,015 miles. The third prize—\$250—went to P. W. Mulford, driver for W. J. Friedlander, of Cincinnati, Ohio, whose total expense for 18,809 miles was 30 cents, and William E. Ochsie, driver for Martin Daab, Hoboken, N. J.,

repair expense of \$3.46. Guy C. Davis, driver for Horace J. Phipps, of Boston, Mass., won the tenth prize—\$100. His mileage was 14,208, and his repair expense was \$1.50.

The contest is open to all employed drivers of Winton Six cars. They are required to make monthly reports of mileage and expense, such reports being attested by the owners. At the end of the contest both drivers and owners are required to supply affidavits substantiating all reports.

#### Discrimination, Coney Island Variety.

Automobile owners, who have occasion to transact business (or pleasure) in Coney Island, N. Y., are trying to figure out by what method of calculation they are rated as more prosperous or more profligate than owners of motor boats. At least they believe this to be the only explanation of the fact that a motor boat owner can run his craft into the rear of a certain place on the island and buy all the gasoline he wants for 12 cents a gallon, while automobilists approaching from the front have to "pony up" 25 cents for each gallon of the needful. The quality is the same in both cases.

## LOS ANGELES STARTS ITS SHOWS

"Independents," with a Dash of Licensees; Lead Off—Handsome Decorations and a Plentitude of Exhibits.

Following a mammoth automobile parade which took up the greater part of the afternoon of December 12 last, the first annual "independent" show held under the auspices of the Los Angeles Motor Car Dealers' Association in the Shrine Auditorium was fittingly opened by Judge Robert M. Lusk, president of the city council. Though slated as an "independent" affair, a few of the products of licensed manufacturers were in evidence and it was not altogether an anti-Selden show.

Bowers of smilax and festoons of red and green bunting transformed the big building into something akin to fairyland, and even those who had anticipated something out of the ordinary in the way of decorations were agreeably surprised at the beauty of the exhibition as a whole. Smilax strands, in which the electric lights were almost hidden, formed a canopy under which automobiles and accessories were exhibited in booths made of more smilax, colored bunting and potted plants. Viewed from the balcony, the entrance appeared as a tunnel of greenery through which a myriad of multi-colored lights diffused a soft glow. Everywhere there was plenty of room; the aisles were broad and the exhibition spaces were uncrowded, leaving ample room for a leisurely and thorough examination of the cars and accessories. The attendance throughout the week was up to expectations.

Motor cars, motorcycles, tires, parts and accessories were shown by 40 odd exhibitors, 27 makes of gasoline pleasure cars, two makes of electric pleasure cars and seven makes of commercial vehicles going to make up a list of nearly 100 complete cars which filled every inch of available space. The list of exhibitors follows:

#### Pleasure Cars.

Haynes Automobile Sales Co., one Haynes touring car and one polished Haynes chassis; Owen Automobile Co., one Owen and one Marion touring car; Siegmund Motor Car Co., two Schacht touring cars; American Car Co., one American torpedo model; Halladay Motor Car Co., five Halladay touring cars; Hawley & King & Co., four Oakland touring cars; Los Angeles Alco Motor Sales Co., one Alco touring car; Standard Motor Car Co., three Ford touring cars and two Vette touring cars; Morrow, Loomis & Co., one Interstate touring car and one chassis; Staver Motor Car Co., two Staver cars; Bekins Motor Car Co., three Amplex touring cars; Williams Automobile Co., three Petrel cars;

Carrigan Brothers Auto Co., two Pratt-Elkhart cars; California Automobile Co., two Warren-Detroit cars, two Firestone-Columbus cars and two Columbus electric cars; Cutting Car Co., two Cutting touring cars; National Motor Car Co., three National cars; Kissel Automobile Co., five Kissel cars; Burkhard-Crippen Motor Car Co., four Lexington touring cars; W. J. Burt Motor Car Co., two Auburn touring cars; Pacific Coast Motor Car Co., four Fiat cars; Abbott-Detroit Motor Co., four Abbott-Detroit cars; Excelsior Autocycle Co., four Excelsior autocycles; Western Mechanical Works, one Doris touring car; Durocar Mfg. Co., two Durocars; Stanley Steamer Co., one Stanley steamer.

#### Commercial Cars.

The Mission Garage, two Hart-Krau trucks; Hawley C. King & Co., one detached Grabowsky power plant and one Beyster-Detroit delivery car; Gramm Motor Truck Co., three Gramm trucks; Pioneer Commercial Automobile Truck Co., two Randolph trucks and one Reliance truck; Standard Motor Car Co., one Frayer-Miller truck.

#### Accessories.

Standard Oil Co., Zerolene and other lubricants; Hallowell Co., Warner automobile, Martin shock absorber and Earl glass fronts; W. J. Burke Motor Car Co., automobile parts and aeroplane accessories; Western Mechanical Works, Solar Eclipse lamps; Western Rubber & Supply Co., G. & J tires, Miller batteries, Gray & Davis lamps and general accessories; Perkins Wind Shield Co., Perkins windshields; Weinstock-Nichols Co., K-W magnetos, Electrobola head lights; E. A. Featherstone Co., Ball multi-spark plug; Chanslor & Lyon Co., Hartford shock absorbers, "Flash" auto-lighters.

#### Damage That Bumpers Cannot Prevent.

Spring bumpers mounted on the front and sometimes the rear of the car as well, are coming into use rapidly, and where properly mounted serve as a considerable protection to the machine under ordinary conditions. It is important that the driver of a car so equipped shall not allow himself to become overconfident on that account, however. When running through close traffic, particularly when it is made up in part of heavy vehicles, there is constant risk of high tail boards in front and wagon poles in the rear. Both of these evils are of the sort that no bumper will provide against, and the only way of avoiding damage is to be extremely cautious about entering a jam of vehicles.

#### Lighter Springs for Easier Cranking.

Although a knack is required to crank a motor, the cranking often can be rendered easier by the substitution of a lighter releasing spring. When the spring is too strong the slightest relaxing of pressure on

the part of the person cranking the engine causes the handle to fly out and disengage itself, necessitating its being turned around and pressed in place again. As a rule a much lighter spring than is commonly used will serve to keep the ratchet out of engagement while the motor is running, while the liberal use of oil will also facilitate cranking.

#### Electric Horn Comes from Wisconsin.

As its title signifies, it is not strange that the Standard Electric Works, of Racine, Wis., should engage in the manufacture of

electric automobile horns, and that the horn—the Arnold, it is styled—should be of the sort to merit quick attention, is almost as much a matter of course. The horn, which is magnetically operated, is of the bell-shaped variety, with the container, holding the diaphragm, at the smaller end. All working parts are protected by heavy brass castings, and the horn presents a very good appearance.

Ignition batteries, either dry cells or storage, will operate the horn, as it requires but six volts, and the current con-

sumption is claimed to be but seven-eighths of an ampere. The diaphragm is made of special steel and is struck at the rate of several thousand taps per minute by a case hardened hammer. A series of rapid vibrations are set up, and these are concentrated and magnified by the horn.

The horn may be adjusted by the screw A, shown in the accompanying illustration, while B B are screws to take up wear of the platinum points. The latter require adjustment not more than once a year.

The tone of the horn is of such a character that it can be heard a great distance. It is guaranteed in every particular.

#### Gear Clashing that Spells Lubrication.

When a terrible clash follows an attempt to change gears in a car fitted with a cone clutch, the clutch collar should be examined to see whether this member has run

dry. Usually clutch collars are provided with grease cups which should be kept full and screwed down every couple of hundred miles. Usually these cups are forgotten because they are under the foot-board and not in plain sight every time the hood is raised. If the collar has run dry, the probability is that it has heated and seized slightly, thus preventing the clutch from spinning as much as it should to facilitate easy and noiseless gear shifting. A generous greasing of the collar will obviate the difficulty.

#### Brookes Handbook Brought up to Date.

For the benefit of motorists who like their information arranged in alphabetical order and condensed to pocket dimensions, Brookes Automobile Handbook has been revised and reprinted, the 1911 edition just having made its appearance. In justice to the work it may be said that for the most part clarity of description has not been sacrificed for brevity, as sometimes is the case in pocketbook authority; it is clearly and concisely phrased and fairly complete in selection of subjects. As frequently happens with revised textbooks, however, not all matter extraneous to current practice has been expunged, while some unnecessary space has been wasted on descriptions of appliances or devices that never have attained to common use. The bulk of the material, however, should prove directly useful to the owner-driver, the chauffeur or mechanic, and is so placed as to be readily getatable. The book, which is in true pocket form, bound in limp leather, is one of a series of similar works published by Frederick J. Drake & Co., Chicago, Ill.

#### Adjustment of the Brake Beams.

In cases where brake equalizing beams are carried in slots cut in the side members of the frame, the utmost care should be taken when adjusting them to see that the ends of the beams do not hit the ends of the slot when the brakes are applied. As the brakes are being adjusted, the beam may be thought to have sufficient clearance, but upon being used it may reduce the braking power if the end of the slot is resisting the action of the beam. Dust, mud, rust or heavy grease may oppose unequal resistance also to the movements of the two ends of the beam and thereby introduce considerable resistance to their motion.

#### Small Chance for Trade in Chili.

Because of the absence of good roads, the American consul at Valparaiso does not think there is much chance for automobile sales in Chili, although he admits that the few American cars in use are giving good service and are well adapted to the rough roads and severe grades. There are but 30 machines in Valparaiso and vicinity and about 75 or 100 in Santiago, where the streets are smoother.

## MAXWELLS AND BRUSHES REDUCED

**United States Motor Co. Completely Revises Price Lists of Its Popular-Priced Cars—Reductions Are Substantial.**

On January 1 there will go into effect a complete revision of the price lists of Maxwell and Brush cars the revision being of a very pronounced downward character.

The new figures, it is understood, will be officially announced on Sunday next, but, although carefully guarded, the reduced prices of the Brush line already have leaked out. The runabout has been reduced from \$485 to \$450; the roadster, without equipment, to \$485; the delivery wagon from \$685 to \$650.

The paring of the Maxwell prices will approximate 20 per cent.

As no intimation that the United States Motor Co. contemplated reductions of the sort had escaped, the news that they are about to be made cannot well fail to create something of a furore. The reason given for the lowering of prices is that they represent the attainment of results for which United States Motor Co. was organized, the economies born of concentration and specialization having had their logical effect.

### Organizing Dealers in the Southwest.

The Kansas City Automobile Dealers' Association has undertaken the formation of what probably will be styled the Southwestern Automobile Dealers' Association, some 1,500 letters having been addressed to the dealers in that part of the country, and the responses having been sufficient practically to assure the consummation of the project. The meeting for that purpose will be held during the Kansas City show, which occurs during the week beginning February 27.

### Lovell-McConnell Takes Klaxon Sales.

On December 31st the Klaxon Co., of New York, which has marketed the well known Klaxon horns, will wind up its af-

fairs and go out of business. After that date, not only the manufacture but the sale of Klaxons will be conducted by the Lovell-McConnell Mfg. Co. at its factory in Newark, N. J. W. O. Turner, the manager of the Klaxon Co., will become secretary of the Lovell-McConnell company, and will remain in charge of the selling end of the business, in which he so conspicuously has distinguished himself.

### Black Crow Placed on Receiver's Perch.

Judge Carpenter, in the United States District Court in Chicago, on Friday last, 23d inst., appointed Frank McKee receiver for the Black Mfg. Co., of Chicago, manufacturers of the Black Crow car, and for the Marvin Smith Co., which did business at the same address, 215-219 West Ohio street. Both concerns were closely interwoven, the Smith company selling some of the cars made by the Black company. The liabilities of the latter are \$60,139 and assets \$46,673, while the Smith company owes \$18,814.77 and has assets of \$26,074. The Black company started with a motor buggy, but abandoned it last year for a conventional touring car.

### Atwater Kent Institutes Infringement Suit.

The Atwater Kent Manufacturing Works, of Philadelphia, has brought suit in the United States Circuit Court for the Eastern District of Pennsylvania against Jacob Lundgren, of Philadelphia, for infringement of its Letters Patent No. 775,665, issued November 22, 1904, to the Varley Duplex Magnet Co., relative to ignition apparatus. The Atwater Kent people control, in addition to the patent in issue, several patents relative to ignition equipment, spark generators and unisparkers, which they manufacture, and, believing them to be basic in their nature, they state that the suit against Lundgren is but the first they intend to institute in protecting their rights.

### Diamond Establishes Branch in Dallas.

The Diamond Rubber Co. has established a branch in Dallas, Tex., at 2028 Commerce street; it is in charge of C. L. Miller.

## MERGER THAT SEEMS MUCH MIXED

**Reports and Denials of Royal Tourist-Pennsylvania Deal—Cleveland Holding Company Discloses Its Personnel.**

Following the publication late last week of authorized reports that the Royal Tourist Car Co., of Cleveland, Ohio, had acquired the Pennsylvania Auto Motor Co., of Bryn Mawr, Pa., and that an actual start thus had been made toward the building up of the Consolidated Motor Car Co., a merger movement projected last August by Royal Tourist interests, George J. Dunham, president of the Royal Tourist Car Co., issued a "positive denial of the story concerning the Consolidated Motor Car Co. and its connection with the Royal Tourist." Later, Mr. Dunham was met in New York City and to a Motor World man he personally reiterated his denial. He declared that there was not a grain of truth in the story, and stated that it could not be repudiated too emphatically. He regretted that anything had appeared in print, but did not deny that negotiations of some sort were in progress, but said that they are in an "entirely different direction." He added that the publicity man who sent out the report was not authorized to do so, and implied that A. L. Kull, who two or three years ago was prominent in the New York retail trade, had more rather than less to do with the publicity.

The publicity man, a usually reliable chap, insists that he had ample authority, and declares that he personally saw the documents in the case. It was his understanding, he added, that though Mr. Dunham may not be agreeable to the transaction, he, Dunham, represents but a small interest, while 70 or 80 per cent. of the Royal Tourist stock interests are favorable and are party to the deal. The publicity man stated that the Cleveland attorney who was engineering the transaction would be communicated with at once on the long-distance

'phone, and that the lawyer would verify the reports that had been issued. Up to a late hour last night (Wednesday), however, the attorney had not been heard from, nor had E. D. Shurmer, president of the Consolidated company, and generally considered the controlling factor in Royal Tourist affairs, to whom the Motor World had transmitted Mr. Dunham's denial and asked for light on the situation. The Pennsylvania Auto Motor Co. also had been advised of the developments, and asked for similar information, in response to which request the Pennsylvania company wired: "Have no information for publication, as deal has not yet been consummated," implying plainly that it at least was pending and possible.

In the story reporting "the purchase of the entire business and plant" of the Pennsylvania company by the Royal Tourist company, it was stated that the latter had also made "tentative arrangements" for the purchase of the Empire Motor Car Co., of Indianapolis, and "one or two other" companies. The Empire company is owned by several men identified with the National Motor Vehicle Co.

The Royal Tourist company represents the reorganization of the Royal Motor Car Co., which suffered financial embarrassment; it fell heir to the Royal company's Selden license, and as the Pennsylvania Auto Motor Co., whose creditors have been lending a helping hand during recent weeks, does not possess a license, the proposed merger may be viewed from more than one angle.

The Consolidated Motor Car Co. was formed in August last, apparently as a holding company. It was capitalized at \$4,000,000. D. M. Kleinzahler, an investment broker of Youngstown, Ohio, its fiscal representative, being the only man then mentioned in connection with its affairs, although it was well understood that the Royal Tourist interests were behind the merger project. At that time it was given out that one of the objects in view was to sell automobiles direct to the consumer, but this week it was stated that all such ideas had been abandoned, and that the cars, when they come through, will be sold through agents and branch houses, as usual. The personnel of the Consolidated company was not made public until last week, when the story regarding the purchase of the Pennsylvania Auto Motor Co. was given out. E. D. Shurmer, as previously stated, is president, and K. F. Gill, of John Gill & Sons, contractors, is vice-president. The treasurer is A. H. Bedell, who is secretary-treasurer of a large insurance agency in Cleveland, and the secretary is W. D. Forsyth, a consulting engineer. The board of directors is composed of the four officers and O. M. Stafford, F. C. Caine and F. W. Scott. Mr. Stafford is president of the Cleveland Worsted Mills Co and treas-

urer of two Cleveland banks. Mr. Caine is president of the National Concrete Fireproofing Company, and Mr. Scott is with John Gill & Sons.

#### Changes Among Prominent Tradesmen.

Cecil H. Taylor has joined the engineering staff of the E-M-F Co., of Detroit. Previously he was chief engineer of the Hudson Motor Car Co.

C. A. Magee has been appointed auditor of the General Motors Co., and will make his headquarters in Detroit. He comes from St. Louis, where he was comptroller of the Laclede Gas Light Co.

Belmont S. Walters, who left the Pullman Motor Car Co., of York, Pa., to join the Parry Automobile Co., of Indianapolis, has returned to his old love. He is again "talking Pullman" in the Middle West and Southwest.

F. Philip Dorn, secretary and general manager of the American Ball Bearing Co., of Cleveland, Ohio, has resigned the general management, but still retains the secretaryship. Frank H. Teagle has assumed the office of general manager.

Harry S. Houpt, former secretary and manager of the New York company bearing his name, has joined the staff of the American Locomotive Co. He will have charge of the metropolitan sales department, dealing, of course, with the Alco car.

Claude S. Briggs, who several months since joined the staff of the Brush Runabout Co., of Detroit, has been promoted to the post of general manager, in which capacity he will considerably relieve President Frank Briscoe, who also devotes himself to the Alden Sampson Mfg Co. Previous to joining the Brush force, Briggs was president of the Krit Motor Car Co., of which he was the principal organizer. He has disposed of his Krit holdings, but remains president of the Briggs Dental Co. and the American Chair Co., both of Detroit.

#### Six-Cylinder Cars as Dividends.

Six-cylinder motor cars instead of money constitute the first year's dividends offered by a "new automobile company, incorporated under the laws of Toronto," which modestly hides its identity in advertising its unusual proposal in a Toronto paper. Although it declares that it has a "bright future," and that "big dividends are assured," it evidently needs money before it can assure either its future or its dividends, for it advertises as follows:

"We manufacture a six-cylinder, 45 horsepower, five and seven-passenger touring car, and a combination touring car, runabout and light delivery or three in one. We will make you the following proposition: Purchase \$2,500 of the company's stock, and we will give you (free from encumbrance) one of these handsome, powerful touring

cars as your first year's dividend; purchase \$1,500 of the company's stock and we will give you (free from encumbrance) one of the three in one cars as your first year's dividend. Only 25 cars to be given. Investigate at once."

#### Canadian Goodyear Spreading Its Wings.

The Goodyear Tire & Rubber Co. of Canada, Ltd., which recently took over the plant of the Durham Rubber Co. at Bowmanville, Ont., is reaching out in all directions. In addition to its already established house in Toronto, it has located branches at 72 St. Antoine street, Montreal; 150 Princess street, Winnipeg, and 1213 Granville street, Vancouver, and within the next month will open similar stores in St. John, N. B., and Calgary, Alberta. Later it is the intention of the concern, of which F. A. Seiberling, of the Akron (Ohio) Goodyear company, is president, to cross the water and press the sale of its tires in Great Britain, Australia and all other British territory.

#### Building Big Plant for Universal Trucks.

The Universal Motor Truck Co., of Detroit, of which C. H. Haberkorn is president, has commenced work on its plant situated in that city on the line of the Grand Trunk Railroad and Theodore street. The main building will be 84 x 258 feet, four stories in height, of reinforced concrete. The truck which will be built is the design of Vincent Link, the company's engineer.

#### Canadian Factory Begins Car Production.

The Sager "30" is the title of the product of the United Motors, Ltd., which has commenced manufacturing operations in Wel-land, Ont. The car, a four-cylinder touring model, listing at \$1,650, takes its name from Frederick Sager, who, with J. H. Gould, organized the company. At one time or another both men were connected with the Olds Motor Works and other American concerns.

#### United States Motor in Salt Lake.

The United States Motor Co. has established a branch in Salt Lake City under the management of Vernon K. McMains; it will be subsidiary to the United Motor Los Angeles Co., and will handle Maxwell and Columbia cars. The branch temporarily is located at 121 South State street, pending the erection of a new building.

#### Jewel Removed From Hands of Receiver.

After having been in the hands of a receiver since June 24 last the Jewel Carriage Co., of Carthage, Ohio, which manufactures the Ohio car for the Ohio Motor Car Co., again is on its feet. The receiver has been discharged, and incidentally the capital stock of the company has been increased to \$450,000.

**CROXTON HEADS A NEW COMPANY**

**New Yorkers Purchase Croxton-Keeton Assets and Make a New Start—Creditors Will Receive 25 Per Cent.**

As the result of an offer of \$75,000 made by J. P. Stoltz and H. D. Michaels, representing New York interests, the plant and other assets of the Croxton-Keeton Motor Co., of Massillon, O., which was placed in the hands of a receiver in August last, have been purchased by a new company, the Croxton Motor Co., of which H. D. Croxton is president and general manager. Stoltz, who formerly represented the Croxton-Keeton in New York, is vice-president of the new company, and Michaels, secretary and treasurer.

After the sale had been made and had been confirmed by the referee in bankruptcy, the law firm of Johnson & Johnson, of Cleveland, filed a petition asking a review of the proceedings, which action served to prevent the immediate transfer of the property, but the process of incorporating the Croxton Motor Co. was not halted. In the application for an Ohio charter, the authorized capital is stated to be \$250,000, of which \$150,000 is common stock and \$100,000 7 per cent. preferred stock. The incorporators named are Messrs. Croxton, Stoltz and Michaels, and C. P. L. McClean and W. E. N. Hemperly, who will constitute the board of directors. It is stated that the holders of preferred stock in the Croxton-Keeton company will be given preferred stock in the new corporation. The selling price of the Croxton-Keeton assets will net the creditors about 25 per cent.

During the term of the receivership the plant at Massillon has been kept in partial operation and now that the embarrassment has been relieved it will resume full activity, producing the same line of cars and taxicabs as of yore. These all are of the so-called French type with sloping hood and radiator on the dash. The sales manager of the company will be W. F. Melhuish. Vice-President Stoltz will have charge of the New York branch, but Secretary-Treasurer Michaels, a New York real estate man, will remove to the factory in Massillon.

**Prizes to Promote Factory Efficiency.**

On Saturday last the Timken-Detroit Axle Co. put into practice a new idea to promote factory efficiency when cash prizes were awarded to the foremen whose departments were adjudged to have been kept most carefully and most cleanly since November 1 when the prizes first were announced. The first prize, \$25, went to the foreman of the drill press department; the second, \$20, to the foreman of the gear cut-

ting and grinding department, and the third, \$15, to the stockkeeper. "Consolation prizes" of \$5 each were awarded to six other foremen, of whom there were 65. All of them received boxes of cigars, and they in turn presented Superintendent Weaver and Assistant Superintendent Thompson with gold watch fobs.

**Tire Company Formed in New Brunswick.**

The Endurance Tire & Rubber Co., of New Brunswick, N. J., which has been incorporated under the laws of that state with \$100,000 capital stock, has leased a plant at 17 Waters street in New Brunswick, and will at once begin the production of automobile tires and tubes. Clement Eckrode, formerly with the J. Elwood Lee Co., and George E. Russell and Jabez Hyde are the known stockholders. The superintendent of the plant, which at the start will employ only about 25 men, will be James Devine, at one time with Michelin and later with the Federal Rubber Co.

**Detroit Parts Company Buys Big Plot.**

The Auto Parts Co., of Detroit, of which Alfred O. Dunk is president, has purchased a factory site of about three acres in that city comprising the block bounded by Trombly and Milwaukee avenues and Orleans and Dequindre streets, the purchase including three factory buildings standing thereon. The company will at once occupy one of these buildings, and for some time will also operate its present plant at 1379-97 St. Antoine street.

**Stilson Wrenched in Bankruptcy Court.**

The Stilson Motor Car Co., Pittsfield, Mass., was petitioned into bankruptcy on Tuesday last, 27th inst., when John B. Cummings, a lawyer, was appointed receiver. Its liabilities are placed at \$40,000 and assets less than \$3,000. The company undertook to build a six-cylinder car, but never made enough of them to cut any figure in the industry.

**Ignition Company Organized in Detroit.**

The American Ignition Co. has been organized in Detroit with \$25,000 capital stock to take over the Co-operative Manufacturers' Co., doing business at 1231 Woodward avenue, in that city. Charles R. Baxter, Ralph O. Stephenson and Joseph E. Schaefer, Jr., are the stockholders.

**Barnes Plant to Be Sold at Auction.**

By order of the court, the plant of the bankrupt Barnes Motor Car Co. of Detroit (formerly the Anhut Motor Car Co.), will be sold at public auction on Wednesday next, January 4.

**Sandusky Plant Begins Making Parts.**

The plant of the Sandusky Auto Parts & Motor Truck Co., at Sandusky, O., which recently was completed, began operations last week. Nearly 150 men are employed.

**UNITED STATES MOTOR'S BALANCE**

**Big Company Renders Report of Its Financial Condition—How Its Assets Compare With Its Liabilities.**

Following its annual meeting in Jersey City last week, the general balance sheet of the United States Motor Co., as of November 30, 1910, was made public. It shows the following.

Assets.	
Securities of subsidiary companies owned .....	\$20,152,283
Treasury stock .....	524,400
Furniture and fixtures .....	20,141
Improvements .....	119,048
Inventory, etc., at cost .....	898,160
Expenses .....	154,115
Deferred charges .....	164,495
Accounts and notes receivable .....	2,850,299
Cash .....	926,333
Accounts due affiliated companies .....	747,629
Total .....	\$26,556,907

Liabilities.	
Preferred stock .....	\$10,093,300
Common stock .....	11,562,100
Stock script .....	1,383
Notes exchangeable for stock August 1, 1911 .....	1,750,000
Customers' deposits .....	516,587
Annual expenses .....	7,840
Notes receivable .....	319,478
Advances on cars, etc. ....	38,108
Accounts payable .....	22,039
Accounts payable affiliated companies .....	1,279,980
Profit and loss surplus (not including surplus profits of affiliated companies) .....	966,089
Total .....	\$26,556,907

**Western Motor to Remove to Marion.**

The Western Motor Co., manufacturers of the Rutenber motors, are about to transfer their general offices and sales department from Logansport, Ind., to Marion, Ind., where a modern, fireproof factory and office building has been completed, and which will permit of an output of 10,000 motors during 1911. New engines for heavy duty are being built and will be brought out in the early part of next year.

**May Make Motor Trucks in Marine City.**

The Peninsular Motor Truck Co., of Detroit, Mich., has obtained an option on a factory site in Marine City, Mich., and if the citizens of the latter place subscribe for enough of the company's stock, it will erect a plant for the production of two-ton trucks. The citizens are to hold a meeting on January 6, when the necessary pledges are expected to be forthcoming.

**To Produce Leak-Proof Piston Rings.**

The McQuay-Norris Mfg. Co. has leased the building at 1311 Chestnut street, St. Louis, Mo., which will be equipped for the manufacture of a leak-proof piston ring which the company controls. The lease covers a period of five years.

**THE WEEK'S INCORPORATIONS.**

Cincinnati, Ohio.—Motor Car Supply Co., under Ohio laws, with \$50,000 capital. Corporators—Andrew C. Gilligan and others.

Pittsburg, Pa.—Auto Tire & Supply Co., under Pennsylvania laws, with \$10,000 capital; to deal in automobile tires and accessories.

Milwaukee, Wis.—Cream City Auto Co., under Wisconsin laws, with \$5,000 capital. Corporators—H. E. Rogers, Carl Stanum, W. J. Sarres.

Jacksonville, Fla.—Florida Motor Co., under Florida laws, with \$10,000 capital. Corporators—H. P. Clark, Henry N. Carrier, J. A. Forsythe, Jr.

Coroapolis, Pa.—Coroapolis Garage Co., under Pennsylvania laws, with \$6,000 capital; to operate a garage. Corporators—W. F. Venter and others.

Boston, Mass.—Coburn Auto Sales Co., under Massachusetts laws, with \$25,000 capital; to deal in automobiles. Corporators—J. L. Coburn and others.

Detroit, Mich.—Woodward Taxicab Co., under Michigan laws, with \$15,000 capital, to operate a taxicab service. Corporators—Richard Cohen, Victor H. Cohen.

Providence, R. I.—Revere Rubber Co., under Rhode Island laws, with \$4,000,000 capital. Corporators—Judge James Harris, Clarence H. Guild, Walter S. Ballou.

St. Louis, Mo.—American Tire Co., under Missouri laws, with \$10,000 capital; to manufacture and deal in automobile and bicycle tires. Corporators—W. E. Grayson, M. A. Dees.

St. Louis, Mo.—Chicopee Motor Car Co., under Missouri laws, with \$3,000 capital; to manufacture and deal in automobiles, etc. Corporators—Harry C. Carr, Francis V. Carr, of St. Louis County, Mo.; Jackson J. Blincoe.

Chicago, Ill.—National Motor Device Co., under Illinois laws, with \$30,000 capital; to do general manufacturing business. Corporators—C. O. Garmire, R. Leviton, J. H. Hoglund.

East Orange, N. J.—Whiting Motor Co., under New Jersey laws, with \$12,000 capital; to deal in automobiles. Corporators—Harry H. Picking, Charles C. Geyer, Frank T. Ruggles.

Boston, Mass.—Taylor Motor Sales Co., under Massachusetts laws, with \$20,000 capital; to deal in automobiles. Corporators—John I. Taylor, Albert H. C. Mitchell, Hugh A. McBreen.

Indianapolis, Ind.—Auto Purchasing & Exchange Co., under Indiana laws, with \$10,000 capital; to deal in automobiles. Corporators—J. W. Northcutt, F. H. Johnson, F. J. Wallace.

Syracuse, N. Y.—Overland-Syracuse Co., under New York laws, with \$50,000 capital; to deal in automobiles and accessories. Cor-

porators—J. W. Lee, M. B. Lee, C. S. Rockhill, of Syracuse.

Boston, Mass.—Massachusetts Sales Co., under Massachusetts laws, with \$25,000 capital; to deal in automobiles. Corporators—Donald B. Smith, James A. Hartshorn, Arthur L. Crowley.

Boston, Mass.—Commercial Vehicle Association, of Boston, under Massachusetts laws, with \$20,000 capital. Corporators—LeBurton B. Butler, Day Baker, Frank S. Carrew, George P. Dennett.

Chicago, Ill.—Wilson Garage Co., under Illinois laws, with \$10,000 capital; to do general automobile and garage business. Corporators—E. A. Roser, Roy O. MacPherson, Edward J. Best.

Cumberland County, Me.—Hormel Auto-Appliance Co., under Maine laws, with \$1,000,000 capital; to manufacture automobile appliances. Corporators—C. E. Eaton, T. L. Croteau, of Portland, Me.

Portland, Ore.—Doyle Automatic Truck Co., under Oregon laws, with \$50,000 capital; to manufacture and deal in industrial motor vehicles and trucks. Corporators—J. C. Doyle, C. D. Ross, D. Doroit.

Camden, N. J.—Acme Ball Bearing Co., under New Jersey laws, with \$150,000 capital; to manufacture ball bearings for axles, trucks, cars, etc. Corporators—J. A. McPeck, F. R. Hansell, W. F. Eidell.

New York City, N. Y.—Stern Motor Co., under New York laws, with \$100,000 capital; to manufacture motors, engines, vehicles, etc. Corporators—F. M. Randall, P. K. Stern, L. Rosenberg, New York City.

Edgewater, N. J.—Marion Motor Co., under New Jersey laws, with \$100,000 capital; to manufacture automobiles, motor vehicles, etc. Corporators—E. J. Forhan, G. F. Martin, H. P. Jones, all of New York City.

Buffalo, N. Y.—Nichols & Wright Motor Co., under New York laws, with \$300,000 capital; to manufacture motors, engines, etc. Corporators—W. R. D. McQuarrie, C. G. Horning, B. Knox, all of Buffalo.

Los Angeles, Cal.—Corbin Motor Car Co., under California laws, with \$25,000 capital, of which \$500 has been paid in. Corporators—F. A. Linck, Edward Eckl, Wallace Roundtree, Albert Herzog, G. Grueb.

Atlanta, Ga.—Fulton Auto Supply Co., a corporation of the State of Georgia, reorganized with a capital of \$30,000; to deal in automobiles. Corporators—J. W. Goldsmith, Carl W. Fort, Andrew Calhoun.

Chicago, Ill.—Lalor Wagon Co., under Illinois laws, with \$200,000 capital; to manufacture and deal in automobiles, wagons, carriages and other vehicles. Corporators—M. W. Lalor, D. K. Lindout, J. C. K. Lindout.

Boston, Mass.—Aeroplane Co. of America, under Massachusetts laws, with \$100,000 capital; to manufacture and deal in automobiles and aeroplanes. Corporators—Al-

bert C. Triaca, W. Mason Turner, John F. Queen.

Wilmington, Del.—Detachable Wheel Co. of America, under Delaware laws, with \$50,000 capital; to manufacture patented automobile wheels. Corporators—W. N. Akers, M. C. Taylord, W. H. Maloney, all of Wilmington.

Brooklyn, N. Y.—Clark-Norwalk Co., under New York laws, with \$3,000 capital; to manufacture and sell motors, engines, etc. Corporators—Harry Meinken, of Brooklyn; Ella M. Schacht, Joseph G. Quinn, Jr., of New York City.

Detroit, Mich.—American Ignition Co., under Michigan laws, with \$25,000 capital; to manufacture ignition devices for internal combustion engines. Corporators—Charles R. Baxter, Ralph O. Stephenson, Joseph E. Schaefer, Jr.

Paterson, N. J.—Fear-Naught Tire & Rubber Co., under New Jersey laws, with \$125,000 capital; to manufacture automobile tires and vehicle tires. Corporators—E. J. Forham, G. F. Martin, H. P. Jones, all of New York City.

New York City, N. Y.—Windshield Mfg. Co., under New York laws, with \$200,000 capital; to manufacture windshields, tools, appliances, etc. Corporators—W. B. La'shar, Bridgeport, Conn.; H. R. Schwartz, R. H. Montgomery, New York City.

New Brunswick, N. J.—Endurance Tire & Rubber Co., under New Jersey laws, with \$100,000 capital; to manufacture automobile tires and accessories. Corporators—Clement Eckrode, of Conshohocken, Pa.; George B. Russell, Jabez H. Helm, of New Brunswick, N. J.

Hartford, Conn.—Barker Auto Co., under Connecticut laws, with \$6,000 capital; to manufacture and deal in motor vehicles and boats, and accessories. Corporators—Charles Barker, of Terryville; Noble E. Pierce and Kendall M. Pierce, of Bristol, Conn.

**Recent Losses by Fire.**

Charleroi, Pa.—Charleroi Automobile Co., garage destroyed; loss, \$20,000.

Cleveland, Ohio—Gabriel Horn Mfg. Co., factory destroyed; loss estimated at \$75,000.

Watertown, Mass.—Edward M. Clancy's garage on Waltham street destroyed; loss, \$1,000.

Lockport, N. Y.—Dusault Garage, on Buffalo street, and contents burned. Loss, \$10,000. Caused by crossed electric wires.

**Dissolutions.**

The Chicago Taxicab Co., of Chicago, Ill., has certified to a dissolution of business.

The F. E. Bowers Co., of New Haven, Conn., has filed its final certificate of dissolution.

## IN THE RETAIL WORLD.

A new garage has been opened on Morton street, Richmond, Va. A. Anderson is the owner.

Work is progressing rapidly on a new garage which is being built in Coeur d'Alenes, Ia. W. A. Boggs is the owner.

W. L. Lynde is building a garage in Los Angeles, Cal. It will be at 133 Locust avenue, two stories high, 50x150 feet, with concrete floors.

The McCulley-Deane Co. is the style of a new accessory house which has been opened in St. Louis, Mo. It is located at 3919 Olive street.

The Motor Accessories Co., which recently was formed at Indianapolis, Ind., has opened a salesroom at 323 North Pennsylvania street.

Work has been started upon a new garage on Dat street, Cambridge, Mass. Thomas H. Kingston and Freeman B. Horseman are building it.

Charles E. and Cora Bloomhuff have leased the building at 5535-37 State street, Chicago, Ill., for a term of seven years. They will use it as a garage.

Washington, Pa., has a new garage at 448 West Chestnut street, where the Clutter Automobile Co. has been established. B. R. Clutter is the manager.

H. Canoll, of Monrovia, Cal., is building a garage 53x100 feet. It will be of reinforced concrete, two stories high, with enameled brick front and plate glass.

The Connellsville Automobile Co. has been formed in the Pennsylvania town of that name. J. B. Slonecker, Harry Williams and James Guyna are the partners.

A garage 32x100 feet is being erected behind the Unique Theater in Tuscaloosa, Ala. It will be one story high, of brick, with plate-glass front, and will face on 7th street.

The Nyberg-Waukesha Automobile Co. is a new concern which just opened a salesroom and garage on Broadway, in Waukesha, Wis. Nyberg cars will be dealt in exclusively.

Dulmage & Smith is the style of a new firm which has "opened up" at the corner of Seventh and Ankeny streets, Portland, Ore. Elmore pleasure cars and Rapid trucks are to be sold.

Work has been started upon a garage to be erected on Liverpool street, East Boston, Mass., by Lin McKie, who will handle Velie cars. The building will be ready for occupancy on May 1, 1911.

R. C. Hulbert, of Los Angeles, Cal., has opened a tire and accessories store in the Angel City. He will operate under the style the Hulbert Rubber Co., with headquarters at 1040 South Main street.

C. L. Lokker and Herman Prins have formed a partnership and are building a garage on the corner of Columbia and

Eighth streets, Holland, Mich. It will be ready for occupancy early in spring.

H. W. and W. A. Buckins have formed the Standard Motor Car Exchange, in Lancaster, Pa., and opened headquarters at 110-114 North Water street. They will maintain a garage and also deal in used cars.

The Youngstown Auto Co. has been organized in the Ohio city of the name, with W. S. Westerbrook and John Goppinger as the principal members of the firm. A garage is to be erected at once in the rear of 511 Market street.

Fred F. Thompson, of Lawton, Okla., has purchased the business of the McDuffie Motor Car Co., of the same town, and will occupy its building at 620 D avenue, under the style the Lawton Garage. He handles the Maxwell line.

A petition in involuntary bankruptcy has been filed against the City Garage, Inc., at White Plains, N. Y., by the Fisk Rubber Co., of Chicopee Falls, Mass., a creditor for \$2,438. The assets of the company are estimated at \$5,000.

The Northwest Auto Co., of Seattle Wash., formerly Northwestern distributor for Buick cars, has relinquished that line and taken the agencies for Reo and Apperson cars. Its new salesrooms are at 511-513 East Pike street.

Wilkinson & Faulkner have begun business in Lincoln, Neb., Rees Wilkinson and Bert E. Faulkner comprising the firm. They will handle the Rauch & Lang electric line in temporary quarters at 1406 O street until their new building is completed.

Fred J. Wagner, of San Francisco Cal., has taken over the interests of the Wagner & Reniffe Co., in which he was a partner, and formed a new company under the style of the Auburn Motor Car Co. As the name indicates, he will handle Auburn cars.

The Boston sales end of the American Motor Co., of Brockton, Mass., has been taken over by the Kenneth Motor Co., at the head of which is Raymond S. Joo. The headquarters of the concern are at 173 Huntington avenue, while the garage is at 330 Newbury street.

Harrah & Stewart, who for many years have dealt in solid rubber tires for buggies, have entered the automobile supply business and opened a large accessory department at 514-520 East Court avenue, Des Moines, Ia. William F. Harrah and George B. Stewart are the members of the firm.

In Alliance, Ohio, the Standard Auto Co. has been formed by C. L. Akins W. T. King and E. A. Fisher, the latter of Detroit. In addition to operating a garage, the company will conduct the business of what was formerly the Michigan & Ohio Welding Co., which belonged to E. A. Fisher.

The Imperial Car Co., recently incorporated with \$150,000 capital stock by

Harry Strauss and others in Cincinnati, Ohio, has purchased a large plot on Madison road, 66x234 feet, and will erect a garage thereon. The building will be 62x200 feet, three stories high and will cost \$50,000.

Henry L. Johnson, former Boston agent for Premier cars, has been appointed manager of the new branch established in Indianapolis, Ind., for the sale of Premier cars. The Gibson Automobile Co., which heretofore handled the Premier line in addition to several others, hereafter will deal in Marion cars exclusively.

E. J. Welch, owner of the Welch brass foundry, Fitchburg, Mass., and F. S. Sutherland, of the Boston branch of the Peerless Motor Car Co., have formed a partnership under the style of Welch & Sutherland. They will operate a garage at 80-86 Lunenburg street, Fitchburg, Mass., and handle the Peerless and Chalmers cars.

W. A. Norton and S. A. Newland, who conducted a gasoline engine business at 21 North First avenue, Marshalltown, Ia., have sold their interests to G. A. Gauthun and K. Bratteig, of the same town. Norton will henceforth devote his time to automobiles, having gone into partnership with W. Bohr, under the style of Mohr & Norton.

W. H. Luesing, one of the partners of the Southern Auto Co., of Louisville, Ky., has filed a petition for dissolution of partnership. The plaintiff alleges that the firm, which is composed of himself, W. H. Montgomery and William A. Baker, owes him \$7,500, and that disagreements among the members of the firm render it impossible to continue business.

An involuntary petition in bankruptcy has been filed in the Federal Court at Houston, Tex., against the Standard Auto Co., of which E. E. Guthrie is president. The petitioning creditors are: Texas Motor Car Co., of San Antonio (\$220); Houston Chronicle Pub. Co. (\$346.10); Bonner Oil Co. (\$128). The company was incorporated about a year ago, and had its salesroom and garage at the corner of Louisiana street and Rusk avenue.

## Rochester Dealers Vote Against Show.

The automobile show which, for the past three years has been held by the Rochester (N. Y.) Automobile Dealers' Association, will not be repeated this year. At a meeting of that association, held last week, it was found that there was practically no demand for the show, hence its abandonment.

## Insurance Policies as Christmas Gifts.

As a Christmas present, each employee of the Velie Motor Vehicle and the Velie Carriage companies received a paid-up 20-year endowment life and accident insurance policy for \$1,000 in his pay envelope. It was the gift of W. L. Velie, the president.

## The Best Proposition for the Dealer

**I**F you are a dealer in vehicles and have watched the encroachment of the automobile trade, perhaps even affiliated yourself with the automobile industry and added touring cars to your line, you still may have found the problem of a successful paying business unsolved. The competition in touring cars is keen—there are so many products—so many claims—so many talking points that it is difficult for real merit to be demonstrated. But in the line of commercial vehicles—the trucks and delivery wagons, competition is much less keen. In fact, one can enumerate on the fingers of one hand the number of manufacturers who have successfully produced motor trucks.

**White Motor Trucks** Conspicuous among these is the White Company. Our one and a half and three ton trucks and fifteen-hundred pound delivery wagons—vehicles that have been tested from Maine to Texas in the hands of countless owners on level streets and cross-country roads, in every case return a verdict of efficiency.

**White Trucks Save** Economy of up-keep and economy of operation has been proven in so many cases there can no longer be a question of the real saving to be made for any customer who has sufficient hauling to be done. White trucks are more reliable than horses—not so liable to injury—not so likely to be laid up at the busy season, they are untiring, capable of being worked twenty-four hours a day if necessary and just as efficient the last hour as the first. These features make White trucks selling propositions—the kind that any dealer likes to push—the kind upon which he can stake his reputation. Why not follow the path of least resistance and sell the things the people want—White Motor Trucks.

Catalogues, testimonials and other literature gladly sent upon request.

### Looking Backward and Forward.

"Look forward, not backward," is an inspiring sentiment and has its uses; but just the same the man who occasionally does not look backward and survey the field over which he passed is far more likely to take blundering mis-steps than is he who is given to surveys of this sort. The closing of an old year and the dawn of a new one always is a fitting season for such retrospect. For it is on the mistakes of the past that the future is corrected. It is hindsight that assists foresight.

A look backward—a long look backward and then a look forward—a long forward look will serve to good purpose those who comprise the automobile industry. In the receding distance will be found dimly outlined days that will come no more—the days of fizz and fireworks, of fun and frolic and "easy money," and lots of it. For if the embers of the dying year render clearer a particular fact, it is that the automobile

industry no longer is a hoity-toity business; like life itself, it has become very real and very earnest; and life has been likened to a nettle of which it has been said: "Disturb it, it stings; grasp it firmly, it stings not." It is the men of firm grasp who will escape the stings of the trade. There are men who have blundered into success despite themselves; but they are not many. Though success often is a matter of opportunity, it is the exception when it is a creation of luck. It is the strong man who finally prevails—the man who knows when to tighten his belt and how to resist temptation; who knows the folly of painting the lily and chasing the rainbow; who recognizes the truth when he sees it; who does not deceive himself, and who is content to believe that but a very small part of the earth is his portion.

The past year has been a not unkindly one. Many problems of the industry have settled themselves; others are in process of settlement, so gradual as scarcely to be felt. Many weak brothers have folded their tents, not a few so silently as scarcely to be missed. In the nature of things others will do likewise; the fittest will survive. It is not a time for pessimism but the optimism must be of the sort that is not fired by fizz or fireworks. All signs indicate that just ahead there is a period of fierce competition—competition that will move men to reach out in this direction and in that one without too much thought of ultimate result or with too much intensity born of war-like mood or too much faith born of confidence in self. It is a time to keep feet planted firmly on the ground, and, while looking forward, to reach not too far or too often.

### Introducing the Business Wagon.

Commercial vehicle salesmen have found it necessary to overthrow a good many false impressions in endeavoring to introduce the business wagon to the business man as a purely business proposition. In a sense the measure of their success is the measure of their ability to dispel mistaken notions as to the purpose and scope of the automobile. But there yet remains to be done considerable further work in the same direction. To the average understanding, the motor truck even yet is too much a special product, its use savors too much of a business stunt, to be wholly advantageous to the market and so to the industry.

One particular illusion which is cherished by many merchants and manufacturers is that the automobile in itself possesses a large amount of advertising value to its user. That there is a certain basis of fact in the assumption is what lends it its deceptive quality. That the impression is general and is shared alike by many users and non-users of commercial automobiles does not alter the fact that its tendency is not wholesome.

That the commercial motor has a certain advertising value goes without saying, nor should that value in the least be depreciated. It is concerning the exact magnitude and import of the automobile as an advertising medium in business that the misconception has arisen. There is publicity in the display of even the mere business card or of a firm name painted on the side of a wagon. If it be a motor wagon, instead of a horse-drawn one, that value may be said to be increased proportionately because its greater radius of travel brings it within the range of vision of a greater number of people in a given period. It is possible even to compute the advertising value of a motor truck on the basis of its average daily mileage, the average traffic on the streets and the area utilized. The calculation is a very pretty and pleasing pastime and in its way is convincing but it does not cover the ground. It expresses only one phase of the question and the least important phase at that.

The true value of the motor truck is that it affords means for local transportation in a cheaper and more expeditious fashion than can be obtained in any other way. Just as labor saving machinery, improved processes, simplified operations and other media of the production engineer accelerate business by speeding up certain intermediary steps so the motor vehicle accelerates business by increasing the rate of local goods movement. The automobile itself occupies exactly the same relation to the ultimate result as does any other mechanical contrivance which serves the same generic purpose. The business which employs it may be distinguished by the expedition with which it accomplishes results, by the quantity of work which it turns over, by its adoption of modern and approved methods of accomplishing results. But the mere use of special machinery, automobile or otherwise, never can benefit it of itself, because it is possible to misuse even improved

machinery, to render it a serious burden on any undertaking, as well as a help. Success with motor vehicles depends quite as much on the way the machine is run as on the nature of the equipment.

The wise commercial vehicle salesman is striving to instil the idea that the motor truck is merely a means to an end, a progressive instrument through the use of which work can be expedited and costs reduced. The prospective buyer who seeks a concession on the purchase price because of the advertising value of the equipment

to the automobile manufacturer, like the motor truck salesman who aims to increase his sales by urging the advertising value of the equipment to its owner as a leading feature, is manifestly on the wrong track. The point to be urged is that the motor truck is nothing more nor less than a utensil the worth of which can be measured only in terms of what it accomplishes.

The manner in which rival shows are springing up in various cities is much to be regretted; every effort should be made

to avoid such clashes. Except for the pockets of the individual promoter, one good show is far better for the trade than two "pretty good" ones, and, however keen may be their rivalry, the dealers concerned should recognize the truth and for common benefit should endeavor to patch up a truce, if only for the occasion. They are the men who must "pay the freight," and however seductive may be the wiles of the promoter, the dealers should be wise enough to grasp that, when rival shows occur, one always suffers by comparison.

## COMING EVENTS

December 24-31, Los Angeles, Cal.—Second annual show of Licensed Motor Car Dealers' Association of Los Angeles at Fiesta Park.

December 31-January 7, New York City—"Independent" automobile show in Grand Central Palace.

January 2, Guttenberg, N. J.—Racemeet on Guttenberg track.

January 2, Tucson, Ariz.—Racemeet under auspices of Tucson Automobile Club.

January 2-7, New York City—Importers' automobile show in Hotel Astor.

January 7-14, New York City—Association of Licensed Automobile Manufacturers' eleventh annual show in Madison Square Garden. Pleasure cars and accessories.

January 10, New York City.—Meeting of executive committee of American Automobile Association.

January 11, New York City.—Meeting of executive committee of National Association of Automobile Manufacturers.

January 11, New York City.—Meeting of the executive committee of the Association of Licensed Automobile Manufacturers.

January 11-12, New York City—Annual meeting of the Society of Automobile Engineers.

January 12, New York City.—Meeting of board of managers of the Association of Licensed Automobile Manufacturers.

January 13, New York City—Annual banquet of the Motor and Accessory Manufacturers at Waldorf-Astoria.

January 14-15, Los Angeles, Cal.—Race-meet on Los Angeles motordrome.

January 14-21, Milwaukee, Wis.—Milwaukee Automobile Dealers' Association's second annual show in the Auditorium.

January 14-28, Philadelphia, Pa.—Annual show of Philadelphia Licensed Automobile Dealers' Association in Third Regiment Armory.

January 16-21, New York City—Association of Licensed Automobile Manufacturers' eleventh annual show in Madison Square Garden. Second week devoted to commercial vehicles.

January 16-21, Detroit, Mich.—Detroit Automobile Dealers' Association's annual show in Wayne Pavilion.

January 17-18, Philadelphia, Pa.—Quaker City Motor Club's roadability run to Harrisburg, Pa., and return.

January 18, New York City—Annual banquet of the Automobile Trade Credit Association.

January 25-28, St. Paul, Minn.—First annual show of automobile dealers in Auditorium.

January 28-February 4, Chicago, Ill.—National Association of Automobile Manufacturers' tenth annual national show in Coliseum. Pleasure cars and accessories only.

February 6-11, Chicago, Ill.—National Association of Automobile Manufacturers' tenth national show in Coliseum. Pleasure and commercial cars, motorcycles and accessories.

February 6-11, Buffalo, N. Y.—Annual show.

February 13-18, Washington, D. C.—Second annual show in Convention hall.

February 13-18, Winnipeg, Canada.—Winnipeg Motor Trades Association's show.

February 14-18, Dayton, Ohio—Second annual show in Memorial building.

February 18-25, Binghamton, N. Y.—Annual show.

February 18-25, Minneapolis, Minn.—Minneapolis Automobile Show Association's annual show in National Guard Armory.

February 18-25, Newark, N. J.—New Jersey Automobile Exhibition Co.'s fourth annual show.

February 18-26, Brooklyn, N. Y.—First annual show of Brooklyn automobile dealers at 23d Regiment armory.

February 20, Cleveland, O.—Show in Central Armory.

February 20-25, Baltimore, Md.—Annual show in Fifth Regiment Armory.

February 20-25, Cincinnati, O.—Cincinnati Automobile Dealers' Association's show in Music Hall.

February 20-25, Omaha, Neb.—Third annual show of the Omaha Automobile Show Association in Auditorium.

February 24-27, New Orleans, La.—First annual show of New Orleans Automobile Club at Fair Grounds.

February 24-25, Keene, N. H.—Consolidated Motorcyclists' third annual motor-vehicle show.

February 25-27, New Orleans, La.—New Orleans Automobile Club's annual Mardi Gras racemeet on Fair Grounds track.

February 25-March 4, Toronto, Canada—Annual show under auspices of Ontario Motor League.

February 27-March 4, Kansas City, Mo.—Fifth annual show of Kansas City Automobile Dealers' Association.

February 27-March 4, Sioux City, Ia.—Automobile Dealers' Association's annual show.

March 4-11, Boston, Mass.—Boston Automobile Dealers' Association's annual show in Mechanics building.

March 6-11, Dayton, Ohio—Dayton Automobile Club's show in Memorial building.

March 7-11, Des Moines, Ia.—Third annual show of Des Moines Automobile Dealers' Association at the Coliseum.

March 11-18, Cleveland, O.—Manufacturers and Dealers' Association's show in Central Armory.

March 14-18, Denver, Colo.—Annual show in Denver auditorium.

March 14-18, Syracuse, N. Y.—Syracuse Automobile Dealers' Association's second annual show in State Armory.

March 15-18, Louisville, Ky.—Louisville Automobile Dealers' Association's annual show in First Regiment Armory.

March 18-25, Pittsburg, Pa.—Annual show in the Exposition Building.

April 1-8, Montreal, Can.—Annual show in Coliseum.

# WHAT THE PALACE SHOW WILL OFFER

Seventy-two Exhibits of Cars and Trucks to be Staged, Most of Them New and Some of Them Novel—Aeroplanes, However, Take the Place of Accessories:

DECORATIVE SCHEME FOR MAIN ROTUNDA OF GRAND CENTRAL PALACE SHOW

When the "independent" show in Grand Central Palace, New York, is opened on Saturday evening next, 31st inst., there will be disclosed more cars bearing names new to New York and the East generally than a goodly portion of the East has imagined were in existence. While cars of eastern manufacture will not be lacking, the show will be essentially an eastern exhibition of western cars.

The products of no less than 72 manu-

facturers will be in evidence, a number sufficient to "give pause" even to seasoned veterans of the trade who may have fancied that after the Selden patent and the Association of Licensed Automobile Manufacturers opened up some ten months ago and gathered in most of those who constituted the previous "independent" shows in Grand Central Palace, there would not be left enough "independents" to prevent echoes from chasing themselves in that

capacious structure. But as the roll attests, the soil of the industry has been fertile, and if it has given root to new cars and strange ones in strange places, so also has it prospered some splendid creations tended by skilled hands and fathered by men well known in other fields of industry.

It is not in cars that the Palace show will be found lacking, but in accessories. It will be an automobile show minus auto-

mobile accessories. For though the promoters figuratively moved heaven and earth and brought all manner of pressure to bear, they failed to enlist the manufacturers of the thousand and one big things and little things that go to make the motor car complete and more convenient or more comfortable. The Palace show failed to obtain a sanction from the National Association of Automobile Manufacturers, and as a result all who exhibit there must perforce expect to find the sanctioned shows in Madison Square Garden in New York, and in the Coliseum in Chicago, closed to them. Few cared to be so "ostracised," and as a result the accessory department at the Palace will cut but a sorry figure. Including two club exhibits, there are but 28 accessories displays listed, and of the 28, the names of scarcely half a dozen are familiar to the trade.

When the promoters—two residents of Troy, N. Y., who are operating as the American Motor Car Manufacturers' Exhibit Association—realized that despite their best efforts accessory exhibits would be conspicuous by their absence, they turned to aeroplanes to fill the void, and during recent weeks, it has been made appear that the show will be almost as much an exhibition of air craft as of road vehicles. The display of the former promises to be a rather notable one, and is expected to assist materially in attracting the public to the box office. It was through the medium of the aeroplane that the interest of Gen. Fred D. Grant commander of the Department of the East was enlisted, and it largely is because of it that he will go through the motions of formally opening the show Saturday evening.

The show promises to prove pleasing to the eye, for the decorative hand has not been stayed. The interior of the building is to be transformed into an Italian garden, with the rotunda forming the main court yard. Crimson and cream are to constitute the color scheme, and the illumination has been so shaded that it is declared the effect will be "gorgeous without being glaring."

Although, due to the lack of accessories, the show will be of almost tabloid proportions, the exhibits will be of considerable interest, owing to the presence of a number of products which never before have appeared in New York. There will be some 30 odd exhibits of products which are brand new, or which hitherto have figured only at local shows in the immediate neighborhoods where they are built, while no less than 18 other productions, though more generally known, never have been staged at a show in New York City.

Viewed from another angle the show will be significant of the trend of the times as revealing the uprising of a number of builders of commercial vehicles not a few of which devote themselves exclusively to the building of business wagons. In both

lines the newer products will reveal strikingly original points in many instances, this being especially true of the commercial side of the show. Something like 50 different makes of pleasure car will be shown as follows:

Abbott-Detroit, Alpena Flyer, Arbenz, Babcock, Bergdoll, Beyster-Detroit, Black Crow, Carhartt, Clarke, Cole, Coleman, Correja, Crawford, Cunningham, Cutting, Cyklonette, De Tamble, Findlay, Firestone-Columbus, Gaylord, Henry, Houpt-Rockwell, Imperial, International, Isotta, Johnson, Kelsey Motorette, Krit, Lexington, Lion, McFarlan Six, Metz, Michigan, Norwalk, Oliver, Only, Otto, Owosso, Paige-

E. W. ARBOCAST  
General Manager De Tamble Motors Co.

Detroit, Parry, Paterson, Penn, Petrel, Roader, Velie, Whiting, Warren-Detroit, Washington.

The score or more of commercial vehicles will include the following:

American Standard, American, Babcock, Beyster-Detroit, Buffalo, Cass, Chase, Coleman, Cortland, Crown, Geneva, Gramm, Hart-Kraft, Ideal, International, Johnson, Kelly, Little Giant, Maytag, Monitor, Oliver, Penn-Unit, Saurer, Seitz.

If the unusual in motor car construction be sought in particular, interest may be expected to center about the three-wheeled vehicle, which is experiencing what may be termed a recall to life, since it is of ancient origin. Two different types of vehicle of this style will be shown, one, the Cyklonette being a German importation, and the other, the Kelsey Motorette, having been conceived and executed in Hartford, Conn. As representing diametrically opposite views of the three-wheeled problem, the former has its motor mounted over the front wheel by means of which the machine is steered as well as propelled. The latter is driven from a single wheel in the rear, though the front wheels are employed for guidance.

Another unusual type, though not strictly a new car except in the sense of mak-

ing its first appearance at a show, is the Only car. This creation is possessed of a 12 horsepower single-cylinder engine of  $5\frac{1}{8}$  by 10 inches dimensions, but otherwise is not particularly extraordinary in construction. It is built for speeding purposes chiefly, and is guaranteed to cover 30 miles on a gallon of gasoline, to go at the rate of 60 miles an hour, and also is guaranteed free of repairs, or rather repairs free, for one year.

A no less striking car in its way, though possessed of features which have gained wider recognition in this country, is the new underslung Krit, which, owing to the manner of its suspension, is enabled to run with safety on a 96-inch wheel base with 36-inch wheels. Though quite well known, the Krit line has not before been shown at a New York exposition. Those who are familiar with its previous construction, however, will recognize in it sundry alterations, even apart from the peculiar features of the underslung model, such new points including the use of independent clutch and brake pedals, increased radiator capacity and other minor improvements.

Among the several makes of car which, though new to the show, already are well known locally because of their solid characteristics, may be mentioned the Bergdoll, which now is equipped with a unit power plant of the four-cylinder type, having a particularly neat block motor with double ball bearing crank shaft, water jacketed intake pipe and other essentially modern features. The pressed steel rear axle and double universal jointed propeller shaft construction are new on the models which will be on view at the Palace. Another car which likewise is equipped with a unit power plant of considerable individual merit is the Cunningham. This car, which still ranks among the comparatively new products, though by no means an untried one, also has the advantages of valves mounted in the head, dust-proof valve gear and offset cylinders.

Other cars which properly belong in the same general class are the Carhartt, Lion, Warren-Detroit, Abbott-Detroit and Washington. The latter machine, by the way, while it is practically unknown to the New York showgoer in its present form, is not strictly new to New York shows inasmuch as it made an initial appearance some years ago at the Palace at which time it was graced by two engines—one engine to make it go and the other to make it go fast. Since that method of construction was abandoned, however, the machine has risen to greater prominence through actual road achievements.

As typifying what, perhaps, will strike the impartial observer as one of the most noteworthy features of the exhibition as a whole, namely, the considerable proportion of cars in which a relatively large amount of automobile is offered for a relatively small price, the De Tamble line may be

instanced. The De Tamble cars are shapely and well proportioned creations that suggest the lines of the "topmost trio" in certain respects, but yet are placed within the reach of the man of moderate means. The McFarlan six cylinder product is another which is striking in this respect, it being made in both "big six" and "little six" styles, to sell at prices that are, to say the least, by no means immoderate. The Henry, Whiting, Cutting, Alpena, Penn and Petrel—the latter friction driven—are other cars belonging in the same general category.

The Johnson, while not a new product, is shown for the first time in New York, the last appearance of a product of the same builder being in the days when his

B. B. HUNTER  
Manager, Maytag-Mason Motor Co.

adherence was entirely to steam power. The Babcock is an eastern production of an old carriage builder, which is new to the show; the Gaylord, from Michigan, likewise is new and is featured in what is termed a utility model, which may be used for either business or pleasure. It may be converted to the latter use by adding a rear seat to the open tray body. The Maytag, or Maytag-Mason, as it perhaps is better known, which is now built in commercial as well as pleasure form, affords another illustration of the same general principle, one of the new models of that make being promised in a "two-in-one" form with interchangeable bodies for work and recreation, according to the owner's fancy.

The Otto will make its second appearance at the Palace, its first having been made a year ago, when it appeared in thoroughly rational form as a generally standard type of car of the medium-powered class. The Firestone-Columbus likewise is a car which is not new to the show. This year it will

#### CONSPICUOUS FIGURES IN THE "INDEPENDENT" TRADE

W. L. VELIE  
President Velie Motor Vehicle Co.

appear in somewhat improved form, with an unusual ignition combination in which the Atwater Kent single-spark system is employed in conjunction with the Mea magneto for ordinary running. One en-

J. J. COLE  
President Cole Motor Car Co.

tirely new model of 32-36 horsepower will be shown, which, like the other style which will be on exhibition, has a new type of pressed steel rear axle, and is mounted throughout on annular ball bearings.

The Paige-Detroit now is made with a four-cycle four-cylinder motor, instead of the two-cycle three-cylinder with which the earlier models were equipped, and has been considerably enlarged and improved. The Velie has, by way of new features, adjust-

able pedals, cork inserts in its three-plate clutch and bushed pistons. The Cole, which is equipped with a neat form of unit power plant, now has a ball bearing mounted change gear and a full floating rear axle, in place of the semi-floating equipment formerly used. Its cylinder dimensions have been increased from 4 by 4 to 4¼ by 4½ inches, and its wheel base from 115 to 118 inches.

In the realm of the business wagon, though not occupying a special department of the show, will be revealed not a little of real ingenuity as well as novelty. One of the most striking vehicles of this class will be the American Standard, as it must be known to distinguish it from the older and perhaps more familiar American truck

H. P. STAVER  
President Staver Carriage Co.

which is made in Lockport, N. Y., instead of in Detroit. The American Standard is built on the four-wheel drive plan, but with its front and rear axles swivelled, instead of being rigidly attached to the frame, so that it is steered from both ends. Besides enabling it to turn in very short radius, therefore, this arrangement is so constituted that the vehicle may be made to run obliquely across the street upon proper manipulation of the steering gear—a feature which at times may be put to very good use. The motor, which is of the horizontal opposed pattern, is mounted in the center of the vehicle and drives by chain to both axles.

In the Seitz may be found another example of originality in truck design. It is of the friction drive type, but the transmission is arranged on a very novel plan. The drive is transmitted through a central disk which is directly driven from the engine. Four driven disks, two on each side of the driver, are arranged to pinch the lat-

ter in order to secure the necessary driving friction without end thrust. The degree of friction is regulated by means of a hand lever, but the changes of speed are obtained by rocking a toe-plate on the floor board which has the effect of putting in motion a worm-gearred arrangement, driven by the engine, by which the driven disks are shifted across the diameter of the driver in order to make contact at different points on its surface. The operation of gear changing is thus rendered free from manual effort.

Among other new trucks is the Cass, which is a sturdy little product of approved construction and proven qualities, and also the Victor which, though new to the shows, already has made a name for itself in the field. The Penn-Unit, as its name implies, is built on the sectional plan, either the engine or change gear being demountable without necessitating the disturbance of other portions of the machine. In the new Oliver the same idea has been applied in a somewhat different manner, the entire power plant being removable complete. By removing two bolts and a strap, and breaking the gasoline connection and disconnecting the operating pedals, the unit may be withdrawn, including the engine, change gear, radiator, magneto and muffler.

The Kelly, formerly known as the Frayer-Miller, while it has not been exhibited under its present name, already is well-known for its successful application of the air-cooling principle. The use of forced draught through chimneys surrounding the cylinders is retained, but the construction of the machine has been altered in a few less material respects. The Buffalo is another car which has not been exhibited in the shows under its present name, though well known in service. It has been considerably improved in the development of the latest types by the adoption of such features as spring radiator suspension, removable sprocket rings, counter shaft brakes and, on the 1,500-pound type, selective gear.

In the class of lighter machines which are new may be mentioned the Ideal, which is equipped with a "fool-proof" change gear system, which is intended to protect the gears from abuse and is of 1,000-pound capacity. Like many other of the new light commercial cars, it is magneto equipped. The Little Giant is another of the same sort, its features being thoroughly original, however, and revealing considerable ingenuity. Like the former vehicle, it is equipped with an opposed motor of compact construction. In the Geneva the opposed motor is rendered even more accessible than commonly is the case with motors of the opposed type by placing it very low down in front. In the Cortland, the purchaser is offered the somewhat unusual option of either air or water cooling. The machine is another of the relatively light class, and is built in ten-passenger bus form as well as for delivery duty.

Certain of the commercial vehicles which are familiar to visitors at the Palace shows of the past and also to those who observe the vehicles which are in daily use upon the streets in considerable numbers also will be included among the exhibits next week. Among them one which has progressed very steadily from a comparatively early beginning is the Gramm. The new one-ton model of this make is equipped with a block motor of approved pattern employed in conjunction with the unit type of power plant which is generally approved for touring cars of the lighter order. There also is a new five-ton model which is new, as well as sundry new features such as spring

HOMER WARREN  
President Warren Motor Car Co.

radiator suspension, original disk clutch design and enclosed brakes which are to be found on all models.

The Chase line is another which is well known. It is distinguished by an original application of air cooling with a single fan embodied in the flywheel to the two-cycle type of engine the use of lubricating oil mixed with the fuel is another point which is a little out of the ordinary though approved by many engineers. Recent improvements in the line include the use of heavier steering gear parts and wheels, larger rear axles and a wider steering lock. The model J, which is of 30 horsepower, has 36-inch wheels in front and 38-inch in the rear, equipped with solid tires, and is fitted with a cone clutch and selective type of sliding gear transmission.

The new onitor model B is similar in many respects to the A model formerly produced, but has a 24 horsepower motor, selective sliding gearset, cone clutch, double brakes and in general is of much heavier construction. The Hartin, which likewise is built for delivery purposes, has an original form of power plant, in which the engine, change gear and counter shaft are built as a unit and suspended from three points.

The complete list of exhibitors and the wares they display follows:

#### Cars and Trucks.

- Abbott Motor Co., Detroit, Mich.—Abbott-Detroit pleasure cars.
- Alpena Motor Car Co., Alpena, Mich.—Alpena Flyer pleasure cars.
- American Motor Truck Co. of Michigan, Detroit, Mich.—American trucks.
- American Motor Truck Co., Lockport, N. Y.—American trucks.
- Atterbury Motor Car Co., Buffalo, N. Y.—Buffalo trucks.
- Babcock Co., H. H., Watertown, N. Y.—Babcock pleasure cars.
- Bader, C. S., New York City—Lexington pleasure cars.
- Bergdoll Motor Car Co., L. J., Philadelphia, Pa.—Bergdoll pleasure cars.
- Beyster-Detroit Motor Car Co., Detroit, Mich.—Beyster-Detroit trucks.
- Carter Motor Car Corp., Washington, D. C.—Washington pleasure cars.
- Carhartt Automobile Corp., Detroit, Mich.—Carhartt pleasure cars.
- Car Makers Selling Co., Chicago, Ill.—De Tamble pleasure cars.
- Cass Motor Truck Co., Port Huron, Mich.—Cass trucks.
- Chase Motor Truck Co., Syracuse, N. Y.—Chase trucks.
- Chicago Pneumatic Tool Co., Chicago, Ill.—Little Giant trucks.
- Clarke-Carter Automobile Co., Jackson, Mich.—Cutting pleasure cars.
- Colt-Stratton Co., New York City—Cole 30 pleasure cars.
- Columbus Buggy Co., Columbus, Ohio—Firestone-Columbus and Columbus electric pleasure cars.
- Correja Motor Car Co., New York City—Correja pleasure cars.
- Coleman Motor Car Co., Iliion, N. Y.—Coleman trucks.
- Clark-Norwalk Co., Brooklyn, N. Y.—Clark and Norwalk pleasure cars.
- Cortland Motor Wagon Co., Cortland, N. Y.—Cortland trucks.
- Crawford Automobile Co., Hagerstown, Md.—Crawford pleasure cars.
- Cunningham & Sons Co., J. M., Rochester, N. Y.—Cunningham pleasure cars.
- Darre, Richard B., New York City—Cyclonette pleasure cars.
- De Tamble Motors Co., Anderson, Ind.—De Tamble pleasure cars.
- Demot Car Sales Co., Detroit, Mich.—Demot pleasure cars.
- Findlay Motor Co., Findlay, Ohio—Findlay pleasure cars.
- Flanagan Motor Car Co., Brooklyn, N. Y.—Monitor trucks.

Meyers, Inc.; W. C. Myron, New York Coil Co., John W. Rapp Co., Rector Eng. Co., Ross Heaton Mfg. Co., Safety Tire Co., Standard Metal Works Co., Sterling Machine & Stamp Co., Touring Club of America, Troy Carriage Sunshade Co., W. R. Winn.

#### Aeroplane Accessories.

Aerial Equip. Co., American Aero. Supply Co., American Metal Fusing & Cutting Co., Dean Mfg. Co., D & F Radiator Co., Elbridge Engine Co., N. Finkelstein, Grady Mfg. Co., U. S. McAdamite Metal Co., Vance Mfg. Co., E. J. Willis.

#### Kansas City Show for Dealers Only.

Kansas City, Mo., has established a precedent in the show business by refusing to sell space to any who are not real Kansas City dealers. It was determined by the Motor Car Trade Association, which will finance the show scheduled for Convention Hall during the week of February 13, that none but bona fide Kansas

City dealers will be permitted to exhibit; it is stated that thirty applications for space from manufacturers who have no established agents in the city have been turned down on this account.

#### Infant Prodigy Bobs Up in Illinois.

The argument as to who is the oldest driver of a motor car, which was started some few weeks ago by an item in the Motor World, apparently having been settled, a new one probably will be caused by the assertion that there is a 5-year-old girl in Edwardsville, Ill., who owns and drives a 20 horsepower Ford car. She is the daughter of Dr. and Mrs. E. H. Schwarz and it is declared that all the residents of the town where she lives can testify that she is able not only to steer the car, but to manipulate all the levers used in starting and stopping. The length of the child's arms and legs is not stated.

#### Quakers to Begin Guessing in January.

Weather conditions permitting, the Keystone State will be the site of the first of the 1911 crop of "roadability" contests, January 17 and 18, being the dates chosen for a guessing contest of the sort which is to be held under the auspices of the Quaker City Motor Club. Present plans provide for a start from Philadelphia at 8 o'clock in the morning of January 17, Harrisburg, Pa., being the objective point for the day. The return journey will be started at the same time on the following morning, and the contestants will check in at the Third Regiment Armory in Philadelphia.

#### Los Angeles Cards a January Racemeet.

The initial racemeet of the new year in the West is scheduled to occur on the Los Angeles Motordrome Saturday and Sunday, January 14 and 15. Six races for cars in classes D and E are on the program for decision on Saturday, and a like number of events constitute the balance of the program, which comes on the following day, when the largest race, 25 miles, will be run.

#### Gutenberg to Provide a "Fresh Air" Meet.

Someone who apparently believes there are enough people in the vicinity of New York anxious to pay for a chance to acquire chilblains and frost bites, has scheduled an automobile racemeet for January 2 on the old Gutenberg (N. J.) track. It is understood that all who attend must provide their own foot warmers.

#### State Association Fixes Meeting Date.

The question of legislative reciprocity will be threshed out thoroughly at the semi-annual meeting of the New York State Automobile Association which has been called for 10 a. m. on January 7 at the Hotel Belmont, New York City. President Frank G. Webb will preside.

## RADICAL TYPE OF TRUCK TIRE

**Firestone Evolves Quick Detachable Rim for Solid Tire—Likely to Exert Far-Reaching and Important Effects.**

Because of its susceptibility to punctures and blow-outs, the pneumatic tire not unnaturally has received almost unremitting attention from those concerned with its production. As a result the improvement in the tire itself and the development of special rims suited to its needs leave little to be desired. The solid rubber tire, which

FIRESTONE QUICK DETACHABLE SOLID TIRE EQUIPMENT IN DUAL FORM

dates back much further, has received attention, of course, but as punctures and blow-outs are foreign to its nature, the attention has not been attended by startling results. The rapidly increasing use of motor trucks and the demands made by their great weight and the weight of their burdens has been, however, giving the tire manufacturers cause for renewed thought, and the direct outcome is the Firestone quick removable side-wire tire and rim, which is shown by the accompanying illustration, and which is of such a revolutionizing nature that it appears to mark almost an epoch in the solid tire industry. It is designed to permit the ready replacement of such tires by the truck driver himself or any other man able to use a wrench, which is the only tool required. The delays and lay-ups incident to tire repairs or replacement of a commercial vehicle are of far more moment than is the case with pleasure cars; they figure unpleasantly in balance sheets and can do much to make or mar the record of a truck. The meaning of the new Firestone tire and rim equipment, which is the product of the Firestone Tire and Rubber Co., of Akron, Ohio, is, therefore, apparent, and that it marks a big step forward and will have vital and far-reaching and helpful influence in the prosecution of commercial car campaigns is undoubted.

Of the illustrations, one shows a single tire mounted on the wheel, and the other, a sectional view of a rear wheel equipped with dual tires, one of which has been removed. In order to change tires, the nuts 6, of which there are 14, are removed, releasing the clamping flange 5. The tire, rim and all are then slid off in one lateral

movement; the clamping ring 4 is split and comes off with the tire. A spare tire applied to the rim is substituted merely by reversing the operation, it being assumed that one or two spare rims with tires already attached have been kept ready for use. Rims of equivalent size are interchangeable on all wheels, front and rear, single or dual.

As all tires are applied to the rims at any of the many Firestone applying stations, there practically is no danger of their not being on firmly and properly. The driver changes only the rim and does not replace the tire to the rim itself.

This equipment has undergone a thorough

test, and it is claimed to be of great efficiency, one of the largest truck manufac-

FIRESTONE EQUIPMENT FOR SINGLE TIRE

turers who tried it already having adopted it as regular equipment.

### Even the Mule Beat the Motor Car.

Florida has seen some fast and exciting automobile racing, but it is doubtful if ever half so much merriment was created as attended an event run December 26 at Jacksonville. It took the shape of a handicap race between a man, a thoroughbred horse, a mule and an automobile. The conditions of this unique contest were that the horse had to cover six furlongs, the mule four and a half, the runner 550 yards, while the automobile had to cover one and one-eighth miles, after being allowed a running start of one-sixteenth of a mile. While the handicapping between the live contestants was fairly good, the fact that the automobile finished about half a minute after the other participants had crossed the tape showed that something must have been overlooked. The horse won, the mule was second and the man third. The stunt constituted a feature of a horse racemect.

## THIRTEEN CONSTITUTE A "SALON"

**That Number of Importers to Display Wares in a Hotel Ballroom—Who and What Will be There.**

While the final touches are being added to the preparations for the annual exhibit of the Association of Licensed Automobile Manufacturers in Madison Square Garden, and while the curious are crowding the aisles of the Grand Central Palace, where the "independents" will hold forth, there will be a "parlor show" in the Hotel Astor, at which only imported cars will be exhibited. This "importers' salon," as it is fondly styled, is to be opened on January 2, and will continue up to and including January 7. It will consist of 13 exhibits.

The big ballroom of the Hotel Astor has been engaged for the purpose, and will be divided into 13 sections—one for each of the exhibitors. No accessories or commercial vehicles will be shown. Among the cars there will be several that were displayed at the London and Paris shows, among them the Napier, fitted with wire wheels; a six cylinder Darracq; two Isotta-Fraschinis; an Itala and an English Daimler, and two Renault polished chassis. One car new to Americans will also be seen at the Astor, the Zedel, a French production. The Panhard exhibit will include a number of the new "valveless" engine models, and it also is probable that a complete car fitted with a 30 horsepower Knight motor will be shown, as the car is on the way and may reach New York in time for the opening of the exhibit. The 13 who will compose the "salon" are as follows:

Benz Automobile Import Co. of America, Benz, Burr & Co., coachwork; C. G. V. Import Co., C. G. V. and Zedel; Cesare Conti, S. P. A.; De Dion-Bouton Selling Branch, De Dion-Bouton; A. T. Demarest & Co., Itala and English Daimler; Henry Ducas & Co., Darracq; Glentworth & Jackson, Napier; Panhard & Levassor Automobile Co., Panhard; Peugeot Import Co., Peugeot; J. M. Quimby & Co., Isotta-Fraschini; Renault Freres Selling Branch, Renault; S. P. O. Automobile Co., S. P. O. and Vinot.

### Two Odometers That Beat as One.

In theory, at least, all odometers should register exactly alike; practice, however, does not always serve to bear out theory. A remarkable instance in which it did bear it out was furnished by the journey from New York to San Jose, Cal., which recently was completed by Mr. and Mrs. W. T. Warren in a Renault car. They had one Warner Auto-Meter fitted on the dash and another in the tonneau, and both instruments recorded alike to the very last tenth, viz., 3,750.2 miles.

# Single Spark Ignition; Its Principle and Effect

Increasing attention, and not without reason, is being drawn to that comparatively new form of ignition, the single spark. It is being employed on the cars of not a few manufacturers of repute, and its growing use is the best evidence that it is doing good work and that it must be considered a serious competitor of the more familiar types of ignition.

The distinguishing feature of the system is the contact-breaker, which replaces the vibrator of the more familiar jump spark ignition. Insofar as its application is concerned, it may be used with single or multiple coils, which is to say with either high tension or low-tension distribution, and it may be used either as an independent or a double system in conjunction with the magneto. The particular advantages claimed for it are that it provides absolute certainty of sparking, accuracy of timing and synchronism, and also that it secures a high degree of battery economy.

The single spark is just what its name implies—one spark, in distinction to a stream of sparks. In effect it is much the same as the result produced when the trembler of an ordinary coil sticks inadvertently immediately after contact is made at the timer. To comprehend its advantages it is necessary to bear in mind the nature of the common jump spark somewhat in detail. Though roughly speaking, it is an abbreviated spark, nevertheless, its absolute nature is somewhat different. The quality and volume of the spark is uniform at any speed of the motor, and the duration of contact is just sufficient to produce a perfect spark for each cylinder with the minimum of battery consumption. Instead of the greater part of the current being wasted, as in the vibrator coil, every particle of the current is utilized.

In the ordinary jump spark systems, although the electrical discharge produced at the gap of the plug commonly is referred to as a spark in the singular sense, the actual effect is that of a stream of very minute sparks flowing with enormous velocity, each individual spark being caused by the breaking of the primary contact by the vibrator. Therefore, the number of sparks depends on the "speed" of the vibrator; or with the engine running, on the "speed" of the vibrator, the number of revolutions per unit of time by the engine and the length of arc of contact on the primary timer.

A point strongly emphasized by single spark advocates is that the first, or "pilot" spark, always is largest, their reasoning for this is that after the primary contact is made at the timer and broken at the vibrator an infinitesimal lag occurs until suf-

ficient voltage has been built up at the gap of the plug to overcome the resistance. Once this is overcome, however, there is less resistance in its path, owing to the heating effect of the "pilot" spark, and the decrease of the air resistance; the succeeding sparks, therefore, are of less intensity.

Thus, the idea of the single spark is, in brief, that the "pilot" spark is the actual source of ignition, and the remainder of the sparks is superfluous. In other words, that but one spark is required for each explosion. By eliminating all but the "pilot"

THE ATWATER KENT UNISPARKER

spark, it is claimed that no difference results in ignition effect, while considerably less energy is required of the battery.

In the development of this system, attention is concentrated on creating high intensity and great volume in the single discharge, and on ensuring a very positive action in the contact-breaker. The ordinary vibrator can miss several vibrations and still not "kill" the spark but only delay it, but the single spark generator must act every time, and this its advocates claim it never fails to do.

The system is productive of smooth and even running of a multiple cylinder motor, because each cylinder receives its ignition at precisely the same relative point on the stroke of the piston. This is very difficult and never attained with the use of vibrator coils, as no two vibrators can be adjusted exactly alike and the difference in the coils themselves renders synchronism impossible, which results in the loss of efficiency at high speeds particularly.

The system in general is designed for the use of batteries, although it is used and may

be used in conjunction with a high tension magneto machine also. One make and break in the primary circuit governs the spark in all cylinders, and but one spark coil and a distributor are used. The method of contact varies in systems of different manufacture, some employing a mechanical and others a magnetic break, allowing but one contact for every ignition.

In general, single spark systems differ one from the other mainly in the construction of the contact-breaker, which is the heart of the system.

There are several systems now on the American market, most prominent being the "Unisparker," the Briggs-Stratton, and the Delco.

The "Unisparker," produced by the Atwater Kent Manufacturing Works, Philadelphia, Pa., was first in the field. It best may be described as a simplified form of a spark generator which they manufacture also. It is designed for use on cars where the arrangement of cam or magneto shafts makes it inconvenient to install the generator, or where it is desired to use an outfit of somewhat lower cost. It consists of two separate units, a contact maker and distributor, adapted to go in place of the ordinary timer on any convenient half-time shaft, and a spark coil, complete with condenser and switch, for the dashboard.

The moving parts of the contact maker are the notched shaft A, the steel snapper B and the contact arm C, which may be seen in Figs. 1A, 2A and 3A. The rotation of the shaft draws the snapper to the position shown in Fig. 3A. Here it snaps off, and, riding up on the rounded part of the shaft, exerts a wedging action against the steel hook D of the contact arm. This forces the contact spring E against the insulated platinum-pointed contact screw F, and closes the circuit. Further movement of B permits D to snap off, as in Fig. 1A, thus suddenly breaking contact at the platinum points.

The duration of contact is the time it takes the snapper B to slide past the hook D. It may be adjusted for a long or a short spark by turning the screw L, but the duration is always brief.

The "Unisparker" is furnished to run either clockwise or counter clockwise, according to which direction it is required to turn.

The distributor casing is of hard rubber, and four posts in it connect to the spark plug cables. A central post receives the high tension current from the coil and carries it to the distributor blade. This blade

is carried by a hard rubber block removably mounted on the contact maker shaft.

A coil of the usual size is mounted on the dash, and enclosed within it is the condenser. When the switch is closed, snapping the lever to the right against a special contact permits the engine to be started on the spark when there is gas in the cylinder.

The positive and negative wires from the battery are connected to posts under the coil box. Two primary wires run from the coil to the contact maker, and one secondary cable connects coil and distributor to the spark plug. The body of the con-

FIGURE 2A

tact maker is rotated by a lever in the ordinary manner for spark advance and retard.

Ordinarily, access is needed but for one thing, and that is to adjust the contact screw once in about 500 miles. By removing the side cover, all parts are exposed, giving access to this adjusting screw as well as to everything else.

Another form of single spark ignition having the contact-breaker operated mechanically is the "B & S Igniter," manufactured by the Briggs & Stratton Co., Milwaukee, Wis.

The novel feature of this device is the

FIGURE 1B

combination of a spark coil distributor and contact maker in a single unit, the entire outfit being contained in a metal case. A single non-vibrating coil is used in connection with the "Igniter" for any number of cylinders.

There are but two moving parts in this new model contact maker, the contact arm and a cam provided with a number of points corresponding to the number of cylinders used. In the accompanying illustrations Fig. 3 shows a part of the operation. The lever B rests normally in the path of cam A; this cam in its rotation engages the

lever, causing the contact points C to be brought together, the points being separated by the spring attached to the lever B as the cam continues in rotation.

In order that the duration of contact cannot vary with the speed of the engine, and that the motor cannot stop in such a position as to leave the contact closed, a new

FIGURE 1A

principle has been brought into use. By a combination of mechanical and magnetic features, the breaker is made to provide a fixed duration of contact regardless of engine speed, and it is impossible for the engine to stop in a position to leave the circuit closed.

Another feature is that the transformer coil itself is carried in the rotor of the igniter, and so placed that the core of the coil rests in a vertical line with the cam of the contact maker. The cam A in Fig. 3 is secured to a flat-headed plunger coming near to the core of the coil. These are so mounted in the driving spindle as to be free to slide up and down in the slots, which serve as guides. They are, however, held against the upper limit with the cam in the plane of the contact arm B by a spring. When the cam A is in its normal

FIGURE 2B

position in the plane of the contact arm, the rotation of the cam caused the contact points C to press together and separate, which, without other provision, the duration of contact would vary with the motor

speed. However, the instant the contact points C are brought together, the current passing through the primary winding causes the core of the coil to become magnetized, thus attracting the plunger and drawing it instantly from its normal position. The contact arm is then retracted by the spring L, pulling the arm over the top of the cam.

The instant the circuit is broken at the contact points, the cam is free to return to its normal position by the action of the spring, provided it has passed in its rotation from beneath the hook. In case the motor stops at the instant the points are in contact, it is obvious that the magnetic ac-

FIGURE 3A

tion of the coil will draw the cam from its normal position, and the contact arm will be pulled over the top of the cam, thus making it possible to close the circuit until the cam is rotated by starting the engine. At high speeds the duration of contact is so short that the magnetic action does not have an opportunity to work, being effective at low speeds, when the duration of contact would be so long as to be wasteful of current, and the balance of the transformer coil disturbed. Hence, the spring holding the cam and plunger against the upper limit does no work except at low

FIGURE 3

speeds, while at high speeds, the only spring in action is the one designated by L, and this works only between very small limits.

Rotation of the shaft backwards will produce no spark, although for two-cycle engines a type of contact maker can be made to operate in either direction.

Differing from both the "Unisparker" and the "B. & S. Igniter" in that it is magnetically instead of mechanically operated, is the Delco, manufactured by the Dayton Engineering Laboratories Co., of Dayton, Ohio. This system uses both batteries and mag-

## ANOTHER TIRE FACTORY PLACED AT THE SERVICE OF THE AUTOMOBILE INDUSTRY

KELLY-RACINE RUBBER CO.'S PLANT IN RACINE, WIS., WHICH JUST HAS BEEN COMPLETED

neto, with a relay and a high-tension distributor.

The relay, of high speed design, is for the purpose of breaking the primary circuit and thereby producing a spark from the secondary windings of the induction coils. It takes the place of the four vibrators on the ordinary four-unit coil, as it acts for each coil in turn as the commutator makes connection in this way, acting as what is commonly known as a master vibrator. However, it differs from the ordinary vibrator in that it makes but one spark for each contact of the commutator.

As stated, the relay is magnetic in its action, the contact-breaker being prevented from vibrating in an ingenious manner. The heavy winding of the coil, through which the primary current passes, draws down an armature, opening the circuit in the primary winding. This would then allow the armature to return, closing the circuit, the armature thus vibrating were it not for its being held by the magnetism of a second fine winding wound on the same coil, but shunted around the contact point. The current flowing through this, holds the armature un-

til the timer slips off the contact, when the armature is released, allowing the contact points to come together ready to break the circuit when the timer makes the next contact.

A kick type of switch on the dash is provided with a button which, when pushed in, opens this auxiliary or holding coil and permits the armature to vibrate as does any other vibrator, making a stream of sparks at the plug points. This is for use only when starting.

The distributor takes the high tension current from the coil, and distributes it to the proper cylinder. The distributor as a unit combines a primary contact maker, a high tension distributor and a means of obtaining spark control.

The distributor proper is made of hard rubber and mounted upon a metal housing. As shown in Figs. 1B and 2B, the primary contact consists of an arm 1, which is moved outwardly against the action of the coil spring 2 by a four-lobed cam 3. The contact arm is made up of three parts; i. e., a hub upon which are mounted the bent arm 4 made of steel and hardened, and the con-

tact spring 5. This spring is set with initial tension, which holds its outer end against the stop 6 of the steel arm.

The contact spring carries a platinum contact which makes connection with a similar point at 7 on the contact screw 8. The relation of the two points is such that they come together when the arm has moved about one-half of its full throw, the tension in the contact spring insuring a positive pressure at the contact points.

The movement of the arm is limited by a stop 9, toward which the arm is normally drawn by the coil spring 2. This spring is very light and is fastened to the arm close to its pivot. The short movement of the spring allows very high speeds on account of the absence of inertia.

The four-lobed cam is so formed as to impart the full movement to the arm in a small part of one revolution, thus avoiding any serious lag in moving parts or variation due to adjustment.

In the high tension distributor the current from the coil is introduced at the central terminal 10, which projects into the chamber at 11. Upon the disk 12 is mount-

ed a steel brush 13, which is connected to the center terminal by a bar. As the brush is normally held against the head of a light spring, it makes contact with the outer terminals successively and at the instant the contacts are closed in the primary circuit.

The flange on the disk projecting into the groove in the distributor head very effectively insulates the terminals from the housing and other points to which the spark might jump.

Spark control is effected by means of a spiral slot in the distributor sleeve, upon which the four-lobed cam is rigidly mounted. A bronze ring, slidably mounted upon the sleeve, carries a pin which passes through the spiral slots. A forked yoke, carrying two pins which co-act with the groove in the ring, is mounted upon a shaft, to which the time lever is connected. The timer shaft on the engine projects into the distributor sleeve and is split to engage the pin projecting through the spiral slots. Rocking the yoke by means of the timer lever causes the ring to slide along the sleeve. The spiral slots in the sleeve cause it to rotate; thus changing the relation between the four-lobed cam and the engine shaft as desired.

#### Most Novel Excuse for "Joy Riding."

To Robert Genslinger, of St. Louis, Mo., the world is indebted for a new excuse for "joy riding." When recently he landed in New Orleans and saw a touring car standing unguarded at the curb, he jumped in and drove off. When the police nabbed him a few hours later, he claimed to have been desirous of "learning the names of the various streets as quickly as possible," and had "borrowed" the car for the purpose. The magistrate took a different view of the matter and held him for grand larceny.

#### Symptoms of Improper Radiation.

Sometimes it is possible to discover the fault in a radiator which is working poorly merely by testing it with the bare hand. If the circulation is impaired through the clogging of certain areas, such points will be found to be much cooler than surrounding parts. Frequently when this is the case the difficulty may be remedied merely by flushing out the system with a hose, packing the filling orifice around the latter with a bunch of waste in order to get the benefit of the full pressure.

#### When Steering Gear Becomes Stiff.

When the steering gear becomes stiff it should be looked over immediately and the cause remedied. One rare, though serious, difficulty which may occasion binding of the gear is the breaking of one or more balls in the steering knuckle bearings. If such a bearing is neglected when out of order there is considerable likelihood that it may jam suddenly, rendering the entire steering gear inoperative.

## THE MOTOR WORLD

### BRAKING BY FLUID PRESSURE

#### New French System Provides for Action On All Four Wheels—Perfect Equalization Assured.

Hydraulic brakes, like hydraulic clutch and change gear mechanisms, long have been in the inventors' eyes, though they have failed to assume concrete form until within a very short time. In respect to the hydraulic brake, in particular, the possible advantages of fluid, instead of metallic, connection for actuating the working parts have remained practically unrecognized until the present foreign show season. One system

PILAIN HYDRAULIC BRAKING SYSTEM

of the sort recently has been brought out in England under the Weight patents, while the exhibits at the Paris Salon included at least one make of car, namely, the Roland Pilain, on which hydraulic braking of all four wheels was a striking feature.

For it is a significant point that the application of the hydraulic principle lends itself very readily to the adaptation of brakes to the hubs of the front wheels, and so possesses double interest, since the subject of front wheel braking is very much to the fore abroad just at this time. The Pilain chassis, therefore, attracted considerable attention among engineers in particular.

As far as the hydraulic system is concerned, it consists merely of a pump, which is actuated from the engine, an oil reservoir and a controlling valve. When the valve is set in position to apply the brakes, the oil is carried into a cylinder located in each brake drum where it acts upon two pistons, forcing one up and the other down, and thus applying the brake segments to the drum. As the oil pressure is distributed uniformly throughout the system, it follows that all brake shoes are applied with absolutely uniform pressure, the braking effort thus being equalized within the limits of wearing surface conditions.

The mechanism of the front wheel brakes is shown by the accompanying illustration. It will be observed that the knuckle construction is of the so-called reversed Elliott type, in which the stationary pivot pin is of large diameter and made hollow to form the cylinder for the brake. Two plungers are fitted within the cylinder, each of which is connected with one of the two segmental brake shoes, the latter being held away from the broad-faced drum by means of two small helical springs. In this particular case the steering arm is brought out underneath the axle. The illustration also plainly indicates the position of the small tube and connection through which the oil is fed to the working cylinder.

As was pointed out in a general review of the subject recently printed in these columns two distinct classes of extra stress have to be provided against in the design of front wheel brakes. One of these is the tendency to swing the wheels about the steering pivots as a result of the resistance to their revolution, which is imposed by the brakes; the other is the tendency to displacement and flexure of the axle as a consequence of the added strain which it is called upon to bear. The first of these two difficulties is taken care of in the present instance, by the form of pivot construction employed. The second, however, appears not to have been provided for in the construction of the end of the axle. Therefore, it may be a matter of some question whether the system is of adequate strength just at this point. In other respects it appears to have much to commend it.

#### To Prevent Sooting of Oil Lamps.

After oil lamps have been lighted for a few minutes, the heat generated makes the oil more volatile and it burns more readily. Therefore, it is well when lighting up to turn down the wicks slightly to allow for this brightening, as otherwise the glasses and reflectors will accumulate a coating of soot which is very hard to remove without danger of damage to the plating.

#### To Remove Obstructions in Carburettors.

By unscrewing the union of a gasoline pipe and pushing the rubber end of a tire pump connection over it, enough pressure generally can be obtained to loosen any obstruction or sediment in the pipe by a few strokes of the pump. When applied to the end of the pipe attached to the carburetter, the needle valve also will be freed of any dirt.

#### Care Needed in Applying Blow-Out Sleeve.

In putting a blow-out sleeve in a shoe great care should be taken to see that the sleeve fully overlaps the blow-out and extends well past it on every side, as otherwise the new tube will blow out around the sleeve, and, increasing the dimensions of the original break, cause injuries which it is impossible to repair.

### VARIATION IN POPPET VALVES

**Dutch Engineers Responsible for Radical Change—Skew Gearing Permits Four Cams to Operate Eight Valves.**

So few variations in poppet valve gear have been developed within the past year or two that in many quarters the impression prevails that the possibilities of novelty have been completely exhausted. But that such is not the case is demonstrated in the latest models of the Spyker car, a Dutch production, which, at one time, was quite widely known, though principally on the other side of the water. In the new models,

The forward driving gear on the crank shaft serves to drive an auxiliary shaft, which operates the magneto and water pump. The second and third driving gears are mounted between the first and second, and third and fourth cranks, respectively, thus necessitating an unusual grouping of the cylinders. The third cam shaft also is used to drive the lubricating pump. While the general effect of the arrangement is to render the motor exceedingly compact and well balanced, the principal advantage claimed for it is that of silence in operation.

The new Spyker cars, the appearance of which indicates the result of a comparatively recent reorganization in the affairs of the company, are equipped with multiple

SPYKER SPIRAL GEAR SYSTEM FOR ACTUATING VALVES

which differ in many respects from their predecessors, the usual longitudinal cam shaft construction has been done away with, three short transverse shafts taking its place. As each of the three shafts is driven by skew gearing directly from the crank shaft, it follows that the crank case construction is considerably simplified, while all difficulties of the sort that sometimes result from the springing of long and weak shafts is eliminated.

The accompanying illustration indicates the nature of the arrangement, which is applied to a block type motor of four-cylinder construction, made in two sizes, one of 16 and the other of 18 horsepower. The inlet valves are placed on the left and the exhausts on the right. Each of the two transverse cam shafts actuates the valves for two of the cylinders. A single cam is mounted on either end of each; the cam at one end actuating a pair of rocker arms which lift the two inlets, or exhausts as the case may be, alternately, the other cam also actuating similar valves. Thus four cams are made to do the work for eight valves, the mechanism being reasonably compact and the operation as silent as it can be rendered by the elimination of spur gears.

disk clutch, three speed sliding change gear and shaft drive. The rear axle housing and differential casing are made in the form of a single steel casting, after a fashion familiar in this country and the car in a number of other respects is in line with up-to-date practice.

#### The Reason For the Front Doors.

Anyone who fancies that it is the philanthropic spirit that leads owners to have their cars fitted with the front doors for the convenience of the driver is deceiving himself in a majority of the cases. The comfort of the driver is in a measure considered in the arrangement, but the fact that the seat beside the driver is rendered more comfortable for the passenger who occupies it is the controlling factor. The chauffeur's comfort is merely incidental.

#### Carburetors Affected by Differing Fuels.

Carburetors in which a needle valve is provided for the regulation of the amount of gasoline supplied from the jet very often require readjustment when a different grade of gasoline is used. This should be noted carefully as erratic running often is attributed to other causes than to the change of fuel.

### CONSTANT PRESSURE CARBURETOR

**Unusual Features Incorporated In a New Foreign Device—Advantages Claimed Over Variable Vacuum Type.**

Combining the advantages of what its inventor terms constant pressure regulation with those of automatic scavenging for the intake manifold and cylinders when coasting with the throttle closed, a new type of carburetor just has been brought out in England which possesses a number of unusual features. The device also is noteworthy in that it introduces for the first time in carburetor construction, so far as is known, the principle of the balanced valve, whereby regulation is rendered more uniform. The carburetor in question has been produced by W. Bourne Dale, an inventor of some prominence, and has the particular merit of being able to deliver its mixture up to the full capacity of the engine without strangling.

"Carburetors may be divided broadly into two classes—those with a constant difference in pressure between the inside and outside, and those in which this pressure is variable," says the inventor in explaining the principle of the new carburetor. "To the former class belong those in which the air supply is controlled by some form of air regulator dependent for its action on the suction of the engine; to the latter belong carburetors in which the air supply is controlled either by hand or mechanically in conjunction with the throttle.

"A satisfactory carburetor may be constructed embodying either principle," he continues, "but undoubtedly the most popular at the present time is the constant vacuum type. One advantage possessed by this pattern over the variable vacuum type is that, if it be properly designed, a supply of fuel with sufficient velocity of air to convert it into spray is assured at the lowest engine speed, and if it be fitted with an air-regulating device of ample area, its efficiency at high speeds is quite equal to the variable pressure type.

"The popularity of the constant vacuum type is therefore due to the present-day desire for an engine which shall be quiet and smooth running at low speeds, and yet possessing powerful torque and good accelerating properties.

"Many carburetors designed on constant vacuum lines do not give good results on account of the improper size and disposition of the constituent parts. The most usual fault is that the air-regulating device is of too small a capacity, necessitating the employment of a large choke tube to keep the partial vacuum normal at high engine speeds. Another frequent trouble is that the piston arrangement of the air regulator commonly in use on this type of carburetor

ter wears and allows air to leak past at slow speeds, resulting in the negative pressure becoming too small for satisfactory slow running."

Passing to a description of the new Dale carburetter, he pauses to define the requirements of the ideal automatic pressure regulator, or air valve, as it more commonly is termed, in a manner which is as thorough as it is explicit. "To maintain a constant negative pressure of, say, 0.5 to 0.75 pounds in the carburetter at any engine speed," he says, "the air regulator must possess the following features:

"It must be capable of passing the full quantity of air required at the highest engine speed; it must close absolutely tight at the lowest engine speed; the force tending to close the valve against the suction of the engine must be practically constant; friction should be eliminated as far as possible, and the action of the valve should be damped, so as not to vibrate with the pulsations of the engine; and, finally, to deaden the sound of the air entering the air regulator its supply should be taken from a chamber of some capacity to act as a silencer."

The manner in which these conditions have been fulfilled in the present instance may be gathered from the accompanying illustration which shows the carburetter in detail. In order to provide against leakage, and also to prevent deterioration in consequence of wear, the mushroom or poppet type of valve has been chosen throughout the device in preference to the more common piston type or even the simple butterfly valve. The air valve, which is indicated at B in the illustration, is of the double mushroom type, which is to say, that it is balanced against the effect of the suction and is absolutely free of any effects due to the suction. A fine bore duct is drilled through its stem at D, leading to a vacuum chamber which is sealed by the diaphragm C. Consequently all variations in pressure in the body of the carburetter and so in the intake manifold will be communicated to the chamber above the diaphragm, and the latter will be proportionately deflected by the free air pressure on its under side. In consequence of such deflections the valve itself is caused to fluctuate in proportion to the variation in engine suction, and so to admit greater or less quantities of air to the mixing chamber. Owing to the small area of the duct, however, it retards the flow of air sufficiently to prevent the valve from fluttering on its seat, and thus exerts a damping action on it.

The choke tube, through which a small supply of air is drawn at all times, is at A, with its orifice directly in front of the jet J. The opening of the valve is opposed only by its own weight and the light tension of a spring, which may be regulated by means of the adjusting screw E. The choke tube purposely is made small because it is

intended chiefly to supply a sufficiently strong blast of air to carburet the charge at very low engine speeds. Hence the air valve is partly open the greater portion of the time, its action being basic rather than supplementary.

The variable type of jet is used instead of the multiple type of jet, because, as the inventor believes, it may be made sufficiently large to be free from any tendency to clogging, and also because it permits of a finer degree of regulation. The needle valve by which the outlet from the jet is controlled is formed with two flats, one on either side, tapering down to chisel points. By moving the needle vertically, therefore, as it is possible to do by means of the rack and pinion gearing at the top and the

DALE CONSTANT PRESSURE CARBURETTER

lever H, a very delicate adjustment may be obtained.

Jet regulation may be carried out either by hand or by an inter-connection with the throttle, such as is shown by the dotted lines at O. It is the inventor's preference, however, to retain the fuel adjustment entirely independent of the normal throttle control, thus enabling adjustment to be made readily for varying running or fuel conditions, and also permitting the skilful driver to effect suitable fuel economies whenever he desires. The float chamber G, from which fuel is delivered to the jet through the passage R, is perfectly regular in its construction.

Like the air valve and jet arrangements, the throttling device also possesses some little originality. It is actuated by the rocking lever arrangement N-M, the latter being a fork which takes hold of the base of the valve K and opens it by direct pressure against the tension of the spring S. The valve opens toward the jet so that the suction of the engine naturally tends to close it, as does the spring. While the valve itself is of the mushroom type, it is provided with a sleeve-like extension in which several V-shaped slots are cut, thus allowing for very gradual opening and permitting delicate adjustment.

When the lever is vertical the throttle is held upon its seat or nearly so; it being possible so to regulate the screw Q as to permit the valve to be held slightly off its

seat in order to give a constant setting for running the engine slowly when the car is at rest and the clutch disengaged. When the lever is moved in the direction of closing beyond the vertical position, the throttle bears against its seat, and the valve L is thus admitting pure air to the intake pipe, while leaving the mixing chamber tightly closed. Such is the arrangement that the same spring tension which serves to hold the throttle on its seat when scavenging also acts to hold the scavenging valve on its seat when the throttle is open.

This provision for preventing air leakage into the mixing chamber, together with the fact that, owing to this arrangement and the form of the air valve, the seats may be ground when they develop leaking tendencies, is thought to render the device unusually durable in its nature and unlikely to develop the signs of old age which, in many otherwise satisfactory types, are prone to render them erratic after they have seen a good share of service.

#### Noise Made by the Timing Gears.

It often happens that in a perfectly new car the timing gears will be conspicuous not alone by the fact that they perform their functions properly but rather by reason of the noise which they make. This may be due to one or more of several causes chief among which is probably improper lubrication. Good stiff grease should be used to lubricate these gears, because as soon as the engine is started heat is generated and as the timing gears often are in a place from which the heat cannot radiate readily the heat is retained and gradually reduces the consistency of the grease until it escapes through bearings which would effectually hold it when in its original condition.

#### Many Reasons for Engine's Slow-Downs.

Several of the probable causes of the slowing down of an engine because of misfiring are that the carburetter may be choked with dirt at the jet or gauze filter, the batteries may be exhausted, the gasoline tank may be empty or air bound, the gasoline tap partly closed, there may be a leak in the piping due to a hole or an unscrewed union. In pressure fed cars there may be a leak at one of the pressure pipe unions.

#### What May Cause a Car to "Drag."

If the car seems to drag, even though the motor is running properly, the clutch may be slipping, there may be oil on the leather, the spring may need tightening or the leather may have reached the stage when it requires renewal.

#### When Motor May Run Without the Spark.

Faulty wiring, a short circuited switch or a badly carbonized piston or cylinder head often will keep the motor running after the spark is switched off.

## Electric Illumination and Its Requirements

During the past two years the manner in which electric lights have increased in use and popularity as a satisfactory means of illuminating motor cars has constituted a development that is fit to rank as such. The progress attained has not been so easy as may appear. The use of electricity for such purposes has entailed problems of its own, not the least of which has been the matter of installation, particularly in respect to the wiring. As in all other applications, there is need of standardization in specifications in order to guard both the manufacturer and the user, and although it is too early to expect any general agree-

insuring complete insulation and effectually preventing a ground as the result of a connection with metallic parts of the car. The boxes also protect wiring joints from accidental injury or strain.

"A special duplex cable having individual leads thoroughly insulated and the outside covered by lightweight armor of metal has been recently placed on the market, and is unquestionably superior for automobile lighting purposes. Equal protection and insulation can only be obtained by placing wires in copper or other metal tubes.

"Other kinds of wire can be used in connection with outlet and junction boxes; but

to have a fuse in the generator circuit as a protection to the generator. A fused outlet box also can be placed in the battery circuit, and in case of a short circuit the fuse will prevent premature discharge and injury to the battery. These fuse boxes are not absolutely necessary, but are recommended where a complete system is installed. They should be arranged to use the standard, new code, 15 ampere fuses, which can be obtained from any electrical supply house.

"It is very important that the connections between lamps and wires leading from outlet boxes be substantial and of such con-

FOCUSED FOR LONG LIGHT AHEAD

FOCUSED FOR BROAD LIGHT AT SIDE

ment among concerns supplying equipment of this nature, a good beginning has been made by the engineering department of the Willard Storage Battery Co., of Cleveland, Ohio, which, in a complete and informing bulletin, discusses the subject with a view of assisting users of their "Elba" equipment to secure the best results from it, but the range of the discussion is so broad that it may be said general in its instructiveness.

"Thorough insulation of all lighting apparatus from the car frame and body is most important," says the Willard company, "on account of the fact that most existing ignition systems have one side of the circuit grounded, and should an accidental ground occur on the other side, through the lighting system, both the ignition and lighting systems would become inoperative.

"Perfect insulation can be obtained only by placing wiring joints in suitable protecting boxes, a main junction box at the center of the system and outlet boxes where leads to individual lamps are joined to main feed wires on the chassis. Additional insulation should be provided by placing wires in conduit, the use of boxes and conduit

they always should be run through a continuous tube of insulating material, similar to circular loom. The wire should also be made that outside braids will not easily fray, and the insulation able to withstand heat, oil and water.

"Experience has shown that nothing smaller than No. 12 wire should be used for main leads. Smaller sizes may be used for short leads from outlet boxes to lamps, but these should not be less than No. 18.

"In view of the fact that the entire wiring system is subjected to vibration and other unusual service conditions, it is obvious that after a connection is made, soldered and taped, for best results it should be packed into a box as above described, and be firmly held there by means of clamps so arranged that they clamp the wire at the point where the leads enter the box.

"Boxes should be made as compact as possible, and it is suggested that aluminum is a good material, as it is light in weight can be worked into a compact space and made to have a neat appearance.

"Outlet boxes may be made in two styles, with fuses and without. It is of advantage

struction that contact is positive at all times. The ordinary type of slip connector has not proved satisfactory for the reason that in time the two sections of plug will work apart, thereby weakening the contact. It is recommended that a plug be used which will protect the wire where it is attached to the plug, and that wires be soldered inside of the plug in such a way that there will never be any liability of their getting loose or being grounded. All connections at lamp should be devoid of small screws and not be of the small or frail type connection that is liable to break or loosen.

"All sockets to which attachment plugs are connected and which will form an integral part of the lamp should be of what is known as the bayonet-lock type, adapted for use with Tungsten lamps fitted with Edi-Swan base and should be arranged for soldered joints.

"These sockets should be made so that there are no screw connections, and be so constructed that the outside of the socket is insulated from the working parts, thereby insuring against a ground with the body of the lamp which will lead to the car frame."

The lamps themselves can be made by any of the well-known manufacturers, and may be of any desired shape or size. The headlights should be provided with parabolic reflectors which are true parabolas of one inch focus. These parabolas should be of at least 20-gauge metal, highly polished, and it is recommended that they have a triple coat of silver plating. A focussing device should be attached to the back of the reflectors, which will allow the lamp to be moved forward or backward, thus enabling

the driver to have a long shaft of light penetrating ahead or a wide beam as desired.

"Switches for automobile electric lighting should be of very durable and strong construction," declare the Willard people. "The back of the switch to which wire connections are made should be provided with terminals which will take at least a one-inch length of bare cable, and should be so made that the wire can be secured in position by heavy set screws. The connections on the back of the switch should be protected so that there are no metallic parts exposed. The switch should be so constructed that there is an independent

unit for each circuit—one for headlights, another for sidelights, etc."

As Tungsten lamps have long life and great stability at low voltages, automobile lighting systems have low voltage, a standard of six volts having been adopted on account of this also being the standard for ignition systems and permitting the best wiring arrangements.

The lamps should be six volt and fitted with Edi-Swan bases as stated. The proper sizes are 3 to 6 candlepower for side lights, 2 to 3 candlepower for tail lights, 12 to 24 candlepower for headlights, although for the latter, lamps of various power may be used to suit the owner's convenience.

For cars that are generator equipped, 3 to 4 ampere lamps, giving respectively 18

and 24 candlepower are recommended, while on cars with straight storage and no generator a headlamp is recommended that does not exceed 2 amperes and giving 12 normal candlepower.

A point or "spot" of light is very desirable in headlamps, as a parabolic reflector would then give its highest efficiency, and for this reason the best lamps have a coiled filament for this purpose.

"The storage battery should be of a type known as the car lighting type, and should be similar to batteries used for railroad train lighting, which is similar service," says the Willard company in dealing with that phase of the subject. "It should be especially designed for electric lighting. Sparking batteries and other batteries not so designed should not be used, as they will not produce proper results, and if used, the service obtained from them will only be temporary. The battery should preferably be mounted on the running board, where the jarring and jolting is the least. It should be placed in a steel box and sufficiently blocked to keep it from shaking about.

"The wires leading from the outlet boxes to the battery should be protected by rubber or other insulating bushings, where they pass through the battery box. At the battery the wires should be soldered to the terminals, which are provided by the battery company. These in turn should be bolted firmly to the posts of the battery and slightly soldered. The battery should be provided with ample head room so that a reasonable amount of acid will always cover the plates. This also will prevent acid from spraying out of the vent holes. The outside of the battery should be coated with an insulating paint thick enough to thoroughly insulate it from the steel containing box. The containing box should be provided with paraffined wood fillers to prevent the storage battery from touching the metal.

"The generator supplying energy for charging an automobile lighting battery should be constructed as carefully of good material as a generator for city or other lighting service. To give the best results the armature should have a large number of coils, not less than 48 is recommended; the commutator should be made of forged copper, and should also have a large number of segments. All coils on the machine should be thoroughly impregnated.

"The brush holders should be large

enough to contain two brushes each, and be so constructed as to permit adjustment to take up wear of brushes. The machine should meet all of the underwriter's requirements as regards heat limits, insulation, etc. The driving shaft and bearings, should be of generous proportions. To keep down the weight and bulk the machine should be of steel, laminated or otherwise. All terminals leading from the

field windings should be doubly insulated.

"Above all things, the generator should be slow speed. It should begin to charge the battery at 300 to 400 r.p.m., and give full load at 900 r.p.m. Above this speed and up to the maximum r.p.m. required of the generator there should be no change in either its voltage or output.

"It is advisable but not absolutely necessary to have it equipped with a cooling

fan. This fan would have two functions to perform—first, keeping perfect circulation of air; second, blowing out the dirt and dust which is a condition of automobile service.

"A machine constructed as above specified naturally will be of generous size and weight, but will have the very desirable qualities of slow speed and low heat factor. A machine of the lighting type should not be crowded.

"To prevent the battery discharging itself through the generator, an automatic switch should be placed in the circuit between generator and battery. The switch should automatically close the circuit when car speed reaches 4 to 6 miles an hour, and open it when speed is reduced to the same

value. Experience has shown that a simple type of polarized switch gives best results, as this construction operates by gravity, thereby dispensing with springs and complicated electrical devices.

"In connection with the automatic switch and mounted with it should be an ampere meter, having a dead-beat action with a divided scale, reading from 0 to 10 to the left, and 0 to 25 to the right. The function of this meter is to show how much current is passing from the generator into the battery.

"It will be noted that it is recommended that the ampere meter be placed in the

speed engines and two and one-half times engine speed for low-speed engines," is the wording of the Willard recommendation on this point.

"Position of the generator should be such that it is protected from mud, water and heat. It can be placed under the bonnet, on the running board, hung from the side frame, or placed under the footboard of the front or rear seats. In fact, in any position in close proximity to a shaft to which can be attached a driving sprocket.

"The three-circuit switch should be placed either on the dash near the center or on the frontboard under the seat at the center,

covered with a round hood, they should be placed on the side of the hood as near the lamps as possible. The outlet box for the tail lights should be attached to the rear portion of the frame. The outlet box for the battery should be bolted to the side of the frame near the battery. The outlet box for the generator should also be bolted on the frame near the generator."

#### How Motor Cars Serve Deer Hunters.

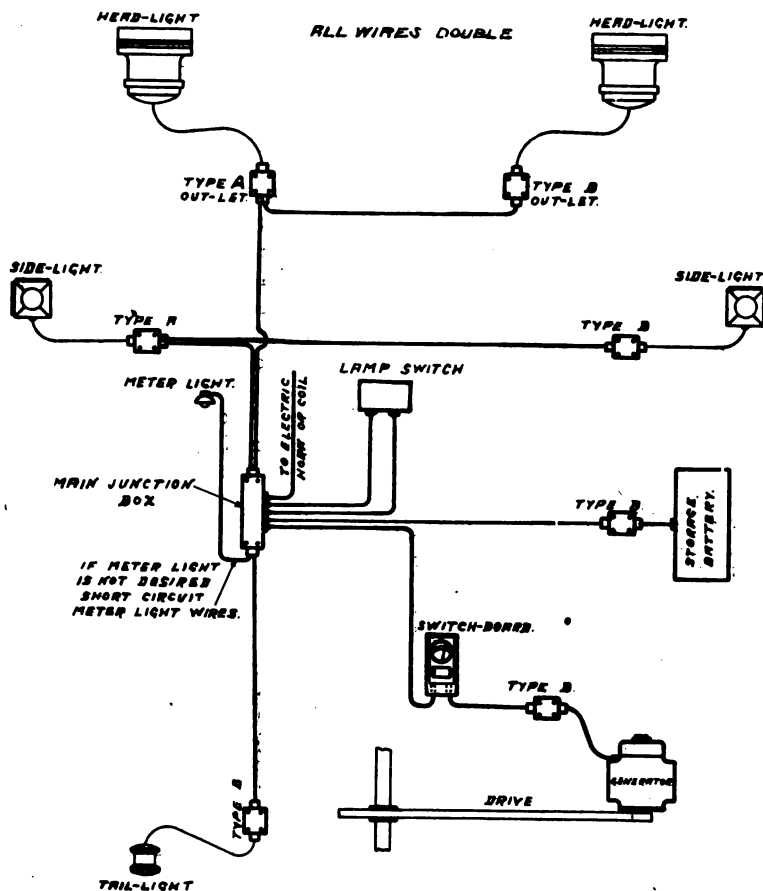

Nimrod, if he lived in the present day, would be up-to-date in his selection of a mode of travel and probably would further enhance the fame of his exploits by using an automobile to assist him in his capture of the denizens of the forest. Others have done and are doing it right along, though just how they enlist the services of this product of today in the pursuit of a sport which antedates civilization, long has remained much of a mystery to those who fancied that deer hunting entailed plunges into deep and trackless forests, and indeed to all except the select few who have used motor cars for the purpose.

The method used by E. A. Moross, of Indianapolis, probably is representative of the general practice and brings to light many of the advantages of the automobile on a hunting trip. While two of the deer he bagged were located while driving a Marmon roadster, the usual practice was to establish a camp where the car was left and to proceed therefrom on foot until the deer was captured. The car then was driven as close to the spot as it was possible to get and the deer loaded onto it, the return to the camp being made in quick time. In this way it was possible for the hunters to cover a great deal of ground in a small period of time. News of the location of game 25 or 30 miles away was the signal for a quick move to that locality, whence it was always easy to reach a village hotel or farm house, thus obviating the necessity of putting up with any of the discomforts of a temporary camp.

On the Moross trip, which started from Detroit and embraced four Michigan counties, the party of five secured eight deer, covering 865 miles during the week required for the excursion.

#### Bridges that Shorten Long Island Routes.

With the opening on December 29 of the three concrete and steel bridges owned by the Pennsylvania railroad and which are over its big Sunnyside yards in Long Island City, N. Y., a more direct route between the Columbus Circle section of New York City and points on the north and south shores of Long Island is opened to motorists. It is estimated that by using these bridges, which have been in course of construction for three and one-half years, the time necessary for the trip between Fifth avenue and 59th street, New York City, and Long Island will be no more than ten minutes.

SHOWING COMPLETE LAYOUT FOR ELECTRIC LIGHT SYSTEM

generator circuit. This is advisable on account of the fact that it is necessary to know at all times that current is going into the battery. The battery will perform its duty properly if it is properly charged. The ammeter will show whether or not this is being done. It will also show whether there is an open circuit short circuit, reversed polarity or any derangement of the system between generator and battery."

The location of the generator may be varied in accordance with the method of attaching is to the car. The accompanying illustration shows that an outlet box is provided for the generator at a convenient point adjacent to it.

"It is advisable that the generator be driven by what is known as the silent chain, at twice engine speed for high-

between the two passengers. We recommend placing on dash for the reason that body of car may be removed without interfering with the wiring insulation. If the depth or space under the seat is not sufficient for the length of the switch, the same can be built out with a frame of hard wood.

"The main junction box shown in this system should be located, if possible, under the engine hood on the front of the dash. It should be placed in a position to avoid crossing the wires. The outlet boxes supplying the headlights should be placed in wooden blocks, which are fastened into the recess on the inside of the spring forks next to the radiator. Outlet boxes for the sidelights should be placed on the front of the dash at each side, or if the dash is

## GARAGE FOR ELECTRIC TRUCKS

**Big Public Service Corporation Reaches Out in New Direction—Facilities that the Garage Will Afford.**

In that it is to be used exclusively for electric trucks, the garage recently established by the Union Electric Light and Power Co., a public service corporation of

secure a practical balance regardless of the number or arrangement of vehicles in the garage.

Adjacent to the board is a roomy office, opening off the main floor, while on the opposite side is a battery room 21 x 50 feet next to the storeroom and the repair shop.

In the repair shop minor repairs will be made but free use will be given of the extensive motor and machine shops of the

## LENGTHENING LIFE OF DRY CELLS

**Attention and Precautions that Contribute to Their Well Being—Some of the Things to be Avoided.**

On the conditions which surround them, the life of dry batteries is dependent. When the service given by batteries is poor, the trouble is more often due to external conditions than to any other cause.

As dry batteries are very susceptible to dampness, it is important that the container be water tight. This will prevent causes of short circuiting developed from weather conditions, or while the car is being carelessly washed by some attendant of the garage where it is stored.

All battery boxes which are metallic lined should be insulated properly by covering the metal with rubber or heavy canvas to prevent contact between the case and connections.

New cells never should be added to an old set before each has been tested individually by an ammeter. One weak cell will cut down the life of the rest.

When new batteries are put in the car, never any more should be lined in series than originally came with the car. Four to six cells arranged in series will give

ST. LOUIS GARAGE FOR ELECTRIC TRUCKS EXCLUSIVELY

St. Louis, Mo., constitutes a significant departure. This new central station is located in the heart of the business center, there being about 95 per cent. of all the freight terminals and important business houses of that city within a distance of one and a quarter miles. The building fronts 70 feet on the main street, running east and west, and has a depth of 175 feet, and contains several unusual conveniences and safeguards. A concrete trench covered with iron plates extends along both sides and the front, adjacent to the walls. This contains all of the piping and wiring. The concrete is carried about six inches above the floor, this serving the purpose of keeping water from flowing into the trench from the floor, and also of preventing machines from backing into the wall.

All charging circuits are carried from the switchboard to the cast-iron plug boxes in grooves moulded in the concrete trench walls. The grooves are enclosed by asbestos lumber and cement. This separates the various circuits in a fireproof and non-conductive material, while access for repairs may be had any time at small expense.

The switchboard controls the charging current for each vehicle, and the energy is supplied by the Edison three-wire system at a 120-volt pressure on each side of the system. Charging plug circuits are arranged on either side of the system to

company when more extensive repairs are necessary.

### Proper Lubricant for Differential Gears.

Cup grease or non-fluid oil should be used in lubricating the differential gears as thin oil works through the housing and may prevent the brakes from doing their work properly. The gear of a new car should go 500 or 600 miles without attention.

satisfactory service on almost any machine; and if four cells give satisfactory service, then any additional number connected in series will last a shorter length of time. This may seem strange to those not versed in electrical matters, but the fact is that with the addition of more cells the voltage is raised, consequently a greater amount of current flows through the coil, and the more current that flows, the shorter the life of the battery.

## DEPARTURES IN DUAL IGNITION

### How They Are Embodied in Connecticut Magnetos—Made for Both Four and Six-Cylinder Motors.

Extending the principle of its well-known unit coil system, the Connecticut Telephone and Electric Co., Meriden, Conn., has brought out several new types of high-tension magnetos, two of which in particular are of the dual type. In all models the transformer coil is made in unit form and mounted within the arch of the magnets. As the coil used is of true unit form, it can be removed and replaced almost as

The particularly noteworthy features of the magneto itself depend in great measure on the fact that it may be dismantled without the use of tools. As the accompanying illustration shows, the distributor arm may be readily withdrawn by raising the locking lever on the distributor cover. Likewise the cup holding the interrupter or circuit-breaker also may be withdrawn from its housing for inspection or adjustment. Another important feature of this device is that it is provided with a slot through which a special file may be inserted for squaring up the contact points. By using the slot as a gauge it is possible to adjust the surfaces accurately with small loss of time. The slot also provides means for regulating the opening between the points by means of

switch is thrown over to the battery side and the starting button on the switch is depressed. This causes the vibrator to act and send a stream of sparks through the plug in the cylinder that happens to be on contact, exactly as the ordinary jump spark is formed under normal conditions. When the motor is started, the button is released, when the system becomes a single spark arrangement, the contact breaker and distributor of the magneto actuating the coil and distributing the secondary current exactly as though the current were derived from the magneto armature. As soon as the motor is turning regularly, the switch is thrown over to the magneto side, when the primary current ceases to be drawn from the battery and is derived solely from the magneto.

The features of the high-tension independent magnetos remain much the same as last year. The dual systems, both for four and six-cylinder motors, however, are new, and are produced in four and six-cylinder forms with both combined switch and starting vibrator and with the vibrator independent of the switch, the new types thus being practically four in number.

#### Loss of Power Due to Temperature.

Heat is power, and in many cases loss of power may be traced through remembrance of this axiom. Motors are not supposed to run absolutely cold, but are designed to run at the temperature at which they will perform at their greatest efficiency and when outside forces cause the motor to run colder than it is intended to run a loss of power ensues. If an otherwise unaccountable loss of power occurs with the advent of cold weather, it is worth while to block off a part of the radiator with a strip of black oilcloth, the size of the shield being varied till the proper temperature is obtained. Care must be taken that the water does not get too hot, as this may be the cause of more serious trouble. The practice of removing a part of the water from the radiator is not to be commended, as air pockets may form and prevent the water from circulating properly. Another method, which may be used if the radiator shield is objected to, is to loosen the fan belt or to remove it entirely, though this should not be done when an anti-freeze solution containing glycerine is used.

#### Paraffin for Removing Body Stains.

Stains caused by grease oil or dirty hands often are left on the body of an automobile after mud and dust have been washed off in the ordinary manner. These remaining stains may be removed by rubbing with a soft cloth moistened with paraffin, but as the paraffin may create a slight stain of its own, it should be applied to the whole area about once in every three or four months. Its effect is to reduce very slightly the depth of the hue, and so should not be used in the daily washing.

THE CONNECTICUT DUAL MAGNETO DISASSEMBLED

readily as any of the units in the familiar type of dashboard coil. This method of construction, of course, renders possible the much to be desired effect of a clean dash, none of the ignition apparatus except the switch being visible outside the hood, and the new dual system has been designed with a view to extending the principle.

The types in which the feature is embodied are the A-4 and A-6 dual, which are properly so-called, which is to say, that they are arranged to utilize primary current supplied either from the magneto armature or from a set of batteries, with only one set of plugs and plug wires in service. For this arrangement a special starting vibrator is necessary in order to ensure an initial spark when it is desired to start the engine without cranking. The starting vibrator may be had in shape for attachment on the front side of the dish, where it is concealed by the hood, only the kick switch remaining in sight, or it may be carried in the battery box, if desired.

the special gauge which accompanies the magneto.

As the interrupter housing is reversible the timing lever can be connected on either side of the magneto, thus facilitating assemblage under varying conditions. As the interrupter is provided with a single roller bearing against the cam surfaces, the timing is rendered accurate at all speeds, and is unaffected by centrifugal force. It may be added that the cams are readily renewable.

The transformer coil, including both primary and secondary windings and the condenser, is enclosed in a metal tube and is perfectly moisture and heat proof. It has but one external connection and is the same in form whether the system be of the independent or dual type. Indeed, the only apparent difference between the independent and dual forms of magneto is that the latter has two terminals on the interrupter cover instead of one.

In starting with the dual system the

## UNIVERSAL JOINTS FROM HARTFORD

**New Series Produced by Well-Known Makers—Characteristic Features and Advantages Claimed for Them.**

Combining the principles which have been developed in former successful practice, the Hartford Auto Parts Co., Hartford, Conn., is now marketing a new series of universal joints for shaft-driven cars, in which prudent design and careful workmanship are revealed. The general method of construction is the same for all types, but the details

is called, is attached to the second plate. The end of the connecting shaft is held in position in the center of the ring by means of a single pivot pin which passes through bearings in the ring at right angles to those by which the ring is attached to the plate.

Advantageous features which are claimed for this method of assemblage are the use of solid forgings for the principal parts, hardened and ground steel bushings and pins, pressed steel housing for the joint, special rawhide grease-retaining boot and steel slip rings for attaching the boot to the shaft, together with felt dust washers. The housing fits in a groove in the main forging, while the rawhide boot is clamped

SHOWING NEW HARTFORD UNIVERSAL JOINTS COMPLETE AND DISASSEMBLED

vary slightly according to the nature of the work to be performed. The principle employed is that of the familiar gimbal ring, which is used in preference to the double cross employed in certain other types of joint.

The accompanying illustration shows the complete drive which is listed by the Hartford company as Type F-400, the two joints being shown in both assembled and disassembled relations. This indicates not only the general system of construction, but also the method of housing the working parts and protecting them from the inroads of dust and dirt. The basis of the joint is a pair of flanged plates, one of which is adapted for connection with the driving shaft, while the other carries a pair of projecting clevises diametrically opposite to one another and fitted with pivot pins. By means of these pins the bearing ring, as it

is placed at both ends by means of adjustable rings so that it can be removed, replaced or tightened at any time with small expense of time or labor.

Besides the particular type which is here illustrated, attention is called to Type F-400-S, which is an outgrowth of a smaller size which has been made for some time, and which is designed for use upon cars up to 45 horsepower where the single universal and torque tube construction are employed instead of the double joints used in the F-400 pattern. Type F-600 is a double joint arrangement in which provision is made for longitudinal motion in the joint itself, the connection being designed for use with the usual torque bar arrangement. Type J-660, as it is designated, is another new type of driving connection, and is intended for use on trucks of one, two and three tons' capacity.

## TO PREVENT SPRING BREAKAGE

**At Least That Sort Charged to the Spring Makers—Competent Authority Offers Far-Reaching Recommendations.**

"Heretofore minds have been riveted on your motive power, transmissions, clutches and various perplexing things that go with the building of an automobile. I feel, however, that engineers have paid too little attention to the matter of breakage of springs in the center," writes R. D. Woodford, of the Sheldon Axle Co., of Wilkes-Barre, Pa., large manufacturers of springs.

"Note this: If the center attachments are planned strong enough and are perfect fits so one could use a broken spring, there never would be a break. Make springs break outside, and then it is the fault of the maker.

"Here are a few recommendations that I would like to make:

"Have the spring seat or lower bearing of proper length, and make the exact radius of the spring normal.

"If two clips are used let them be of liberal size.

"Plan a top plate to go underneath these clips with a slightly sharper curve than the radius of the spring normal, and have it strong enough in thickness so it will be impossible for a spring to move underneath it at the center.

"I would recommend using between the spring and its lower bearing duck No. 6 or No. 8, saturated with lead and oil. This will preserve the fibre, and when drawn down tight there will be no material to displace. Do not use material under a spring that will displace while in use.

"Use as heavy a spring washer under the nuts as the stem of the clip will compress without injury.

"I advise for a light runabout in which there is used 1 3/4-inch steel, a clip with 1/2-inch shank. For a five-passenger car, where 2-inch steel is used, 9-16-inch shank. For a seven-passenger car, where 2 1/4-inch or 2 1/2-inch steel is used, 5/8-inch shank. And in each case use spring washers as thick as you possibly can crush without injury to the clip shank.

"Many are using a single clip. When these are used care should be taken that the inside of the clip is of the same radius as the spring is normal, so it will absolutely bind the spring tight in the center.

"If these recommendations are observed I think they will eliminate the breakage of springs in the center, which is no fault of the spring maker.

"Some are using springs which are called beaded center. In my mind there is nothing gained by this. If a spring is held down firmly in the center and not allowed to move, it cannot crystallize or break."

## Development of Dustless Roads in Europe

The campaign in Europe against dust and the deterioration of road surfaces, caused primarily by motor-car traffic, was inaugurated by Dr. Guglielminetti, of Monte Carlo, who, during the past ten years, has organized "Leagues Against Dust" in many European countries and with unswerving enthusiasm has worked continually to interest officials and engineers in the necessity for the suppression of dust, says Prof. Arthur H. Blanchard, consulting highway engineer, of Brown University, in a paper dealing with the topic, "Dustless Roads in Europe." The results of Dr. Guglielminetti's successful experiments with superficial tarring in 1902 in the principality of Monaco were published throughout all Europe. In the following year trials were carried out at Champigny by the engineers of the Department of Roads and Bridges of France. In the 1903 report on these trials the French engineers formulated all the basic principles of superficial tarring. Unfortunately the writer has found many instances in Europe and in the United States where these simple axiomatic rules have been ignored resulting in unsatisfactory surfaces and the uneconomical expenditure of many thousands of dollars annually.

After the world powers of Europe had been for several years developing various systems for the allaying of dust and the preservation of the road surface, the French engineers, realizing that an exchange of ideas and a dissemination of knowledge acquired was desirable from the standpoint of economical procedure in the future, through the medium of the French Government, organized the First International Road Congress which resulted in the formation of the Permanent International Association of Road Congresses. The influence of the association upon all European countries, with the possible exception of England, has been far reaching and decidedly beneficial. In many cases the conclusions and recommendations of one congress are made the basis of new construction work carried out before the succeeding congress.

The predominating method employed by the French engineers during the past nine years has been the use of tar as a surface coating mainly on roads of ordinary macadam. Superficial tarring has been accomplished by two general methods: application by hand and by machinery, both cold and hot tar being applied by both methods. Application by machines has been adopted for many years by some of the French engineers. Two types have

been employed, the pressure spraying machine and the gravity flow machine. There are two forms of the second type, namely, those equipped with mechanical brushes and those without; the further distribution of the tar being accomplished by hand brushing in the case of the latter type. By no means is there a consensus of opinion among French engineers relative to the comparative merits of the various machines. Another subject under discussion in France, which is of special interest to the motoring public, is with reference to the relative value of allowing the tar coat to remain without being covered with sand, gravel or stone screenings for a period of time, or to apply such coating immediately after the application of the tar. As the amount of time considered requisite by various engineers varies from a few hours to one or even two days under similar conditions, it would seem desirable that complete service tests should be made to determine if the advantages claimed for the delayed application of the covering are real or imaginary. The maintenance of the macadam surface of that famous Parisian boulevard, the Avenue du Bois de Boulogne, is interesting, due to the fact that twice during the year—once in May and once in October—its surface is coated with tar. During six months of the year its surface resembles that of a perfect sheet asphalt pavement. In February and September, however, the tar begins to disappear from the surface of the traveled ways, and small depressions are naturally formed in many places.

A unique method of surface application, which is only in an experimental state in France, is called by the inventor "Goudronnage par le Feu." The method consists in the application of cold crude tar to the road surface, and the subsequent setting on fire of the tar coat. Comment on the inconvenience caused by burning tar on the public highway is superfluous.

Under the direction of the Technical Commission of the Department of Roads and Bridges of France many experimental sections of various types of surfaces and pavements are being constructed on the national roads. The most interesting and, in the opinion of the writer, the most satisfactory experiment thus far made was the construction of a section of asphalt macadam on the trunk line between Versailles and Paris, in August, 1909. The method consisted of mixing broken stone, sand, asphalt mastic and Trinidad asphalt in a caldron. The mixture was spread to a depth of from  $1\frac{3}{4}$  to 2 inches on a founda-

tion of ordinary macadam and thoroughly compacted. The writer inspected this section in November, 1909, and again in July, 1910. At both times the surface was found to be in perfect condition and was of such a character as to provide a good foothold for horses. In addition to the experimental work of the commission, many of the French engineers have experimented with palliatives and many types of bituminous and cement-concrete pavements.

In Belgium, Italy and Switzerland two types of construction are employed, namely, superficial tarring and a pavement constructed by the Aeberli system. The methods used in connection with superficial tarring are similar to those employed in France; in fact, they are adopted from the French practice.

The Aeberli system of constructing a bituminous pavement has numerous features. First, by means of one machine the broken stone is dried, cleaned and finally passed through a cold bath of crude tar. The tar-coated stone is then stored in piles covered with a blanket of sand 3 to 4 inches in thickness for a period of from three to six weeks, after which it is used in the ordinary way for the construction of a bituminous macadam pavement.

Austria for the past five or six years has been experimenting with superficial tarring and various types of bituminous pavements constructed by the mixing method. The engineers of Austria, in common with those of Northern England and the United States, have to contend with the disintegrating effect of the blows from horses' hoofs shod with shoes provided with calks. Those of the Austrian horse are without doubt the most disastrous in their action on road surfaces, as the shoe is equipped with four calks instead of two, while the shape of the calk is that of a pyramid mounted on a prism. The resulting effect is that on warm days many bituminous surfaces are honey-combed with perforations.

In Germany, in addition to superficial tarring by hand and by various types of German machines and the construction of bituminous pavements of various types by the mixing method, the highway engineers have used very extensively both for city streets and trunk lines subjected to intense motor-car traffic a type of stone block pavement known as *kleinpfaster*. The small stone sets used are so cut that when laid they form circular or parabolic arcs. The stone blocks are laid on a foundation of macadam or concrete with a cushion

coat of sand or gravel, and with joints filled with sand or gravel, and in some cases grouted. Laid in circular arcs, the joints of the pavement are continually "broken" from the standpoint of traffic, resulting in a surface much smoother than ordinary stone block and not as noisy. Hundreds of miles have been constructed throughout the Empire, while its future seems assured as it is enthusiastically supported by the German engineers and the motoring public. A departure from the German practice is found in Hungary, where small square blocks are laid in straight rows forming angles of 45 degrees with the longitudinal axis of the road.

The British engineers have expended large sums of money in the development of many types of bituminous surfaces and pavements adaptable to economical use on trunk lines subjected to heavy and intense traffic, and in some cases as a substitute for asphalt comprimé and wood block on city streets. It is, however, somewhat surprising to find the diversity of opinion which exists among British engineers when it is remembered that, especially in England, bituminous surfaces and pavements have been constructed for many years. However, remarkable progress has been made both from the standpoints of construction and maintenance.

One feature of English practice is materially different from the Continent practice, namely, the more general use of refined tar. This practice is not universal, but has, however, new adherents each year.

In considering the various methods employed in England and Scotland for allaying dust and the preservation of the road surface, the use of water and the numerous palliatives with which the European market is flooded will not be alluded to in detail. Before dismissing the subject of palliatives, however, the recent decisions of the judges appointed by the Roads Improvement Association of England to investigate the dust-laying qualities of calcium chloride should be mentioned. The pith of the judges' comments contained in the reports of September, 1909, and March, 1910, is to the effect "that the results of the tests of calcium chloride applied in granular form by the dry method have shown that it is a very effective dust layer, but the treatment has the ill effects of causing, during the winter months, an abnormal quantity of sticky mud, a decided tendency to licking up, and a disintegrating action upon the macadam surface. Notwithstanding this, we are of the opinion that the process is probably not more injurious to macadamized roads than the excessive watering now demanded by the public effectively to lay the dust."

Within the borders of England can be found a greater variety of methods of using tar in road construction than in any other country in the world. Proceeding from the simple to the complex the first type

which will be considered is superficial tarring. Hundreds of miles have been so treated either by hand method or by various machines of the types used by French engineers but of English design. Two notable diversions may be found from Continental practice by a thorough investigation of English practice. One is the positive conclusion on the part of many engineers that the use of refined tar for a surface coating is economical and possesses many advantages over the use of crude tar. One advantage which is appreciated by motorists is that a road properly coated with refined tar can be opened to traffic within a few hours after treatment. Roads coated with crude tar, however, may have to be closed to traffic for two or three days. In connection with the use of refined tar it is of interest to note that a number of British engineers feel compelled to use refined material from the standpoint of the danger of damages being claimed for the pollution of fish streams by the washings from a road surface treated with crude tar. The second difference is, that the practice of some eminent English highway engineers is to admit the surface dressing of sand or screenings as the same is not considered either necessary or efficacious.

The method of using tarred sand, gravel or chips in both England and Scotland in connection with the construction of ordinary macadam and bituminous pavements is worthy of consideration. The practice of many engineers is to use the fine tarred material as a filler, rather than as a carpet or coating, thus allowing the mosaic surface of the upper layer of macadam to take the wear.

The durability of the various types of tar macadam roads constructed by the British engineers is remarkable, especially when the character of the intense and heavy traffic to which a large percentage of the mileage of this class of road is subjected is taken into consideration. This traffic, consisting of heavy motor vans, tractors and traction engine hauling, in many instances, from one to three trailers is unknown in the United States and on the Continent.

Bituminous pavements have, of course, been constructed for many years previous to the twentieth century, but, at present, interest is centered on those types which have been used during the past ten years. Two methods have been used to a considerable extent, namely, the penetration method and the mixing method. Two modifications of the penetration method usually employed in the United States will be mentioned. Pitchmac is constructed on a foundation of inferior stone, which has been flush coated with bituminous material. On this foundation a layer of 1½-inch stone, varying from 2 to 4½ inches in depth, is rolled in from one to three courses, a coat of bituminous material be-

ing applied to each course, while the surface is completed with a top dressing of chippings. The bituminous mastic used consists of pitch, creosote oil, fine sand and other ingredients. The writer, while in Liverpool, inspected many sections of pitchmac which had been subjected to severe traffic for many years, one having been down nine years, and in every case found the surface in excellent condition. The other modification of the penetration method is the Gladwell system, which consists of first, lightly rolling a thin layer of 2-inch stone on a bed of bituminous mastic; second, painting with refined tar, and third, filling the voids of the surface with mastic, after which the pavement is rolled and at once opened to traffic.

In the mixing method of constructing bituminous pavements two variations from the common American practice should be noted. First, the employment of a great variety of mixers some of which are very satisfactory in the results secured, judged from the standpoints of economics and the quality of the mix. Mixing machines of both the batch and continuous types have secured the attention deserved by British manufacturers. Unfortunately, the limitations of the various machines and, in some cases, operating charges, etc., have not been ascertained so as to permit American engineers to purchase machines without thorough investigation. The other diversion from American practice is in the extensive use of slag, since the first successful experiments were carried out twelve years ago. Although Tarmac has its limitations, as is the case with all classes of pavements, the roads coated with a Tarmac surface, which are found all over England, are generally excellent in character. In connection with the mixing method, it should be noted that asphalt either alone or in combination with tar and other materials has been successfully employed in the construction of many sections of bituminous pavements.

The introduction of Durax as a substitute for wood block, asphalt comprimé and other bituminous pavements and even for ordinary stone block in some cases has occurred during the past few years. Durax is simply the kleinpflaster of Germany with the addition of a bituminous cushion between the foundation and the stone blocks and the joints filled with a bituminous mastic. The city of Birmingham furnishes many examples of Durax pavements which have been under service for a number of years and appear to be giving satisfaction, although subjected to heavy and intense traffic.

Trackways of rectangular stone blocks averaging 12 inches wide, 6 inches thick and of varying lengths have been used for many years on steep hills or where the traffic is exceptionally heavy in some cities of England and Scotland. Trackways both of stone blocks and steel girders

laid in ordinary macadam are now proposed by some foreign engineers as a solution of the problem of economically maintaining macadam roads subjected to swiftly moving motor cars.

In marked contrast to the practice in many sections of the United States, especially in our municipalities, is the well-established custom of giving to one department complete control of the design, construction and maintenance of roads and pavements. The practice in many of our cities of assigning the design and construction to the city engineer and the maintenance to the commissioner of public works would not be considered good practice from the standpoint of economics.

The responsibility for the solution of engineering problems in Europe is placed where it belongs, namely, on the chief engineer. If his first solution is not financially possible or advisable, another is requested, but with practically no interference on the part of laymen with the engineering features of the problem. As a direct result of the above custom three commendable features of foreign practice have become well established in many countries. First, the same thorough preliminary investigation is given to a road problem as is now given to the design of a waterworks system or a sewage disposal plant in the United States. Second, the rapidly developing practice, especially characteristic of the work of the leading municipal and county engineers of England, of constructing that type of surface or pavement which is economically adaptable to local conditions and environments. Third, the development of economical systems of continuous maintenance. One feature, characteristic particularly of the French and English systems of maintenance, is of special interest to the motoring public, namely, the development of economical methods of surfacing large areas with tar or other compounds at the beginning of the summer season. In France this means that the bulk of superficial tarring is done in May and June while in England, due to the rainy season, the work extends into July. In connection with superficial tarring it is interesting to note that the fact has been established, based on the best English and French practice, that it is possible to tar paint macadam roads traversing woods without the subsequent formation of the black mud about which so much has been written.

A commendable feature of French and English practice is the construction of trunk lines with a greater width of the metallized surface than is characteristic of the American highway. This results, when considered in connection with the reduced cross-fall or crown, in a highway which is ideal from the standpoint of modern traffic and more economical in maintenance due to the self-evident distribution of traffic over the surface of the road.

## TITLES THAT ATTRACT DOLLARS

**"Leagues" and "Associations" That Are Not Always What They Seem—"Easy Money" in "Membership Fees."**

While most motorists who consider themselves fairly well informed, rightly believe that the American Automobile Association is the only bona-fide national organization devoted to their interests and properly fulfilling the functions of a membership association holding regular meetings at which members are entitled to vote, the number of organizations, partnerships and corporations the titles of which suggest that they are of the same order is not short of remarkable.

Practically all of them, like the so-called International Automobile League, of Buffalo, which now is under investigation by the New York authorities, are corporations doing a mercantile business and in return for an annual fee of from \$5 to \$25, the shrewd promoters usually offer the bait of cut prices on accessories as a lure for "members." The terms "club," "league," "association" and "society" are so suggestively uncommercial that they assist the allurements, and that they were adopted for the purpose scarcely admits of dispute.

In most instances the "league" or "association" is housed in a small store or a small office, in the latter case carrying little, if any, stock, and simply taking money with one hand and passing it out with the other, less the commission exacted, delivering goods ordered by "members" when they are obtainable, and making substitutions or excuses when they cannot be procured. The "membership fee" is just so much "found money." The "members" have voice or vote in the affairs of few organizations of the sort.

While the promise of automobiles or accessories at less than the market rates is, as stated, the bait that usually is offered, some of the self-styled "national bodies" confine themselves to particular spheres. The tourist, the hotel keeper and the garage men are the special objects of their attention. They furnish the tourist with a lovely little flag or emblem, and the hotel man and the garage man with equally lovely "official signs" in exchange, of course, for a more or less modest sum of American coin. In some parts of the country, in New England, particularly, the number of such signs and of variously appointed "official hotels" and "official garages" is sufficient to make the new motorist wonder whether he does not require the services of an oculist. Poor, indeed, is the hotel or garage that is not the "official" establishment of some organization or other. The so-called Touring Club of America, of New York, and the National Automobile Association and Auto-

mobile Legal Association, both of Boston, Mass., are three strictly business institutions that love the tourist and the hotel keeper and garage man. They each have "official signs" for sale. The T. C. A. also sells maps and road books and touring information, and when hotel keepers desire it and pay for it, the "club" maps out "ideal tours" designed to bring "automobile money" to the hotels' doors. The Automobile Legal Association admires the tourist and the hotel man just as much as does the Touring Club, but as its name suggests, it loves the lawyer more. It comprises a chain of attorneys, any one of whom is at the call of the "member" when he runs afoul of the law. The self-styled National Automobile Association is many things to many men, and to a few men in particular. Its proprietors used to style themselves the Automobile Owners' Supply Co., but apparently realizing the more attractive jingle of such an apparently uncommercial title as National Automobile Association, they adopted it. The nature of their business, however, remains unchanged.

These are but a few of the many similar business institutions trading under uncommercial titles. In New York City alone there are five such "organizations"—the National Association of Automobile Owners, the Mutual Automobile Association, the Inter-State Motoring Association, the Empire Automobile League and the Automobile Co-operative Association of America, in the latter of which the name of August Belmont, the New York banker and multimillionaire, is one of the chief assets; he figures as its chairman, and on the surface at least appears as anxious to get his little "10 per cent off" as the man who has fewer cents than he has dollars. All the other kindred "leagues" and "associations" also point with more or less pride to Belmont's connection with the Co-operative Association of America whenever the nature of their business is questioned and as justifying their existence and methods.

In New York state, outside of the big city, there are several other high-sounding and coin-catching titles employed by shrewd men who, to their own advantage, have answered the "What's in a name?" question and demonstrated that though a rose by any other name may smell as sweet, the same is not always true of a firm or corporation. The International Automobile League, of Buffalo, which now is under fire, is one of this number; the Motor League of America, of Syracuse, is another.

Chicago, like New York, also does not lack men able to appreciate the value of transacting business under uncommercial designations. For in the metropolis of the West there is not only an Automobile Owners' Association, but an Independent Automobile League and a Universal Auto League. Alleged owners' associations, but without "fancy" designations, fairly dot the country. Other than those mentioned they

exist in Philadelphia, in Providence, in Pittsburg, in Cleveland, in Minneapolis, in Los Angeles and few men know in how many other places. The nature of all essentially is the same.

In Boston, in addition to the so-called National Automobile Association, there is the Automobile League of New England, but the over-weening desire to save the automobile owner "from 10 to 20 per cent." knows no climate, and the name employed in promising the "saving" differs only in respect to the imaginations of the men who employ them. Thus while in Birmingham, Ala., they are content with the title Inter-State Automobile Association, in Memphis, Tenn., nothing less than International Automobile Club serves the same purpose. There is an American Automobile Owners' League doing business in Louisville, Ky.; a Southern Economy League in Nashville, Tenn.; a West Coast Automobile League in Los Angeles, and of known "national associations," other than those already specified, there are at least three—the National Automobile Association, of Dayton, Ohio; the National Automobile League, of Logansport, Ind., and the National Association of Automobile Owners, of Harrisburg, Pa., all located in little-big cities and rarely, if ever, heard of outside their confines, except when seeking to obtain goods for "members" at "dealers' prices," mention of which seems to stir the soul of the average man and move him to open his purse and reach out his hand toward whatever appears to offer those prices.

While few of the "leagues" and "associations" have circulated as much printed matter as the so-called International Automobile League, of Buffalo, the value of such an uncommercial title is well illustrated by that tight little corporation. According to one of its bulletins issued during the present month, it has a "membership" of more than 41,000, and as each "member" parted with \$10 solely for the promise of obtaining "dealers' prices," it means that the three individuals who comprise the "league" have divided at least \$410,000 in the less than three years in which they have been banded together. At the investigation of its affairs by the New York authorities, it was brought out that they are trying to collect "back dues" from delinquent "members," and as they undoubtedly collected from some of them, and as they also undoubtedly subtracted a profit from such goods as they were able to deliver to the "members," that the name has netted the trio well over a half-million dollars seems clear. And yet at the investigation it was brought out that about 1,000 "members" had filed complaints that the "league" had failed to deliver goods at "dealers' prices" as agreed, while but 22 could be found who were willing to testify that they ever had received benefits from their "memberships."

## SPEED LAWS MUST BE SPECIFIC

**Court Upsets Indiana State Law—"Closely Built Up Portions" Too Indefinite to be Legal.**

If the decision of Judge Henry H. Vinton, of the Indiana Circuit Court, rendered last week, is recognized as good law in other states of the Union, there is likely to be a general amending of speed laws in several of the commonwealths. For he holds that a statute or law attempting to regulate traffic conditions or the speed of vehicles must be clear and specific in its wording in order to be considered legal.

The validity of the Indiana automobile law was attacked by two attorneys appearing for three motorists charged with violating the law. The fight was carried through the lower courts on several appeals and the case finally came before Judge Vinton, who had been called as a special judge. After hearing the arguments, he declared invalid that portion of the act which limits the speed of motor vehicles in "the business and closely built-up portions of a municipality" to eight miles an hour and in "other portions of a municipality" to fifteen miles an hour. These terms, Judge Vinton holds, are too broad and indefinite. There is nothing in the law to define the terms and it is absolutely impossible to determine which is "the business and closely built-up portion of a municipality" and which is "the other portion." The terms, the court holds, admit of different construction.

In rendering this opinion Judge Vinton referred to decisions made by the Supreme Court as to laws which are not sufficiently specific to admit of clear construction. He instanced a law relating to the use of broad and narrow wagon tires which the Supreme bench had declared invalid because there was nothing in the law defining exactly what are narrow or broad tires.

This decision is of considerable importance especially at this season when several states are preparing to establish so-called "indefinite" speed limits.

### Nutmeggers Want Ferry Tolls Reduced.

Connecticut automobiles, through the Connecticut Automobile Association, are protesting against the ferry rates prevailing throughout their home state, and will petition the next legislature to have a reduction made in the tolls. It is contended that, while the present high schedule of rates was justifiable some time ago when it was necessary for the ferry companies to maintain a force of men to move the cars because of the law prohibiting the operation of motors on the boats, present conditions do not warrant these charges. It is claimed that the charge for an automobile

is from 50 to 100 per cent. greater than that for a two-horse truck in spite of the fact that the automobile takes up less room than the truck.

### Macon Maintains Motor Police Wagon.

It is customary to picture the wrongdoers of the more up-to-date municipalities as in a joyous frame of mind when their misdeeds earn them an opportunity to ride in one of the growing number of motor driven police patrols, but not so with the naughty ones of the little city of Macon, Ga. For them the "hurry-up" wagon offers opportunities of a real automobile ride, but not a free one. Each ride sets the passengers back 75 cents a head, and in real money, when convictions are obtained, the price of the automobile ride being added to the court costs. By this ingenious expedient the city has been able to create a maintenance fund for its police patrol which fund at present has a balance to its credit of \$176.35, although two tires and inner tubes have been purchased as reserve equipment. During the month of November last, the total upkeep expense for the vehicle was \$11.80; \$7.00 for gasoline, \$2.80 for lubricating oil, 50 cents for repairs and \$1.50 for supplies consisting of two sponges and a bottle of polish. During the month 206 police calls and 38 hospital calls were answered, necessitating a total mileage of 567, as against 669 in October.

### License Fees Returned to Portland Owners.

According to a decision of the judiciary committee of the city council of Portland, Ore., owners of vehicles who a year ago paid license fees for the privilege of operating their vehicles under the vehicle license law will receive back the amounts paid into the city treasury. A short time ago the State Supreme Court declared the law invalid and a few owners filed claims against the city for a refund of their fees. The city council had the matter under consideration for several weeks and finally decided that the city would be compelled to make the refund sooner or later, and it was thought best to end the matter by returning the fees illegally obtained.

### Panama-Pacific Race "in the Air."

The Panama-Pacific race in former years run on the roads adjacent to San Francisco under the name of the Portola road race has been postponed and it appears that attempts at the revival of this event may fail of their object, internal dissension having arisen. Though February 22 is considered favorably by the promoters, no specific date has been set, the postponement being of indefinite nature.

The Rhode Island Chauffeur's Club has been incorporated in Providence. The incorporators are: Walter L. Rowell, Harvey Campbell, Charles H. Johnson, Charles W. Harden and Danuel E. Barnes.
